Coagulation factor IX substitute. Preparations with appropriate activity may be used to correct deficiencies of coagulation factors II or X.

Ph Eur

DEFINITION

Human prothrombin complex is a plasma protein fraction containing blood coagulation factor IX together with variable amounts of coagulation factors II, VII and X; the presence and proportion of these additional factors depends on the method of fractionation. It is obtained from human plasma that complies with the monograph on *Human plasma for fractionation (0853).*

The potency of the preparation, reconstituted as stated on the label, is not less than 20 IU of factor IX per millilitre.

If the content of any of the factors is stated as a single value, the estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency; if the content of any of the factors is stated as a range, the estimated potency is not less than the lower limit and not greater than the upper limit of the stated range.

PRODUCTION

The method of preparation is designed to minimise activation of any coagulation factor (to minimise potential thrombogenicity) and includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 0.6 IU of factor IX per milligram of total protein, before the addition of any protein stabiliser.

The prothrombin complex fraction is dissolved in a suitable liquid. Heparin, antithrombin and other auxiliary substances such as a stabiliser may be added. No antimicrobial preservative is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

CHARACTERS

A white or slightly coloured powder or friable solid, very hygroscopic.

Reconstitute the preparation to be examined as stated on the label immediately before *carrying out the identification, tests (except those for solubility and water) and assay.*

IDENTIFICATION

It complies with the limits of the assays for factor IX and for factor II and, where applicable, those for factors VII and X.

TESTS

Solubility

To a container of the preparation to be examined add the volume of the liquid stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within 10 min, giving a clear solution that may be coloured.

pH (*2.2.3*)

6.5 to 7.5.

Osmolality (*2.2.35*)

Minimum 240 mosmol/kg.

Total protein

If necessary, dilute an accurately measured volume of the reconstituted preparation with a 9 g/l solution of *sodium chloride R* to obtain a solution expected to contain about 15 mg of protein in 2 ml. To 2.0 ml of the solution in a round-bottomed centrifuge tube add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion (*2.5.9*) and calculate the amount of protein by multiplying the result by 6.25.

Activated coagulation factors (*2.6.22*)

If necessary, dilute the preparation to be examined to contain 20 IU of factor IX per millilitre. For each of the dilutions, the coagulation time is not less than 150 s.

Heparin

If heparin has been added during preparation, determine the amount present by the assay of heparin in coagulation factor concentrates (*2.7.12*). The preparation to be examined contains not more than the amount of heparin stated on the label and in all cases not more than 0.5 IU of heparin per International Unit of factor IX.

Thrombin

If the preparation to be examined contains heparin, determine the amount present as described in the test for heparin and neutralise it by addition of *protamine sulphate R* (10 µg of protamine sulphate neutralises 1 IU of heparin). In each of 2 test tubes, mix equal volumes of the reconstituted preparation and a 3 g/l solution of *fibrinogen R*. Keep one of the tubes at 37 °C for 6 h and the other at room temperature for 24 h. In a 3rd tube, mix a volume of the fibrinogen solution with an equal volume of a solution of *human thrombin R* (1 IU/ml) and place the tube in a water-bath at 37 °C. No coagulation occurs in the tubes containing the preparation to be examined. Coagulation occurs within 30 s in the tube containing thrombin.

Water

Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectrometry (*2.2.40*), the water content is within the limits approved by the competent authority.

Sterility (*2.6.1*)

It complies with the test for sterility.

Pyrogens (*2.6.8*)

It complies with the test for pyrogens. Inject per kilogram of the rabbit's mass a volume of the reconstituted preparation equivalent to not less than 30 IU of factor IX.

ASSAY

Factor IX

Carry out the assay of human coagulation factor IX (*2.7.11*).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence interval ($P = 0.95$) of the estimated potency is not greater than 80 per cent to 125 per cent.

Factor II

Carry out the assay of human coagulation factor II (*2.7.18*).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence interval ($P = 0.95$) of the estimated potency is not greater than 90 per cent to 111 per cent.

The estimated factor II potency is not less than 70 per cent and not more than 165 per cent of the estimated factor IX potency.

Factor VII

If the label states that the preparation contains factor VII, carry out the assay of human coagulation factor VII (*2.7.10*).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence interval ($P = 0.95$) of the estimated potency is not greater than 80 per cent to 125 per cent.

Factor X

If the label states that the preparation contains factor X, carry out the assay of human coagulation factor X (*2.7.19*).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence interval ($P = 0.95$) of the estimated potency is not greater than 90 per cent to 111 per cent.

STORAGE

In an airtight container , protected from light.

LABELLING

The label states:

— the number of International Units of factor IX, and the number or range of International Units of factor II per container;

— where applicable, the number or range of International Units of factor VII and factor X per container;

— the amount of protein per container;

— the name and quantity of any added substances, including, where applicable, heparin and antithrombin;

— the name and quantity of the liquid to be used for reconstitution;

— that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

Ph Eur

Fibrin Sealant Kit

General Notices

(Ph Eur monograph 0903)

Ph Eur

DEFINITION

Fibrin sealant kit is essentially composed of 2 components, namely fibrinogen concentrate (component 1), a protein fraction containing human fibrinogen and a preparation containing human thrombin (component 2). A fibrin clot is rapidly formed when the 2 thawed or reconstituted components are mixed. Other ingredients (for example, human coagulation factor XIII, a fibrinolysis inhibitor or calcium ions) and stabilisers (for example, *Human albumin solution (0255)*) may be added. No antimicrobial preservative is added.

Human constituents are obtained from plasma that complies with the requirements of the monograph on *Human plasma for fractionation (0853).* No antibiotic is added to the plasma used.

When thawed or reconstituted as stated on the label, component 1 contains not less than 40 g/l of clottable protein; the thrombin activity of component 2 varies over a wide range (approximately 4-1000 IU/ml).

PRODUCTION

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and any residues are such as not to compromise the safety of the preparation for patients.

Constituents or mixtures of constituents are passed through a bacteria-retentive filter and distributed aseptically into sterile containers. Containers of freeze-dried constituents are closed under vacuum or filled with oxygen-free nitrogen or other suitable inert gas before being closed. In either case, they are closed so as to exclude micro-organisms.

If the human coagulation factor XIII content in component 1 is greater than 10 units/ml, the assay of factor XIII is carried out.

CHARACTERS

Freeze-dried constituents are hygroscopic, white or pale yellow powders or friable solids. Frozen constituents are colourless or pale yellow, opaque solids. Liquid constituents are colourless or pale yellow.

For the freeze-dried or frozen constituents, reconstitute or thaw as stated on the label immediately before carrying out the identification and the tests, except those for solubility and water.

COMPONENT 1 (FIBRINOGEN CONCENTRATE)

IDENTIFICATION

A. It complies with the limits of the assay of fibrinogen.

B. It complies with the limits of the assay of factor XIII (where applicable).

TESTS

pH (*2.2.3*)

6.5 to 8.0.

Solubility

Freeze-dried concentrates dissolve within 20 min in the volume of solvent for reconstitution and at the temperature stated on the label, forming an almost colourless, clear or slightly turbid solution.

Stability of solution

No gel formation appears at room temperature during 120 min following thawing or reconstitution.

Water

Determined by a suitable method, such as the semi-microdetermination (*2.5.12*), loss on drying (*2.2.32*) or near infrared spectrophotometry (*2.2.40*), the water content is within the limits approved by the competent authority.

Sterility (*2.6.1*)

It complies with the test for sterility.

ASSAY

Fibrinogen (clottable protein)

The estimated content in milligrams of clottable protein is not less than 70 per cent and not more than 130 per cent of the content stated on the label.

Mix 0.2 ml of the reconstituted preparation with 2 ml of a suitable buffer solution (pH 6.6-7.4) containing sufficient *human thrombin R* (approximately 3 IU/ml) and calcium (0.05 mol/l). Maintain at 37 °C for 20 min, separate the precipitate by centrifugation (5000 *g*, 20 min), wash thoroughly with a 9 g/l solution of *sodium chloride R* and determine the protein as nitrogen by sulphuric acid digestion (*2.5.9*). Calculate the protein content by multiplying the result by 6.0. If for a particular preparation this method cannot be applied, use another validated method for determination of fibrinogen.

Factor XIII

Where the label indicates that the human coagulation factor XIII activity is greater than 10 units/ml, the estimated activity is not less than 80 per cent and not more than 120 per cent of the activity stated on the label.

Make at least 3 suitable dilutions of thawed or reconstituted component 1 and of human normal plasma (reference preparation) using as diluent coagulation factor XIII deficient plasma or another suitable diluent. Add to each dilution suitable amounts of the following reagents:

— activator reagent, containing bovine or human thrombin, a suitable buffer, calcium chloride and a suitable inhibitor such as Gly-Pro-Arg-Pro-Ala-NH_2 which inhibits clotting of the sample but does not prevent coagulation factor XIII activation by thrombin,

— detection reagent, containing a suitable factor XIIIa-specific peptide substrate, such as Leu-Gly-Pro-Gly-Glu-Ser-Lys-Val-Ile-Gly-NH_2 and glycine ethyl ester as 2^{nd} substrate in a suitable buffer solution,

— NADH reagent, containing glutamate dehydrogenase, α-ketoglutarate and NADH in a suitable buffer solution.

After mixing, the absorbance changes (ΔA/min) are measured at a wavelength of 340 nm, after the linear phase of the reaction is reached.

1 unit of factor XIII is equal to the activity of 1 ml of human normal plasma.

Calculate the activity of the test preparation by the usual statistical methods (*5.3*, for example) . The confidence limits (P = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated activity.

COMPONENT 2 (THROMBIN PREPARATION)

IDENTIFICATION

It complies with the limits of the assay of thrombin.

TESTS

pH (*2.2.3*)

5.0 to 8.0.

Solubility

Freeze-dried preparations dissolve within 5 min in the volume of solvent for reconstitution stated on the label, forming a colourless, clear or slightly turbid solution.

Water

Determined by a suitable method, such as the semi-microdetermination (*2.5.12*), loss on drying (*2.2.32*) or near infrared spectrophotometry (*2.2.40*), the water content is within the limits approved by the competent authority.

Sterility (*2.6.1*)

It complies with the test for sterility.

ASSAY

Thrombin

The estimated activity is not less than 80 per cent and not more than 125 per cent of the activity stated on the label.

If necessary, dilute the reconstituted preparation to be examined to approximately 2-20 IU of thrombin per millilitre using as diluent a suitable buffer pH 7.3-7.5, such as *imidazole buffer solution pH 7.3 R* containing 10 g/l of *human albumin R* or *bovine albumin R*. To a suitable volume of the dilution, add a suitable volume of fibrinogen solution (1 g/l of clottable protein) warmed to 37 °C and start measurement of the clotting time immediately. Repeat the procedure with each of at least 3 dilutions, in the range stated above, of a reference preparation of thrombin, calibrated in International Units. Calculate the activity of the test preparation by the usual statistical methods (*5.3*, for example). The confidence limits ($P = 0.95$) are not less than 80 per cent and not more than 125 per cent of the estimated activity.

STORAGE

Protected from light and, for freeze-dried components, in an airtight container.

LABELLING

The label states:

- the amount of fibrinogen (milligrams of clottable protein), thrombin (International Units) per container, and coagulation factor XIII, if this is greater than 10 units/ml,
- where applicable, the name and volume of solvent to be used to reconstitute the components.

Ph Eur

Hepatitis A Immunoglobulin

General Notices

(Human Hepatitis A Immunoglobulin, Ph Eur monograph 0769)

Action and use

Ph Eur

DEFINITION

Human hepatitis A immunoglobulin is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma from selected donors having antibodies against hepatitis A virus. *Human normal immunoglobulin (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin (0338),* except for the minimum number of donors and the minimum total protein content.

POTENCY

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (*2.7.1*).

The International Unit is the activity contained in a stated amount of the International Standard for anti-hepatitis A immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Human hepatitis A immunoglobulin BRP is calibrated in International Units by comparison with the International Standard.

The stated potency is not less than 600 IU/ml. The estimated potency is not less than the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 80 per cent and not more than 125 per cent.

STORAGE

Ph Eur

Hepatitis B Immunoglobulin for Intravenous Use

General Notices

(Human Hepatitis B Immunoglobulin for Intravenous Administration, Ph Eur monograph 1016)

Ph Eur

DEFINITION

Human hepatitis B immunoglobulin for intravenous administration is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. It is obtained from plasma from selected and/or immunised donors having antibodies against hepatitis B surface antigen. *Human normal immunoglobulin for intravenous administration (0918)* may be added.

It complies with the monograph on *Human normal immunoglobulinum for intravenous administration (0918)*, except for the minimum number of donors, the minimum total protein content and the limit for osmolality.

POTENCY

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay (*2.7.1*) of suitable sensitivity and specificity.

The International Unit is the activity contained in a stated amount of the International Reference Preparation of hepatitis B immunoglobulin. The equivalence in International Units of the International Reference Preparation is stated by the World Health Organisation.

The stated potency is not less than 50 IU/ml. The estimated potency is not less than the stated potency. The confidence limits ($P = 0.95$) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

STORAGE

Ph Eur

Human α-1-proteinase Inhibitor

General Notices

(Ph Eur monograph 2387)

Ph Eur

DEFINITION

Human α-1-proteinase inhibitor is a plasma protein fraction containing mainly human α-1-proteinase inhibitor (also known as human α-1-antitrypsin or α-1-antiproteinase). Human α-1-proteinase inhibitor is a glycoprotein existing in isoforms with different isoelectric points and is the most abundant multifunctional serine proteinase inhibitor in human plasma. It is obtained from human plasma that complies with the monograph *Human plasma for fractionation (0853)*, using a suitable fractionation process and further purification steps. Other plasma proteins may be present.

PRODUCTION

GENERAL PROVISIONS

The method of preparation includes steps that have been shown to remove or to inactivate known agents of infection. The subsequent purification procedure must be validated to demonstrate that the concentration of any substances used for inactivation of viruses during production is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 0.35 mg of active human α-1-proteinase inhibitor per milligram of total protein. Ratio of human α-1 proteinase inhibitor activity to human α-1-proteinase inhibitor antigen is not less than 0.7.

Buffering and other auxiliary substances such as a stabiliser may be included. No antimicrobial preservative is added. The solution is passed through a bacteria-retentive filter and distributed aseptically into the final containers. The product may be freeze-dried.

CONSISTENCY OF THE METHOD OF PRODUCTION

The consistency of the method of production, including demonstration that the manufacturing process yields a product with a consistent composition and maintains the functional integrity of human α-1-proteinase inhibitor, is evaluated by suitable analytical procedures that are determined during process development, and which include:

— assay of human α-1-proteinase inhibitor activity;

— determination of specific human α-1-proteinase inhibitor activity, expressed as the ratio of active human α-1-proteinase inhibitor to total protein;

— characterisation of isoform composition and protein structure by suitable methods such as isoelectric focusing *(2.2.54)*, spectrometric methods (for example, mass spectrometry) or capillary electrophoresis *(2.2.47)*;

— determination of the ratio of human α-1-proteinase inhibitor activity to human α-1-proteinase inhibitor antigen;

— characterisation of accompanying plasma proteins that might be present, by a set of suitable methods such as SDS-PAGE, cellulose acetate electrophoresis or capillary zone electrophoresis *(2.2.31)* and quantitative determination of relevant accompanying plasma proteins;

— determination of molecular-size distribution, used to quantify the polymeric forms of human α-1-proteinase inhibitor; consideration is given to the potential presence of accompanying proteins that might affect the results.

CHARACTERS

Appearance

Freeze-dried products are hygroscopic, white or pale yellow or pale brown powders or friable solids; liquid products are clear or slightly opalescent, colourless or pale yellow or pale green or pale brown.

If the preparation to be examined is freeze-dried, reconstitute it as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.

IDENTIFICATION

The assay of human α-1-proteinase inhibitor activity serves to identify the preparation.

TESTS

pH *(2.2.3)*

6.5 to 7.8.

Solubility

To a container of the preparation to be examined add the volume of the liquid stated on the label at room temperature. The preparation dissolves completely when reconstituted according to the instructions for use, giving a clear, colourless or pale green or pale yellow or pale brown solution.

Osmolality *(2.2.35)*

Minimum 210 mosmol/kg.

Total protein

Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 ml. To 2.0 ml of this solution in a round-bottomed centrifuge tube add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion *(2.5.9)* and calculate the protein content by multiplying by 6.25.

Water

Determined by a suitable method, such as the semi-micro determination of water *(2.5.12)*, loss on drying *(2.2.32)* or near-infrared spectrophotometry *(2.2.40)*, the water content is within the limits approved by the competent authority.

Sterility *(2.6.1)*

It complies with the test.

Pyrogens *(2.6.8)*

It complies with the test. Inject per kilogram of the rabbit's mass a volume equivalent to not less than 60 mg of human α-1-proteinase inhibitor.

ASSAY

Carry out the assay of human α-1-proteinase inhibitor *(2.7.32)*. The estimated potency is not less than 80 per cent and not more than 120 per cent of the stated potency. The confidence limits ($P = 0.95$) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

STORAGE

Unless otherwise justified and authorised, in an airtight and sterile container, at a temperature not exceeding 25 °C.

LABELLING

The label states:

- the potency of active (functional) human α-1-proteinase inhibitor per container;
- the name and quantity of any added substances;
- the quantity of protein per container;
- where applicable, the name and volume of the liquid to be used for reconstitution;
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

Ph Eur

Human Haematopoietic Stem Cells

General Notices

(Ph Eur monograph 2323)

Ph Eur

This monograph provides a standard for the preparation and control of human haematopoietic stem cells for use in therapy. It does not exclude the use of alternative preparation and control methods that are acceptable to the competent authority.

DEFINITION

Human haematopoietic stem cells are primitive multipotent cells capable of self-renewal as well as differentiation and maturation into all haematopoietic lineages. They are found in small numbers in bone marrow, in the mononuclear cell fraction of circulating blood and in umbilical cord blood. The preparation also contains haematopoietic progenitor cells, which are capable of differentiation but not self-renewal. The numbers of haematopoietic stem cells and haematopoietic progenitor cells are correlated.

This monograph applies to haematopoietic stem cells that have not undergone expansion or genetic modification, and that are intended to provide a successful engraftment leading to a permanent restoration of all lineages of blood cell production to a sufficient level and function in a recipient whose haematopoiesis has been compromised by, for example, disease or high doses of chemotherapy and/or radiation therapy, or has to be replaced in certain congenital diseases. The infused haematopoietic stem cells can originate from the recipient (autologous) or from another individual (allogeneic).

Haematopoietic stem cells are recognised by their ability to reconstitute human haematopoiesis *in vivo*. They also have the capacity to differentiate into colony-forming cells, which are able to give rise to colonies in the presence of various growth factors. The membrane marker CD34 is commonly used for the successful isolation/purification of haematopoietic stem cells from crude preparations and as an indicator of haematopoietic stem cell content in routine quality control.

PRODUCTION

DONORS

Where allogeneic cells are used, they are derived from carefully selected donors in accordance with donor selection criteria. Directive 2004/23/EC of the European Union deals with the criteria for donor selection.

COLLECTION

Peripheral blood stem cells These are collected by cytapheresis after mobilisation from the bone marrow by administration of growth factors and/or treatment of autologous donors with cytotoxic substances. The cells may be processed to select a population of interest and may be cryopreserved.

Bone marrow Bone marrow is harvested by aspirating the cells from the cavities of hollow bones, then removing bone fragments by filtration and, if necessary, separating the buffy coat cells after centrifugation or with commercial kits based on the cytapheresis principle. The cells may be processed to select a population of interest and may be cryopreserved.

Umbilical cord blood Placental blood haematopoietic cells are collected from placentae via the vein of the umbilical cord. The cells are then cryopreserved.

CRYOPRESERVATION

Cryopreservation allows storage for long periods. The cells are suspended in a validated medium containing a suitable cryoprotectant (for example, dimethyl sulphoxide) and macromolecules (for example, autologous plasma/albumin) and are frozen in cryobags in a manner designed to maintain viability of the cells by controlled cooling according to a validated method. They are stored at a temperature of - 140 °C or lower. Where cryobags are stored under other conditions of temperature and duration, the functionality of the preparation must be validated. Cryobags from donors that test positive for any infectious disease marker must be stored in such a way as to avoid cross-contamination.

SUBSTANCES USED IN PRODUCTION

The quality of substances used in production may be critical with respect to the quality, safety and efficacy of the final product, particularly for substances of biological origin. This is of particular importance for:

— proteins, including enzymes and antibodies;

— cryopreservation reagents;

— purification reagents.

Quality assurance

All substances must be produced within a recognised quality assurance system using suitable production facilities.

Quality specifications

A suitable quality specification must be presented for each substance, including notably:

— identity;

— potency (where applicable);

— purity;

— determination of bacterial endotoxins *(2.6.14)* (where applicable);

— microbiological quality (total viable count, tests for specified micro-organisms);

— sterility *(2.6.1)* (where applicable).

Viral safety

The requirements of chapter *5.1.7*. apply.

Transmissible spongiform encephalopathies

A risk assessment of the product with respect to transmissible spongiform encephalopathies is carried out, and suitable measures are taken to minimise any such risk *(5.2.8)*.

Water

Water used in the preparation of cellular products complies with the relevant monograph (*Water for injections (0169), Water, highly purified (1927), Purified water (0008)*). Water incorporated into the final product complies with the section on Water for injections in bulk in the monograph *Water for injections (0169)*, and in addition is sterile.

TESTS

Target specifications are established for the different tests, but these are not used as rigid acceptance criteria.

Tests carried out include the following (further tests, such as purging, cell depletion, allogeneic application, may be necessary depending on any treatment applied to the cells and on the intended recipient):

Nucleated cell count

Nucleated cells are counted using a validated automated apparatus (automated haematology analyser) or by a manual method (counting chamber).

Viability

Viability is assessed for products that are not infused within 24 h of collection. It is determined either using a validated automated apparatus (for example, by flow cytometry *(2.7.24)* with nucleic acid intercalating agents such as propidium iodide or 7-aminoactinomycin D) or by a manual method (for example, visual observation of trypan blue staining).

CD34+ cell count

For peripheral blood stem cells, CD34+ cell count is determined using a validated automated apparatus to analyse cells labelled with anti-CD34 antibodies. The apparatus and method employed must be able to determine the number of CD34+ cells with a sensitivity, accuracy and reproducibility comparable with those of immunophenotyping *(2.7.23)*, where cells are labelled using anti-CD34 and anti-CD45 antibodies conjugated to a fluorochrome and analysed by flow cytometry *(2.7.24)*.

Colony-forming cell (CFC) assay

Proliferative capacity is established by a suitable assay. The test is not necessarily carried out on each unit. The correlation between the dose of CD34 and the number of CFCs in a given situation (pathology, packaging, mobilisation) is determined. The CFC assay is carried out periodically; whenever a change that could affect the quality of CD34+ cells is made to the protocol for packaging or mobilisation, it is carried out on a suitable number of units.

Microbiological control

Examine as prescribed in general method *2.6.27. Microbiological control of cellular products*. Where justified, the product may be released before completion of the test.

Ph Eur

Measles Immunoglobulin

General Notices

(Human Measles Immunoglobulin, Ph Eur monograph 0397)

Ph Eur

DEFINITION

Human measles immunoglobulin is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma containing specific antibodies against the measles virus. *Human normal immunoglobulin (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin (0338),* except for the minimum number of donors and the minimum total protein content.

POTENCY

The potency of the liquid preparation and of the freeze-dried preparation after reconstitution as stated on the label is not less than 50 IU per millilitre of neutralising antibody against measles virus.

The potency is determined by comparing the antibody titres of the immunoglobulin to be examined and of a reference preparation calibrated in International Units, using a challenge dose of measles virus in a suitable cell culture system. A method of equal sensitivity and precision may be used providing that the competent authority is satisfied that it correlates with neutralising activity for the measles virus by comparison with the reference preparation.

The International Unit is the specific neutralising activity for measles virus contained in a stated amount of the International Standard for human anti-measles serum. The equivalence in International Units of the International Reference Preparation is stated by the World Health Organisation.

Prepare serial two-fold dilutions of the immunoglobulin to be examined and of the reference preparation. Mix each dilution with an equal volume of a suspension of measles virus containing about 100 $CCID_{50}$ in 0.1 ml and incubate protected from light at 37 °C for 2 h. Using not fewer than six cell cultures per mixture, inoculate 0.2 ml of each mixture into each of the cell cultures allocated to that mixture and incubate for not less than 10 days. Examine the cultures for viral activity and compare the dilution containing the smallest quantity of the immunoglobulin which neutralises the virus with that of the corresponding dilution of the reference preparation.

Calculate the potency of the immunoglobulin to be examined in International Units per millilitre of neutralising antibody against measles virus.

STORAGE

See *Human normal immunoglobulin (0338).*

LABELLING

See *Human normal immunoglobulin (0338).*

The label states the number of International Units per container.

Ph Eur

Normal Immunoglobulin for Intravenous Use

General Notices

(Human Normal Immunoglobulin for Intravenous Administration, Ph Eur monograph 0918)

Ph Eur

DEFINITION

Human normal immunoglobulin for intravenous administration is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G (IgG). Other proteins may be present. Human normal immunoglobulin for intravenous administration contains the IgG antibodies of normal subjects. This monograph does not apply to products intentionally prepared to contain fragments or chemically modified IgG.

Human normal immunoglobulin for intravenous administration is obtained from plasma that complies with the requirements of the monograph on *Human plasma for fractionation (0853).* No antibiotic is added to the plasma used.

PRODUCTION

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses, it shall have been shown that any residues present in the final product have no adverse effects on the patients treated with the immunoglobulin.

The product shall have been shown, by suitable tests in animals and evaluation during clinical trials, to be well tolerated when administered intravenously.

Human normal immunoglobulin for intravenous administration is prepared from pooled material from not fewer than 1000 donors by a method that has been shown to yield a product that:

— does not transmit infection;

— at an immunoglobulin concentration of 50 g/l, contains antibodies for at least 2 of which (1 viral and 1 bacterial) an International Standard or Reference Preparation is available, the concentration of such antibodies being at least 3 times that in the initial pooled material;

— has a defined distribution of immunoglobulin G subclasses;

— complies with the test for Fc function of immunoglobulin (*2.7.9*).

Human normal immunoglobulin for intravenous administration is prepared as a stabilised solution or as a freeze-dried preparation. A stabiliser may be added. In both cases the preparation is passed through a bacteria-retentive filter. The preparation may subsequently be freeze-dried and the containers closed under vacuum or under an inert gas. No antimicrobial preservative is added either during fractionation or at the stage of the final bulk solution.

The stability of the preparation is demonstrated by suitable tests carried out during development studies.

CHARACTERS

The liquid preparation is clear or slightly opalescent and colourless or pale yellow. The freeze-dried preparation is a hygroscopic, white or slightly yellow powder or solid friable mass.

For the freeze-dried preparation, reconstitute as stated on the label immediately before carrying out the identification and the tests, except those for solubility and water.

IDENTIFICATION

Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal human serum, compare normal human serum and the preparation to be examined, both diluted to contain 10 g/l of protein. The main component of the preparation to be examined corresponds to the IgG component of normal human serum. The preparation to be examined may show the presence of small quantities of other plasma proteins; if human albumin has been added as a stabiliser, it may be seen as a major component.

TESTS

Solubility

For the freeze-dried preparation, add the volume of the liquid stated on the label. The preparation dissolves completely within 30 min at 20-25 °C.

pH (*2.2.3*)

4.0 to 7.4.

Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to obtain a solution containing 10 g/l of protein.

Osmolality (*2.2.35*)

Minimum 240 mosmol/kg.

Total protein

Minimum 30 g/l and between 90 per cent and 110 per cent of the quantity of protein stated on the label.

Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 ml. To 2.0 ml of this solution in a round-bottomed centrifuge tube add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the centrifugation residue by the method of sulphuric acid digestion (*2.5.9*) and calculate the content of protein by multiplying the result by 6.25.

Protein composition

Zone electrophoresis (*2.2.31*).

Use strips of suitable cellulose acetate gel or suitable agarose gel as the supporting medium and *barbital buffer solution pH 8.6 R1* as the electrolyte solution.

If cellulose acetate is the supporting material, the method described below can be used. If agarose gels are used, and because they are normally part of an automated system, the manufacturer's instructions are followed instead.

Test solution Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to an immunoglobulin concentration of 30 g/l.

Reference solution Reconstitute *human immunoglobulin for electrophoresis BRP* and dilute with a 9 g/l solution of *sodium chloride R* to a protein concentration of 30 g/l.

To a strip apply 4.0 µl of the test solution as a 10 mm band or apply 0.4 µl per millimetre if a narrower strip is used. To another strip apply in the same manner the same volume of the reference solution. Apply a suitable electric field such that the albumin band of normal human serum applied on a control strip migrates at least 30 mm. Stain the strips with *amido black 10B solution R* for 5 min. Decolourise with a mixture of 10 volumes of *glacial acetic acid R* and 90 volumes of *methanol R* so that the background is just free of colour. Develop the transparency of the strips with a mixture of 19 volumes of *glacial acetic acid R* and 81 volumes of *methanol R*. Measure the absorbance of the bands at 600 nm in an instrument having a linear response over the range of measurement. Calculate the result as the mean of 3 measurements of each strip.

System suitability In the electropherogram obtained with the reference solution on cellulose acetate or on agarose gels, the proportion of protein in the principal band is within the limits stated in the leaflet accompanying the reference preparation.

Results In the electropherogram obtained with the test solution on cellulose acetate or on agarose gels, not more than 5 per cent of protein has a mobility different from that of the principal band. This limit is not applicable if albumin has been added to the preparation as a stabiliser; for such preparations, a test for protein composition is carried out during manufacture before addition of the stabiliser.

Distribution of molecular size

Liquid chromatography (*2.2.29*).

Test solution Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to a concentration suitable for the chromatographic system used. A concentration in the range of 4-12 g/l and injection of 50-600 µg of protein are usually suitable.

Reference solution Dilute *human immunoglobulin (molecular size) BRP* with a 9 g/l solution of *sodium chloride R* to the same protein concentration as the test solution.

Column:

- *size: l* = 0.6 m, Ø = 7.5 mm, or l = 0.3 m, Ø = 7.8 mm;
- *stationary phase*: *hydrophilic silica gel for chromatography R* of a grade suitable for fractionation of globular proteins with relative molecular masses in the range 10 000 to 500 000.

Mobile phase Dissolve 4.873 g of *disodium hydrogen phosphate dihydrate R*, 1.741 g of *sodium dihydrogen phosphate monohydrate R*, 11.688 g of *sodium chloride R* and 50 mg of *sodium azide R* in 1 litre of *water R*.

Flow rate 0.5 ml/min.

Detection Spectrophotometer at 280 nm.

In the chromatogram obtained with the reference solution, the principal peak corresponds to the IgG monomer and there is a peak corresponding to the dimer with a relative retention to the principal peak of about 0.85. Identify the peaks in the chromatogram obtained with the test solution by comparison with the chromatogram obtained with the reference solution; any peak with a retention time shorter than that of the dimer corresponds to polymers and aggregates.

Results In the chromatogram obtained with the test solution:

— *relative retention*: for the monomer and for the dimer, the relative retention to the corresponding peak in the chromatogram obtained with the reference solution is 1 ± 0.02;

— *peak area*: the sum of the peak areas of the monomer and the dimer represent not less than 90 per cent of the total area of the chromatogram and the sum of the peak areas of polymers and aggregates represents not more than 3 per cent of the total area of the chromatogram. This requirement does not apply to products where albumin has been added as a stabiliser; for products stabilised with albumin, a test for distribution of molecular size is carried out during manufacture before addition of the stabiliser.

Anticomplementary activity (*2.6.17*)

The consumption of complement is not greater than 50 per cent (1 CH_{50} per milligram of immunoglobulin).

Prekallikrein activator (*2.6.15*)

Maximum 35 IU/ml, calculated with reference to a dilution of the preparation to be examined containing 30 g/l of immunoglobulin.

Anti-A and anti-B haemagglutinins (*2.6.20*)

Carry out the tests for anti-A and anti-B haemagglutinins. If the preparation to be examined contains more than 30 g/l of immunoglobulin, dilute to this concentration before preparing the dilutions to be used in the test. The 1 to 64 dilutions do not show agglutination.

Anti-D antibodies (*2.6.26*)

It complies with the test for anti-D antibodies in human immunoglobulin for intravenous administration.

Antibody to hepatitis B surface antigen

Minimum 0.5 IU/g of immunoglobulin, determined by a suitable immunochemical method (*2.7.1*).

Water

Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near infrared spectrophotometry (*2.2.40*), the water content is within the limits approved by the competent authority.

Sterility (*2.6.1*)

It complies with the test for sterility.

Pyrogens (*2.6.8*)

It complies with the test for pyrogens. Inject per kilogram of the rabbit's mass a volume equivalent to 0.5 g of immunoglobulin but not more than 10 ml per kilogram of body mass.

STORAGE

For the liquid preparation, store in a colourless glass container, protected from light, at the temperature stated on the label. For the freeze-dried preparation, store in an airtight colourless glass container, protected from light, at a temperature not exceeding 25 °C.

LABELLING

The label states:

- — for liquid preparations, the volume of the preparation in the container and the protein content expressed in grams per litre;
- — for freeze-dried preparations, the quantity of protein in the container;
- — the amount of immunoglobulin in the container;
- — the route of administration;
- — for freeze-dried preparations, the name or composition and the volume of the reconstituting liquid to be added;
- — the distribution of subclasses of immunoglobulin G present in the preparation;
- — where applicable, the amount of albumin added as a stabiliser;
- — the maximum content of immunoglobulin A.

Ph Eur

Normal Immunoglobulin

General Notices

Normal Immunoglobulin Injection

(Human Normal Immunoglobulin, Ph Eur monograph 0338)

Ph Eur

DEFINITION

Human normal immunoglobulin is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G (IgG). Other proteins may be present. Human normal immunoglobulin contains the IgG antibodies of normal subjects. It is intended for intramuscular or subcutaneous administration.

Human normal immunoglobulin is obtained from plasma that complies with the requirements of the monograph on *Human plasma for fractionation (0853)*. No antibiotic is added to the plasma used.

PRODUCTION

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses, it shall have been shown that any residues present in the final product have no adverse effects on the patients treated with the immunoglobulin.

The product shall have been shown, by suitable tests in animals and evaluation during clinical trials, to be well tolerated when administered intramuscularly or subcutaneously.

Human normal immunoglobulin is prepared from pooled material from at least 1000 donors by a method that has been shown to yield a product that:

— does not transmit infection;

— at a protein concentration of 160 g/l, contains antibodies for at least 2 of which (1 viral and 1 bacterial) an International Standard or Reference Preparation is available, the concentration of such antibodies being at least 10 times that in the initial pooled material.

If the human normal immunoglobulin is intended for subcutaneous administration, the production method shall have been shown to consistently yield products that comply with the test for Fc function of immunoglobulin *(2.7.9)*.

Human normal immunoglobulin is prepared as a stabilised solution, for example in a 9 g/l solution of sodium chloride, a 22.5 g/l solution of glycine or, if the preparation is to be freeze-dried, a 60 g/l solution of glycine. Multidose preparations contain an antimicrobial preservative. Single-dose preparations do not contain an antimicrobial preservative. Any antimicrobial preservative or stabilising agent used shall have been shown to have no deleterious effect on the final product in the amount present. The solution is passed through a bacteria-retentive filter. The preparation may subsequently be freeze-dried and the containers closed under vacuum or under an inert gas.

The stability of the preparation is demonstrated by suitable tests carried out during development studies.

CHARACTERS

The liquid preparation is clear and pale-yellow or light-brown; during storage it may show formation of slight turbidity or a small amount of particulate matter. The freeze-dried preparation is a hygroscopic, white or slightly yellow powder or solid, friable mass.

For the freeze-dried preparation, reconstitute as stated on the label immediately before carrying out the identification and the tests, except those for solubility and water.

IDENTIFICATION

Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal human serum, compare normal human serum and the preparation to be examined, both diluted to a protein concentration of 10 g/l. The main component of the preparation to be examined corresponds to the IgG component of normal human serum. The solution may show the presence of small quantities of other plasma proteins.

TESTS

Solubility

For the freeze-dried preparation, add the volume of the liquid stated on the label. The preparation dissolves completely within 20 min at 20-25 °C.

pH *(2.2.3)*

5.0 to 7.2.

Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to a protein concentration of 10 g/l.

Total protein

Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 ml. To 2.0 ml of this solution in a round-bottomed centrifuge tube add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion *(2.5.9)* and calculate the content of protein by multiplying the result by 6.25. The preparation has a protein concentration of not less than 100 g/l and not more than 180 g/l and contains not less than 90 per cent and not more than 110 per cent of the quantity of protein stated on the label.

Protein composition

Examine by zone electrophoresis *(2.2.31)*.

Use strips of suitable cellulose acetate gel or suitable agarose gel as the supporting medium and *barbital buffer solution pH 8.6 R1* as the electrolyte solution.

If cellulose acetate is the supporting material, the method described below can be used. If agarose gels are used, and because they are normally part of an automated system, the manufacturer's instructions are followed instead.

Test solution Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to a protein concentration of 50 g/l.

Reference solution Reconstitute *human immunoglobulin for electrophoresis BRP* and dilute with a 9 g/l solution of *sodium chloride R* to a protein concentration of 50 g/l.

To a strip apply 2.5 µl of the test solution as a 10 mm band or apply 0.25 µl per millimetre if a narrower strip is used. To another strip apply in the same manner the same volume of the reference solution. Apply a suitable electric field such that the albumin band of normal human serum applied on a control strip migrates at least 30 mm. Stain the strip with *amido black 10B solution R* for 5 min. Decolourise with a mixture of 10 volumes of *glacial acetic acid R* and 90 volumes of *methanol R* so that the background is just free of colour. Develop the transparency of the strips with a mixture of 19 volumes of *glacial acetic acid R* and 81 volumes of *methanol R*. Measure the absorbance of the bands at 600 nm in an instrument having a linear response over the range of measurement. Calculate the result as the mean of 3 measurements of each strip.

System suitability In the electropherogram obtained with the reference solution on cellulose acetate or on agarose gels, the proportion of protein in the principal band is within the limits stated in the leaflet accompanying the reference preparation.

Results In the electropherogram obtained with the test solution on cellulose acetate or on agarose gels, not more than 10 per cent of protein has a mobility different from that of the principal band.

Distribution of molecular size

Liquid chromatography *(2.2.29)*.

Test solution Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to a concentration suitable for the chromatographic system used. A concentration in the range of 4-12 g/l and injection of 50-600 µg of protein are usually suitable.

Reference solution Dilute *human immunoglobulin (molecular size) BRP* with a 9 g/l solution of *sodium chloride R* to the same protein concentration as the test solution.

Column:

— *size:* l = 0.6 m, Ø = 7.5 mm [or l = 0.3 m, Ø = 7.8 mm];

— *stationary phase: hydrophilic silica gel for chromatography R*, of a grade suitable for fractionation of globular proteins with relative molecular masses in the range 10 000 to 500 000.

Mobile phase Dissolve 4.873 g of *disodium hydrogen phosphate dihydrate R*, 1.741 g of *sodium dihydrogen phosphate monohydrate R*, 11.688 g of *sodium chloride R* and 50 mg of *sodium azide R* in 1 litre of *water R*.

Flow rate 0.5 ml/min.

Detection Spectrophotometer at 280 nm.

In the chromatogram obtained with the reference solution, the principal peak corresponds to the IgG monomer and there is a peak corresponding to the dimer with a relative retention to the principal peak of about 0.85. Identify the peaks in the chromatogram obtained with the test solution by comparison with the chromatogram obtained with the reference solution; any peak with a retention time shorter than that of the dimer corresponds to polymers and aggregates. The preparation to be examined complies with the test if, in the chromatogram obtained with the test solution:

— *relative retention*: for the monomer and for the dimer, the relative retention to the corresponding peak in the chromatogram obtained with the reference solution is 1 ± 0.02;

— *peak area*: the sum of the peak areas of the monomer and the dimer represent not less than 85 per cent of the total area of the chromatogram and the sum of the peak areas of polymers and aggregates represents not more than 10 per cent of the total area of the chromatogram.

Anti-A and anti-B haemagglutinins *(2.6.20)*

If human normal immunoglobulin is intended for subcutaneous administration, carry out the tests for anti-A and anti-B haemagglutinins. Dilute the preparation to be examined to an immunoglobulin concentration of 30 g/l before preparing the dilutions to be used in the test. The 64-fold dilutions do not show agglutination.

Anti-D antibodies *(2.6.26)*

If human normal immunoglobulin is intended for subcutaneous administration, it complies with the test for anti-D antibodies in human immunoglobulin for intravenous administration.

Antibody to hepatitis B surface antigen

Not less than 0.5 IU/g of immunoglobulin, determined by a suitable immunochemical method *(2.7.1)*.

Antibody to hepatitis A virus

If intended for use in the prophylaxis of hepatitis A, it complies with the following additional requirement. Determine the antibody content by comparison with a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity *(2.7.1)*.

The International Unit is the activity contained in a stated amount of the International Standard for anti-hepatitis A immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Human hepatitis A immunoglobulin BRP is calibrated in International Units by comparison with the International Standard.

The stated potency is not less than 100 IU/ml. The estimated potency is not less than the stated potency. The confidence limits ($P = 0.95$) of the estimated potency are not less than 80 per cent and not more than 125 per cent.

Water

Determined by a suitable method, such as the semi-micro determination of water *(2.5.12)*, loss on drying *(2.2.32)* or near infrared spectrophotometry *(2.2.40)*, the water content is within the limits approved by the competent authority.

Sterility *(2.6.1)*

It complies with the test for sterility.

Pyrogens *(2.6.8)*

It complies with the test for pyrogens. Inject 1 ml per kilogram of the rabbit's mass.

STORAGE

For the liquid preparation, in a colourless glass container, protected from light. For the freeze-dried preparation, in an airtight colourless glass container, protected from light.

LABELLING

The label states:

— for liquid preparations, the volume of the preparation in the container and the protein content expressed in grams per litre;

— for freeze-dried preparations, the quantity of protein in the container;

— the route of administration;

— for freeze-dried preparations, the name or composition and the volume of the reconstituting liquid to be added;

— where applicable, that the preparation is suitable for use in the prophylaxis of hepatitis A infection;

— where applicable, the anti-hepatitis A virus activity in International Units per millilitre;

— where applicable, the name and amount of antimicrobial preservative in the preparation.

Ph Eur

Plasma (Pooled and Treated for Virus Inactivation)

General Notices

(Human Plasma (Pooled and Treated for Virus Inactivation), Ph Eur monograph 1646)

Ph Eur

DEFINITION

Human plasma (pooled and treated for virus inactivation) is a frozen or freeze-dried, sterile, non-pyrogenic preparation obtained from human plasma derived from donors belonging to the same ABO blood group. The preparation is thawed or reconstituted before use to give a solution for infusion.

The human plasma used complies with the monograph on *Human plasma for fractionation (0853)*.

PRODUCTION

The units of plasma to be used are cooled to - 30 °C or lower within 6 h of separation of cells and always within 24 h of collection.

The pool is prepared by mixing units of plasma belonging to the same ABO blood group.

The pool of plasma is tested for hepatitis B surface antigen (HBsAg) and for HIV antibodies using test methods of suitable sensitivity and specificity; the pool must give negative results in these tests.

Hepatitis C virus RNA

The plasma pool is tested using a validated nucleic acid amplification technique *(2.6.21)*. A positive control with 100 IU of hepatitis C virus RNA per millilitre and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors. The pool complies with the test if it is found non-reactive for hepatitis C virus RNA.

Hepatitis C virus RNA for NAT testing BRP is suitable for use as a positive control.

To limit the potential burden of B19 virus in plasma pools, the plasma pool is also tested for B19 virus using a validated nucleic acid amplification technique *(2.6.21)*.

B19 virus DNA

The plasma pool contains not more than 10.0 IU/µl.

A positive control with 10.0 IU of B19 virus DNA per microlitre and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors.

B19 virus DNA for NAT testing BRP is suitable for use as a positive control.

The method of preparation is designed to minimise activation of any coagulation factor (to minimise potential thrombogenicity) and includes a step or steps that have been shown to inactivate known agents of infection; if substances are used for the inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

Inactivation process

The solvent-detergent process, which is one of the methods used to inactivate enveloped viruses, uses treatment with a combination of tributyl phosphate and octoxinol 10; these reagents are subsequently removed by oil extraction or by solid phase extraction so that the amount in the final product is less than 2 µg/ml for tributyl phosphate and less than 5 µg/ml for octoxinol 10.

No antimicrobial preservative is added.

The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen; it may subsequently be freeze-dried.

Plastic containers comply with the requirements for sterile plastic containers for human blood and blood components *(3.2.3)*.

Glass containers comply with the requirements for glass containers for pharmaceutical use *(3.2.1)*.

CHARACTERS

The frozen preparation, after thawing, is a clear or slightly opalescent liquid free from solid and gelatinous particles. The freeze-dried preparation is an almost white or slightly yellow powder or friable solid.

Thaw or reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests and assay.

IDENTIFICATION

A. Examine by electrophoresis *(2.2.31)* comparing with normal human plasma. The electropherograms show the same bands.

B. It complies with the test for anti-A and anti-B haemagglutinins (see Tests).

TESTS

pH *(2.2.3)*

6.5 to 7.6.

Osmolality *(2.2.35)*

Minimum 240 mosmol/kg.

Total protein

Minimum 45 g/l.

Dilute with a 9 g/l solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 ml. Place 2.0 ml of this solution in a round-bottomed centrifuge tube and add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free* *sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion *(2.5.9)* and calculate the quantity of protein by multiplying the result by 6.25.

Activated coagulation factors *(2.6.22)*

It complies with the test for activated coagulation factors. Carry out the test with 0.1 ml of the preparation to be examined instead of 10-fold and 100-fold dilutions. The coagulation time for the preparation to be examined is not less than 150 s.

Anti-A and anti-B haemagglutinins *(2.6.20)*

The presence of haemagglutinins (anti-A or anti-B) corresponds to the blood group stated on the label.

Hepatitis A virus antibodies

Minimum 2 IU/ml, determined by a suitable immunochemical method *(2.7.1)*.

Human hepatitis A immunoglobulin BRP is suitable for use as a reference preparation.

Irregular erythrocyte antibodies

The preparation to be examined does not show the presence of irregular erythrocyte antibodies when examined without dilution by an indirect antiglobulin test.

Citrate

Liquid chromatography *(2.2.29)*.

Test solution Dilute the preparation to be examined with an equal volume of a 9 g/l solution of *sodium chloride R*. Filter the solution using a filter with 0.45 µm pores.

Reference solution Dissolve 0.300 g of *sodium citrate R* in *water R* and dilute to 100.0 ml with the same solvent.

Column:
- *size:* l = 0.3 m, Ø = 7.8 mm;
- *stationary phase: cation exchange resin R* (9 µm).

Mobile phase 0.51 g/l solution of *sulphuric acid R*.

Flow rate 0.5 ml/min.

Detection Spectrophotometer at 215 nm.

Equilibration 15 min.

Injection 10 µl.

Retention time Citrate = about 10 min.

Limit:
- *citrate*: maximum 25 mmol/l.

Calcium

Maximum 5.0 mmol/l.

Atomic absorption spectrometry *(2.2.23, Method I)*.

Source Calcium hollow-cathode lamp using a transmission band preferably of 0.5 nm.

Wavelength 622 nm.

Atomisation device Air-acetylene or acetylene-propane flame.

Potassium

Maximum 5.0 mmol/l.

Atomic emission spectrometry *(2.2.22, Method I)*.

Wavelength 766.5 nm.

Sodium

Maximum 2.00×10^2 mmol/l.

Atomic emission spectrometry *(2.2.22, Method I)*.

Wavelength 589 nm.

Water

Determined by a suitable method, such as the semi-micro determination of water *(2.5.12)*, loss on drying *(2.2.32)* or near-infrared spectrometry *(2.2.40)*, the water content is within the limits approved by the competent authority (freeze-dried product).

Sterility *(2.6.1)*

It complies with the test for sterility.

Pyrogens *(2.6.8)*

It complies with the test for pyrogens. Inject 3 ml per kilogram of the rabbit's mass.

ASSAY

Factor VIII

Carry out the assay of human coagulation factor VIII *(2.7.4)* using a reference plasma calibrated against the International Standard for blood coagulation factor VIII in plasma.

The estimated potency is not less than 0.5 IU/ml. The confidence limits (*P* = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

Factor V

Carry out the assay of human coagulation factor V described below using a reference plasma calibrated against the International Standard for blood coagulation factor V in plasma.

Using *imidazole buffer solution pH 7.3 R*, prepare at least 3 two-fold dilutions of the preparation to be examined, preferably in duplicate, from 1 in 10 to 1 in 40. Test each dilution as follows: mix 1 volume of *plasma substrate deficient in factor V R*, 1 volume of the dilution to be examined, 1 volume of *thromboplastin R* and 1 volume of a 3.5 g/l solution of *calcium chloride R*; measure the coagulation times, i.e. the interval between the moment at which the calcium chloride solution is added and the 1st indication of the formation of fibrin, which may be observed visually or by means of a suitable apparatus.

In the same manner, determine the coagulation time of 4 twofold dilutions (1 in 10 to 1 in 80) of human normal plasma in *imidazole buffer solution pH 7.3 R*. 1 unit of factor V is equal to the activity of 1 ml of human normal plasma. Human normal plasma is prepared by pooling plasma units from not fewer than 30 donors and stored at - 30 °C or lower.

Check the validity of the assay and calculate the potency of the test preparation by the usual statistical methods for a parallel-line assay (for example, *5.3*).

The estimated potency is not less than 0.5 IU/ml. The confidence limits ($P = 0.95$) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

Factor XI

Carry out the assay of human coagulation factor XI *(2.7.22)* using a reference plasma calibrated against the International Standard for blood coagulation factor XI in plasma.

The estimated potency is not less than 0.5 IU/ml. The confidence limits ($P = 0.95$) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

Protein C

Carry out the assay of human protein C *(2.7.30)* using a reference plasma calibrated against the International Standard for human protein C in plasma.

The estimated potency is not less than 0.7 IU/ml. The confidence limits ($P = 0.95$) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

Protein S

Carry out the assay of human protein S *(2.7.31)* using a reference plasma calibrated against the International Standard for human protein S in plasma.

The estimated potency is within the limits approved for the particular product. The confidence limits ($P = 0.95$) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

Plasmin inhibitor (α_2-antiplasmin)

Carry out the assay of human plasmin inhibitor *(2.7.25)* using a reference plasma calibrated against a suitable reference standard for human plasmin inhibitor (α_2-antiplasmin) in plasma.

The estimated potency is not less than 0.2 units/ml. The confidence limits ($P = 0.95$) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

LABELLING

The label states:

- the ABO blood group;
- the method used for virus inactivation.

Ph Eur

Plasma for Fractionation

General Notices

(Human Plasma for Fractionation, Ph Eur monograph 0853)

Ph Eur

DEFINITION

Human plasma for fractionation is the liquid part of human blood remaining after separation of the cellular elements from blood collected in a receptacle containing an anticoagulant, or separated by continuous filtration or centrifugation of anticoagulated blood in an apheresis procedure; it is intended for the manufacture of plasma-derived products.

PRODUCTION

DONORS

Only a carefully selected, healthy donor who, as far as can be ascertained after medical examination, laboratory blood tests and a study of the donor's medical history, is free from detectable agents of infection transmissible by plasma-derived products may be used. Recommendations in this field are made by the Council of Europe [*Recommendation No. R (95) 15 on the preparation, use and quality assurance of blood components*, or subsequent revision]; a directive of the European Union also deals with the matter: *Commission Directive 2004/33/EC of 22 March 2004 implementing Directive 2002/98/EC of the European Parliament and of the Council as regards certain technical requirements for blood and blood components*.

Immunisation of donors

Immunisation of donors to obtain immunoglobulins with specific activities may be carried out when sufficient supplies of material of suitable quality cannot be obtained from naturally immunised donors. Recommendations for such immunisations are formulated by the World Health Organisation (*Requirements for the collection, processing and quality control of blood, blood components and plasma derivatives*, WHO Technical Report Series, No. 840, 1994 or subsequent revision).

Records

Records of donors and donations made are kept in such a way that, while maintaining the required degree of confidentiality concerning the donor's identity, the origin of each donation in a plasma pool and the results of the corresponding acceptance procedures and laboratory tests can be traced.

Laboratory tests

Laboratory tests are carried out for each donation to detect the following viral markers:

1. antibodies against human immunodeficiency virus 1 (anti-HIV-1);

2. antibodies against human immunodeficiency virus 2 (anti-HIV-2);
3. hepatitis B surface antigen (HBsAg);
4. antibodies against hepatitis C virus (anti-HCV).

The test methods used are of suitable sensitivity and specificity and comply with the regulations in force. If a repeat-reactive result is found in any of these tests, the donation is not accepted.

INDIVIDUAL PLASMA UNITS

The plasma is prepared by a method that removes cells and cell debris as completely as possible. Whether prepared from whole blood or by plasmapheresis, the plasma is separated from the cells by a method designed to prevent the introduction of micro-organisms. No antibacterial or antifungal agent is added to the plasma. The containers comply with the requirements for glass containers *(3.2.1)* or for plastic containers for blood and blood components *(3.2.3)*. The containers are closed so as to prevent any possibility of contamination.

If 2 or more units are pooled prior to freezing, the operations are carried out using sterile connecting devices or under aseptic conditions and using containers that have not previously been used.

When obtained by plasmapheresis or from whole blood (after separation from cellular elements), plasma intended for the recovery of proteins that are labile in plasma is frozen within 24 h of collection by cooling rapidly in conditions validated to ensure that a temperature of - 25 °C or below is attained at the core of each plasma unit within 12 h of placing in the freezing apparatus.

When obtained by plasmapheresis, plasma intended solely for the recovery of proteins that are not labile in plasma is frozen by cooling rapidly in a chamber at - 20 °C or below as soon as possible and at the latest within 24 h of collection.

When obtained from whole blood, plasma intended solely for the recovery of proteins that are not labile in plasma is separated from cellular elements and frozen in a chamber at - 20 °C or below as soon as possible and at the latest within 72 h of collection.

It is not intended that the determination of total protein and factor VIII shown below be carried out on each unit of plasma. They are rather given as guidelines for good manufacturing practice, the test for factor VIII being relevant for plasma intended for use in the preparation of concentrates of labile proteins.

The total protein content of a unit of plasma depends on the serum protein content of the donor and the degree of dilution inherent in the donation procedure. When plasma is obtained from a suitable donor and using the intended proportion of anticoagulant solution, a total protein content complying with the limit of 50 g/l is obtained. If a volume of blood or plasma smaller than intended is collected into the anticoagulant solution, the resulting plasma is not necessarily unsuitable for pooling for fractionation. The aim of good manufacturing practice must be to achieve the prescribed limit for all normal donations.

Preservation of factor VIII in the donation depends on the collection procedure and the subsequent handling of the blood and plasma. With good practice, 0.7 IU/ml can usually be achieved, but units of plasma with a lower activity may still be suitable for use in the production of coagulation factor concentrates. The aim of good manufacturing practice is to conserve labile proteins as much as possible.

Total protein

Carry out the test using a pool of not fewer than 10 units. Dilute the pool with a 9 g/l solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 ml. To 2.0 ml of this solution in a round-bottomed centrifuge tube add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion *(2.5.9)* and calculate the protein content by multiplying the quantity of nitrogen by 6.25. The total protein content is not less than 50 g/l.

Factor VIII

Carry out the test using a pool of not fewer than 10 units. Thaw the samples to be examined, if necessary, at 37 °C. Carry out the assay of factor VIII *(2.7.4)*, using a reference plasma calibrated against the International Standard for human coagulation factor VIII in plasma. The activity is not less than 0.7 IU/ml.

STORAGE AND TRANSPORT

Frozen plasma is stored and transported in conditions designed to maintain the temperature at or below - 20 °C; for accidental reasons, the storage temperature may rise above - 20 °C on one or more occasions during storage and transport but the plasma is nevertheless considered suitable for fractionation if all the following conditions are fulfilled:

— the total period of time during which the temperature exceeds - 20 °C does not exceed 72 h;

— the temperature does not exceed - 15 °C on more than one occasion;

— the temperature at no time exceeds - 5 °C.

POOLED PLASMA

During the manufacture of plasma products, the first homogeneous pool of plasma (for example, after removal of cryoprecipitate) is tested for HBsAg and for HIV antibodies using test methods of suitable sensitivity and specificity; the pool must give negative results in these tests.

The plasma pool is also tested for hepatitis C virus RNA using a validated nucleic acid amplification technique *(2.6.21)*. A positive control with 100 IU/ml of hepatitis C virus RNA and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors. The plasma pool complies with the test if it is found non-reactive for hepatitis C virus RNA.

Hepatitis C virus RNA for NAT testing BRP is suitable for use as a positive control.

CHARACTERS

Before freezing, a clear to slightly turbid liquid without visible signs of haemolysis; it may vary in colour from light yellow to green.

LABELLING

The label enables each individual unit to be traced to a specific donor.

Ph Eur

Rabies Immunoglobulin

General Notices

(Human Rabies Immunoglobulin, Ph Eur monograph 0723)

Ph Eur

DEFINITION

Human rabies immunoglobulin is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma from donors immunised against rabies. It contains specific antibodies neutralising the rabies virus. *Human normal immunoglobulin (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin (0338),* except for the minimum number of donors and the minimum total protein content.

POTENCY

The potency is determined by comparing the dose of immunoglobulin required to neutralise the infectivity of a rabies virus suspension with the dose of a reference preparation, calibrated in International Units, required to produce the same degree of neutralisation (*2.7.1*). The test is performed in sensitive cell cultures and the presence of unneutralised virus is revealed by immunofluorescence.

The International Unit is the specific neutralising activity for rabies virus in a stated amount of the International Standard for anti-rabies immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Human rabies immunoglobulin BRP is calibrated in International Units by comparison with the International Standard.

Carry out the test in suitable sensitive cells. It is usual to use the BHK 21 cell line, grown in the medium described below, between the 18th and 30th passage levels counted from the ATCC seed lot. Harvest the cells after 2 to 4 days of growth, treat with trypsin and prepare a suspension containing 500 000 cells per millilitre (cell suspension). 10 min before using this suspension add 10 µg of *diethylamino-ethyldextran R* per millilitre, if necessary, to increase the sensitivity of the cells.

Use a fixed virus strain grown in sensitive cells, such as the CVS strain of rabies virus adapted to growth in the BHK 21 cell line (seed virus suspension). Estimate the titre of the seed virus suspension as follows.

Prepare a series of dilutions of the viral suspension. In the chambers of cell-culture slides (8 chambers per slide), place 0.1 ml of each dilution and 0.1 ml of medium and add 0.2 ml of the cell suspension. Incubate in an atmosphere of carbon dioxide at 37 °C for 24 h. Carry out fixation, immunofluorescence staining and evaluation as described below. Determine the end-point titre of the seed virus suspension and prepare the working virus dilution corresponding to 100 $CCID_{50}$ per 0.1 ml.

For each assay, check the amount of virus used by performing a control titration: from the dilution corresponding to 100 $CCID_{50}$ per 0.1 ml, make three tenfold dilutions. Add 0.1 ml of each dilution to four chambers containing 0.1 ml of medium and add 0.2 ml of the cell suspension. The test is not valid unless the titre lies between 30 $CCID_{50}$ and 300 $CCID_{50}$.

Dilute the reference preparation to a concentration of 2 IU/ml using non-supplemented culture medium (stock reference dilution, stored below - 80 °C). Prepare two suitable predilutions (1:8 and 1:10) of the stock reference dilution so that the dilution of the reference preparation that reduces the number of fluorescent fields by 50 per cent lies within the four dilutions of the cell-culture slide. Add 0.1 ml of the medium to each chamber, except the first in each of two rows, to which add respectively 0.2 ml of the two predilutions of the stock reference dilution transferring successively 0.1 ml to the other chambers.

Dilute the preparation to be examined 1 in 100 using non-supplemented medium (stock immunoglobulin dilution) - to reduce to a minimum errors due to viscosity of the undiluted preparation - and make three suitable predilutions so that the dilution of the preparation to be examined that reduces the number of fluorescent fields by 50 per cent lies within the four dilutions of the cell-culture slide. Add 0.1 ml of the medium to all the chambers except the first in each of three rows, to which add respectively 0.2 ml of the three predilutions of the stock immunoglobulin dilution. Prepare a series of twofold dilutions transferring successively 0.1 ml to the other chambers.

To all the chambers containing the dilutions of the reference preparation and the dilutions of the preparation to be examined, add 0.1 ml of the virus suspension corresponding to 100 $CCID_{50}$ per 0.1 ml (working virus dilution), shake manually, allow to stand in an atmosphere of carbon dioxide at 37 °C for 90 min, add 0.2 ml of the cell suspension, shake manually and allow to stand in an atmosphere of carbon dioxide at 37 °C for 24 h.

After 24 h, discard the medium and remove the plastic walls. Wash the cell monolayer with *phosphate buffered saline pH 7.4 R* and then with a mixture of 20 volumes of *water R* and 80 volumes of *acetone R* and fix in a mixture of 20 volumes of *water R* and 80 volumes of *acetone R* at - 20 °C for 3 min. Spread on the slides *fluorescein-conjugated rabies antiserum R* ready for use. Allow to stand in an atmosphere with a high level of moisture at 37 °C for 30 min. Wash with *phosphate buffered saline pH 7.4 R* and dry. Examine twenty fields in each chamber at a magnification of 250 ×, using a microscope equipped for fluorescence readings. Note the number of fields with at least one fluorescent cell. Check the test dose used in the virus titration slide and determine the dilution of the reference preparation and the dilution of the preparation to be examined that reduce the number of fluorescent fields by 50 per cent, calculating the two or three dilutions together using probit analysis. The test is not valid unless the statistical analysis shows a significant slope of the dose-response curve and no evidence of deviation from linearity or parallelism.

The stated potency is not less than 150 IU/ml. The estimated potency is not less than the stated potency and is not greater than twice the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 80 per cent and not more than 125 per cent.

CULTURE MEDIUM FOR GROWTH OF BHK 21 CELLS

Commercially available media that have a slightly different composition from that shown below may also be used.

Sodium chloride	6.4 g
Potassium chloride	0.40 g
Calcium chloride, anhydrous	0.20 g

Magnesium sulphate, heptahydrate	0.20 g
Sodium dihydrogen phosphate, monohydrate	0.124 g
Glucose monohydrate	4.5 g
Ferric nitrate, nonahydrate	0.10 mg
L-Arginine hydrochloride	42.0 mg
L-Cystine	24.0 mg
L-Histidine	16.0 mg
L-Isoleucine	52.0 mg
L-Leucine	52.0 mg
L-Lysine hydrochloride	74.0 mg
L-Phenylalanine	33.0 mg
L-Threonine	48.0 mg
L-Tryptophan	8.0 mg
L-Tyrosine	36.0 mg
L-Valine	47.0 mg
L-Methionine	15.0 mg
L-Glutamine	0.292 g
i-Inositol	3.60 mg
Choline chloride	2.0 mg
Folic acid	2.0 mg
Nicotinamide	2.0 mg
Calcium pantothenate	2.0 mg
Pyridoxal hydrochloride	2.0 mg
Thiamine hydrochloride	2.0 mg
Riboflavine	0.2 mg
Phenol red	15.0 mg
Sodium hydrogen carbonate	2.75 g

Water to	1000 ml

The medium is supplemented with:

Foetal calf serum (heated at 56 °C for 30 min)	10 per cent
Tryptose phosphate broth	10 per cent
Benzylpenicillin sodium	60 mg/l
Streptomycin	0.1 g/l

Ph Eur

Rubella Immunoglobulin

General Notices

(Human Rubella Immunoglobulin, Ph Eur monograph 0617)

Ph Eur

DEFINITION

Human rubella immunoglobulin is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma containing specific antibodies against rubella virus. *Human normal immunoglobulin (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin (0338),* except for the minimum number of donors and the minimum total protein content.

POTENCY

The potency is determined by comparing the activity of the preparation to be examined in a suitable haemagglutination-inhibition test with that of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the International Standard for anti-rubella immunoglobulin. The equivalence in International Units of the International Reference Preparation is stated by the World Health Organisation.

The estimated potency is not less than 4500 IU/ml. The confidence limits ($P = 0.95$) of the estimate of potency are not less than 50 per cent and not more than 200 per cent of the stated potency.

STORAGE

Ph Eur

Tetanus Immunoglobulin

General Notices

(Human Tetanus Immunoglobulin, Ph Eur monograph 0398)

Ph Eur

DEFINITION

Human tetanus immunoglobulin is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma containing specific antibodies against the toxin of *Clostridium tetani*. *Human normal immunoglobulin (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin (0338),* except for the minimum number of donors and the minimum total protein content.

PRODUCTION

During development, a satisfactory relationship shall be established between the potency determined by immunoassay as described under Potency and that determined by means of the following test for toxin-neutralising capacity in mice.

Toxin-neutralising capacity in mice The potency is determined by comparing the quantity necessary to protect mice against the paralytic effects of a fixed quantity of tetanus toxin with the quantity of a reference preparation of human tetanus immunoglobulin, calibrated in International Units, necessary to give the same protection.

The International Unit of antitoxin is the specific neutralising activity for tetanus toxin contained in a stated amount of the International Standard, which consists of freeze-dried human immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Human tetanus immunoglobulin BRP is calibrated in International Units by comparison with the International Standard.

Selection of animals Use mice weighing 16 g to 20 g.

Preparation of the test toxin Prepare the test toxin by a suitable method from the sterile filtrate of a culture in liquid medium of *C. tetani*. The two methods shown below are given as examples and any other suitable method may be used.

(1) To the filtrate of an approximately 9-day culture add 1 to 2 volumes of *glycerol R* and store the mixture in the liquid state at a temperature slightly below 0 °C.

(2) Precipitate the toxin by addition to the filtrate of *ammonium sulphate R*, dry the precipitate *in vacuo* over *diphosphorus pentoxide R*, reduce to a powder and store dry, either in sealed ampoules or *in vacuo* over *diphosphorus pentoxide R*.

Determination of test dose of toxin (Lp/10 dose) Prepare a solution of the reference preparation in a suitable liquid such that it contains 0.5 IU of antitoxin per millilitre. If the test toxin is stored dry, reconstitute it using a suitable liquid. Prepare mixtures of the solution of the reference preparation and the test toxin such that each contains 2.0 ml of the solution of the reference preparation, one of a graded series of volumes of the test toxin and sufficient of a suitable liquid to bring the volume to 5.0 ml. Allow the mixtures to stand, protected from light, for 60 min. Using six mice for each mixture, inject a dose of 0.5 ml subcutaneously into each mouse. Observe the mice for 96 h. Mice that become paralysed may be euthanised. The test dose of toxin is the quantity in 0.5 ml of the mixture made with the smallest amount of toxin capable of causing, despite partial neutralisation by the reference preparation, paralysis in all six mice injected with the mixture, within the observation period.

Determination of potency of the immunoglobulin Prepare a solution of the reference preparation in a suitable liquid such that it contains 0.5 IU of antitoxin per millilitre. Prepare a solution of the test toxin in a suitable liquid such that it contains five test doses per millilitre. Prepare mixtures of the solution of the test toxin and the immunoglobulin to be examined such that each contains 2.0 ml of the solution of the test toxin, one of a graded series of volumes of the immunoglobulin to be examined and sufficient of a suitable liquid to bring the total volume to 5.0 ml. Also prepare mixtures of the solution of the test toxin and the solution of the reference preparation such that each contains 2.0 ml of the solution of the test toxin, one of a graded series of volumes of the solution of the reference preparation centred on that volume (2.0 ml) that contains 1 IU and sufficient of a suitable liquid to bring the total volume to 5.0 ml. Allow the mixtures to stand, protected from light, for 60 min. Using six mice for each mixture, inject subcutaneously a dose of 0.5 ml into each mouse. Observe the mice for 96 h. Mice that become paralysed may be euthanised. The mixture that contains the largest volume of immunoglobulin that fails to protect the mice from paralysis contains 1 IU. This quantity is used to calculate the potency of the immunoglobulin in International Units per millilitre.

The test is not valid unless all the mice injected with mixtures containing 2.0 ml or less of the solution of the reference preparation show paralysis and all those injected with mixtures containing more do not.

POTENCY

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (*2.7.1*).

The International Unit is the activity contained in a stated amount of the International Standard for anti-tetanus immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Human tetanus immunoglobulin BRP is calibrated in International Units by comparison with the International Standard.

The stated potency is not less than 100 IU of tetanus antitoxin per millilitre. The estimated potency is not less than the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 80 per cent and not more than 125 per cent.

Varicella Immunoglobulin for Intravenous Use

General Notices

(Human Varicella Immunoglobulin for Intravenous Administration, Ph Eur monograph 1528)

Ph Eur

DEFINITION

Human varicella immunoglobulin for intravenous administration is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. It is obtained from plasma from selected donors having antibodies against human herpesvirus 3 (varicella-zoster virus 1) . *Human normal immunoglobulin for intravenous administration (0918)* may be added.

It complies with the monograph on *Human normal immunoglobulin for intravenous administration (0918)*, except for the minimum number of donors, the minimum total protein content and the limit for osmolality.

POTENCY

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (*2.7.1*).

The International Unit is the activity contained in a stated amount of the International Standard for anti varicella-zoster immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

The stated potency is not less than 25 IU/ml. The estimated potency is not less than the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 80 per cent and not more than 125 per cent.

Ph Eur

von Willebrand Factor

General Notices

(Human von Willebrand factor, Ph Eur monograph 2298)

Ph Eur

DEFINITION

Human von Willebrand factor is a preparation of a plasma protein fraction that contains the glycoprotein von Willebrand factor with varying amounts of coagulation factor VIII, depending on the method of preparation. It is prepared from human plasma that complies with the monograph on *Human plasma for fractionation (0853).*

This monograph applies to preparations formulated according to the von Willebrand factor activity.

The potency of the preparation, reconstituted as stated on the label, is not less than 20 IU of von Willebrand factor per millilitre.

PRODUCTION

The method of preparation includes steps that have been shown to remove or to inactivate known agents of infection; if substances are used for the inactivation of viruses, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 1 IU of von Willebrand factor per milligram of total protein before the addition of any protein stabiliser.

The von Willebrand factor fraction is dissolved in a suitable liquid. Excipients such as a stabiliser may be added. No antimicrobial preservative is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

VALIDATION STUDIES

Composition It shall be demonstrated that the manufacturing process yields a product having a consistent composition with respect to von Willebrand factor, factor VIII and the proportions of von Willebrand factor and factor VIII.

von Willebrand factor multimers

The distribution of the different von Willebrand factor multimers is determined by a suitable method such as sodium dodecyl sulphate (SDS) agarose gel electrophoresis with or without Western blot analysis, using a suitable normal human plasma as standard. Visualisation of the multimeric pattern may be performed using, for example, an immunoenzymatic technique and quantitative evaluation may be carried out by densitometric analysis.

von Willebrand factor activity (*2.7.21*)

The von Willebrand factor activity is estimated by determining the ristocetin cofactor activity and by one or more other suitable assays such as determination of collagen-binding activity using a suitable reference preparation.

von Willebrand factor activity/antigen ratio

Consistency of the manufacturing process with respect to the ratio of von Willebrand factor activity to von Willebrand factor antigen content is demonstrated.

Products that show particles after reconstitution If a few particles remain when the preparation is reconstituted, it shall be demonstrated during validation studies that the potency is not significantly affected after passage of the preparation through the filter to be provided with the preparation.

CHARACTERS

Appearance

White or pale yellow, hygroscopic powder or friable solid.

Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.

IDENTIFICATION

The assay for von Willebrand factor serves also to identify the preparation.

TESTS

Solubility

To a container of the preparation to be examined add the volume of the solvent stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within 10 min, giving a clear or slightly opalescent, colourless or slightly yellow solution.

In addition, where the label states that the product may show a few particles after reconstitution, reconstitute the preparation as described on the label and pass it through the filter provided: the filtered solution is clear or slightly opalescent.

pH (*2.2.3*)

6.5 to 7.5.

Osmolality (*2.2.35*)

Minimum 240 mosmol/kg.

Total protein

If necessary, dilute an accurately measured volume of the preparation to be examined with a 9 g/l solution of *sodium chloride R*, to obtain a solution that may be expected to contain about 15 mg of protein in 2 ml. Place 2.0 ml of this solution in a round-bottomed centrifuge tube and add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion (*2.5.9*) and calculate the amount of protein by multiplying the result by 6.25. *For some products, especially those without a protein stabiliser, this method may not be applicable. Another validated method for protein determination must therefore be performed.*

Anti-A and anti-B haemagglutinins (*2.6.20*)

Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to contain 6 IU of von Willebrand factor activity per millilitre. The 1 to 64 dilutions do not show agglutination.

Water

Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near infrared spectrophotometry (*2.2.40*), the water content is within the limits approved by the competent authority.

Sterility (*2.6.1*)

It complies with the test for sterility.

Pyrogens (*2.6.8*)

It complies with the test for pyrogens. Inject per kilogram of the rabbit's mass a volume of the preparation to be examined equivalent to not less than 100 IU of von Willebrand factor activity.

ASSAY

von Willebrand factor (*2.7.21*)

The estimated potency is not less than 80 per cent and not more than 120 per cent of the stated potency. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

Pending the availability of an International Standard for von Willebrand factor concentrate calibrated for use in the collagen-binding assay, only the ristocetin cofactor assay may be used.

Factor VIII (*2.7.4*)

The assay is carried out where the factor VIII content is greater than 10 IU of factor VIII per 100 IU of von Willebrand factor activity. The estimated potency is not less than 60 per cent and not more than 140 per cent of the stated potency. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

STORAGE

In an airtight container , protected from light.

LABELLING

The label states:

— the number of International Units of von Willebrand factor in the container;

— the number of International Units of factor VIII in the container, or that the content of factor VIII is less than or equal to 10 IU of factor VIII per 100 IU of von Willebrand factor activity;

— the amount of protein in the container;

— the name and quantity of any added substance;

— the name and volume of the liquid to be used for reconstitution;

— where applicable, that the preparation may show the presence of a few particles after reconstitution;

— that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

Ph Eur

Old Tuberculin

General Notices

(Tuberculin for Human Use, Old, Ph Eur monograph 0152)

Ph Eur

DEFINITION

Old tuberculin for human use consists of a filtrate, concentrated by heating, containing the soluble products of the culture and lysis of one or more strains of *Mycobacterium bovis* and/or *Mycobacterium tuberculosis* that is capable of demonstrating a delayed hypersensitivity in an animal sensitised to micro-organisms of the same species.

Old tuberculin for human use in concentrated form is a transparent, viscous, yellow or brown liquid.

PRODUCTION

GENERAL PROVISIONS

The production of old tuberculin is based on a seed-lot system. The production method shall have been shown to yield consistently old tuberculin of adequate potency and safety in man. A batch of old tuberculin, calibrated in International Units by the method described under Assay and for which adequate clinical information is available as to its activity in man, is set aside to serve as a reference preparation.

The International Unit is the activity of a stated quantity of the International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

SEED LOTS

The strains of mycobacteria used shall be identified by historical records that include information on their origin and subsequent manipulation.

The working seed lots used to inoculate the media for the production of a concentrated harvest shall not have undergone more than 4 subcultures from the master seed lot.

Only seed lots that comply with the following requirements may be used for propagation.

Identification

The species of mycobacterium of the master and working seed lots is identified.

Bacterial and fungal contamination

Carry out the test for sterility *(2.6.1)*, using 10 ml for each medium. The working seed lot complies with the test for sterility except for the presence of mycobacteria.

PROPAGATION AND HARVEST

The bacteria are grown in a liquid medium which may be a glycerolated broth or a synthetic medium. Growth must be typical for the strain. The culture is inactivated by a suitable method, such as treatment in an autoclave (121 °C for not less than 30 min) or in flowing steam at a temperature not less than 100 °C for at least 1 h. The culture liquid, from which the micro-organisms may or may not have been separated by filtration, is concentrated by evaporation, usually to one-tenth of its initial volume. The preparation is free from live mycobacteria. The concentrated harvest is shown to comply with the test for mycobacteria *(2.6.2)* before addition of any antimicrobial preservative or other substance that might interfere with the test. Phenol (5 g/l) or another suitable antimicrobial preservative that does not give rise to false positive reactions may be added.

Only a concentrated harvest that complies with the following requirements may be used in the preparation of the final bulk tuberculin.

pH *(2.2.3)*

The pH of the concentrated harvest is 6.5 to 8.

Glycerol

Where applicable, determine the glycerol content of the concentrated harvest. The amount is within the limits approved for the particular product.

Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than 85 per cent and not more than 115 per cent of the intended amount. If phenol has been used in the preparation, the concentration is not more than 5 g/l *(2.5.15)*.

Sensitisation

Carry out the test described under Tests.

Sterility *(2.6.1)*

The concentrated harvest complies with the test for sterility, carried out using 10 ml for each medium.

Potency

Determine the potency as described under Assay.

FINAL BULK TUBERCULIN

The concentrated harvest is diluted aseptically.

Only a final bulk tuberculin that complies with the following requirement may be used in the preparation of the final lot.

Sterility *(2.6.1)*

The final bulk tuberculin complies with the test for sterility, carried out using 10 ml for each medium.

FINAL LOT

The final bulk tuberculin is distributed aseptically into sterile containers which are then closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

The following tests may be omitted on the final lot if they have been carried out at the stages indicated:

— live mycobacteria: concentrated harvest;

— sensitisation: concentrated harvest;

— toxicity: concentrated harvest or final bulk tuberculin;

— antimicrobial preservative: final bulk tuberculin.

IDENTIFICATION

Inject increasing doses of the preparation to be examined intradermally into healthy, white or pale-coloured guinea-pigs, specifically sensitised (for example, as described under Assay). A reaction varying from erythema to necrosis is produced at the site of the injection. Similar injections administered to non-sensitised guinea-pigs do not stimulate a reaction. The assay may also serve as identification.

TESTS

Old tuberculin for human use in concentrated form (≥ 100 000 IU/ml) complies with each of the tests prescribed below; the diluted product complies with the tests for antimicrobial preservative and sterility.

Toxicity

Inject a quantity equivalent to 50 000 IU subcutaneously into each of two healthy guinea-pigs weighing 250 g to 350 g and which have not been subjected to any treatment likely to interfere with the test. Observe the animals for 7 days. No adverse effect is produced.

Sensitisation

Use 3 guinea-pigs that have not been subjected to any treatment likely to interfere with the test. On 3 occasions at intervals of 5 days, inject intradermally into each guinea-pig about 500 IU of the preparation to be examined in a volume of 0.1 ml. 2 to 3 weeks after the third injection, administer the same dose intradermally to the same animals and to a control group of 3 guinea-pigs of the same mass that have not previously received injections of tuberculin. After 24 h to 72 h, the reactions in the 2 groups of animals are not substantially different.

Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than the minimum amount shown to be effective and not more than 115 per cent of the amount stated on the label. If phenol has been used in the preparation, the concentration is not more than 5 g/l *(2.5.15)*.

Live mycobacteria *(2.6.2)*

It complies with the test for mycobacteria.

Sterility *(2.6.1)*

It complies with the test for sterility.

ASSAY

The potency of old tuberculin is determined by comparing the reactions produced by the intradermal injection of increasing doses of the preparation to be examined into sensitised guinea-pigs with the reactions produced by known concentrations of the reference preparation.

Prepare a suspension containing a suitable amount (0.1 mg to 0.4 mg/ml) of heat-inactivated, dried mycobacteria in mineral oil with or without emulsifier; use mycobacteria of a strain of the same species as that used in the preparation to be examined. Sensitise not fewer than 6 pale-coloured guinea-pigs weighing not less than 300 g by injecting intramuscularly or intradermally a total of about 0.5 ml of the suspension, divided between several sites if necessary. Carry out the test after the period of time required for optimal sensitisation which is usually 4 to 8 weeks after sensitisation. Depilate the flanks of the animals so that it is possible to make at least three injections on each side and not more than a total of 12 injection points per animal. Use at least three different doses of the reference preparation and at least 3 different doses of the preparation to be examined. For both preparations, use doses such that the highest dose is about 10 times the lowest dose. Choose the doses such that when they are injected the lesions produced have a diameter of not less than 8 mm and not more than 25 mm. In any given test, the order of the dilutions injected at each point is chosen at random in a Latin square design. Inject each dose intradermally in a constant volume of 0.1 ml or 0.2 ml. Measure the diameters of the lesions 24 h to 48 h later and calculate the results of the test by the usual statistical methods, assuming that the diameters of the lesions are directly proportional to the logarithm of the concentration of the preparation.

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P = 0.95$) are not less than 64 per cent and not more than 156 per cent of the stated potency.

STORAGE

Store protected from light.

LABELLING

The label states:

— the number of International Units per millilitre;

— the species of mycobacterium used to prepare the product;

— the name and quantity of any antimicrobial preservative or other substance added to the preparation;

— the expiry date;

— where applicable, that old tuberculin is not to be injected in its concentrated form but diluted so as to administer not more than 100 IU per dose.

Ph Eur

Tuberculin Purified Protein Derivative

General Notices

Tuberculin P.P.D.

(Tuberculin Purified Protein Derivative for Human Use, Ph Eur monograph 0151)

Ph Eur

DEFINITION

Tuberculin purified protein derivative (tuberculin PPD) for human use is a preparation obtained by precipitation from the heated products of the culture and lysis of *Mycobacterium bovis* and/or *Mycobacterium tuberculosis* and capable of demonstrating a delayed hypersensitivity in an animal sensitised to micro-organisms of the same species.

Tuberculin PPD is a colourless or pale-yellow liquid; the diluted preparation may be a freeze-dried powder which upon dissolution gives a colourless or pale-yellow liquid.

PRODUCTION

GENERAL PROVISIONS

The production of tuberculin PPD is based on a seed-lot system. The production method shall have been shown to yield consistently tuberculin PPD of adequate potency and safety in man. A batch of tuberculin PPD, calibrated in International Units by method A described under Assay and for which adequate clinical information is available as to its activity in man, is set aside to serve as a reference preparation.

The International Unit is the activity of a stated quantity of the International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

SEED LOTS

The strains of mycobacteria used shall be identified by historical records that include information on their origin and subsequent manipulation.

The working seed lots used to inoculate the media for production of a concentrated harvest shall not have undergone more than 4 subcultures from the master seed lot.

Only seed lots that comply with the following requirements may be used for propagation.

Identification

The species of mycobacterium of the master and working seed lots is identified.

Bacterial and fungal contamination

Carry out the test for sterility *(2.6.1)*, using 10 ml for each medium. The working seed lot complies with the test for sterility except for the presence of mycobacteria.

PROPAGATION AND HARVEST

The bacteria are grown in a liquid synthetic medium. Growth must be typical for the strain. The culture is inactivated by a suitable method such as treatment in an autoclave (121 °C for not less than 30 min) or in flowing steam at a temperature not less than 100 °C for at least 1 h and filtered. The active fraction of the filtrate, consisting mainly of protein, is isolated by precipitation, washed and re-dissolved. The preparation is free from mycobacteria. The concentrated harvest is shown to comply with the test for mycobacteria *(2.6.2)* before addition of any antimicrobial preservative or other substance that might interfere with the test. Phenol (5 g/l) or another suitable antimicrobial preservative that does not give rise to false positive reactions may be added; a suitable stabiliser intended to prevent adsorption on glass or plastic surfaces may be added. The concentrated harvest may be freeze-dried. Phenol is not added to preparations that are to be freeze-dried.

Only a concentrated harvest that complies with the following requirements may be used in the preparation of the final bulk tuberculin PPD.

Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than 85 per cent and not more than 115 per cent of the intended amount. If phenol has been used in the preparation, the concentration is not more than 5 g/l *(2.5.15)*.

Sensitisation

Carry out the test described under Tests.

Sterility *(2.6.1)*

The concentrated harvest, reconstituted if necessary, complies with the test for sterility, carried out using 10 ml for each medium.

Potency

Determine the potency as described under Assay.

FINAL BULK TUBERCULIN PPD

The concentrated harvest is diluted aseptically, after reconstitution if necessary.

Only a final bulk tuberculin PPD that complies with the following requirement may be used in the preparation of the final lot.

Sterility *(2.6.1)*

The final bulk tuberculin PPD complies with the test for sterility, carried out using 10 ml for each medium.

FINAL LOT

The final bulk tuberculin PPD is distributed aseptically into sterile containers which are then closed so as to prevent contamination. It may be freeze-dried.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

The following tests may be omitted on the final lot if they have been carried out at the stages indicated:

- — live mycobacteria: concentrated harvest
- — sensitisation: concentrated harvest
- — toxicity: concentrated harvest or final bulk tuberculin PPD
- — antimicrobial preservative: final bulk tuberculin PPD.

IDENTIFICATION

Inject increasing doses of the preparation to be examined intradermally into healthy, white or pale-coloured guinea-pigs, specifically sensitised (for example as described under Assay). A reaction varying from erythema to necrosis is produced at the site of the injection. Similar injections administered to non-sensitised guinea-pigs do not stimulate a reaction. The assay may also serve as identification.

TESTS

Tuberculin purified protein derivative for human use in concentrated form (≥ 100 000 IU/ml) complies with each of the tests prescribed below; the diluted product complies with the tests for pH, antimicrobial preservative and sterility.

pH *(2.2.3)*

The pH of the preparation, reconstituted if necessary as stated on the label, is 6.5 to 7.5.

Toxicity

Inject subcutaneously 50 000 IU of the preparation to be examined into each of two healthy guinea-pigs weighing 250 g to 350 g and which have not been subjected to any treatment likely to interfere with the test. Observe the animals for 7 days. No adverse effect is produced.

Sensitisation

Use 3 guinea-pigs that have not been subjected to any treatment likely to interfere with the test. On 3 occasions at intervals of 5 days, inject intradermally into each guinea-pig about 500 IU of the preparation to be examined in a volume of 0.1 ml. 2 to 3 weeks after the third injection, administer the same dose intradermally to the same animals and to a control group of three guinea-pigs of the same mass that have not previously received injections of tuberculin. After 24 h to 72 h, the reactions in the 2 groups of animals are not substantially different.

Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than the minimum amount shown to be effective and not more than 115 per cent of the amount stated on the label. If phenol has been used in the preparation, the concentration is not more than 5 g/l *(2.5.15)*.

Live mycobacteria *(2.6.2)*

It complies with the test for mycobacteria.

Sterility *(2.6.1)*

It complies with the test for sterility.

ASSAY

Use method A or, where the preparation contains 1 IU to 2 IU, use method B.

METHOD A

The potency of tuberculin PPD is determined by comparing the reactions produced by the intradermal injection of increasing doses of the preparation to be examined into sensitised guinea-pigs with the reactions produced by known concentrations of the reference preparation.

Prepare a suspension containing a suitable amount (0.1 mg/ml to 0.4 mg/ml) of heat-inactivated, dried mycobacteria in mineral oil with or without emulsifier; use mycobacteria of a strain of the same species as that used in the preparation to be examined. Sensitise not fewer than six pale-coloured guinea-pigs weighing not less than 300 g by injecting intramuscularly or intradermally a total of about 0.5 ml of the suspension, divided between several sites if necessary. Carry out the test after the period of time required for optimal sensitisation which is usually 4 to 8 weeks after sensitisation. Depilate the flanks of the animals so that it is possible to make at least 3 injections on each side but not more than a total of 12 injection points per animal. Prepare dilutions of the preparation to be examined and of the reference preparation using isotonic phosphate-buffered saline (pH 6.5 to 7.5) containing 50 mg/l of *polysorbate 80 R*. If the preparation to be examined is freeze-dried and does not contain a stabiliser, reconstitute it using the liquid described above. Use at least 3 different doses of the reference preparation and at least 3 different doses of the preparation to be examined. For both preparations, use doses such that the highest dose is about 10 times the lowest dose. Choose the doses such that when they are injected the lesions produced have a diameter of not less than 8 mm and not more than 25 mm. In any given test, the order of the dilutions injected at each point is chosen at random in a Latin square design. Inject each dose intradermally in a constant volume of 0.1 ml or 0.2 ml. Measure the diameters of the lesions 24 h to 48 h later and calculate the results of the test by the usual statistical methods, assuming that the diameters of the lesions are directly proportional to the logarithm of the concentration of the preparation.

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P = 0.95$) are not less than 64 per cent and not more than 156 per cent of the stated potency.

METHOD B

The potency of tuberculin PPD is determined by comparing the reactions produced by the intradermal injection of the preparation to be examined into sensitised guinea-pigs with the reactions produced by known concentrations of the reference preparation.

Prepare a suspension in mineral oil with or without emulsifier and containing a suitable amount (0.1 mg/ml to 0.4 mg/ml) of heat-inactivated, dried mycobacteria; use mycobacteria of a strain of the same species as that used in the preparation to be examined. Sensitise not fewer than 6 pale-coloured guinea-pigs weighing not less than 300 g by injecting intramuscularly or intradermally a total of about 0.5 ml of the suspension, divided between several sites if necessary. Carry out the test after the period of time required for optimal sensitisation which is usually 4 to 8 weeks after sensitisation. Depilate the flanks of the animals so that it is possible to make at least 3 injections on each side but not more than a total of 12 injection points per animal. Prepare dilutions of the reference preparation using isotonic phosphate-buffered saline (pH 6.5 to 7.5) containing 50 mg/l of *polysorbate 80 R.* Use at least 3 different doses of the reference preparation such that the highest dose is about 10 times the lowest dose and the median dose is the same as that of the preparation to be examined. In any given test, the order of the dilutions injected at each point is chosen at random in a Latin square design. Inject the preparation to be examined and each dilution of the reference preparation intradermally in a constant volume of 0.1 ml or 0.2 ml. Measure the diameters of the lesions 24 h to 48 h later and calculate the results of the test by the usual statistical methods, assuming that the areas of the lesions are directly proportional to the logarithm of the concentration of the preparation to be examined. (This dose relationship applies to this assay and not necessarily to other test systems.)

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P = 0.95$) are not less than 64 per cent and not more than 156 per cent of the stated potency.

STORAGE

Store protected from light.

LABELLING

The label states:

— the number of International Units per container;

— the species of mycobacteria used to prepare the product;

— the name and quantity of any antimicrobial preservative or other substance added to the preparation;

— the expiry date;

— for freeze-dried products, a statement that the product is to be reconstituted using the liquid provided by the manufacturer;

— where applicable, that tuberculin PPD is not to be injected in its concentrated form but diluted so as to administer not more than 100 IU per dose.

If the package does not contain a leaflet warning that the inhalation of concentrated tuberculin PPD may produce toxic effects, this warning must be shown on the label on the container together with a statement that the powder must be handled with care.

Ph Eur

Agnus Castus Fruit

General Notices

(Ph Eur monograph 2147)

Ph Eur

DEFINITION

Whole, ripe, dried fruit of *Vitex agnus-castus* L.

Content

Minimum 0.08 per cent of casticin ($C_{19}H_{18}O_8$; M_r 374.3) (dried drug).

IDENTIFICATION

A. Agnus castus fruit is oval to almost globular, with a diameter of up to 5 mm. The persistent calyx is greenish-grey, finely pubescent, ends in 4-5 short teeth and envelops 2/3 to 3/4 of the surface of the fruit. The blackish-brown fruit consists of a pericarp that becomes progressively sclerous up to the endocarp. The style scar is often visible. Some of the fruits may retain a stalk, about 1 mm long. A transverse section of the fruit shows 4 locules, each containing an elongated seed.

B. Reduce to a powder (355) *(2.9.12)*. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: fragments of the outer epidermis of the calyx composed of polygonal cells densely covered with short, bent or undulate, uni-, bi- or tri-cellular uniseriate covering trichomes; cells of the epicarp with thick walls and well-marked, large pits; isolated glandular trichomes with a unicellular stalk and a uni- or multi-cellular head; layers of parenchyma from the outer part of the mesocarp, some containing brown pigment, others extending into septa; fragments from the inner part of the mesocarp composed of thin-walled, pitted, sclerenchymatous cells and of typical isodiametric sclerous cells with very thick, deeply grooved walls and a narrow, stellate lumen; small brown cells of the endocarp; fragments of the testa containing areas of fairly large, thin-walled lignified cells with reticulate bands of thickening; numerous fragments of the endosperm composed of thin-walled parenchymatous cells containing aleurone grains and oil droplets.

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 10 ml of *methanol R* . Heat in a water-bath at 60 °C for 10 min. Allow to cool and filter.

Reference solution Dissolve 0.5 mg of *aucubin R* and 1 mg of *agnuside R* in *methanol R* and dilute to 1.0 ml with the same solvent.

Plate *TLC silica gel* F_{254} *plate R* (5-40 µm) [or *TLC silica gel* F_{254} *plate R* (2-10 µm)].

Mobile phase *water R, methanol R, ethyl acetate R* (8:15:77 *V/V/V*).

Application 10 µl [or 8 µl] as bands.

Development Over a path of 8 cm [or 5 cm].

Drying In air.

Detection Spray with *formic acid R* and heat at 120 °C for 10 min; examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

TESTS

Foreign matter *(2.8.2)*

Maximum 3.0 per cent.

Other species of *Vitex*, in particular *Vitex negundo*

No fruit of other species with a much greater diameter is present.

Total ash *(2.4.16)*

Maximum 5.0 per cent.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

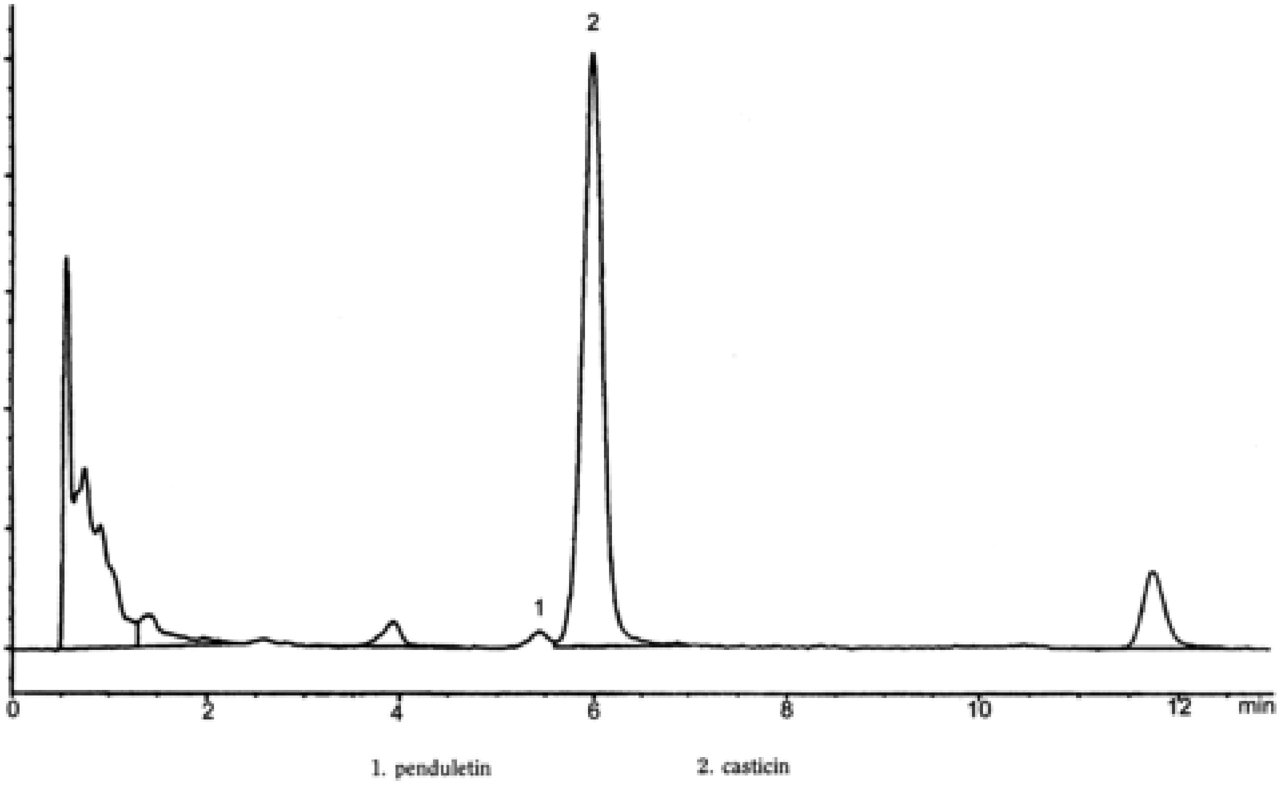

Figure 2147.-1. – *Chromatogram for the assay of casticin in Agnus castus fruit: test solution*

ASSAY

Liquid chromatography *(2.2.29)* .

Test solution Extract 1.000 g of the powdered drug (355) *(2.9.12)* with 40 ml of *methanol R* for 2 min using a suitable-speed homogeniser. Collect the supernatant liquid and filter into a 250 ml flask. Repeat the extraction with a further 40 ml of *methanol R* , collecting the supernatant liquid and filtering as before. Rinse the residue carefully with a small quantity of *methanol R* . Combine the methanol extracts and rinsings and evaporate to dryness *in vacuo* in a water-bath at not more than 30 °C. With the aid of ultrasound, dissolve the residue obtained in *methanol R* and dilute to 20.0 ml with the same solvent. Filter the solution through a membrane filter (0.45 µm). Dilute 1.0 ml to 10.0 ml with *methanol R* .

Reference solution Dissolve 100.0 mg of *agnus castus fruit standardised dry extract CRS* in 20.0 ml of *methanol R* with the aid of ultrasound for 20 min, then dilute to 25.0 ml with the same solvent. Filter the solution through a membrane filter (0.45 µm).

Column:

— *size: l* = 0.125 m, Ø = 3.0 mm;

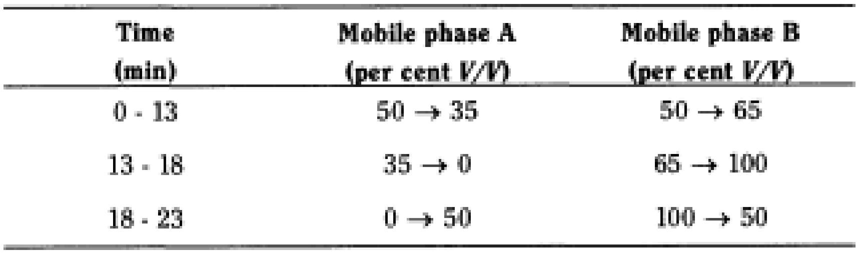
— *stationary phase: octadecylsilyl silica gel for chromatography R* (3 µm);

— *temperature*: 25 °C.

Mobile phase:

— *mobile phase A:* 5.88 g/l solution of *phosphoric acid R* ;

— *mobile phase B: methanol R* ;



Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 13	50 → 35	50 → 65
13 - 18	35 → 0	65 → 100
18 - 23	0 → 50	100 → 50

Flow rate 1.0 ml/min.

Detection Spectrophotometer at 348 nm.

Injection 10 µl.

System suitability Test solution:

— *resolution*: minimum 1.5 between the peaks due to penduletin and casticin (see Figure 2147.-1).

Calculate the percentage content of casticin using the following expression:

$$\frac{F_1 \times m_2 \times p_1 \times 8}{F_2 \times m_1}$$

F_1 = area of the peak due to casticin in the chromatogram obtained with the test solution;

F_2 = area of the peak due to casticin in the chromatogram obtained with the reference solution;

m_1 = mass of the drug used to prepare the test solution, in grams;

m_2 = mass of *agnus castus fruit standardised dry extract CRS* used to prepare the reference solution, in grams;

p_1 = percentage content of casticin in *agnus castus fruit standardised dry extract CRS*.

Ph Eur

Agrimony

General Notices

(Ph Eur monograph 1587)

Ph Eur

DEFINITION

Dried flowering tops of *Agrimonia eupatoria* L.

Content

Minimum 2.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1) (dried drug).

IDENTIFICATION

A. The stem is green or, more usually, reddish, cylindrical and infrequently branched. It is covered with long, erect or tangled hairs. The leaves are compound imparipennate with 3 or 6 opposite pairs of leaflets, with 2 or 3 smaller leaflets between. The leaflets are deeply dentate to serrate, dark green on the upper surface, greyish and densely tormentose on the lower face. The flowers are small and form a terminal spike. They are pentamerous and borne in the axils of hairy bracts, the calyces closely surrounded by numerous terminal hooked spires, which occur on the rim of the hairy receptacle. The petals are free, yellow and deciduous. Fruit-bearing obconical receptacles, with deep furrows and hooked bristles, are usually present at the base of the inflorescence.

B. Reduce to a powder (355) *(2.9.12)*. The powder is yellowish-green to grey. Examine under a microscope using *chloral hydrate solution R* . The powder shows numerous straight of bent, unicellular, long thick-walled (about 500 µm) trichomes finely warty and sometimes spiraly marked; fragments of parenchyma with prisms and cluster crystals of calcium oxalate; fragments of leaf epidermis with sinuous walls, those of the lower epidermis with abundant stomata, mostly anomocytic but occasionally anisocytic; ovoid to subspherical-pollen grains, with 3 pores and a smooth exine; fragments of glandular trichomes with a multicellular uniseriate stalk and a spherical unicellular or quadricellular head; groups of fibres and spiral and bardered-fitted vessels from the stem.

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 2.0 g of the powdered drug (355) *(2.9.12)* add 20 ml of *methanol R* . Heat with shaking at 40 °C for 10 min. Filter.

Reference solution Dissolve 1.0 mg of *rutin R* and 1.0 mg of *isoquercitroside R* in 2 ml of *methanol R* .

Plate *TLC silica gel plate R.*

Mobile phase *anhydrous formic acid R, water R, ethyl acetate R* (10:10:80 *V/V/V*).

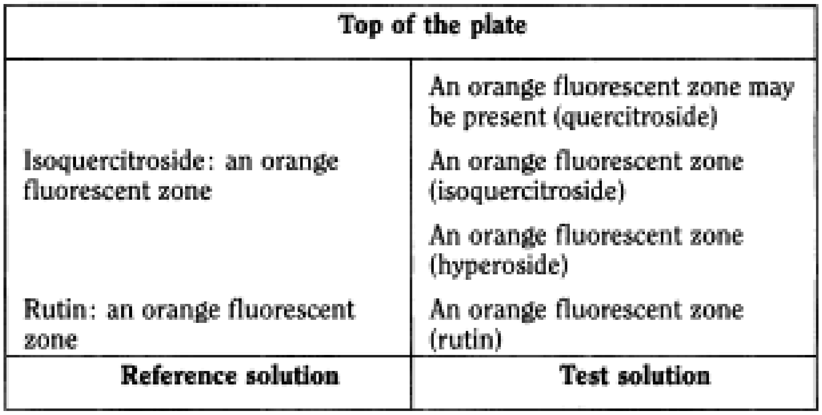
Application 10 µl, as bands.

Development Over a path of 12 cm.

Drying At 100-105 °C.

Detection Spray the still warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for 30 min. Examine in ultraviolet light at 365 nm

Results See below the sequence of the zones present in the chromatograms obtained with the reference and test solutions.



Top of the plate

TESTS

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 10.0 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs *(2.8.14)* . Use a 1.000 g of powdered drug (180) *(2.9.12)*.

Ph Eur

Alchemilla

General Notices

(Ph Eur monograph 1387)

Ph Eur

DEFINITION

Whole or cut, dried, flowering, aerial parts of *Alchemilla vulgaris* L. *sensu latiore*.

Content

Minimum 6.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1) (dried drug).

IDENTIFICATION

A. The greyish-green, partly brownish-green, radical leaves which are the main part of the drug are reniform or slightly semicircular with a diameter generally up to 8 cm, seldom up to 11 cm and have 7 to 9, or 11 lobes and a long petiole. The smaller, cauline leaves, which have a pair of large stipules at the base, have 5-9 lobes and a shorter petiole or they are sessile. The leaves are densely pubescent especially on the lower surface and have a coarsely serrated margin. Young leaves are folded with a whitish-silvery pubescence; older leaves are slightly pubescent and have a finely meshed venation, prominent on the lower surface. The greyish-green or yellowish-green petiole is pubescent, about 1 mm in diameter, with an adaxial groove. The apetalous flowers are yellowish-green or light green and about 3 mm in diameter. The calyx is double with 4 small segments of the epicalyx alternating with 4 larger sepals, subacute or triangular. They are 4 short stamens and a single carpel with a capitate stigma. The greyish-green or yellowish-green stem is pubescent, more or less longitudinally wrinkled and hollow.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greyish-green. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: unicellular, narrow trichomes up to 1 mm long partly tortuous, acuminate, and bluntly pointed at the apex, with thick lignified walls, somewhat enlarged and pitted at the base; fragments of leaves with 2 layers of palisade parenchyma, the upper layer of which is 2-3 times longer than the lower layer and with spongy parenchyma, containing scattered cluster crystals of calcium oxalate, up to 25 µm in diameter; leaf fragments in surface view with sinuous or wavy epidermal cells, the anticlinal walls unevenly thickened and beaded, anomocytic stomata *(2.8.3)* ; groups of vascular tissue and lignified fibres from the petioles and stems, the vessels spirally thickened or with bordered pits; occasional thin-walled conical trichomes, about 300 µm long; thin-walled parenchyma containing cluster crystals of calcium oxalate; spherical pollen grains, about 15 µm in diameter, with 3 distinct pores and a granular exine; occasional fragments of the ovary wall with cells containing a single crystal of calcium oxalate.

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 0.5 g of the powdered drug (355) *(2.9.12)* add 5 ml of *methanol R* and heat in a water-bath at 70 °C under a reflux condenser for 5 min. Cool and filter.

Reference solution Dissolve 1.0 mg of *caffeic acid R* and 1.0 mg of *chlorogenic acid R* in 10 ml of *methanol R* .

Plate *TLC silica gel plate R.*

Mobile phase *anhydrous formic acid R, water R, ethyl acetate R* (8:8:84 *V/V/V*).

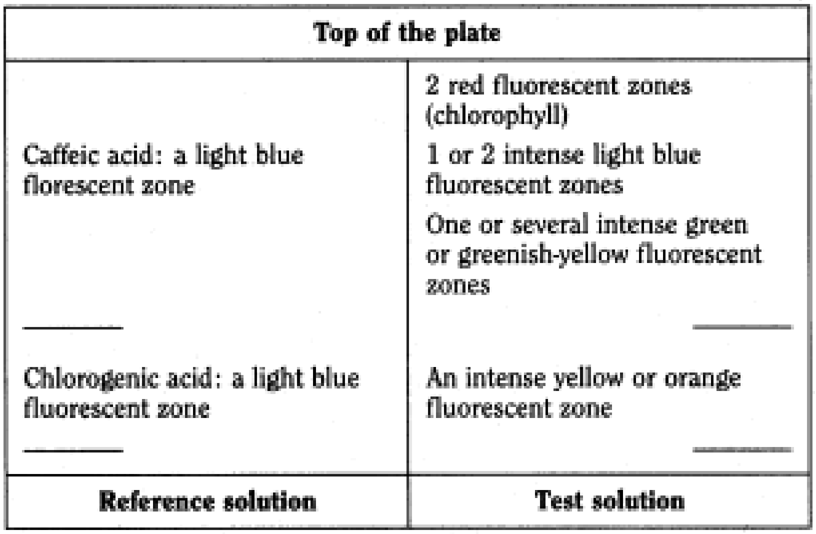
Application 20 µl of the test solution and 10 µl of the reference solution, as bands.

Development Over a path of 10 cm.

Drying At 100-105 °C for 5 min.

Detection Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* . Subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R* . Allow to dry in air for about 30 min. Examine in ultraviolet light at 365 nm.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	2 red fluorescent zones (chlorophyll)
Caffeic acid: a light blue florescent zone	1 or 2 intense light blue fluorescent zones
	One or several intense green or greenish-yellow fluorescent zones
_______	_______
Chlorogenic acid: a light blue fluorescent zone	An intense yellow or orange fluorescent zone
_______	_______
Reference solution	**Test solution**

TESTS

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 12.0 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs *(2.8.14)* . Use 0.50 g of the powdered drug (355) *(2.9.12)*.

Ph Eur

Alexandrian Senna Fruit

General Notices

(Alexandrian Senna Pods, Ph Eur monograph 0207)

Preparations

Senna Liquid Extract

Standardised Senna Granules

Senna Tablets

When Powdered Alexandrian Senna Fruit is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter shall be dispensed or supplied.

Ph Eur

DEFINITION

Dried fruit of *Cassia senna* L. (*C. acutifolia* Delile).

Content

Minimum 3.4 per cent of hydroxyanthracene glycosides, expressed as sennoside B ($C_{42}H_{38}O_{20}$; M_r 863) (dried drug).

CHARACTERS

Slight odour.

IDENTIFICATION

A. Flattened reniform pods, green or greenish-brown with brown patches at the positions corresponding to the seeds, usually 40-50 mm long and at least 20 mm wide. At one end is a stylar point and at the other a short stalk. The pods contain 6-7 flattened and obovate seeds, green or pale brown, with a continuous network of prominent ridges on the testa.

B. Reduce to a powder (355) *(2.9.12)*. The powder is brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: epicarp with polygonal cells and a small number of conical warty trichomes and occasional anomocytic or paracytic stomata *(2.8.3)*; fibres in 2 crossed layers accompanied by a crystal sheath of calcium oxalate prisms; characteristic palisade cells in the seed and stratified cells in the endosperm; clusters and prisms of calcium oxalate.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 0.5 g of the powdered drug (180) *(2.9.12)* add 5 ml of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* and heat to boiling. Centrifuge and use the supernatant liquid.

Reference solution Dissolve 10 mg of *senna extract CRS* in 1 ml of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* (a slight residue remains).

Plate *TLC silica gel G plate R*.

Mobile phase *Glacial acetic acid R, water R, ethyl acetate R, propanol R* (1:30:40:40 *V/V/V/V*).

Application 10 µl, as bands of 20 mm by 2 mm.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with a 20 per cent *V/V* solution of *nitric acid R* and heat at 120 °C for 10 min; allow to cool and spray with a 50 g/l solution of *potassium hydroxide R* in *ethanol (50 per cent V/V) R* until the zones appear.

Results The principal zones in the chromatogram obtained with the test solution are similar in position (sennosides B, A, D and C in order of increasing R_F value), colour and size to the principal zones in the chromatogram obtained with the reference solution; between the zones due to sennosides D and C, a red zone due to rhein-8-glucoside may be visible; the zones due to sennosides D and C are faint in the chromatogram obtained with the test solution.

D. Place about 25 mg of the powdered drug (180) *(2.9.12)* in a conical flask and add 50 ml of *water R* and 2 ml of *hydrochloric acid R*. Heat in a water-bath for 15 min, cool and shake with 40 ml of *ether R*. Separate the ether layer, dry over *anhydrous sodium sulphate R*, evaporate 5 ml to dryness and to the cooled residue add 5 ml of *dilute ammonia R1*. A yellow or orange colour develops. Heat on a water-bath for 2 min. A reddish-violet colour develops.

TESTS

Foreign matter *(2.8.2)*

Maximum 1 per cent.

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 9.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 2.0 per cent.

ASSAY

Carry out the assay protected from bright light. Place 0.150 g of the powdered drug (180) *(2.9.12)* in a 100 ml flask. Add 30.0 ml of *water R*, mix, weigh and place in a water-bath. Heat under a reflux condenser for 15 min. Allow to cool, weigh and adjust to the original mass with *water R*. Centrifuge and transfer 20.0 ml of the supernatant liquid to a 150 ml separating funnel. Add 0.1 ml of *dilute hydrochloric acid R* and shake with 3 quantities, each of 15 ml, of *chloroform R*. Allow to separate and discard the chloroform layer. Add 0.10 g of *sodium* *hydrogen carbonate R* and shake for 3 min. Centrifuge and transfer 10.0 ml of the supernatant liquid to a 100 ml round-bottomed flask with a ground-glass neck. Add 20 ml of *ferric chloride solution R1* and mix. Place the flask in a water-bath so that the water level is above that of the liquid in the flask, and heat under a reflux condenser for 20 min. Add 1 ml of *hydrochloric acid R* and heat for a further 20 min, with frequent shaking, to dissolve the precipitate. Cool, transfer the mixture to a separating funnel and shake with 3 quantities, each of 25 ml, of *ether R* previously used to rinse the flask. Combine the 3 ether layers and wash with 2 quantities, each of 15 ml, of *water R*. Transfer the ether layers to a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 10.0 ml carefully to dryness and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance *(2.2.25)* at 515 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of hydroxyanthracene glycosides, expressed as sennoside B, using the following expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of sennoside B to be 240.

A = absorbance at 515 nm;

m = mass of the substance to be examined, in grams.

STORAGE

Protected from moisture.

Ph Eur

Angelica Root

General Notices

(Ph Eur monograph 1857)

Ph Eur

DEFINITION

Whole or cut, carefully dried rhizome and root of *Angelica archangelica* L. (*Archangelica officinalis Haffm.*).

Content

Minimum 2.0 ml/kg of essential oil (dried drug).

CHARACTERS

Bitter taste.

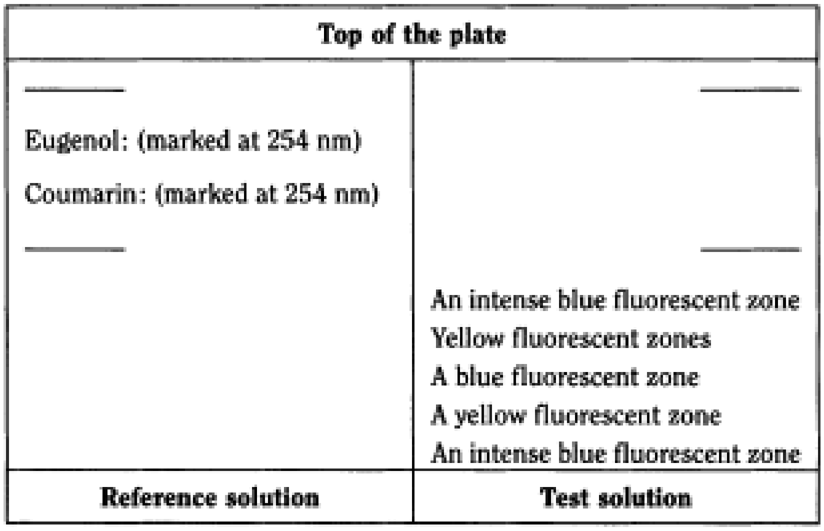
IDENTIFICATION

A. The rhizome is greyish-brown or reddish-brown, with transversely annulated thickenings. The base bears greyish-brown or reddish-brown, cylindrical, longitudinally furrowed, occasionally branched roots often with incompletely encircling, transverse ridges. The apex sometimes shows remnants of stem and leaf bases. The fracture is uneven. The transversely cut surface shows a greyish-white, spongy, distinctly radiate bark, in which the secretory channels are visible as brown spots, and a bright yellow or greyish-yellow wood which, in the rhizome, surrounds the greyish or brownish-white pith.

B. Reduce to a powder (355) *(2.9.12)*. The powder is brownish-white. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: fragments of cork consisting of several layers of thin-walled greyish-brown or reddish-brown cells; fragments of large, yellowish-brown secretory channels; fragments of medullary rays 2 or 4 cells wide; fragments of xylem with medullary rays and radially arranged, lignified vessels with reticulate thickenings. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R* . The powder shows numerous, simple starch granules 2-4 µm in diameter.

C. Examine the chromatograms obtained in the test for lovage root.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
———	———
Eugenol: (marked at 254 nm)	
Coumarin: (marked at 254 nm)	
———	———
	An intense blue fluorescent zone
	Yellow fluorescent zones
	A blue fluorescent zone
	A yellow fluorescent zone
	An intense blue fluorescent zone
Reference solution	**Test solution**

TESTS

Lovage root

Thin-layer chromatography *(2.2.27)* .

Test solution To 1.0 g of the freshly powdered drug (355) *(2.9.12)* add 5 ml of *methanol R* and boil for 30 s. Cool and filter.

Reference solution Dissolve 5 mg of *coumarin R* and 25 µl of *eugenol R* in 10 ml of *methanol R* .

Plate *TLC silica gel F* $_{254}$ *plate R* .

Mobile phase *methylene chloride R* , *toluene R* (50:50 *V/V*).

Application 20 µl, as bands.

Development Twice over a path of 10 cm.

Drying In air.

Detection Examine in ultraviolet light at 254 nm. Mark the quenching zones due to coumarin and eugenol on the chromatogram obtained with the reference solution. Examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the test solution shows no pale blue or white fluorescent zone between the zones of coumarin and eugenol in the chromatogram obtained with the reference solution.

Foreign matter *(2.8.2)*

Maximum 5 per cent of leaf bases and stem bases, maximum 5 per cent of discoloured pieces and maximum 1 per cent of other foreign matter.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 10.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 2.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs *(2.8.12)*. Reduce the drug to a powder (500) *(2.9.12)* and immediately use 40.0 g for the determination. Use a 2 litre round-bottomed flask, 10 drops of *liquid paraffin R*, 500 ml of *water R* as distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 4 h.

Ph Eur

Angelica Sinensis Root for use in THM

General Notices

DEFINITION

Angelica Sinensis Root for use in THM is the dried whole root of *Angelica sinensis* (Oliv.) Diels. (*Angelica polymorpha* Maxim. var. *sinensis* Oliv.). The dried root consists of the top (uppermost part), main body and small lateral roots (tails).

It is collected in late autumn, removed from rootlets and dried.

It contains not less than 0.1% of *Z*-ligustilide ($C_{12}H_{14}O_2$), calculated with reference to the dried material.

IDENTIFICATION

A. The whole root is yellowish-brown to brown, up to 25 cm long, irregularly cylindrical with 3 to 5 or more branch roots arising from the lower end. The upper part is 1.5 to 5 cm in diameter, annulated on the surface and rounded at the apex which may show purple or yellowish-green remains of stems and leaves; the surface of the remainder of the main root is strongly longitudinally wrinkled and has pale, transverse lenticels; the branch roots are 0.3 to 1 cm in diameter in the upper part, twisted and tapering towards the base, the outer surface is strongly striated and has few rootlet scars.

B. Reduce to a powder (355). The powder is pale yellowish to buff. Examine under a microscope using *chloral hydrate solution* . The powder shows brown fragments of cork composed of thin-walled cells; abundant thin-walled parenchyma from the secondary cortex, phloem and medullary rays, some of the phloem cells fusiform with slightly thickened walls; lignified vessels in groups of 2 or 3 associated with small celled and pitted xylem parenchyma; the vessels are up to 80 µm in diameter and have reticulate or scalariform thickening. Examine under a microscope using 50% v/v of *glycerol* . The powder shows small groups of single starch granules, spherical to ovoid, up to about 8 µm in diameter.

C. Carry out the method for *thin-layer chromatography* , Appendix III A, using the following solutions.

(1) Add 4 ml of *heptane* to 1.0 g of the powdered drug, mix with the aid of ultrasound for 5 minutes and filter (use a 0.22 µm membrane filter).

(2) 0.1% w/v of *linoleic acid* in *methanol* .

(3) 0.1% w/v of *ferulic acid* in *methanol* .

(4) 0.1% w/v of Z-*ligustilide CRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *silica gel* F_{254} precoated plate (Merck silica gel 60 F_{254} HPTLC plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µl of solution (1) and 5 µl of solutions (2) to (4), as bands.

(d) Develop the plate to 15 cm.

(e) Remove the plate, allow to dry in a stream of warm air for 5 minutes or until the solvents are completely removed. Examine under *ultraviolet light (254 nm)*. Spray the plate with *methanolic sulphuric acid (5%),* heat at 105º for 3 minutes and examine in daylight.

MOBILE PHASE

1 volume of *formic acid*, 10 volumes of *ethyl acetate* and 90 volumes of *toluene*.

SYSTEM SUITABILITY

When examined under *ultraviolet light (254 nm)* the violet band with an Rf value of approximately 0.7 the chromatogram obtained with solution (4) corresponds in colour and position to that in the chromatogram obtained with solution (1). A band with an Rf value of approximately 0.23 in the chromatogram obtained with solution (3) corresponds in position to a band in the chromatogram obtained with solution (1). Other bands may be present in the chromatogram obtained with solution (1).

CONFIRMATION

When sprayed with *methanolic sulphuric acid (5%)* the chromatogram obtained with solution (1) shows three spots with similar Rf values to the spots in the chromatograms obtained with solutions (2), (3) and (4). Other spots may be present in the chromatogram obtained with solution (1).

TESTS

Lovage root (*Levisticum officinale*)

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions.

(1) Extract approximately 20 g of the coarsely powdered drug in a 500 ml round-bottomed flask by hydrodistillation for 2 to 3 hours in 200 ml of *water*, collecting the distillate in suitable glassware. Extract the oily drops on top of the distillate with 5 ml of *toluene*.

(2) 0.2% w/v each of *coumarin* and *eugenol* in *toluene*.

(3) 0.1% w/v of Z-*ligustilide CRS* in a*cetonitrile*.

(4) 0.1% w/v of *benzyl alcohol* in *toluene*.

(5) 0.1% w/v of *(-)-carvone* in *toluene*.

(6) 0.1% w/v of *octanoic acid* in *toluene*.

(7) 0.1% w/v of *3-propylidenephthalide* in *toluene*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a fused silica capillary column (50 m × 0.32 mm) bonded with a film (1.05 µm) of 5% phenyl/95% dimethylpolysiloxane (HP 5 is suitable).

(b) Use *helium* as the carrier gas at 1 ml per minute.

(c) Use an oven maintained at an initial temperature of 40° increasing linearly to 220° at a rate of 5° per minute, then maintained at 220°.

(d) Use a split injection system having a split ratio of 20:1 maintained at 250°.

(e) Use a flame ionisation detector maintained at a temperature of 250°.

(f) Inject 1 µl of each solution.

(g) Record the chromatograms for a sufficient length of time to elute all the peaks in the chromatogram obtained with solution (1) (55 minutes may be suitable).

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the resolution between coumarin (eluting at approximately 34 minutes) and eugenol (eluting at approximately 37 minutes) is at least 3.0.

CONFIRMATION

In the chromatogram obtained with solution (1):

— there are no peaks corresponding to the principal peaks in the chromatograms obtained with solutions (4), (5), (6) and (7);

— there is a peak corresponding to the principal peak in the chromatogram obtained with solution (3).

Loss on drying

When dried at 100° to 105° for 2 hours, loses not more than 12.0% of its weight. Use 1 g.

Total ash

Not more than 7.0%, Appendix XI J, Method II.

Acid-insoluble ash

Not more than 2.0%, Appendix XI K.

Ethanol-soluble extractive

Not less than 45%, Appendix XI B1.

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Finely powder not less than 5.0 g of the drug being examined. Transfer 0.5 g of the

powder into a 25 ml volumetric flask and add 20 ml of *methanol* , place in an ultrasonic bath (maintained at a low temperature by adding ice to the bath) for 100 minutes, equilibrate to ambient temperature and dilute to volume with *methanol* . Centrifuge the solution at 5000 rpm for 5 minutes or until a clear supernatant is obtained. Filter through a 0.45-µm filter.

(2) 0.025% w/v of Z-*ligustilide CRS* in *acetonitrile.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 ml per minute.

(d) Use a detection wavelength of 350 nm.

(e) Inject 10 µl of each solution.

MOBILE PHASE

A mixture of 8 volumes of *water* and 12 volumes of *acetonitrile* .

SYSTEM SUITABILITY

Inject solution (2) not less than five times. The test is not valid unless the relative standard deviation of the peak areas of the *Z*-ligustilide peak is not more than 3.0%, the relative standard deviation of the retention times of the *Z*-ligustilide peak is not more than 3.0%. The *column efficiency* , determined on the *Z*-ligustilide peak, is not less than 5000 theoretical plates. The *symmetry factor* , determined on the *Z*-ligustilide peak, is not more than 1.3.

Inject solution (1). The test is not valid unless the *resolution factor* between the *Z*-ligustilide peak and the closest peak (relative retention about 0.9 with respect to *Z*-ligustilide) is not less than 1.5.

DETERMINATION OF CONTENT

Using the retention time and the peak area from the chromatograms obtained with solution (2) , locate and integrate the peak due to *Z*-ligustilide in the chromatogram obtained with solution (1).

Calculate the content of *Z*-ligustilide in the sample using the declared content of *Z*-ligustilide ($C_{12}H_{14}O_2$) in Z-*ligustilide CRS* and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100-d}$$

A_1 = Area of the peak due to *Z*-ligustilide in the chromatogram obtained with solution (1) .

A_2 = Area of the peak due to *Z*-ligustilide in the chromatogram obtained with solution (2) .

m_1 = Weight of the drug being examined in mg.

m_2 = Weight of Z-*ligustilide CRS* in mg.

V_1 = Dilution volume of solution (1) in ml.

V_2 = Dilution volume of solution (2) in ml.

p = Percentage content of $C_{12}H_{14}O_2$ in Z-*ligustilide CRS .*

d = Percentage loss on drying of the herbal drug being examined.

STORAGE

Angelica Sinensis Root for use in THM should be protected from moisture.

Anise Oil

General Notices

Aniseed Oil

(Ph Eur monograph 0804)

Preparation

Concentrated Anise Water

Ph Eur

DEFINITION

Essential oil obtained by steam distillation from the dry ripe fruits of *Pimpinella anisum* L.

CHARACTERS

Appearance

Clear, colourless or pale yellow liquid.

IDENTIFICATION

First identification *B.*

Second identification *A.*

A. Thin-layer chromatography *(2.2.27)* .

Test solution Dissolve 1 g of the substance to be examined in *toluene R* and dilute to 10 ml with the same solvent.

Reference solution Dissolve 10 µl of *linalol R* , 30 µl of *anisaldehyde R* and 200 µl of *anethole R* in *toluene R* and dilute to 15 ml with the same solvent. Dilute 1 ml of this solution to 5 ml with *toluene R* .

Plate *TLC silica gel* F_{254} *plate R* .

Mobile phase *ethyl acetate R* , *toluene R* (7:93 *V/V*).

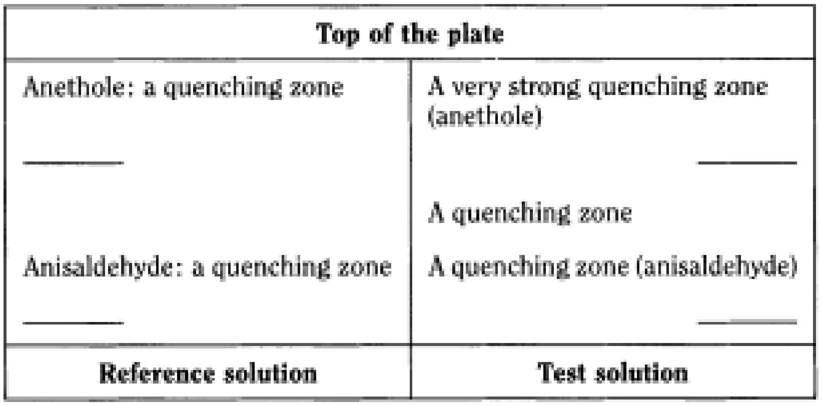
Application 5 µl as bands of 10 mm (for normal TLC plates) or 2 µl as bands of 10 mm (for fine particle size plates).

Development Over a path of 15 cm (for normal TLC plates) or over a path of 6 cm (for fine particle size plates).

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

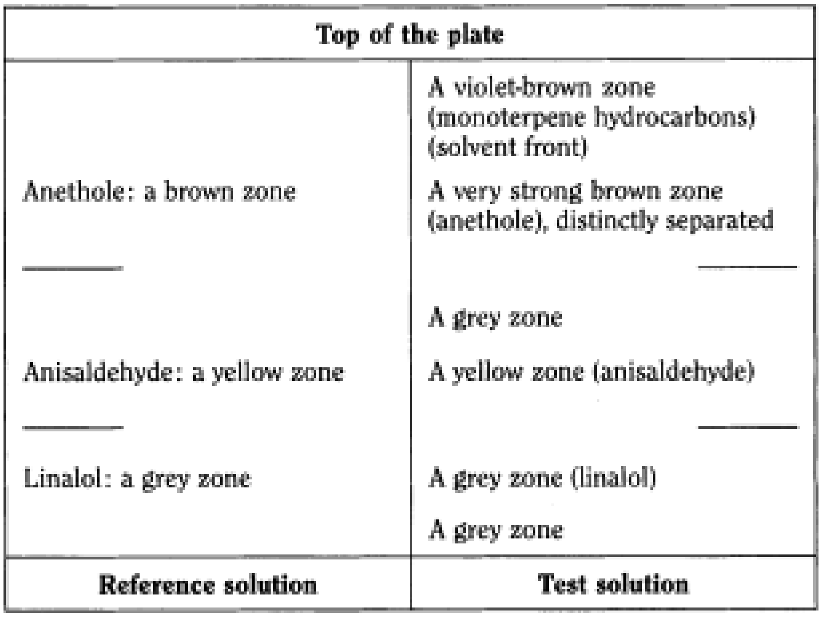
Results A See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
Anethole: a quenching zone	A very strong quenching zone (anethole)
———	———
	A quenching zone
Anisaldehyde: a quenching zone	A quenching zone (anisaldehyde)
———	———
Reference solution	**Test solution**

Detection B Spray with *methyl 4-acetylbenzoate reagent R* and heat at 100-105 °C for 10 min; examine the still hot plate in daylight within 5 min.

Results B See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A violet-brown zone (monoterpene hydrocarbons) (solvent front)
Anethole: a brown zone	A very strong brown zone (anethole), distinctly separated
———	———
	A grey zone
Anisaldehyde: a yellow zone	A yellow zone (anisaldehyde)
———	———
Linalol: a grey zone	A grey zone (linalol)
	A grey zone
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density ***(2.2.5)***

0.980 to 0.990.

Refractive index ***(2.2.6)***

1.552 to 1.561.

Freezing point ***(2.2.18)***

15 °C to 19 °C.

Fenchone

Gas chromatography *(2.2.28)* as described in the test for chromatographic profile with the following modifications.

Test solution Dissolve 400 µl of the substance to be examined in 2.0 ml of *hexane R* .

Reference solution (a) Dilute 10 µl of *fenchone R* to 1.2 g with *hexane R* .

Reference solution (b) Dilute 100 µl of reference solution (a) to 100 ml with *hexane R* .

System suitability Reference solution (b):

— *signal-to-noise ratio* : minimum 10 for the principal peak.

Limit:

— *fenchone* : maximum 0.01 per cent.

Foeniculin

Gas chromatography *(2.2.28)* as described in the test for chromatographic profile with the following modifications.

Test solution The substance to be examined.

Reference solution (a) Dilute 10 mg of the test solution to 1.000 g with *hexane R* . Dilute 0.5 ml of this solution to 100 ml with *hexane R* .

Reference solution (b) *Foeniculin for peak identification CRS.*

System suitability:

— the chromatogram obtained with reference solution (b) is similar to the chromatogram provided with *foeniculin for peak identification CRS* ,

— *signal-to-noise ratio* : minimum 10 for the principal peak in the chromatogram obtained with reference solution (a).

Limit Locate the peak due to foeniculin by comparison with the chromatogram provided with *foeniculin for peak identification CRS.*

— *foeniculin*: maximum 0.01 per cent.

Fatty oils and resinified essential oils ***(2.8.7)***

It complies with the test for fatty oils and resinified essential oils.

Chromatographic profile

Gas chromatography *(2.2.28)* : use the normalisation procedure.

Test solution Dissolve 200 µl of the substance to be examined in 1.0 ml of *hexane R* .

Reference solution To 1.0 ml of *hexane R* , add 20 µl of *linalol R* , 20 µl of *estragole R* , 20 µl of α-*terpineol R* , 60 µl of *anethole R* and 30 µl of *anisaldehyde R* .

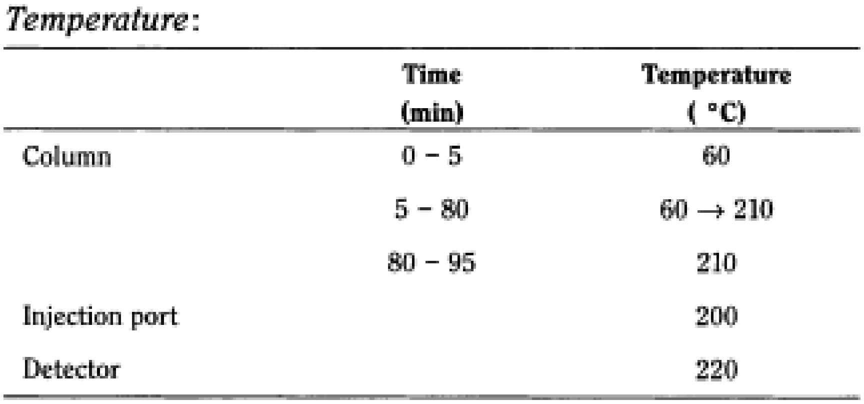
Column:
- *material*: fused silica,
- *size*: *l* = 30 m, Ø = 0.25 mm,
- *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas *helium for chromatography R* .

Flow rate 1.0 ml/min.

Split ratio 1:100.

Temperature:



Temperature:

	Time (min)	Temperature (°C)
Column	0 – 5	60
	5 – 80	60 → 210
	80 – 95	210
Injection port		200
Detector		220

Detection Flame ionisation.

Injection 0.2 µl.

Elution order Order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability Reference solution:

- *resolution*: minimum 1.5 between the peaks due to estragole and α-terpineol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution and locate *cis*-anethole and pseudoisoeugenyl 2-methylbutyrate using the chromatogram shown in Figure 0804.-1 (disregard any peak due to hexane).

Determine the percentage content of these components. The percentages are within the following ranges:

- *linalol* : less than 1.5 per cent,
- *estragole* : 0.5 per cent to 5.0 per cent,
- α-*terpineol* : less than 1.2 per cent,

— *cis-anethole* : 0.1 per cent to 0.4 per cent,

— *trans-anethole* : 87 per cent to 94 per cent,

— *anisaldehyde* : 0.1 per cent to 1.4 per cent,

— *pseudoisoeugenyl 2-methylbutyrate*: 0.3 per cent to 2.0 per cent.

STORAGE

In a well-filled, airtight container, protected from light and at a temperature not exceeding 25 °C.

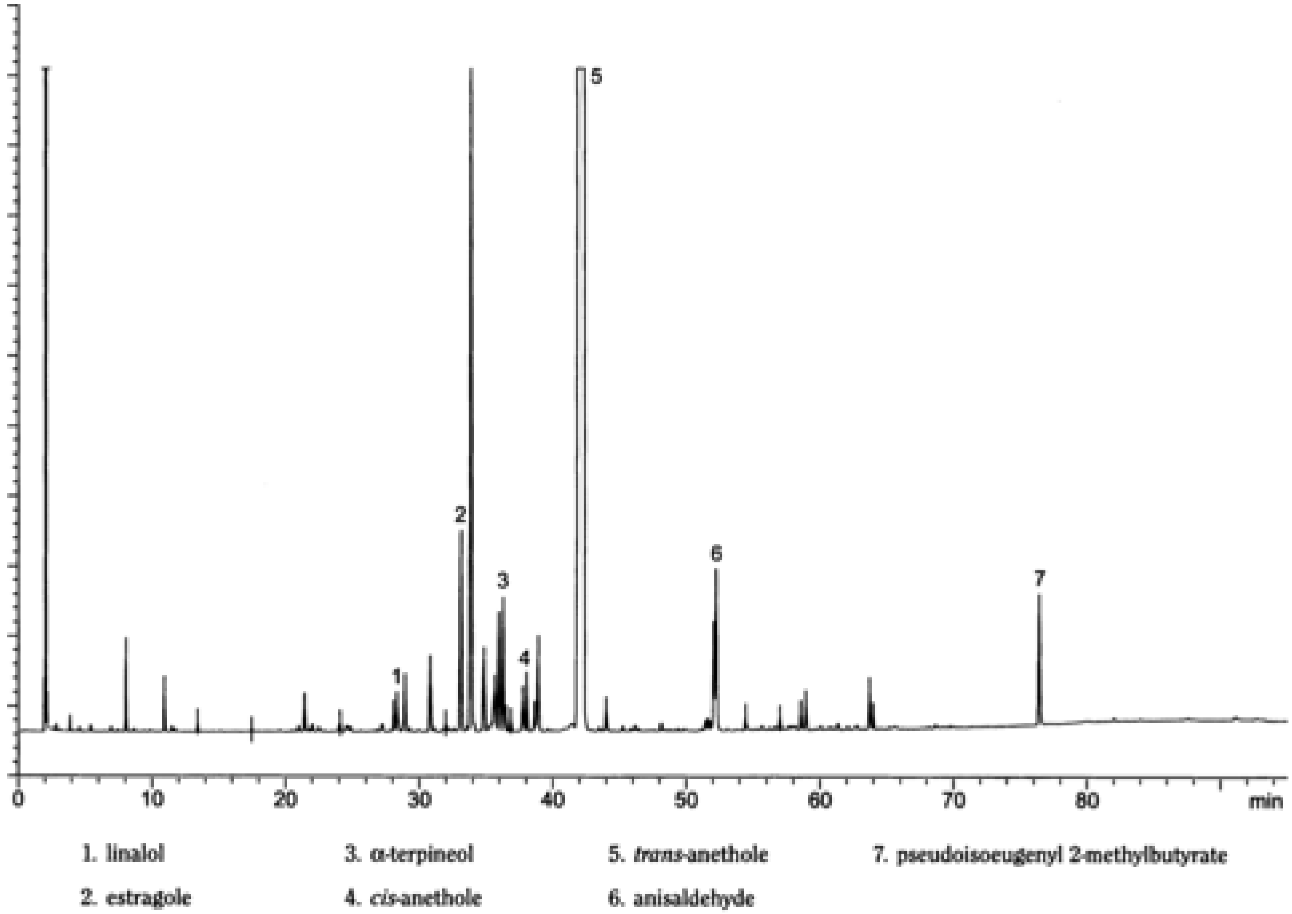


Figure 0804.-1. – *Chromatogram for the test for chromatographic profile of anise oil*

Ph Eur

Aniseed

General Notices

Anise

(Ph Eur monograph 0262)

When Powdered Aniseed is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter shall be dispensed or supplied.

Ph Eur

DEFINITION

Whole dry cremocarp of *Pimpinella anisum* L.

Content

Minimum 20 ml/kg of essential oil.

CHARACTERS

Reminiscent odour of anethole.

The fruit is a cremocarp and generally entire; a small fragment of the thin, rigid, slightly curved pedicel is frequently attached.

IDENTIFICATION

A. The cremocarp is ovoid or pyriform and slightly compressed laterally, yellowish-green or greenish-grey, 3-5 mm long and up to 3 mm wide, surmounted by a stylopod with 2 short, reflexed stylar points. The mericarps are attached by their tops to the carpophore with a plane commissural surface and a convex dorsal surface, the latter being covered with short, warty trichomes visible using a lens; the fruit shows 5 primary ridges, running longitudinally, comprising 3 dorsal ridges and 2 lateral ridges, non-prominent, and lighter in colour.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greenish-yellow or brownish-green. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: whole or broken trichomes, mostly unicellular, sometimes curved, with blunt apex and warty cuticle; fragments of epidermis with striated cuticle, occasional anomocytic stomata *(2.8.3)* ; fragments of numerous narrow, branched vittae, fragments of endosperm containing aleurone grains and micro-rosettes of calcium oxalate; oblong sclereids from the commissural zone and bundles of sclerenchymatous fibres from the carpophore and the pedicel. Starch is absent.

C. Thin-layer chromatography *(2.2.27)* .

Test solution Shake 0.10 g of the powdered drug (1500) with 2 ml of *methylene chloride R* for 15 min. Filter and carefully evaporate the filtrate to dryness on a water-bath at 60 °C. Dissolve the residue in 0.5 ml of *toluene R* .

Reference solution Dissolve 3 µl of *anethole R* and 40 µl of *olive oil R* in 1 ml of *toluene R* .

Plate *TLC silica gel GF* $_{254}$ *plate R*.

Mobile phase *toluene R* .

Application 2 µl and 3 µl of the test solution and 1 µl, 2 µl and 3 µl of the reference solution, at 2 cm intervals.

Development Over a path of 10 cm.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

Results A The chromatograms show a quenching zone (anethole) in the central part against a light background.

Detection B Spray with a freshly prepared 200 g/l solution of *phosphomolybdic acid R* in *ethanol (96 per cent) R* , using 10 ml for a plate 200 mm square, and heat at 120 °C for 5 min.

Results B The spots due to anethole appear blue against a yellow background. In the chromatogram obtained with 2 µl of the test solution, the spot due to anethole is intermediate in size between the corresponding spots in the chromatograms obtained with 1 µl and 3 µl of the reference solution. The chromatograms obtained with the test solution show in the lower third a blue spot (triglycerides) similar in position to the spot in the lower third of the chromatograms obtained with the reference solution (triglycerides of olive oil).

TESTS

Water *(2.2.13)*

Maximum 70 ml/kg, determined on 20.0 g of the powdered drug.

Total ash *(2.4.16)*

Maximum 12.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 2.5 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs *(2.8.12)* . Use 10.0 g of the drug reduced to a coarse powder immediately before determination, a 250 ml round-bottomed flask, 100 ml of *water R* as the distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 2.5-3.5 ml/min for 2 h.

Arnica Flower

General Notices

(Ph Eur monograph 1391)

Ph Eur

DEFINITION

Whole or partially broken, dried flower-heads of *Arnica montana* L.

Content

Minimum 0.40 per cent *m/m* of total sesquiterpene lactones, expressed as dihydrohelenalin tiglate (dried drug).

CHARACTERS

Aromatic odour.

The capitulum, when spread out, is about 20 mm in diameter and about 15 mm deep, and has a peduncle 2-3 cm long. The involucre consists of 18-24 elongated lanceolate bracts, with acute apices, arranged in 1-2 rows: the bracts, about 8-10 mm long, are green with yellowish-green external hairs visible under a lens. The receptacle, about 6 mm in diameter, is convex, alveolate and covered with hairs. Its periphery bears about 20 ligulate florets 20-30 mm long; the disc bears a greater number of tubular florets about 15 mm long. The ovary, 4-8 mm long, is crowned by a pappus of whitish bristles 4-8 mm long. Some brown achenes, crowned or not by a pappus, may be present.

IDENTIFICATION

A. The involucre consists of elongated oval bracts with acute apices; the margin is ciliated. The ligulate floret has a reduced calyx crowned by fine, shiny, whitish bristles, bearing small coarse trichomes. The orange-yellow corolla bears 7-10 parallel veins and ends in 3 small lobes. The stamens, with free anthers, are incompletely developed. The narrow, brown ovary bears a stigma divided into 2 branches curving outwards. The tubular floret is actinomorphic. The ovary and the calyx are similar to those of the ligulate floret. The short corolla has 5 reflexed triangular lobes; the 5 fertile stamens are fused at the anthers.

B. Separate the capitulum into its different parts. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: the epidermises of the bracts of the involucre have stomata and trichomes, more abundant on the outer (abaxial) surface. There are several different types of trichomes: uniseriate multicellular covering trichomes, varying in length from 50-500 µm, particularly abundant on the margins of the bract; secretory trichomes with uni- or biseriate multicellular stalks and with multicellular, globular heads, about 300 µm long, abundant on the outer surface of the bract;

secretory trichomes with uniseriate multicellular stalks and with multicellular, globular heads, about 80 µm long, abundant on the inner surface of the bract. The epidermis of the ligulate corolla consists of lobed or elongated cells, a few stomata and trichomes of different types: covering trichomes, with very sharp ends, whose length may exceed 500 µm, consisting of 1-3 proximal cells with thickened walls and 2-4 distal cells with thin walls; secretory trichomes with biseriate multicellular heads; secretory trichomes with multicellular stalks and multicellular globular heads. The ligule ends in rounded papillose cells. The epidermis of the ovary is covered with trichomes: secretory trichomes with short stalks and multicellular globular heads; twinned covering trichomes usually consisting of 2 longitudinally united cells, with common punctuated walls; their ends are sharp and sometimes bifid. The epidermises of the calyx consist of elongated cells bearing short, unicellular, covering trichomes pointing towards the upper end of the bristle. The pollen grains have a diameter of about 30 µm, are rounded, with a spiny exine, and have 3 germinal pores.

C. Examine the chromatograms obtained in the test for Calendula officinalis L. - *Heterotheca inuloides* Cass.

Results The chromatogram obtained with the test solution shows, in the middle, a fluorescent blue zone corresponding to the zone due to chlorogenic acid in the chromatogram obtained with the reference solution; it shows, above this zone, 3 fluorescent yellowish-brown or orange-yellow zones, and above these 3 zones a fluorescent greenish-yellow zone due to astragalin. The zone located below the astragalin zone is due to isoquercitroside; the zone located just below this zone is due to luteolin-7-glucoside. It also shows a fluorescent greenish-blue zone below the zone due to caffeic acid in the chromatogram obtained with the reference solution.

TESTS

Foreign matter (*2.8.2*)

Maximum 5.0 per cent.

***Calendula officinalis* L. - *Heterotheca inuloides* Cass**

Thin-layer chromatography (*2.2.27*).

Test solution To 2.00 g of the powdered drug (710) (*2.9.12*) add 10 ml of *methanol R*. Heat in a water-bath at 60 °C for 5 min with shaking. Cool and filter.

Reference solution Dissolve 2.0 mg of *caffeic acid R*, 2.0 mg of *chlorogenic acid R* and 5.0 mg of *rutin R* in *methanol R* and dilute to 30 ml with the same solvent.

Plate *TLC silica gel plate R.*

Mobile phase *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 *V/V/V/V*).

Application 15 µl, as bands.

Development Over a path of 15 cm.

Drying In air for a few minutes.

Detection Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol*

R, and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Heat at 100-105 °C for 5 min. Allow to dry in air and examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the reference solution shows in the lower part an orange-yellow fluorescent zone due to rutin, in the middle part a fluorescent zone due to chlorogenic acid and in the upper part a light bluish fluorescent zone due to caffeic acid. The chromatogram obtained with the test solution does not show a fluorescent orange-yellow zone corresponding to the zone due to rutin in the chromatogram obtained with the reference solution, nor does it show a zone below this.

Loss on drying (*2.2.32*)

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 10.0 per cent.

ASSAY

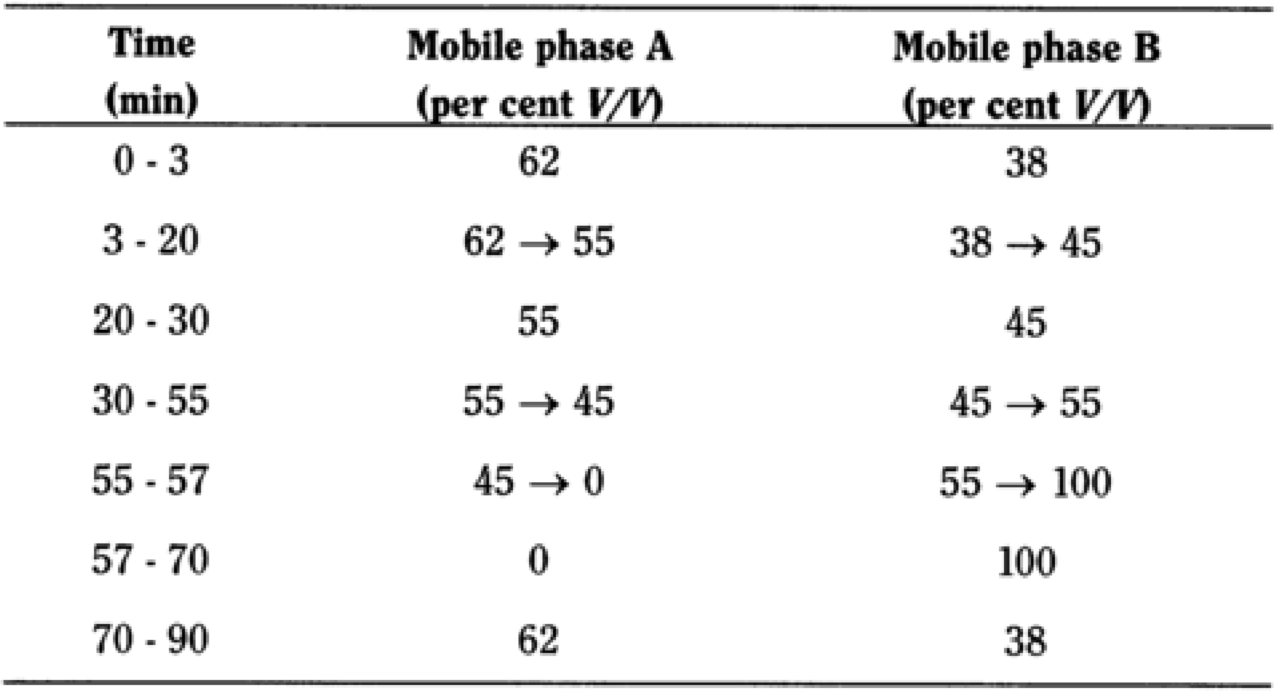
Liquid chromatography (*2.2.29*).

Internal standard solution Dissolve immediately before use 0.010 g of *santonin R*, accurately weighed in 10.0 ml of *methanol R*.

Test solution Introduce 1.00 g of the powdered drug (355) (*2.9.12*) into a 250 ml round-bottomed flask, add 50 ml of a mixture of equal volumes of *methanol R* and *water R* and heat under a reflux condenser in a water-bath at 50-60 °C for 30 min, shaking frequently. Allow to cool and filter through a paper filter. Add the paper filter, cut into pieces, to the residue in the round-bottomed flask, add 50 ml of a mixture of equal volumes of *methanol R* and *water R* and heat under a reflux condenser in a water-bath at 50-60 °C for 30 min, shaking frequently. Repeat this procedure twice. To the combined filtrate add 3.00 ml of the internal standard solution and evaporate to 18 ml under reduced pressure. Rinse the round-bottomed flask with *water R* and dilute, with the washings, to 20.0 ml. Transfer the solution to a chromatography column about 0.15 m long and about 30 mm in internal diameter containing 15 g of *kieselguhr for chromatography R*. Allow to stand for 20 min. Elute with 200 ml of a mixture of equal volumes of *ethyl acetate R* and *methylene chloride R*. Evaporate the eluate to dryness in a 250 ml round-bottomed flask. Dissolve the residue in 10.0 ml of *methanol R* and add 10.0 ml of *water R*. Add 7.0 g of *neutral aluminium oxide R*, shake for 120 s, centrifuge at 5000 g for 10 min and filter through a paper filter. Evaporate 10.0 ml of the filtrate to dryness. Dissolve the residue in 3.0 ml of a mixture of equal volumes of *methanol R* and *water R* and filter.

Column:
- — *size*: *l* = 0.12 m, Ø = 4 mm;
- — *stationary phase*: *octadecylsilyl silica gel for chromatography R* (4 µm).

Mobile phase:
- — *mobile phase A*: *water R*;
- — *mobile phase B*: *methanol R*;



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 3	62	38
3 - 20	62 → 55	38 → 45
20 - 30	55	45
30 - 55	55 → 45	45 → 55
55 - 57	45 → 0	55 → 100
57 - 70	0	100
70 - 90	62	38

Flow rate 1.2 ml/min.

Detection Spectrophotometer at 225 nm.

Injection A 20 µl loop injector.

Calculate the percentage content of total sesquiterpene lactones, expressed as dihydrohelenalin tiglate, using the following expression:

$$\frac{S_{\mathrm{LS}} \times C \times V \times 1.187 \times 100}{S_{\mathrm{S}} \times m \times 1000}$$

S_{LS} = area of all peaks due to sesquiterpene lactones appearing after the santonin peak in the chromatogram obtained with the test solution

S_{S} = area of the peak due to santonin in the chromatogram obtained with the test solution

m = mass of the drug to be examined, in grams

C = concentration of santonin in the internal standard solution used for the test solution, in milligrams per millilitre

V = volume of the internal standard solution used for the test solution, in millilitres

1.187 = peak correlation factor between dihydrohelenalin tiglate and santonin.

Ph Eur

Arnica Tincture

General Notices

(Ph Eur monograph 1809)

Ph Eur

DEFINITION

Tincture produced from *Arnica flower (1391)*.

Content

Minimum 0.04 per cent of sesquiterpene lactones expressed as dihydrohelenalin tiglate ($C_{20}H_{26}O_5$; M_r 346.42).

PRODUCTION

The tincture is produced from 1 part of the drug and 10 parts of ethanol (60 per cent *V/V* to 70 per cent *V/V*) by an appropriate procedure.

CHARACTERS

Appearance

Yellowish-brown liquid.

IDENTIFICATION

Examine the chromatograms obtained in the test for *Calendula officinalis - Heterotheca inuloides.*

Chromatogram obtained with the test solution:

— in the middle, a fluorescent blue zone corresponding to the zone due to chlorogenic –acid in the chromatogram obtained with the reference solution;

— above this zone, 3 fluorescent yellowish-brown to orange-yellow zones, and above these 3 zones a fluorescent greenish-yellow zone corresponding to astragalin; the zone located below the astragalin zone corresponds to isoquercitrin; the zone located just below this zone corresponds to luteolin-7-glucoside;

— a fluorescent greenish-blue zone below the zone due to caffeic acid in the chromatogram obtained with the reference solution.

TESTS

Calendula officinalis - *Heterotheca inuloides*

Thin-layer chromatography (*2.2.27*).

Test solution The tincture to be examined.

Reference solution Dissolve 2.0 mg of *caffeic acid R*, 2.0 mg of *chlorogenic acid R* and 5.0 mg of *rutin R* in *methanol R* and dilute to 30.0 ml with the same solvent.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 *V/V/V/V*).

Application 30 µl [or 8 µl] as bands.

Development Over a path of 15 cm [or 8 cm].

Drying At 80-105 °C.

Detection Spray the plate whilst still hot with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Heat 5 min at 100 - 105 °C. Allow the plate to dry in air and examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the reference solution shows in the lower part an orange-yellow fluorescent zone (rutin), in the middle part a fluorescent zone due to chlorogenic acid and in the upper part a light bluish fluorescent zone (caffeic acid). The chromatogram obtained with the test solution does not show any fluorescent orange-yellow zone corresponding to rutin in the chromatogram obtained with the reference solution and no zone below the zone corresponding to rutin.

Ethanol *(2.9.10)*

The final alcohol concentration is not less than 90 per cent of that of the initial extraction solvent.

Methanol and 2-propanol *(2.9.11)*

Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

Dry residue *(2.8.16)*

Minimum of 1.7 per cent.

ASSAY

Liquid chromatography *(2.2.29)* .

Internal standard solution Dissolve immediately before use 0.010 g accurately weighed of *santonin R* and 0.02 g of *butyl 4-hydroxybenzoate R* in 10.0 ml of *methanol R*.

Test solution In a round-bottomed flask introduce 5.00 g of the tincture to be examined, add 2.00 ml of internal standard solution and 3 g of *anhydrous aluminium oxide R*, shake for 120 s and filter through a paper filter. Rinse the round-bottomed flask and filter with 5 ml of a mixture of equal volumes of *methanol R* and *water R* and filter. Evaporate the filtrate to dryness. Dissolve the residue in 2.0 ml of a mixture of 20 volumes of *water R* and 80 volumes of *methanol R* and filter by a membrane filter (porosity: 0.45 µm).

Reference solution Dissolve 0.02 g of *methyl 4-hydroxybenzoate R* and 0.02 g of *ethyl 4-hydroxybenzoate R* in *methanol R* and dilute to 10.0 ml with the same solvent.

Column:

— *size: l* = 0.12 m, Ø = 4 mm,

— *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm),

— *temperature*: 20 °C.

Mobile phase:

— *mobile phase A*: *water R* ;

— *mobile phase B*: *methanol R;*

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 3	62	38
3 - 20	62 → 55	38 → 45
20 - 30	55	45
30 - 55	55 → 45	45 → 55

Flow rate 1.2 ml/min.

Detector Spectrophotometer at 225 nm.

Injection 20 µl.

Relative retention With reference to santonin (retention time = about 9.5 min): butyl 4-hydroxybenzoate = about 4.6.

System suitability Reference solution:

— *resolution*: minimum 5 between the peaks due to methyl 4-hydroxybenzoate and ethyl 4-hydroxybenzoate.

Calculate the percentage of lactone sesquiterpenes, expressed as dihydrohelenalin tiglate from the expression:

$$\frac{F_1 \times C \times V \times 1.187}{F_2 \times m \times 10}$$

F_1 = area of all peaks appearing between the peaks due to santonin and butyl 4-hydroxybenzoate in the chromatogram obtained with the test solution,

F_2 = area of the peak due to santonin in the chromatogram obtained with the test solution,

m = mass of the tincture to be examined, in grams,

C = concentration of santonin in the internal standard solution used for the test solution in milligrams per millilitre,

V = volume of internal standard solution used for the test solution, in millilitres,

1.187 = peak correlation factor between dihydrohelenalin tiglate and santonin.

Ph Eur

Artichoke Leaf

General Notices

(Ph Eur monograph 1866)

Ph Eur

DEFINITION

Whole or cut, dried leaf of *Cynara scolymus* L.

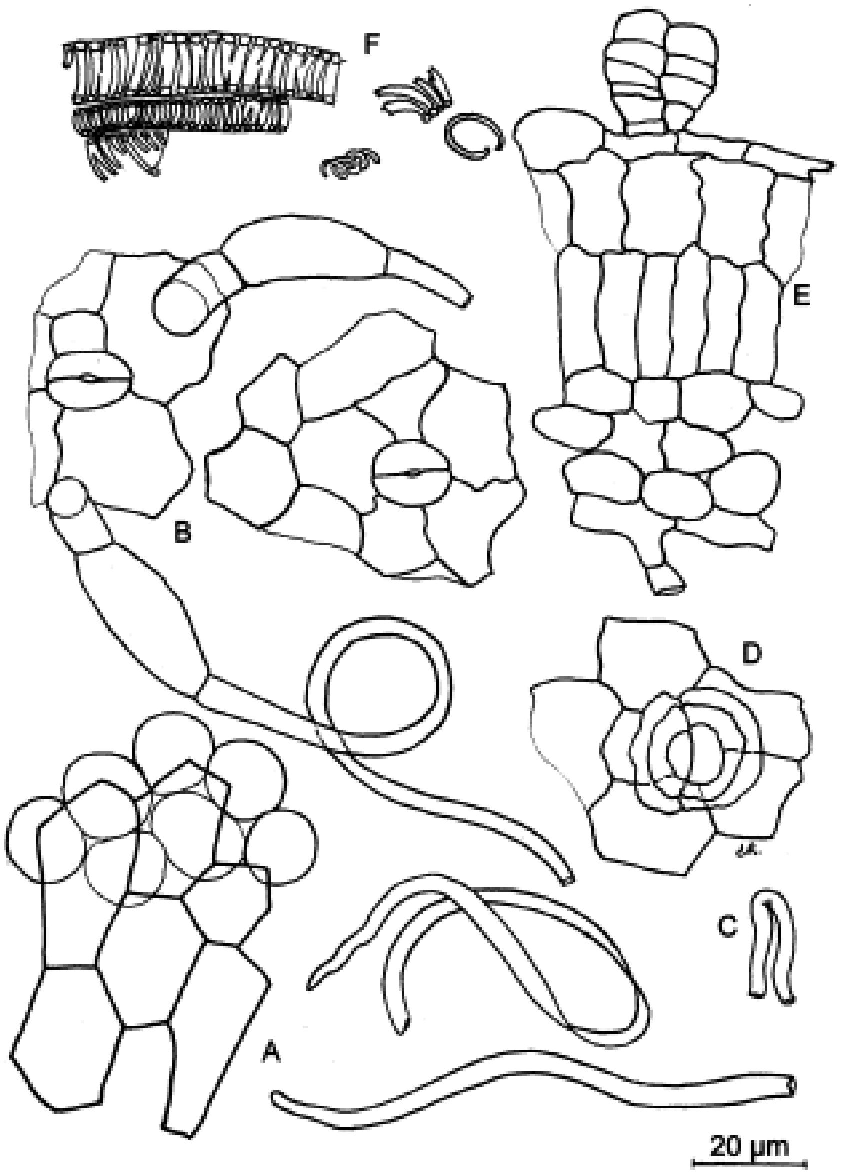
Content

Minimum 0.8 per cent of chlorogenic acid ($C_{16}H_{18}O_9$; M_r 354.3) (dried drug).

IDENTIFICATION

A. The entire leaf may be up to 70 cm long and 30 cm wide. The lamina is deeply lobed in the upper part to within 1-2 cm of the petiole on either side, in the lower part the leaf becomes pinnate; all the segments have markedly dentate margins and taper at the apex. Spines are absent. The upper surface of the lamina is green with a fine covering of whitish hairs, the lower surface is pale green or white and densely tomentose with long, tangled hairs. The petiole and main veins are flat on the upper surface, prominently raised and longitudinally ridged on the lower surface, with conspicuous hairs on both surfaces.

B. Reduce to a powder (1000) *(2.9.12)*. The powder is greenish-grey. Examine under a microscope using *chloral hydrate solution R* . The powder shows fragments of the epidermis of the lamina, those of the upper epidermis composed of cells with straight or slightly sinuous walls, those of the lower epidermis more sinuous-walled; abundant anomocytic stomata *(2.8.3)* on both surfaces; multicellular, uniseriate covering trichomes in felted masses, the majority with a short stalk composed of several cells and a very long, narrow and frequently curled terminal cell, others consisting of 4-6 cylindrical cells; very occasional glandular trichomes with a short stalk and a biseriate or uniseriate head; abundant fragments of vascular tissue from the petiole and veins.



A. Upper epidermis of lamina in surface view

B. Lower epidermis of lamina in surface view showing stomata and covering trichomes

C. Fragment of covering trichomes

D. Multicelluar, biseriate, glandular trichome in surface view

E. Section view of lamina showing a glandular trichome

F. Fragments of vascular tissue

Figure 1866.-1. – *Illustration for the identification of artichoke leaf (see Identification B)*

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 2.0 g of the powdered drug (1000) *(2.9.12)* add 20 ml of *ethanol (60 per cent V/V) R*. Allow to stand for 2 h with occasional stirring. Filter.

Reference solution Dissolve 5 mg of *luteolin-7-glucoside R* and 5 mg of *chlorogenic acid CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *acetic acid R* , *anhydrous formic acid R* , *water R* , *ethyl acetate R* (11:11:27:100 *V/V/V/V).*

Application 10 µl [or 2 µl] as bands.

Development Over a path of 13 cm [or 6 cm].

Drying In air.

Detection Heat the plate at 100 °C for 5 min; spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* followed by a 50 g/l solution of *macrogol 400 R* in *methanol R* ; examine in ultraviolet light at 365 nm.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

System suitability Test solution:

- the chromatogram obtained is similar to the chromatogram shown in Figure 1866.-2;

— *resolution*: minimum 2.0 between the peak due to chlorogenic acid and the subsequent peak (peak 2).

Calculate the percentage content of chlorogenic acid using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1}$$

A_1 = area of the peak due to chlorogenic acid in the chromatogram obtained with the test solution;

A_2 = area of the peak due to chlorogenic acid in the chromatogram obtained with the reference solution;

m_1 = mass of the drug to be examined in the test solution, in grams;

m_2 = mass of *chlorogenic acid CRS* in the reference solution, in grams;

p = percentage content of chlorogenic acid in *chlorogenic acid CRS*.

Ph Eur

Ash Leaf

General Notices

(Ph Eur monograph 1600)

Ph Eur

DEFINITION

Dried leaf of *Fraxinus excelsior* L. or *Fraxinus oxyphylla* M. Bieb.

Content

Minimum 2.5 per cent of total hydroxycinnamic acid derivatives, expressed as chlorogenic acid ($C_{16}H_{18}O_9$; M_r 354.3) (dried drug).

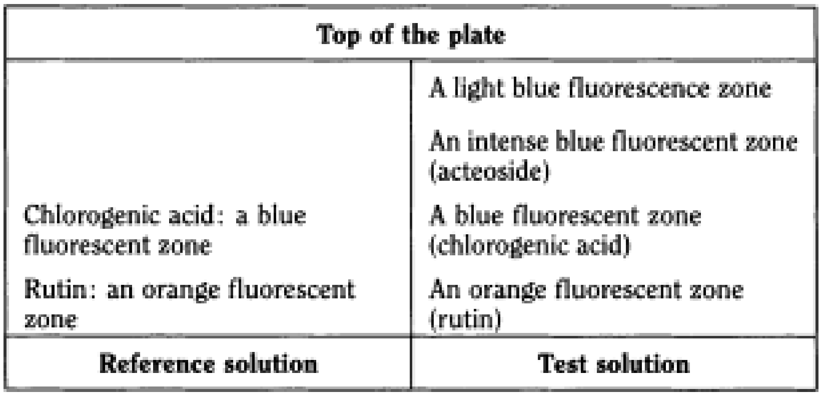
IDENTIFICATION

A. The leaf consists of leaflets which are sometimes detached and separated from the rachis. The leaflet is about 6 cm long and 3 cm wide. Each leaflet is subsessile or shortly petiolate, oblong, lanceolate, somewhat unequal at the base, acuminate at the apex, with fine acute teeth on the margins, the upper surface is dark green and the lower surface is greyish-green. The midrib and secondary veins are whitish and prominent on the lower surface.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greyish-green. Examined under a microscope, using *chloral hydrate solution R* . The powder shows the following diagnostic characters: fragments of the lamina in surface view, with the lower epidermis showing numerous anomocytic stomata *(2.8.3)* and some of the cells of the upper epidermis with cuticular striations; occasional uniseriate, conical covering trichomes composed of 1 or 2 cells with thick walls and a striated cuticle; rare peltate glands with a unicellular stalk and a shield-like glandular head composed of 8 radiating cells; groups of fibres and fragments of vascular tissue from the veins.

C. Examine the chromatograms obtained in the test for *Fraxinus ornus* L.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones are present in the chromatogram obtained with the test solution.



Top of the plate	
	A light blue fluorescence zone
	An intense blue fluorescent zone (acteoside)
Chlorogenic acid: a blue fluorescent zone	A blue fluorescent zone (chlorogenic acid)
Rutin: an orange fluorescent zone	An orange fluorescent zone (rutin)
Reference solution	**Test solution**

TESTS

Foreign matter *(2.8.2)*

Maximum 3.0 per cent of stems and maximum 2.0 per cent of other foreign matter.

Fraxinus ornus L

Thin-layer chromatography *(2.2.27)* .

Test solution To 1 g of the powdered drug (355) *(2.9.12)* add 20 ml of *methanol R* . Heat with shaking at 40 °C for 10 min. Filter.

Reference solution Dissolve 5.0 mg of *rutin R* and 5.0 mg of *chlorogenic acid R* in 10 ml of *methanol R* .

Plate *TLC silica gel plate R* .

Mobile phase *anhydrous formic acid R* , *water R* , *ethyl acetate R* (10:10:80 *V/V/V*).

Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with a solution containing 10 g/l of *diphenylboric acid aminoethyl ester R* and 50 g/l of *macrogol 400 R* in *methanol R* . Examine in ultraviolet light at 365 nm.

Results In the case of a substitution by F. *ornus*, the chromatogram obtained with the test solution does not show the zones of acteoside, chlorogenic acid and rutin.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 12.0 per cent.

ASSAY

Test solution (a) To 0.300 g of the powdered drug (355) *(2.9.12)* add 95 ml of *ethanol (50* *per cent V/V) R*. Boil in a water-bath under a reflux condenser for 30 min. Allow to cool and filter. Rinse the filter with 5 ml of *ethanol (50 per cent V/V) R*. Combine the filtrate and the rinsings in a volumetric flask and dilute to 100.0 ml with *ethanol (50 per cent V/V) R*.

Test solution (b) To 1.0 ml of test solution (a) in a test tube, add 2 ml of *0.5 M hydrochloric acid* , 2 ml of a solution prepared by dissolving 10 g of *sodium nitrite R* and 10 g of *sodium molybdate R* in 100 ml of *water R* , then add 2 ml of *dilute sodium hydroxide solution R* and dilute to 10.0 ml with *water R* ; mix.

Immediately measure the absorbance *(2.2.25)* of test solution (b) at 525 nm, using as compensation liquid a solution prepared as follows: mix 1.0 ml of test solution (a), 2 ml of *0.5 M hydrochloric acid* , 2 ml of *dilute sodium hydroxide solution R* and dilute to 10.0 ml with *water R* .

Calculate the percentage content of total hydroxycinnamic acid derivatives, expressed as chlorogenic acid, from the following expression:

$$\frac{A \times 5.3}{m}$$

taking the specific absorbance of chlorogenic acid to be 188.

A = absorbance at 525 nm,

m = mass of the substance to be examined, in grams.

Ph Eur

Astragalus Root for use in THM

General Notices

DEFINITION

Astragalus Root for use in THM is the dried root of *Astragalus propinquus.* Schischk. (synonyms: *Astragalus mongholicus* Bunge; *Astragalus membranaceus* (Fisch.) Bunge.)

It is collected in spring and autumn, separated from the rootlets and rootstock and dried.

IDENTIFICATION

A. The whole root is cylindrical, sometimes branched, up to 30 to 90 cm long and about 2 to 3 cm in diameter at the widest part, buds or the remains of shoots may be present at the crown, near which the root is frequently twisted. The outer surface is pale yellowish to greyish brown, faintly striated longitudinally with irregular transverse ridges. The fracture is difficult, fibrous and starchy. The smoothed transverse surface is cream to yellow and shows an outer region separated by darker cambium ring from the radiate xylem; on the larger pieces there is a central hollow surrounded by dark brown fragments of disintegrating tissue.

B. Reduce to a powder. The powder is yellowish-white. Examine under a microscope using *chloral hydrate solution* . The fibres are in bundles or scattered, 8 to 30 µm in diameter, thick-walled, with longitudinal fissures on the surface, the primary walls often separated from the secondary walls, both ends often broken to tassel-like, or slightly truncated. Bordered-pitted vessels colourless or orange, bordered pits arranged closely. Stone cells occasionally visible, rounded, oblong or irregular, slightly thick-walled. Examine under a microscope using 50% v/v of *glycerol* in *water*. Starch granules usually simple, ovoid, 5 to 20 µm in diameter, with a visible linear or punctuate hilum.

C. Carry out the method for *thin-layer chromatography* , Appendix III A, using the following solutions.

(1) Place 6 g of the powdered drug in a Soxhlet extractor, add 75 ml of *methanol* , heat under reflux for 7 hours, cool and filter.

(2) 0.3% w/v each of *ferulic acid* and *linoleic acid* in *methanol.*

(3) 0.1% w/v each of *astragaloside I CRS, astragaloside II CRS* and *astragaloside IV CRS* in *methanol* .

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} HPTLC plates are suitable).

(b) Use the mobile phase described below.

(c) Apply 10 µl of each solution, as bands.

(d) Develop the plate to 15 cm [or 7 cm].

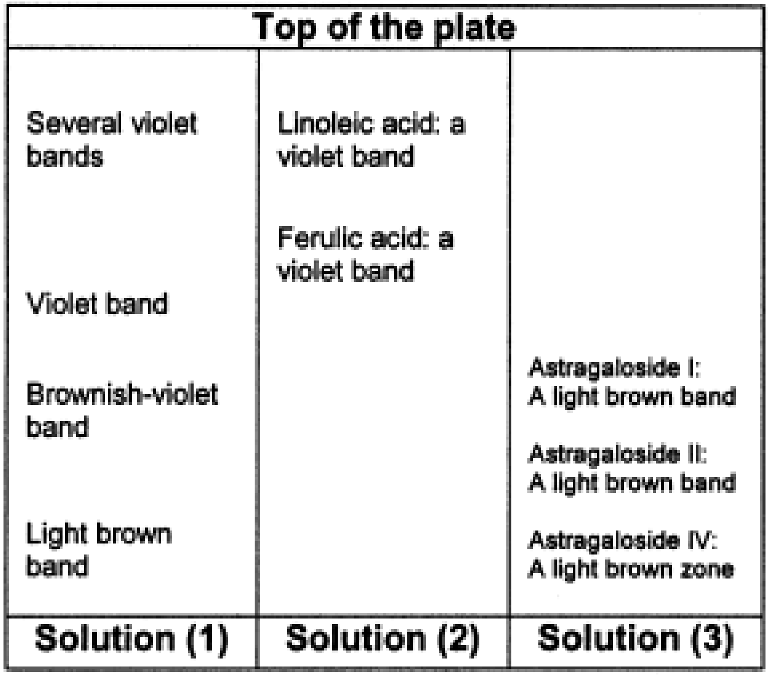
(e) Remove the plate and allow it to dry in cold air for 5 minutes. Examine under *ultraviolet light (254 nm)*. Spray the plate with *anisaldehyde solution*, heat at 100° to 105° for 5 minutes and examine in daylight.

MOBILE PHASE

A mixture of 30 volumes of *water*, 41 volumes of *methanol* and 200 volumes of *ethyl acetate.*

SYSTEM SUITABILITY

The test is not valid unless, when examined under daylight after spraying with *anisaldehyde solution*, the chromatogram obtained with solution (2) shows two clearly separated bands and the chromatogram obtained with solution (3) shows three clearly separated bands.



Top of the plate		
Several violet bands	Linoleic acid: a violet band	
	Ferulic acid: a violet band

Brownish-violet band		Astragaloside I: A light brown band
		Astragaloside II: A light brown band
Light brown band		Astragaloside IV: A light brown zone
Solution (1)	**Solution (2)**	**Solution (3)**

CONFIRMATION

When examined under daylight after spraying with *anisaldehyde solution* the chromatogram obtained with solution (1) shows a band corresponding to astragaloside IV and several other bands as shown above. Other bands may be present.

When examined under *ultraviolet light (254 nm)* the chromatogram obtained with solution (1) shows violet coloured bands with Rf values of approximately 0.4 and 0.8 and no band corresponding to ferulic acid as shown below. Other bands may be present. The chromatogram obtained with solution (2) shows a single violet band with an Rf value of approximately 0.7 (ferulic acid). The chromatogram obtained with solution (3) shows no bands.

Top of the plate

TESTS

Hedysarum root

Macroscopical *Hedysarum polybotrys* root, a known adulterant of Astragalus Root for use in THM, has much smaller and more branched roots, with many branches arising from near the crown; the outer surface is dark reddish-brown.

Thin-layer chromatography In Identification test C, the chromatogram obtained with solution (1) shows no bands due to *astragaloside I CRS* and *astragaloside IV CRS* when examined under daylight after spraying with *anisaldehyde solution* .

Top of the plate			
Several violet bands	Several violet bands	Linoleic acid: a violet band

Astragalus	***Hedysarum***	**Solution (2)**	**Solution (3)**
Solution (1)			

Acid-insoluble ash

Not more than 1.0%, Appendix XI K .

Total ash

Not more than 5.0%, Appendix XI J, Method II.

Loss on drying

When dried for 2 hours at 100° to 105°, loses not more than 10.0% of its weight. Use 1 g.

Water-soluble extractive

Not less than 30%, Appendix XI B2.

STORAGE

Astragalus Root for use in THM should be protected from moisture. Exposure to sunlight for as little as 30 minutes can bleach the yellow colour.

Barbados Aloes

General Notices

Curaçao Aloes

(Ph Eur monograph 0257)

Preparation

Standardised Aloes Dry Extract

Ph Eur

DEFINITION

Concentrated and dried juice of the leaves of *Aloe barbadensis* Miller.

Content

Minimum 28.0 per cent of hydroxyanthracene derivatives, expressed as barbaloin ($C_{21}H_{22}O_9$; M_r 418.4) (dried drug).

CHARACTERS

Appearance

Dark brown masses, slightly shiny or opaque with a conchoidal fracture, or brown powder.

Solubility

Partly soluble in boiling water, soluble in hot ethanol (96 per cent).

IDENTIFICATION

A. Thin-layer chromatography *(2.2.27)* .

Test solution To 0.25 g of the powdered drug add 20 ml of *methanol R* and heat to boiling in a water-bath. Shake for a few minutes and decant the solution. Store at about 4 °C and use within 24 h.

Reference solution Dissolve 25 mg of *barbaloin R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel G plate R*.

Mobile phase *water R, methanol R, ethyl acetate R* (13:17:100 *V/V/V*).

Application 10 µl, as bands of 20 mm by maximum 3 mm.

Development Over a path of 10 cm.

Drying In air.

Detection A Spray with a 100 g/l solution of *potassium hydroxide R* in *methanol R* and examine in ultraviolet light at 365 nm.

Results A The chromatogram obtained with the test solution shows in the central part a yellow fluorescent zone (barbaloin) similar in position to the zone due to barbaloin in the chromatogram obtained with the reference solution and in the lower part a light blue fluorescent zone (aloesine).

Detection B Heat at 110 °C for 5 min.

Results B In the chromatogram obtained with the test solution, a violet fluorescent zone appears just below the zone due to barbaloin.

B. Shake 1 g of the powdered drug with 100 ml of boiling *water R*. Cool, add 1 g of *talc R* and filter. To 10 ml of the filtrate add 0.25 g of *disodium tetraborate R* and heat to dissolve. Pour 2 ml of this solution into 20 ml of *water R*. Yellowish-green fluorescence appears which is particularly marked in ultraviolet light at 365 nm.

C. To 5 ml of the filtrate obtained in identification test B add 1 ml of freshly prepared *bromine water R*. A brownish-yellow precipitate is formed and the supernatant liquid is violet.

TESTS

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug by drying in an oven at 105 °C.

Total ash *(2.4.16)*

Maximum 2.0 per cent.

ASSAY

Carry out the assay protected from bright light.

Introduce 0.300 g of powdered drug (180) *(2.9.12)* into a 250 ml conical flask. Moisten with 2 ml of *methanol R*, add 5 ml of *water R* warmed to about 60 °C, mix, then add a further 75 ml of *water R* at about 60 °C and shake for 30 min. Cool, filter into a volumetric flask, rinse the conical flask and filter with 20 ml of *water R*, add the rinsings to the volumetric flask and dilute to 1000.0 ml with *water R*. Transfer 10.0 ml of this solution to a 100 ml round-bottomed flask containing 1 ml of a 600 g/l solution of *ferric chloride R* and 6 ml of *hydrochloric acid R*. Heat in a water-bath under a reflux condenser for 4 h, with the water level above that of the liquid in the flask. Allow to cool, transfer the solution to a separating funnel, rinse the flask successively with 4 ml of *water R*, 4 ml of *1 M sodium hydroxide* and 4 ml of *water R* and add the rinsings to the separating funnel. Shake the contents of the separating funnel with 3 quantities, each of 20 ml, of *ether R*. Wash the combined ether layers with 2 quantities, each of 10 ml, of *water R*. Discard the washings and dilute the organic phase to 100.0 ml with *ether R*. Evaporate 20.0 ml of the solution carefully to dryness on a water-bath and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance *(2.2.25)* at 512 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of hydroxyanthracene derivatives, as barbaloin, from the following expression:

$$\frac{A \times 19.6}{m}$$

i.e. taking the specific absorbance of barbaloin to be 255.

A = absorbance at 512 nm,

m = mass of the substance to be examined, in grams.

STORAGE

In an airtight container .

Ph Eur

Bearberry Leaf

General Notices

(Ph Eur monograph 1054)

Ph Eur

DEFINITION

Whole or cut, dried leaf of *Arctostaphylos uva-ursi* (L.) Spreng.

Content

Minimum 7.0 per cent of anhydrous arbutin ($C_{12}H_{16}O_7$; M_r 272.3) (dried drug).

IDENTIFICATION

A. The leaf, shiny and dark green on the adaxial surface, lighter on the abaxial surface, is normally 7-30 mm long and 5-12 mm wide. The entire leaf is obovate with smooth margins, somewhat reflexed downwards, narrowing at the base into a short petiole. The leaf is obtuse or retuse at its apex. The lamina is thick and coriaceous. The venation, pinnate and finely reticulate, is clearly visible on both surfaces. The adaxial surface is marked with sunken veinlets, giving it a characteristic grainy appearance. Only the young leaf has ciliated margins. Old leaves are glabrous.

B. Reduce to a powder (355) (*2.9.12*). The powder is green to greenish-grey or yellowish-green. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: fragments of epidermises, which, seen in surface view, show polygonal cells covered by a thick smooth cuticle, and with straight, thick and irregularly pitted walls; anomocytic stomata (*2.8.3*), surrounded by 5-11 subsidiary cells and scars of hair bases only on the abaxial epidermis; fragments of palisade parenchyma, with 3 or 4 layers of cells of unequal lengths, and spongy parenchyma; groups of lignified fibres from the pericycle, with rows of cells containing prisms of calcium oxalate; occasional conical, unicellular covering trichomes.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 0.5 g of the powdered drug (355) (*2.9.12*) add 5 ml of a mixture of equal volumes of *methanol R* and *water R* , and heat under a reflux condenser for 10 min. Filter whilst hot. Wash the flask and the filter with a mixture of equal volumes of *methanol R* and *water R* and dilute to 5 ml with the same mixture of solvents.

Reference solution Dissolve 25 mg of *arbutin R* , 25 mg of *gallic acid R* and 25 mg of *hydroquinone R* in *methanol R* and dilute to 10.0 ml with the same solvent.

Plate *TLC silica gel G plate R.*

Mobile phase *anhydrous formic acid R* , *water R* , *ethyl acetate R* (6:6:88 *V/V/V*).

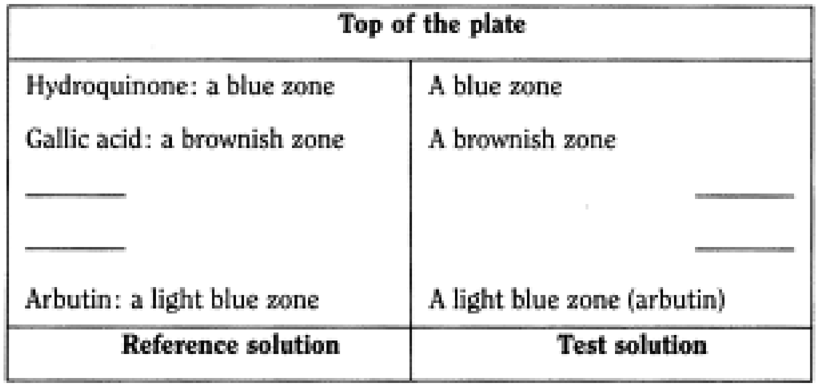
Application 10 µl of the reference solution and 20 µl of the test solution, as bands.

Development Over a path of 15 cm.

Drying At 105-110 °C until the mobile phase has evaporated.

Detection Spray with a 10 g/l solution of *dichloroquinonechlorimide R* in *methanol R* , then spray with a 20 g/l solution of *anhydrous sodium carbonate R* .

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, 2 or 3 blue bands and several brown or brownish-grey bands may be present in the chromatogram obtained with the test solution.



Top of the plate	
Hydroquinone: a blue zone	A blue zone
Gallic acid: a brownish zone	A brownish zone
_______	_______
_______	_______
Arbutin: a light blue zone	A light blue zone (arbutin)
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*)

Maximum 5 per cent of stems and maximum 3 per cent of other foreign matter.

Leaves of different colour

Maximum 10 per cent, determined in the same manner as foreign matter (*2.8.2*).

Loss on drying (*2.2.32*)

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 5.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution In a 100 ml flask with a ground-glass neck, place 0.800 g of the powdered drug (250) (*2.9.12*). Add 20 ml of *water R* and heat under a reflux condenser on a water-bath for 30 min. Allow to cool and filter the liquid through a plug of absorbent cotton. Add the absorbent cotton to the residue in the 100 ml flask and extract with 20 ml of *water R* under a reflux condenser on a water-bath for 30 min. Allow to cool and filter through a paper filter. Combine the filtrates and dilute to 50.0 ml with *water R*. Filter the liquid through a paper filter. Discard the first 10 ml of the filtrate.

Reference solution (a) Dissolve 50.0 mg of *arbutin CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b) Dissolve 2.5 mg of *hydroquinone R* in the mobile phase and dilute to 10.0 ml with the mobile phase. To 5.0 ml of this solution add 2.5 ml of reference solution (a) and dilute to 10.0 ml with the mobile phase.

Column:
— *size*: $l = 0.25$ m, Ø = 4 mm;
— *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (5 µm) .

Mobile phase *methanol R*, *water R* (10:90 *V/V*).

Flow rate 1.2 ml/min.

Detection Spectrophotometer at 280 nm.

Injection 20 µl.

System suitability:
— *resolution*: minimum 4.0 between the peaks due to arbutin and hydroquinone in the chromatogram obtained with reference solution (b).

Calculate the percentage content of arbutin using the following expression:

$$\frac{F_1 \times m_2 \times p}{F_2 \times m_1}$$

F_1 = area of the peak due to arbutin in the chromatogram obtained with the test solution

F_2 = area of the peak due to arbutin in the chromatogram obtained with the reference solution

m_1 = mass of the drug to be examined used to prepare the test solution, in grams

m_2 = mass of *arbutin CRS* used to prepare the reference solution, in grams

p = percentage content of arbutin in *arbutin CRS*.

Preparations

Prepared Belladonna

Standardised Belladonna Leaf Dry Extract

Belladonna Tincture

When Belladonna Herb, Belladonna Leaf or Powdered Belladonna Herb is prescribed, Prepared Belladonna shall be supplied.

Ph Eur

DEFINITION

Dried leaf or dried leaf and flowering, and occasionally fruit-bearing tops *of Atropa belladonna L.*

Content

Minimum 0.30 per cent of total alkaloids, expressed as hyoscyamine ($C_{17}H_{23}NO_3$; M_r 289.4) (dried drug). The alkaloids consist mainly of hyoscyamine together with small quantities of hyoscine (scopolamine).

CHARACTERS

Slightly nauseous odour.

IDENTIFICATION

A. The leaves are green or brownish-green, slightly darker on the upper surface, often crumpled and rolled and partly matted together in the drug. The leaf is petiolate and the base of the lamina is acute and decurrent and the margin entire. The flowering stems are flattened and bear at each node a pair of leaves unequal in size, in the axils of which occur singly the flowers or occasionally fruits. The flowers have a gamosepalous calyx and campanulate corolla. The fruits are globular berries, green or brownish-black and surrounded by the persistent calyx with widely spread lobes.

B. Reduce to a powder (355) *(2.9.12)*. The powder is dark green. Examine under a microscope, using *chloral hydrate solution R* . The powder shows the following diagnostic characters: fragments of leaf lamina showing sinuous-walled epidermal cells, a striated cuticle; stomata more frequent on the lower epidermis (anisocytic and also some anomocytic) *(2.8.3)* ; multicellular uniseriate covering trichomes with smooth cuticle, glandular trichomes with unicellular heads and multicellular, uniseriate stalks or with multicellular heads and unicellular stalks; parenchyma cells including rounded cells containing microsphenoidal crystals of calcium oxalate; annular and spirally thickened vessels. The powdered drug may also show: fibres and reticulately thickened vessels from the stems; subspherical pollen grains, 40-50 µm in diameter, with 3 germinal pores, 3 furrows and an extensively pitted exine; fragments of the corolla, with a papillose epidermis or bearing numerous covering or glandular trichomes of the types previously described; brownish-yellow seed fragments containing irregularly sclerified and pitted cells of the testa.

C. Shake 1 g of powdered drug (180) *(2.9.12)* with 10 ml of *0.05 M sulphuric acid* for 2 min. Filter and add to the filtrate 1 ml of *concentrated ammonia R* and 5 ml of *water R* . Shake cautiously with 15 ml of *ether R* , avoiding formation of an emulsion. Separate the ether layer and dry over *anhydrous sodium sulphate R* . Filter and evaporate the ether in a porcelain dish. Add 0.5 ml of *fuming nitric acid R* and evaporate to dryness on a water-bath. Add 10 ml of *acetone R* and, dropwise, a 30 g/l solution of *potassium hydroxide R* in *ethanol (96 per cent) R* . A deep violet colour develops.

D. Examine the chromatograms obtained in the chromatography test.

Results The principal zones in the chromatograms obtained with the test solution are similar in position, colour and size to the principal zones in the chromatograms obtained with the same volume of the reference solution.

TESTS

Chromatography.

Thin-layer chromatography *(2.2.27)* .

Test solution To 0.6 g of powdered drug (180) *(2.9.12)* add 15 ml of *0.05 M sulphuric acid* , shake for 15 min and filter. Wash the filter with *0.05 M sulphuric acid* until 20 ml of filtrate is obtained. To the filtrate add 1 ml of *concentrated ammonia R* and shake with 2 quantities, each of 10 ml, of *peroxide-free ether R* . If necessary, separate by centrifugation. Dry the combined ether layers over *anhydrous sodium sulphate R* , filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 ml of *methanol R* .

Reference solution Dissolve 50 mg of *hyoscyamine sulphate R* in 9 ml of *methanol R* . Dissolve 15 mg of *hyoscine hydrobromide R* in 10 ml of *methanol R* . Mix 1.8 ml of the hyoscine hydrobromide solution and 8 ml of the hyoscyamine sulphate solution.

Plate *TLC silica gel G plate R.*

Mobile phase *Concentrated ammonia R, water R, acetone R* (3:7:90 *V/V/V*).

Application 10 µl and 20 µl, as bands of 20 mm by 3 mm leaving 1 cm between the bands.

Development Over a path of 10 cm.

Drying At 100-105 °C for 15 min, allow to cool.

Detection A Spray with *potassium iodobismuthate solution R2* , using about 10 ml for a plate 200 mm square, until the orange or brown zones become visible against a yellow background.

Results A The zones in the chromatograms obtained with the test solution are similar in position (hyoscyamine in the lower third, hyoscine in the upper third of the chromatogram) and colour to the bands in the chromatograms obtained with the reference solution. The zones in the chromatograms obtained with the test solution are at least equal in size to the corresponding zones in the chromatogram obtained with the same volume of the reference solution. Faint secondary zones may appear, particularly in the middle of the chromatogram obtained with 20 µl of the test solution or near the starting point in the chromatogram obtained with 10 µl of the test solution.

Detection B Spray with *sodium nitrite solution R* until the coating is transparent and examine after 15 min.

Results B The zones due to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from brown to reddish-brown but not to greyish-blue (atropine) and any secondary zones disappear.

Foreign matter ***(2.8.2)***

Maximum 3 per cent of stems with a diameter greater than 5 mm.

Total ash ***(2.4.16)***

Maximum 16.0 per cent.

Ash insoluble in hydrochloric acid ***(2.8.1)***

Maximum 4.0 per cent.

ASSAY

a) Determine the loss on drying *(2.2.32)* on 2.000 g of powdered drug (180) *(2.9.12)*, by drying in an oven at 105 °C.

b) Moisten 10.00 g of powdered drug (180) *(2.9.12)* with a mixture of 5 ml of *ammonia R*, 10 ml of *ethanol (96 per cent) R* and 30 ml of *peroxide-free ether R* and mix thoroughly. Transfer the mixture to a suitable percolator, if necessary with the aid of the extracting mixture. Allow to macerate for 4 h and percolate with a mixture of 1 volume of *chloroform R* and 3 volumes of *peroxide-free ether R* until the alkaloids are completely extracted. Evaporate to dryness a few millilitres of the liquid flowing from the percolator, dissolve the residue in *0.25 M sulphuric acid* and verify the absence of alkaloids using *potassium tetraiodomercurate solution R*. Concentrate the percolate to about 50 ml by distilling on a water-bath and transfer it to a separating funnel, rinsing with *peroxide-free ether R*. Add a quantity of *peroxide-free ether R* equal to at least 2.1 times the volume of the percolate to produce a liquid of a density well below that of water. Shake the solution with no fewer than 3 quantities, each of 20 ml, of *0.25 M sulphuric acid*, separate the 2 layers by centrifugation if necessary and transfer the acid layers to a 2nd separating funnel. Make the acid layer alkaline with *ammonia R* and shake with 3 quantities, each of 30 ml, of *chloroform R*. Combine the chloroform layers, add 4 g of *anhydrous sodium sulphate R* and allow to stand for 30 min with occasional shaking. Decant the chloroform and wash the sodium sulphate with 3 quantities, each of 10 ml, of *chloroform R.* Add the washings to the chloroform extract, evaporate to dryness on a water-bath and heat in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of *chloroform R*, add 20.0 ml of *0.01 M sulphuric acid* and remove the chloroform by evaporation on a water-bath. Titrate the excess of acid with *0.02 M sodium hydroxide* using *methyl red mixed solution R* as indicator.

Calculate the percentage content of total alkaloids, expressed as hyoscyamine, using the following expression:

$$\frac{57.88 \times (20 - n)}{(100 - d) \times m}$$

d = loss on drying as a percentage

n = volume of *0.02 M sodium hydroxide* , in millilitres;

m = mass of drug, in grams

Ph Eur

Belladonna Tincture

General Notices

(Standardised Belladonna Leaf Tincture, Ph Eur monograph 1812)

Ph Eur

DEFINITION

Tincture produced from *Belladonna leaf (0221).*

Content

0.027 per cent to 0.033 per cent of total alkaloids, calculated as hyoscyamine ($C_{17}H_{23}NO_3$; M_r 289.4). The alkaloids consist mainly of hyoscyamine together with small quantities of hyoscine.

PRODUCTION

The tincture is produced from 1 part of the powdered drug (355) (*2.9.12*) and 10 parts of ethanol (70 per cent *V/V*) by a suitable procedure.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

Test solution Evaporate to dryness 10.0 ml of the tincture to be examined in a water-bath at 40 °C under reduced pressure. Dissolve the residue in 1.0 ml of *methanol R* .

Reference solution Dissolve 1.0 mg of *chlorogenic acid R* and 2.5 mg of *rutin R* in 10 ml of *methanol R* .

Plate *TLC silica gel plate R.*

Mobile phase *anhydrous formic acid R* , *water R* , *methyl ethyl ketone R, ethyl acetate R* (10:10:30:50 *V/V/V/V*).

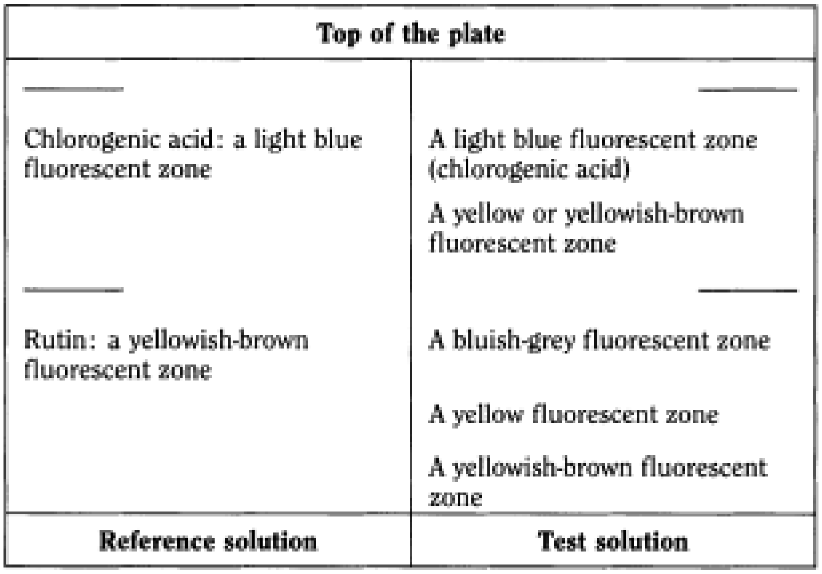
Application 40 µl, as bands.

Development Over a path of 15 cm.

Drying At 100-105 °C.

Detection Spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* ; subsequently spray the plate with a 50 g/l solution of *macrogol 400 R* in *methanol R* ; allow the plate to dry in air for 30 min and examine in ultraviolet light at 365 nm.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.



Top of the plate

Reference solution	**Test solution**

TESTS

Atropine

Thin-layer chromatography (*2.2.27*).

Test solution To 15.0 ml of the tincture to be examined add 15 ml of *0.05 M sulphuric acid* . Filter. Add 1 ml of *concentrated ammonia R* to the filtrate and shake with 2 quantities, each of 10 ml, of *peroxide-free ether R* . Separate by centrifugation if necessary. Dry the combined ether layers over *anhydrous sodium sulphate R*. Filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 ml of *methanol R*.

Reference solution Dissolve 50 mg of *hyoscyamine sulphate R* in 9 ml of *methanol R*. Dissolve 15 mg of *hyoscine hydrobromide R* in 10 ml of *methanol R*. Mix 1.8 ml of the hyoscine hydrobromide solution and 8 ml of the hyoscyamine sulphate solution.

Plate *TLC silica gel plate R*.

Mobile phase *concentrated ammonia R*, *water R*, *acetone R* (3:7:90 *V/V/V*).

Application 20 µl and 40 µl of each solution, as bands.

Development Over a path of 10 cm.

Drying At 100-105 °C for 15 min.

Detection A Spray with *potassium iodobismuthate solution R2*.

Detection B Spray with *sodium nitrite solution R* until the plate is transparent. Examine after 15 min.

Results B The zones due to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from brownish-orange to reddish-brown but not to greyish-blue (atropine) and any secondary zones disappear.

Ethanol (*2.9.10*)

64 per cent *V/V* to 69 per cent *V/V.*

ASSAY

Evaporate 50.0 g of the tincture to be examined to a volume of about 10 ml. Transfer quantitatively to a separating funnel, with the minimum volume of *alcohol (70 per cent V/V) R*. Add 5 ml of *ammonia R* and 15 ml of *water R*. Shake with not fewer than 3 quantities each of 40 ml of a mixture of 1 volume of *methylene chloride R* and 3 volumes of *peroxide-free ether R*, carefully to avoid emulsion, until the alkaloids are completely extracted. Combine the organic layers and concentrate the solution to a volume of about 50 ml by distilling on a water-bath. Transfer the resulting solution quantitatively to a separating funnel, rinsing with *peroxide-free ether R*. Add a quantity of *peroxide-free ether R* equal to at least 2.1 times the volume of the solution to produce a layer having a density well below that of water. Shake the resulting solution with not fewer than 3 quantities each of 20 ml of *0.25 M sulphuric acid* until the alkaloids are completely extracted. Separate the layers by centrifugation if necessary and transfer the layers to a separating funnel. Make the combined layers alkaline with *ammonia R* and shake with not fewer than 3 quantities each of 30 ml of *methylene chloride R* until the alkaloids are completely extracted. Combine the organic layers, add 4 g of *anhydrous sodium sulphate R* and allow to stand for 30 min with occasional shaking. Decant the methylene chloride and filter. Wash the sodium sulphate with 3 quantities each of 10 ml of *methylene chloride R*. Combine the organic extracts, evaporate to dryness on a water-bath. Heat the residue in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of *methylene chloride R*, evaporate to dryness on a water-bath and heat the residue in an oven at 100-105 °C for 15 min again. Dissolve the residue in a few millilitres of *methylene chloride R*. Add 20.0 ml of *0.01 M sulphuric acid* and remove the methylene chloride by evaporation on a water-bath. Titrate the excess of acid with *0.02 M sodium hydroxide* using *methyl red mixed solution R* as indicator.

Calculate the percentage content of total alkaloids, expressed as hyoscyamine, from the expression:

$$\frac{57.88 \times (20 - n)}{100 \times m}$$

n = volume of *0.02 M sodium hydroxide* used, in millilitres,

m = mass of drug used, in grams.

Ph Eur

Birch Leaf

General Notices

(Ph Eur monograph 1174)

Ph Eur

DEFINITION

Whole or fragmented dried leaves of *Betula pendula* Roth and/or *Betula pubescens* Ehrh. as well as hybrids of both species.

Content

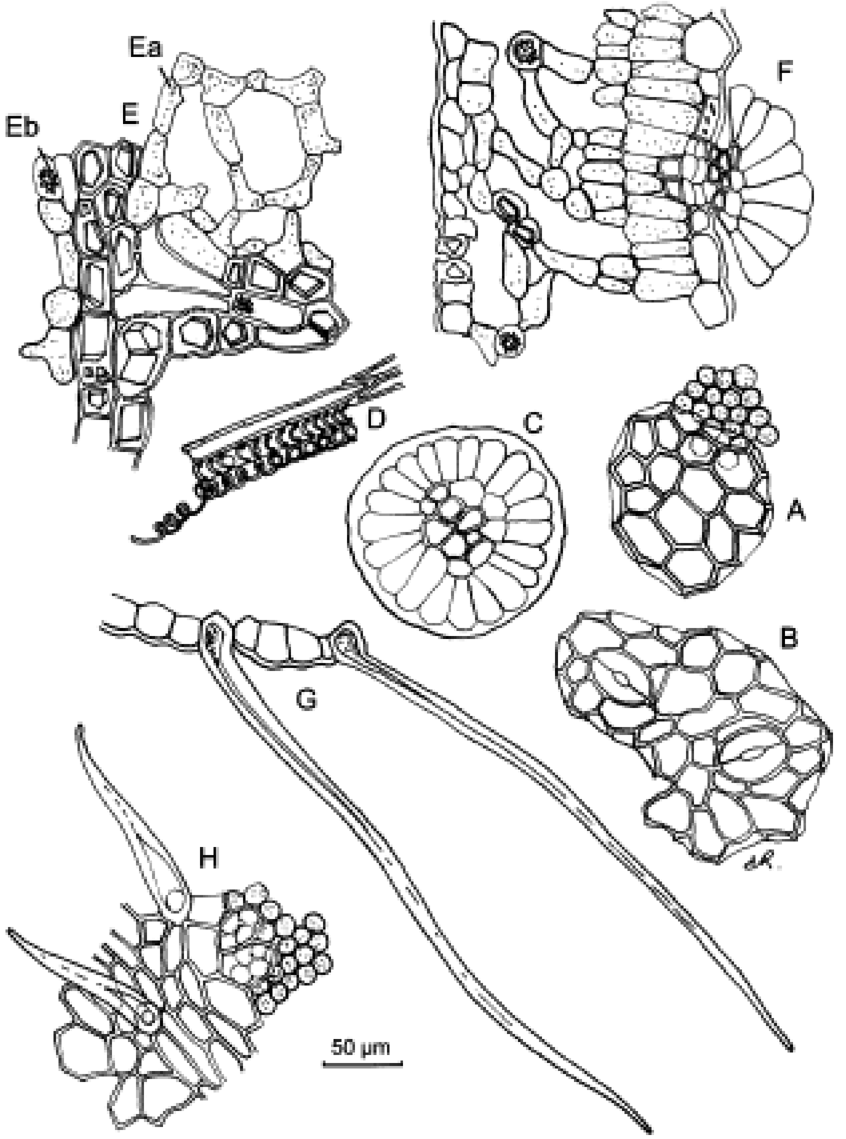
Minimum 1.5 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried drug).

IDENTIFICATION

A. The leaves of both species are dark green on the adaxial surface and lighter greenish-grey on the abaxial surface; they show a characteristic dense reticulate venation. The veins are light brown or almost white.

The leaves of *Betula pendula* are glabrous and show closely spaced glandular pits on both surfaces. The leaves of *Betula pendula* are 3-7 cm long and 2-5 cm wide; the petiole is long and the doubly dentate lamina is triangular or rhomboid and broadly cuneate or truncate at the base. The angle on each side is unrounded or slightly rounded, and the apex is long and acuminate.

The leaves of *Betula pubescens* show few glandular trichomes and are slightly pubescent on both surfaces. The abaxial surface shows small bundles of yellowish-grey trichomes at the branch points of the veins. The leaves of *Betula pubescens* are slightly smaller, oval or rhomboid and more rounded. They are more roughly and more regularly dentate. The apex is neither long nor acuminate.



A. Upper epidermis of the lamina accompanied by palisade parenchyma

B. Lower epidermis of the lamina with anomocytic stomata

C. Peltate gland, in surface view

D. Xylem vessels accompanied by sclerenchyma fibres

E. Crystal sheaths containing prisms of calcium oxalate, spongy parenchyma (Ea) and cells containing cluster crystals of calcium oxalate (Eb)

F. Transverse section of the lamina, showing a peltate gland in side view

G. Covering trichomes on the margin of the lamina (*B. pubescens*)

H. Covering trichomes on the upper epidermis of the lamina (*B. pubescens*)

Figure 1174.-1. – *Illustration of powdered herbal drug of birch leaf (see Identification B)*

B. Reduce to a powder (355) *(2.9.12)*. The powder is greenish-grey. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: numerous fragments of lamina with straight-walled epidermal cells and cells of the lower epidermis surrounding anomocytic stomata *(2.8.3)* . Peltate large glands usually measuring 100-120 µm are found on the upper and lower epidermises. The mesophyll fragments contain calcium oxalate crystals. Fragments of radial vascular bundles and sclerenchyma fibres are accompanied by crystal sheaths. If *Betula pubescens* is present, the powder also contains unicellular covering trichomes with very thick walls, about 80-600 µm long, usually 100-200 µm.

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 1 g of the powdered drug (355) *(2.9.12)* add 10 ml of *methanol R* . Heat in a water-bath at 60 °C for 5 min. Cool and filter the solution.

Reference solution Dissolve 1 mg of *caffeic acid R* and 1 mg of *chlorogenic acid R* , 2.5 mg of *hyperoside R* and 2.5 mg of *rutin R* in 10 ml of *methanol R* .

Plate *TLC silica gel plate R* .

Mobile phase *anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R* (10:10:30:50 *V/V/V/V*).

Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In a current of warm air.

Detection Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* ; subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R* ; allow to dry in air for 30 min and examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the reference solution shows 3 zones in its lower half: in increasing order of R_F a yellowish-brown fluorescent zone (rutin), a light blue fluorescent zone (chlorogenic acid) and a yellowish-brown fluorescent zone (hyperoside), and in its upper third, a light blue fluorescent zone (caffeic acid). The chromatogram obtained with the test solution shows 3 zones similar in position and fluorescence to the zones due to rutin, chlorogenic acid and hyperoside in the chromatogram obtained with the reference solution. The zone due to rutin is very faint and the zone due to hyperoside is intense. It also shows other yellowish-brown faint fluorescence zones between the zones due to caffeic acid and chlorogenic acid in the chromatogram obtained with the reference solution. Near the solvent front, the red fluorescent zone due to chlorophylls is visible. In the chromatogram obtained with the test solution, between this zone and the zone due to caffeic acid in the chromatogram obtained with the reference solution, there is a brownish-yellow zone due to quercetin.

TESTS

Foreign matter *(2.8.2)*

Maximum 3 per cent of fragments of female catkins and maximum 3 per cent of other foreign matter.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of powered drug (355) by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 5.0 per cent.

ASSAY

Stock solution In a 100 ml round-bottomed flask introduce 0.200 g of the powdered drug (355) *(2.9.12)*, 1 ml of a 5 g/l solution of *hexamethylenetetramine R* , 20 ml of *acetone R* and 2 ml of *hydrochloric acid R1* . Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a plug of absorbent cotton in a 100 ml flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 ml, of *acetone R* , each time boiling under a reflux condenser for 10 min. Allow to cool to room temperature, filter the liquid through a plug of absorbent cotton then through a filter-paper in the volumetric flask, and dilute to 100.0 ml with *acetone R* by rinsing of the flask and filter. Introduce 20.0 ml of the solution into a separating funnel, add 20 ml of *water R* and extract the mixture with 1 quantity of 15 ml and then 3 quantities, each of 10 ml, of *ethyl acetate R* . Combine the ethyl acetate extracts in a separating funnel, rinse with 2 quantities, each of 50 ml, of *water R* , and filter the extract over 10 g of *anhydrous sodium sulphate R* into a 50 ml volumetric flask and dilute to 50.0 ml with *ethyl acetate R* .

Test solution To 10.0 ml of the stock solution add 1 ml of *aluminium chloride reagent R* and dilute to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R* .

Compensation liquid Dilute 10.0 ml of the stock solution to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R* .

Measure the absorbance *(2.2.25)* of the test solution after 30 min, by comparison with the compensation liquid at 425 nm.

Calculate the percentage content of flavonoids, expressed as hyperoside, using the following expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of hyperoside to be 500.

A = absorbance at 425 nm;

m = mass of the substance to be examined, in grams.

Ph Eur

Bistort Rhizome

General Notices

(Ph Eur monograph 2384)

Ph Eur

DEFINITION

Whole or fragmented, dried rhizome of *Persicaria bistorta* (L.) Samp. (syn. *Polygonum bistorta* L.) without adventitious roots.

Content

Minimum 3.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1) (dried drug).

CHARACTERS

The whole rhizome is up to 13 cm long and 2.5 cm in diameter. The remnants of the roots are not longer than 1 cm and are about 1 mm in diameter.

IDENTIFICATION

A. The whole rhizome, reddish-brown or blackish-brown, is thick, twisted, and turned back on itself. Its outer surface shows transverse striations and blackish spots. It is flattened and somewhat depressed on the upper surface, convex on the lower surface. It shows adventitious root scars on the surface. The fracture, pinkish-beige, shows an elliptical zone of whitish pits corresponding to the vessels. The drug may also be obtained as more-or-less cylindrical fragments about 0.3 cm in diameter and up to 1 cm long, with a reddish-brown outer surface, marked by adventitious root scars and a pinkish-beige fracture.

B. Reduce to a powder (355) *(2.9.12)*. The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: fragments of parenchyma; very numerous calcium oxalate cluster crystals either free or inside parenchyma cells; a few reticulate lignified vessels; rare cork fragments. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R* . The powder shows rounded to ovoid starch granules, simple, about 10 µm in diameter.

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 10 ml of a mixture of equal volumes of *water R* and *methanol R* , heat on a water-bath at about 65 °C for 30 min and filter.

Reference solution Dissolve 5 mg of *fructose R* and 5 mg of *catechin R* in 5 ml of *methanol R* .

Plate *TLC silica gel plate R* (2-10 µm).

Mobile phase *water R, anhydrous formic acid R, ethyl acetate R* (5:10:85 *V/V/V*).

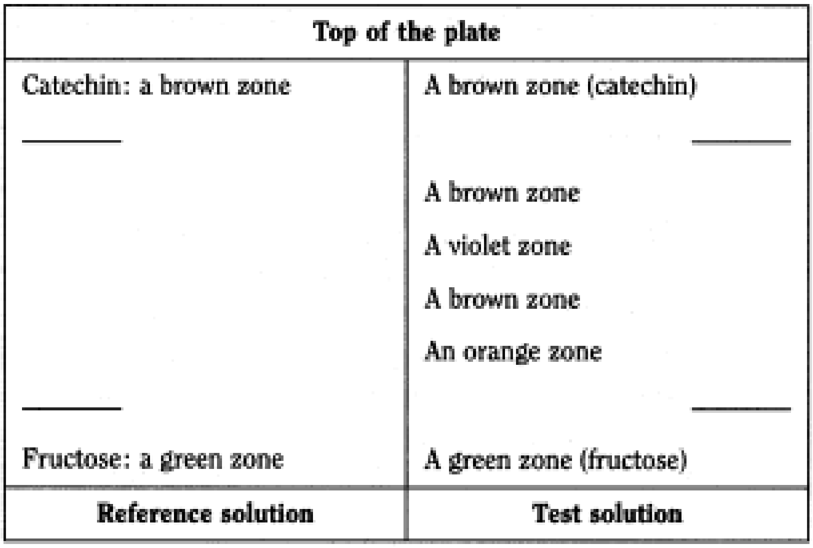
Application 2 µl as bands.

Development Over a path of 7 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R* and heat at 100-105 °C for 5 min; examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
Catechin: a brown zone	A brown zone (catechin)

Reference solution	**Test solution**

TESTS

Paris polyphylla* or *Paris quadrifolia

Examine the powdered drug (355) *(2.9.12)* under a microscope using *chloral hydrate solution R* . The presence of raphides of calcium oxalate, free or in bundles, indicates adulteration by the rhizome of *Paris polyphylla* Smith var. *yunnanensis* (Franch.) Hand.-Mazz or *Paris polyphylla* Smith var. *chinensis* (Franch.) Hara or *Paris quadrifolia* L.

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C.

Total ash *(2.4.16)*

Maximum 9.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 1.0 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs *(2.8.14)* . Use 1.000 g of the powdered drug (180) *(2.9.12)*.

Ph Eur

Bitter Fennel

General Notices

(Ph Eur monograph 0824)

Ph Eur

DEFINITION

Dry cremocarps and mericarps of *Foeniculum vulgare* Miller sp. *vulgare* var. *vulgare*.

Content

— *essential oil*: minimum 40 ml/kg (anhydrous drug);

— *anethole* : minimum 60.0 per cent in the essential oil;

— *fenchone* : minimum 15.0 per cent in the essential oil.

CHARACTERS

Bitter fennel is greenish-brown, brown or green.

IDENTIFICATION

A. The fruit of bitter fennel is a cremocarp, of almost cylindrical shape with a rounded base and a narrower summit crowned with a large stylopod. It is generally 3-12 mm long and 3-4 mm wide. The mericarps, usually free, are glabrous. Each bears 5 prominent slightly carenated ridges. When cut transversely, 4 vittae on the dorsal surface and 2 on the commissural surface may be seen with a lens.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greyish-brown or greyish-yellow. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: yellow fragments of wide secretory canals, often made up of yellowish-brown-walled polygonal secretory cells, frequently associated with a layer of thin-walled transversely elongated cells 2-9 µm wide, having a parquetry arrangement; reticulate parenchyma of the mesocarp; numerous fibre bundles from the ridges, often accompanied by narrow spiral vessels; very numerous endosperm fragments containing aleurone grains and very small calcium oxalate microrosette crystals, as well as some fibre bundles from the carpophore.

C. Thin-layer chromatography *(2.2.27)* .

Test solution Shake 0.3 g of the freshly powdered drug (1400) *(2.9.12)* with 5.0 ml of *methylene chloride R* for 15 min. Filter and carefully evaporate the filtrate to dryness on a water-bath at 60 °C. Dissolve the residue in 0.5 ml of *toluene R* .

Reference solution Dissolve 50 µl of *anethole R* and 10 µl of *fenchone R* in 5.0 ml of *hexane R* .

Plate *TLC silica gel GF$_{254}$ plate R*.

Mobile phase *hexane R* , *toluene R* (20:80 *V/V*).

Application 10 µl, as bands of 20 mm by 3 mm.

Development Over a path of 10 cm.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

Results A The chromatograms show in the central part a quenching zone due to anethole.

Detection B Spray with *sulphuric acid R* and heat at 140 °C for 5-10 min until a yellow zone due to fenchone appears in the lower third of the chromatograms.

Results B Anethole appears as a violet band in the central part. The chromatogram obtained with the test solution also shows a reddish-brown zone in its upper third (terpenes).

TESTS

Estragole

Gas chromatography (2.2.28) Use the normalisation procedure.

Test solution Dilute the mixture of essential oil and *xylene R* obtained in the determination of essential oil to 5.0 ml with *xylene R* , by rinsing the apparatus.

Reference solution Dissolve 5 mg of *estragole R* in 0.5 ml of *xylene R* .

Column:
- *size: l* = 30-60 m, Ø = 0.3 mm;
- *stationary phase*: *macrogol 20 000 R* .

Carrier gas *nitrogen for chromatography R* .

Flow rate 0.40 ml/min.

Split ratio 1:200.

	Time (min)	Temperature (°C)
Column	0 - 4	60
	4 - 26	60 → 170
	26 - 41	170
Injection port		220
Detector		270

Detection Flame ionisation.

Injection 1 µl.

Limits:

— *estragole* : maximum 5.0 per cent in the essential oil obtained in the assay.

Foreign matter ***(2.8.2)***

Maximum 1.5 per cent of peduncles and maximum 1.5 per cent of other foreign matter.

Water ***(2.2.13)***

Maximum 80 ml/kg, determined on 20.0 g of the powdered drug (710) *(2.9.12)*.

Total ash ***(2.4.16)***

Maximum 10.0 per cent.

ASSAY

Essential oil

Carry out the determination of essential oils in herbal drugs *(2.8.12)* . Use a 500 ml round-bottomed flask and 200 ml of *water R* as the distillation liquid. Reduce the drug to a coarse powder (1400) *(2.9.12)* and immediately use 5.0 g for the determination. Introduce 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

Anethole and fenchone

Gas chromatography *(2.2.28)* as described in the test for estragole with the following modifications.

Reference solution Dissolve 5 mg of *fenchone R* and 5 mg of *anethole R* in 0.5 ml of *xylene R* .

Elution order The order indicated in the composition of the reference solution. Record the retention times of these substances.

STORAGE

Protected from moisture.

Ph Eur

Bitter-Fennel Fruit Oil

General Notices

(Ph Eur monograph 1826)

Ph Eur

DEFINITION

Essential oil obtained by steam distillation from the ripe fruits of *Foeniculum vulgare* Miller, ssp. *vulgare* var. *vulgare*.

Content:

- — fenchone: 12.0 per cent to 25.0 per cent,
- — *trans*-anethole: 55.0 per cent to 75.0 per cent.

CHARACTERS

Appearance

Clear, colourless or pale yellow liquid.

It has a characteristic odour.

IDENTIFICATION

First identification *B.*

Second identification *A.*

A. Thin-layer chromatography *(2.2.27)* .

Test solution Dissolve 0.1 ml of the oil to be examined in 5 ml of *toluene R* .

Reference solution Dissolve 10 µl of *fenchone R* and 80 µl of *anethole R* in 5 ml of *toluene R* .

Plate *TLC silica gel plate R.*

Mobile phase *ethyl acetate R* , *toluene R* (5:95 *V/V*).

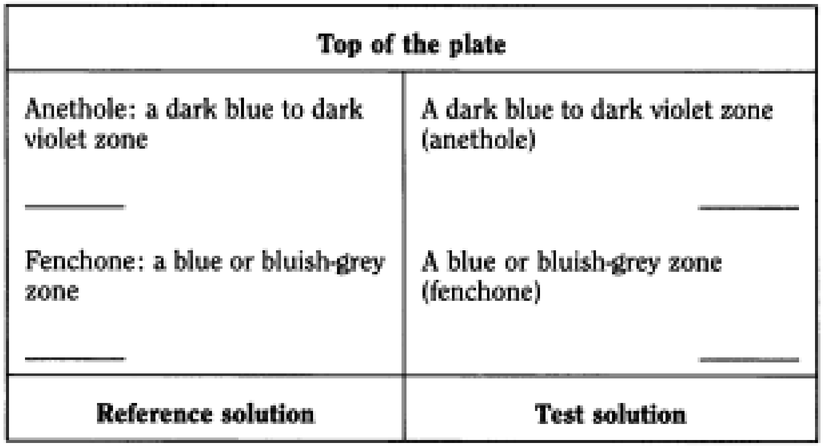
Application 10 µl as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with a freshly prepared 200 g/l solution of *phosphomolybdic acid R* in *ethanol (96 per cent) R* and heat at 150 °C for 15 min; examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
Anethole: a dark blue to dark violet zone	A dark blue to dark violet zone (anethole)
Fenchone: a blue or bluish-grey zone	A blue or bluish-grey zone (fenchone)
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density *(2.2.5)*

0.961 to 0.975.

Refractive index *(2.2.6)*

1.528 to 1.539.

Optical rotation *(2.2.7)*

+ 10.0° to + 24.0°.

Chromatographic profile

Gas chromatography *(2.2.28)* : use the normalisation procedure.

Test solution Dissolve 0.20 ml of the oil to be examined in *heptane R* and dilute to 10.0 ml with the same solvent.

Reference solution Dissolve 20 µl of *α-pinene R*, 20 µl of *limonene R*, 50 µl of *fenchone R*, 20 µl of *estragole R*, 100 µl of *anethole R* and 20 µl of *anisaldehyde R* in *heptane R* and dilute to 10.0 ml with the same solvent.

Column:
- *material:* fused silica,
- *size:* l = 60 m, Ø = 0.25 mm,

— *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas *helium for chromatography R* .

Flow rate 1 ml/min.

Split ratio 1:200.

Temperature:

	Time (min)	Temperature (°C)
Column	0 – 4	60
	4 – 26	60 → 170
	26 – 41	170
Injection port		220
Detector		270

Detection Flame ionisation.

Injection 1.0 µl.

Elution order Order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability Reference solution:

— *resolution*: minimum 5.0 between the peaks due to estragole and *trans*-anethole.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution on the chromatogram obtained with the test solution and locate *cis*-anethole using Figure 1826.-1. (Disregard the peak due to heptane).

Determine the percentage content of each of these components. The percentages are within the following ranges:

— *α-pinene* : 1.0 per cent to 10.0 per cent,

— *limonene* : 0.9 per cent to 5.0 per cent,

— *fenchone* : 12.0 per cent to 25.0 per cent,

— *estragole* : maximum 6.0 per cent,

— *cis-anethole* : maximum 0.5 per cent,

— *trans-anethole* : 55.0 per cent to 75.0 per cent,

— *anisaldehyde* : maximum 2.0 per cent.

The ratio of α-pinene content to limonene content is greater than 1.0.

STORAGE

In a well-filled, airtight container , protected from light and at a temperature not exceeding 25 °C.

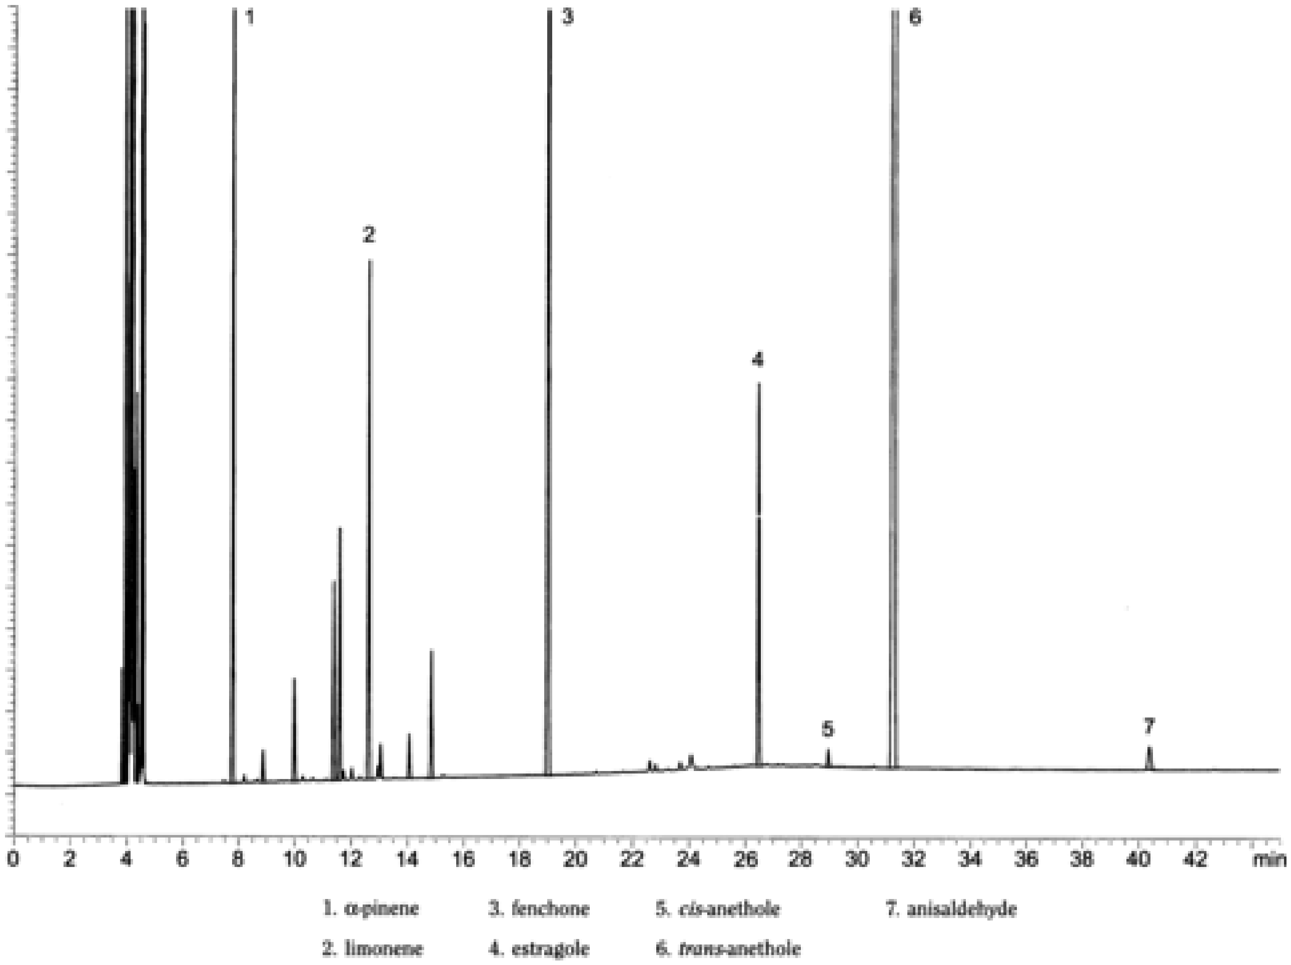


Figure 1826.-1. – *Chromatogram for the test for chromatographic profile of bitter-fennel fruit oil*

Ph Eur

Bitter-Orange Flower

General Notices

(Ph Eur monograph 1810)

Ph Eur

DEFINITION

Whole, dried, unopened flower of *Citrus aurantium* L. ssp. *aurantium* (C. *aurantium* L. ssp. *amara* Engl.).

Content

Minimum 8.0 per cent of total flavonoids, expressed as naringin ($C_{27}H_{32}O_{14}$; M_r 580.5) (dried drug).

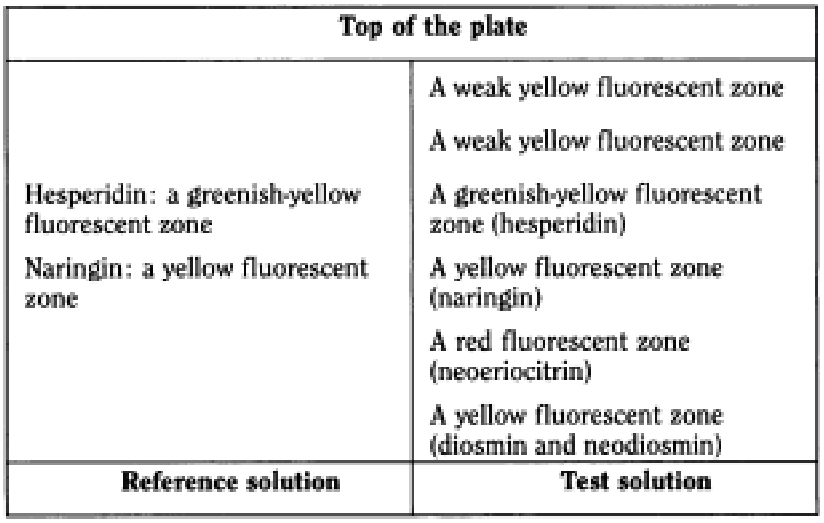
IDENTIFICATION

A. The flower buds are white or yellowish-white and may reach up to 25 mm in length. The dialypetalous corolla is composed of 5 thick, oblong and concave petals dotted with oil glands visible under a hand lens; the short, yellowish-green persistent gamosepalous calyx has 5 spreading sepals, connate at the base and forming a star-shaped structure attached to the yellowish-green peduncle which is about 5 mm to 10 mm long. The flower buds contain at least 20 stamens with yellow anthers and with filaments fused at the base into groups of 4 or 5; the ovary is superior, brownish-black and spherical, consists of 8 to 10 multi-ovular loculi and is surrounded at the base by an annular granular hypogynous disc; the thick, cylindrical style ends in a capitate stigma.

B. Reduce to a powder (355) (*2.9.12*). The powder is brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows numerous spherical pollen grains, with a finely pitted exine and 3 to 5 germinal pores; fragments of the epidermis of the sepals with unicellular trichomes and with large prism crystals of calcium oxalate in the underlying mesophyll; fragments of the epidermis of the petals with a distinctly striated cuticle; fragments of large schizolysigenous oil glands which measure up to 100 µm in diameter, numerous anomocytic stomata (*2.8.3*). Examine under a microscope using a 300 g/l solution of *potassium hydroxide R*. The powder shows yellow crystals of hesperidin.

C. Examine the chromatograms obtained in the test for sweet-orange flower.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
	A weak yellow fluorescent zone
	A weak yellow fluorescent zone
Hesperidin: a greenish-yellow fluorescent zone	A greenish-yellow fluorescent zone (hesperidin)
Naringin: a yellow fluorescent zone	A yellow fluorescent zone (naringin)
	A red fluorescent zone (neoeriocitrin)
	A yellow fluorescent zone (diosmin and neodiosmin)
Reference solution	**Test solution**

TESTS

Sweet-orange flower

Thin-layer chromatography (*2.2.27*).

Test solution To 0.5 g of the powdered drug (355) (*2.9.12*), add 5 ml of *methanol R*. Heat with stirring at 40 °C for 10 min. Filter.

Reference solution Dissolve 3.0 mg of *naringin R* and 3.0 mg of *hesperidin R* in 10 ml of *methanol R*.

Plate TLC silica gel plate R.

Mobile phase water R, *anhydrous formic acid R*, *ethyl acetate R* (10:15:75 *V/V/V*).

Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air, then heat in an oven at 110-120 °C for 5 min.

Detection Spray the hot plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. After at least 1 h, examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the test solution shows a yellow zone similar in position to the zone of naringin in the chromatogram obtained with the reference solution and immediately below it a red zone (neoeriocitrin).

Loss on drying (*2.2.32*)

Maximum 11.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C.

Total ash (*2.4.16*)

Maximum 10.0 per cent.

ASSAY

Stock solution To 0.175 g of the powdered drug (355) (*2.9.12*) add 95 ml of *alcohol (50 per cent V/V) R*. Heat on a water-bath under a reflux condenser for 30 min. Allow to cool and filter through a sintered-glass filter (*2.1.2*). Rinse the filter with 5 ml of *alcohol (50 per cent V/V) R*. Combine the filtrate and the rinsings in a volumetric flask and dilute to 100.0 ml with *alcohol (50 per cent V/V) R*.

Test solution Into a test tube (10 mm × 180 mm) introduce 0.150 g of powdered (250) (*2.9.12*) *magnesium R*, a magnetic stirring bar 25 mm long and 2.00 ml of the stock solution. Maintain the test tube upright, centrifuge at 125 g and carefully add dropwise, especially at the beginning, 2.0 ml of *hydrochloric acid R*, and then 6.0 ml of *alcohol (50 per cent V/V) R*. Stopper the tube and mix by inverting.

Compensation solution Into a second tube, introduce 2.00 ml of the stock solution and carefully add dropwise, especially at the beginning, 2.0 ml of *hydrochloric acid R* and then 6.0 ml of *alcohol (50 per cent V/V) R*.

After 10 min, measure the absorbance (*2.2.25*) of the test solution at 530 nm.

Calculate the percentage content of total flavonoids, expressed as naringin, from the expression:

$$\frac{A \times 9.62}{m}$$

i.e. taking the value of the specific absorbance of the reaction product of naringin to be 52.

A = absorbance at 530 nm,

m = mass of the substance to be examined, in grams.

Ph Eur

Black Currant

General Notices

Preparation

Black Currant Syrup

DEFINITION

Black Currant consists of the fresh ripe fruits of *Ribes nigrum* L., together with their pedicels and rachides.

CHARACTERISTICS

Odour, strong and characteristic.

Macroscopical Berries: globose, ranging in diameter from about 7 to 15 mm, occurring in pendulous racemes; epicarp shiny black externally, enclosing a yellowish green translucent pulp containing numerous flattened ovoid seeds, about 2.5 mm long, 1.25 mm wide and 1 mm thick; berry crowned with withered remains of five-cleft calyx; pedicels thin, up to about 10 mm long, attached to a rachis of variable length.

Microscopical Epicarp: glands yellow, disc-shaped, roughly circular or broadly elliptical, varying in diameter from about 140 to 240 µm, each consisting of a single layer of cells attached in the centre to the epicarp by means of a short, multiseriate stalk. Calyx: trichomes unicellular, blunt-ended with thin, crooked walls, about 10 to 14 µm wide and averaging about 350 µm in length. Seed: testa with pigment layer composed of small cells with horseshoe-shaped wall thickenings as seen in cross section, each cell containing one or two prismatic crystals of calcium oxalate; endosperm cells with irregularly thickened walls.

Black Horehound

General Notices

(Ph Eur monograph 1858)

Ph Eur

DEFINITION

Dried flowering tops of *Ballota nigra* L.

Content

Minimum 1.5 per cent of total *ortho*-dihydroxycinnamic acid derivatives, expressed as acteoside ($C_{29}H_{36}O_{15}$; M_r 624.6) (dried drug).

IDENTIFICATION

A. The stems are conspicuously four-angled, longitudinally striated, dark green or reddish-brown and more or less pubescent. The leaves are greyish-green, petiolate, the lamina ovate or orbicular, 2-4 cm wide, the margin irregularly crenate, and cuneate or cordate at the base; both surfaces are covered with abundant whitish hairs; the venation is pinnate, prominent on the lower surface, slightly depressed on the upper. The flowers are sessile or very shortly pedicellate, the calyx is infundibuliform, densely pubescent, with 10 prominent ribs and 5 subequal, broadly ovate teeth; the corolla, with a tube slightly shorter than the calyx tube, is purple and bilabiate, the upper lip pubescent on the outer surface and the lower lip with 3 lobes, the middle of which is notched.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greyish-green and slightly flocculent. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: numerous long, uniseriate, multicellular covering trichomes consisting of 4 or more cells, thickened and swollen at the junctions, with slightly lignified and pitted walls; fewer glandular trichomes, some with a unicellular or multicellular stalk and a globose, uni- or bicellular head, others with a unicellular stalk and a multicellular head; fragments of the leaf epidermis with sinuous walls, those from the lower epidermis with numerous stomata, some diacytic *(2.8.3)* but the majority anomocytic; epidermis of the corolla composed of polygonal cells, those of the inner epidermis papillose; pollen grains subspherical with 3 pores and a smooth exine; groups of collenchyma and lignified, spirally thickened and bordered pitted vessels, from the stem.

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 2 g of the powdered drug (355) *(2.9.12)* add 100 ml of *methanol R* . Heat on a water-bath under a reflux condenser for 30 min. Allow to cool. Filter. Evaporate the filtrate under reduced pressure until a volume of about 10 ml is obtained.

Reference solution Dissolve 2.5 mg of *rutin R* and 1 mg of *chlorogenic acid R* in 10 ml of *methanol R* .

Plate *TLC silica gel plate R.*

Mobile phase *anhydrous formic acid R, glacial acetic acid R, water R, ethyl acetate* R (7.5:7.5:18:67 *V/V/V/V*).

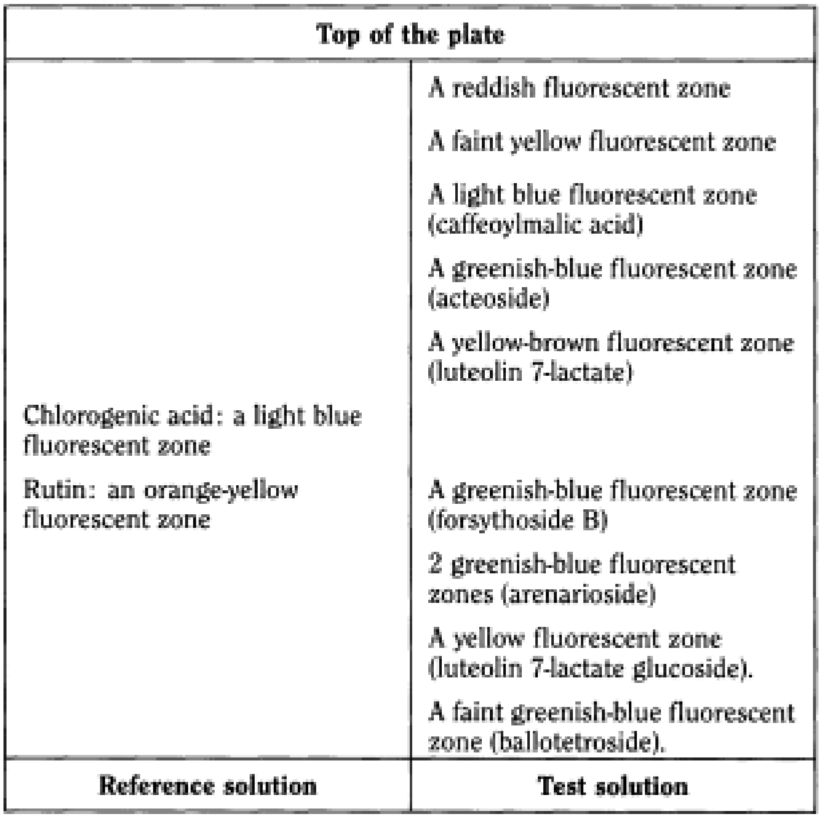
Application 20 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with a solution containing 10 g/l of *diphenylboric acid aminoethyl ester R* and 50 g/l of *macrogol 400 R in methanol R* . Allow to dry in a current of warm air. Examine in ultraviolet light at 365 nm after 30 min.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A reddish fluorescent zone
	A faint yellow fluorescent zone
	A light blue fluorescent zone (caffeoylmalic acid)
	A greenish-blue fluorescent zone (acteoside)
	A yellow-brown fluorescent zone (luteolin 7-lactate)
Chlorogenic acid: a light blue fluorescent zone	
Rutin: an orange-yellow fluorescent zone	A greenish-blue fluorescent zone (forsythoside B)
	2 greenish-blue fluorescent zones (arenarioside)
	A yellow fluorescent zone (luteolin 7-lactate glucoside).
	A faint greenish-blue fluorescent zone (ballotetroside).
Reference solution	**Test solution**

TESTS

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 13.0 per cent.

ASSAY

Stock solution Place 1.000 g of the powdered drug (355) *(2.9.12)* in a flask. Add 90 ml of *ethanol (50 per cent V/V) R*. Heat under a reflux condenser on a water-bath for 30 min. Allow to cool and filter, collecting the filtrate in a 100 ml volumetric flask. Rinse the flask and the filter with 10 ml of *ethanol (50 per cent V/V) R*. Add the rinsings to the filtrate and dilute to 100.0 ml with *ethanol (50 per cent V/V) R.*

Test solution Into a 10 ml volumetric flask, introduce successively, with shaking after each addition, 1.0 ml of the stock solution, 2 ml of *0.5 M hydrochloric acid* , 2 ml of a solution containing 100 g/l of sodium nitrite R and 100 g/l of *sodium molybdate R* , 2 ml of *dilute sodium hydroxide solution R* and dilute to 10.0 ml with *water R* .

Compensation liquid Into a 10 ml volumetric flask, introduce 1.0 ml of the stock solution, 2 ml of *0.5 M hydrochloric acid* and 2 ml of *dilute sodium hydroxide solution R* , and dilute to 10.0 ml with *water R* .

Measure immediately the absorbance *(2.2.25)* of the test solution at 525 nm, by comparison with the compensation liquid.

Calculate the percentage content of total *ortho*-dihydroxycinnamic acid derivatives, expressed as acteoside, using the following expression:

$$\frac{A \times 1000}{185 \times m}$$

i.e. taking the specific absorbance of acteoside to be 185.

A = absorbance at 525 nm

m = mass of the substance to be examined, in grams

Ph Eur

Bogbean Leaf

General Notices

(Ph Eur monograph 1605)

Ph Eur

DEFINITION

Dried, entire or fragmented leaf of *Menyanthes trifoliata* L.

CHARACTERS

Very bitter and persistant taste.

IDENTIFICATION

A. The leaf is long-petiolated, trifoliate, with long sheaths from the base; the petiole is up to 5 mm in diameter and strongly striated longitudinally. The lamina is divided into equal leaflets, sessile, obovate up to 10 cm long and up to 5 cm wide, with an entire, occasionally sinuous margin with brownish or reddish hydathodes and a spathulate base; it is glabrous, dark green on the upper surface and paler green on the lower surface, with a wide, whitish, finely striated prominent midrib.

B. Reduce to a powder (355) *(2.9.12)*. The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R* . The powder shows fragments of upper epidermis with polyhedral cells and thin wavy walls; fragments of lower epidermis with sinuous walls; anomocytic stomata *(2.8.3),* on both surfaces, with the subsidiary cells showing radiating striations; epidermal cells from the veins straight walled and papillose; fragments of mesophyll parenchyma with large intercellular spaces (aerenchyma); irregular cells with rare sclereids; fragments of spiral or annular vessels.

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 10 ml of *methanol R* . Heat, with stirring, in a water-bath at 60 °C for 5 min. Allow to cool and filter. Evaporate to dryness under reduced pressure in a water-bath at 60 °C. Dissolve the residue in 2.0 ml of *methanol R* .

Reference solution Dissolve 5 mg of *loganin R* in 15 ml of *methanol R* .

Plate *TLC silica gel plate R.*

Mobile phase *water R, methanol R, ethyl acetate R* (8:15:77 *V/V/V*).

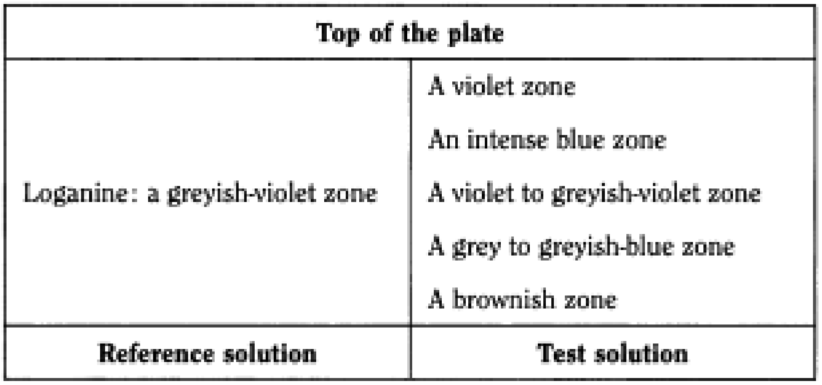
Application 30 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with vanillin *reagent R*. Heat in an oven at 100-105 °C for 10 min. Examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference and test solutions. Furthermore, other zones are present in the chromatogram obtained with the test solution.



Top of the plate	
	A violet zone
	An intense blue zone
Loganine: a greyish-violet zone	A violet to greyish-violet zone
	A grey to greyish-blue zone
	A brownish zone
Reference solution	**Test solution**

TESTS

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Maximum 10.0 per cent.

Bitterness value *(2.8.15)*

Minimum 3000.

Ph Eur

Boldo Leaf Dry Extract

General Notices

(Ph Eur monograph 1816)

Ph Eur

DEFINITION

Extract produced from *Boldo leaf (1396).*

Content:

— *for aqueous extracts*: minimum 0.5 per cent of total alkaloids, expressed as boldine ($C_{19}H_{21}NO_4$; M_r 327.4) (dried extract);

— *for hydroalcoholic extracts*: minimum 1.0 per cent of total alkaloids, expressed as boldine ($C_{19}H_{21}NO_4$; M_r 327.4) (dried extract).

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using either hot water at not less than 65 °C or a hydroalcoholic solvent equivalent in strength to ethanol (45-75 per cent *V/V*).

CHARACTERS

Appearance

Brown or greenish-brown, hygroscopic powder.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)* .

Test solution To 0.5 g of the extract to be examined add 1 ml of *hydrochloric acid R* and 20 ml of *water R.* Sonicate for 10 min. Transfer the liquid to a separating funnel and make alkaline with 2 ml of *dilute ammonia R1* . Shake with 2 quantities, each of 20 ml, of *methylene chloride R.* Evaporate the combined organic layers to dryness. Dissolve the residue in 1 ml of *methanol R* .

Reference solution Dissolve 2 mg of *boldine R* and 10 mg of *hyoscine hydrobromide R* in 5 ml of *methanol R.*

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *diethylamine R* , *methanol R* , *toluene R* (10:10:80 *V/V/V*).

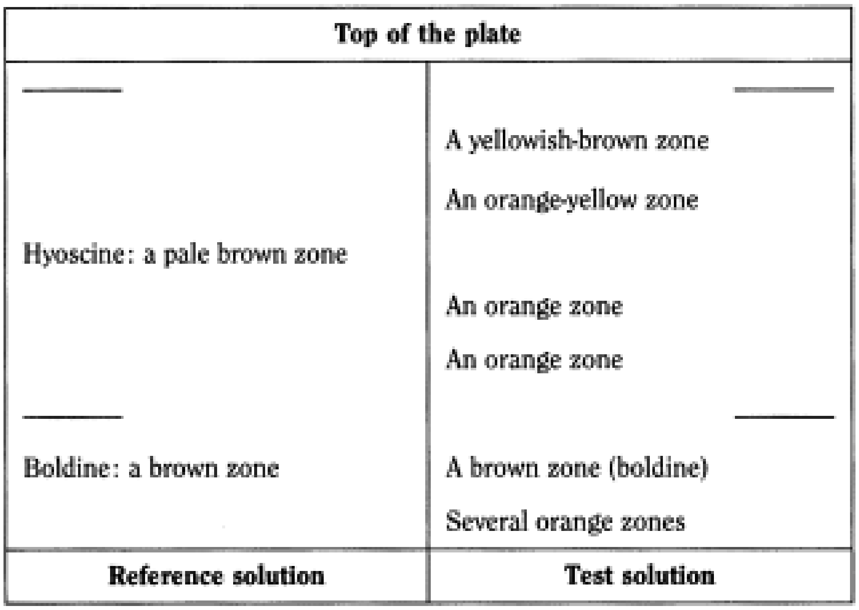
Application 20 µl [or 3 µl], as bands of 15 mm [or 8 mm].

Development Over a path of 15 cm [or 6 cm].

Drying In air.

Detection Spray with *potassium iodobismuthate solution R2* , allow to dry in air for 5 min and spray with *sodium nitrite solution R*; examine in daylight after 30 min.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.



Top of the plate

Boldine: a brown zone	A brown zone (boldine)
	Several orange zones
Reference solution	**Test solution**

ASSAY

Liquid chromatography *(2.2.29)* .

Test solution To 1.000 g of the extract to be examined add 50 ml of *dilute hydrochloric acid R* and sonicate for 10 min. Transfer to a separating funnel and wash with 10 ml of a mixture of equal volumes of *ethyl acetate R* and *hexane R* . Adjust the aqueous phase to pH 9.5 with *dilute ammonia R1* . After cooling, shake successively with 100 ml, 50 ml, and a further 50 ml of *methylene chloride R* , taking care not to form an emulsion. Evaporate the combined lower layers to dryness under reduced pressure. Dissolve the residue in the mobile phase and transfer the solution to a volumetric flask. Rinse and dilute to 10.0 ml with the mobile phase.

Reference solution Dissolve 12.0 mg of *boldine CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Column:

— *size: l* = 0.25 m, Ø = 4.6 mm;

— *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Solution A Mix 0.2 ml of *diethylamine R* with 99.8 ml of *acetonitrile R* .

Solution B Mix 0.2 ml of *diethylamine R* with 99.8 ml of *water R* and adjust to pH 3 with *anhydrous formic acid R* .

Mobile phase Solution A, solution B (16:84 *V/V*).

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 304 nm.

Injection 20 µl.

Relative retention With reference to boldine (retention time = about 6 min): isoboldine = about 0.9; isocorydine *N*-oxide = about 1.8; laurotetanine = about 2.2; isocorydine = about 2.8; *N*-methyllaurotetanine = about 3.2. Additional peaks may be present.

System suitability Test solution:

— *resolution*: minimum 1.0 between the peaks due to isoboldine and boldine.

Calculate the percentage content of total alkaloids, expressed as boldine, using the following expression:

$$\frac{(\sum A_1) \times m_2 \times p}{A_2 \times m_1 \times 10}$$

ΣA_1 = sum of the areas of the peaks due to the 6 alkaloids identified in the chromatogram obtained with the test solution

A_2 = area of the peak due to boldine in the chromatogram obtained with the reference solution

m_1 = mass of the extract to be examined used to prepare the test solution, in grams

m_2 = mass of *boldine CRS* used to prepare the reference solution, in grams

p = percentage content of boldine in *boldine CRS* .

Ph Eur

Boldo Leaf

General Notices

(Ph Eur monograph 1396)

Ph Eur

DEFINITION

Whole or fragmented dried leaf of *Peumus boldus* Molina.

Content

Minimum 0.1 per cent of total alkaloids, expressed as boldine ($C_{19}H_{21}NO_4$; M_r 327.4) (anhydrous drug).

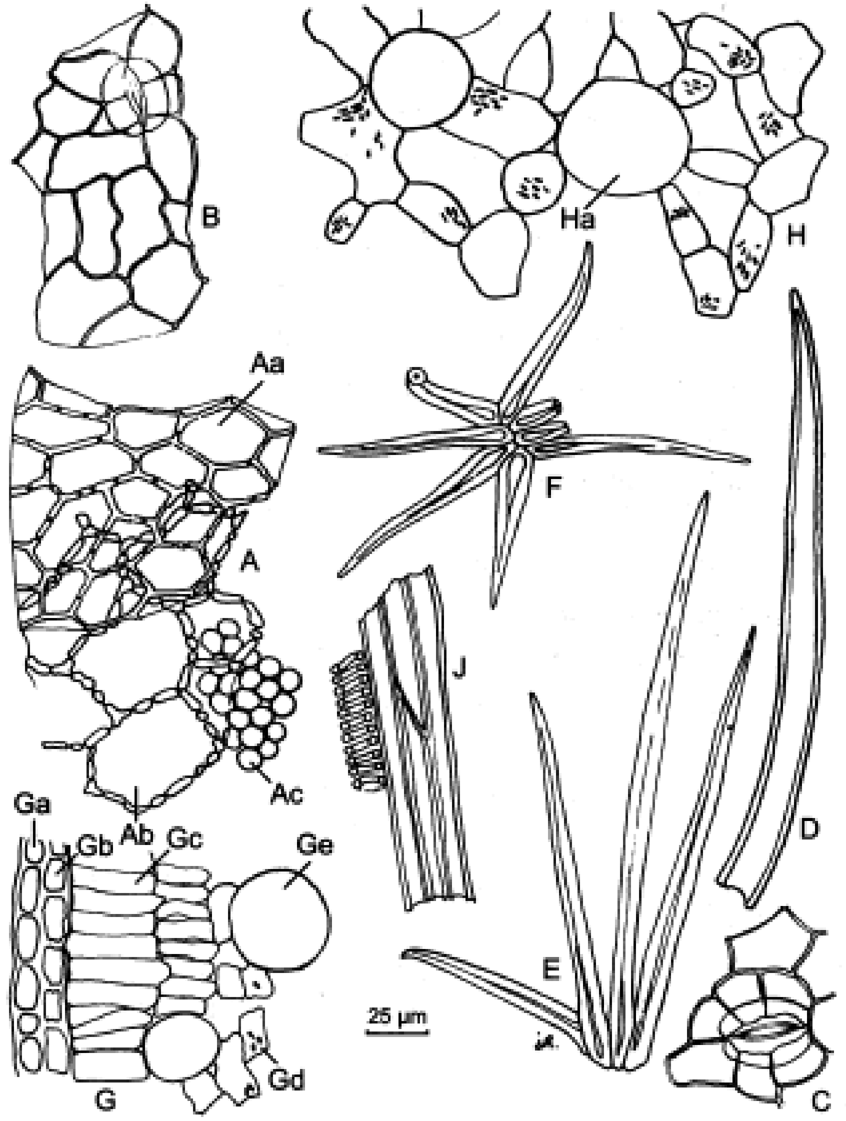
CHARACTERS

Characteristic odour, especially when rubbed.

IDENTIFICATION

A. The leaf is oval or elliptical usually 5 cm long with a short petiole, an obtuse or slightly emarginate or mucronate apex and an equal and rounded base; the margin is entire and slightly undulate and the thickened edges are more or less revolute. The lamina is greyish-green, thick, tough and brittle. The upper surface is rough with numerous prominent small protuberances and a depressed venation. The lower surface is finely pubescent, with the protuberances less well-marked, and a prominent, pinnate venation.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greyish-green. Examine under a microscope using *chloral hydrate solution R* . The powder shows fragments of the upper epidermis and underlying hypodermis with straight or slightly sinuous thickened and beaded walls, those of the lower epidermis with numerous stomata surrounded by 4-7 subsidiary cells; solitary, bifurcated or stellate clustered unicellular covering trichomes with more or less thickened and lignified walls; fragments of the lamina showing a two-layered palisade; debris of the spongy mesophyll including numerous large, rounded oil cells and parenchyma containing fine needle-shaped crystals; thick-walled fibres and lignified, pitted parenchymatous cells associated with vascular tissue from the veins.



A. Fragment of the lamina, in surface view, showing the upper epidermis (Aa), hypodermis with thickened and beaded walls (Ab), and palisade parenchyma (Ac)

B and C. Lower epidermis with stomata surrounded by 4-7 subsidiary cells

D. Unicellular covering trichome, solitary

E and F. Unicellular covering trichomes, stellate clustered

G. Fragment of the lamina, in transverse section, showing the upper epidermis (Ga), hypodermis (Gb), palisade parenchyma (Gc) and spongy parenchyma (Gd) containing oil cells (Ge)

H. Spongy parenchyma containing fine needle-shaped crystals and oil cells (Ha)

J. Vascular tissue with fibres

Figure 1396.-1. – *Illustration of powdered herbal drug of boldo leaf (see Identification B)*

C. Thin-layer chromatography *(2.2.27)* .

Test solution Mix 1.5 g of the powdered drug (355) *(2.9.12)* and 5 ml of *methanol R* and sonicate for 10 min. Filter the supernatant through a 3 cm × 0.5 cm column of *cellulose for chromatography R1*. Use the first 1 ml of the eluate as the test solution.

Reference solution Dissolve 2 mg of *boldine R* and 10 mg of *hyoscine hydrobromide R* in 5 ml of *methanol R*.

Plate TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

Mobile phase *diethylamine R*, *methanol R*, *toluene R* (10:10:80 *V/V/V*).

Application 40 µl [or 6 µl] of the test solution and 20 µl [or 2 µl] of the reference solution, as bands of 15 mm [or 8 mm].

Development Over a path of 15 cm [or 6 cm].

Drying In air.

Detection Spray with *potassium iodobismuthate solution R2*, dry for 5 min in air and spray with *sodium nitrite solution R*; examine in daylight after 30 min.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

TESTS

Essential oil *(2.8.12)*

Maximum 40 ml/kg (anhydrous drug).

Use 10.0 g of the freshly fragmented drug, a 1000 ml flask and 300 ml of *water R* as the distillation liquid. Distil at a rate of 2-3 ml/min for 3 h.

Foreign matter *(2.8.2)*

Maximum 4 per cent of twigs and maximum 2 per cent of other foreign matter.

Water *(2.2.13)*

maximum 100 ml/kg, determined by distillation of 20.0 g of the powdered drug (355) *(2.9.12)*.

Total ash *(2.4.16)*

Maximum 13.0 per cent.

ASSAY

Alkaloids

Liquid chromatography *(2.2.29).*

Test solution To 1.000 g of the powdered drug (355) *(2.9.12)* add 50 ml of *dilute hydrochloric acid R* . Shake in a water-bath at 80 °C for 30 min. Filter, take up the residue with 50 ml of *dilute hydrochloric acid R* and shake in a water-bath at 80 °C for 30 min. Filter and repeat the operation once on the residue obtained. Filter. Combine the cooled filtrates and shake with 100 ml of a mixture of equal volumes of *ethyl acetate R* and *hexane R* . Discard the organic layer. Adjust the aqueous layer to pH 9.5 with *dilute ammonia R1* . Shake successively with 100 ml, 50 ml and 50 ml of *methylene chloride R* . Combine the lower layers and evaporate to dryness under reduced pressure. Dissolve the residue in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution Dissolve 12 mg of *boldine CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Column:

— *size: l* = 0.25 m, Ø = 4.6 mm;

— *stationary phase: octadecylsilyl silica gel for chromatography R* (5 µm).

Solution A Mix 0.2 ml of *diethylamine R* and 99.8 ml of *acetonitrile R* .

Solution B Mix 0.2 ml of *diethylamine R* and 99.8 ml of *water R* and adjust to pH 3 with *anhydrous formic acid R .*

Mobile phase Solution A, solution B (16:84 *V/V*).

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 304 nm.

Injection 20 µl.

Relative retention With reference to boldine (retention time = about 6 min): isoboldine = about 0.9; isocorydine *N*-oxide = about 1.8; laurotetanine = about 2.2; isocorydine = about 2.8; *N*-methyllaurotetanine = about 3.2. Additional peaks may be present.

System suitability Test solution:

Calculate the percentage content of total alkaloids expressed as boldine using the following expression:

$$\frac{(\sum A_1) \times m_2 \times p}{A_2 \times m_1 \times 100}$$

m_1 = mass of the drug to be examined, in grams

m_2 = mass of *boldine CRS* in the reference solution, in grams

ΣA_1 = sum of the areas of the peaks due to the 6 alkaloids identified in the chromatogram obtained with the test solution

A_2 = of the peak due to boldine in the chromatogram obtained with the reference solution area;

p = percentage content of boldine in *boldine CRS*

Ph Eur

Buckwheat Herb

General Notices

(Ph Eur monograph 2184)

Ph Eur

DEFINITION

Whole or cut aerial parts of *Fagopyrum esculentum* Moench, collected in the early flowering period prior to fruiting and dried immediately.

Content

Minimum 4.0 per cent of rutin ($C_{27}H_{30}O_{16}$,$3H_2O$; M_r 665) (dried drug).

IDENTIFICATION

A. The stem is cylindrical, hollow, finely ridged longitudinally, about 2-6 mm in diameter, brownish-green or reddish, with few branches and thickened at the internodes; the leaves are arranged spirally and have membranous, sheathing stipules; the surface is glabrous except in the region of the stipules, where short, white hairs may occur. The leaves are dark green, paler on the lower surface, up to 7 cm wide and 11 cm long, saggitate or cordate, almost pentagonal with 2 widely rounded lobes; the lower leaves are petiolate, the upper leaves sessile or amplexicaul; the lamina is glabrous and the margin finely sinuate and fringed with minute, reddish-brown projections; similar projections occur on the veins on the upper surface. The inflorescence is a cymose panicle, the individual flowers 1-2 mm long and 6 mm in diameter with 5 free, white or reddish petals.

B. Reduce to a powder (355) *(2.9.12)*. The powder is dark green with a few brown, pink or whitish particles. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: fragments of the epidermis of the stem and leaf lamina in surface view, those of the stem composed of elongated cells showing striations on the outer walls, those of the lamina polygonal with numerous anomocytic stomata; occasional fragments of the leaf margins and the epidermis over the veins with ovoid to rounded papilla-like projections, often reddish, with thickened and striated walls; abundant cluster crystals of calcium oxalate, 25-100 µm in diameter, and smaller prismatic crystals, occurring scattered and in the mesophyll of the leaf, also in longitudinal files in the parenchyma of the stem; fragments of lignified tissue with bordered pitted or reticulate vessels and thin-walled, pitted fibres; occasional fragments of the corolla with papillose epidermis; pollen spherical, about 50 µm in diameter, with a pitted exine and 3 furrows.

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 0.5 g of the powdered drug (355) *(2.9.12)* add 5.0 ml of *methanol R* and heat in a water-bath at 60 °C under a reflux condenser for 10 min. Cool and filter.

Reference solution Dissolve 10 mg of *hyperoside R* and 10 mg of *rutin R* in 10 ml of *methanol R*.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *anhydrous formic acid R, water R, ethyl acetate R* (1:1:8 *V/V/V*).

Application 20 µl [or 5 µl] as bands.

Development Over a path of 10 cm [or 6 cm].

Drying At 100-105 °C.

Detection Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for about 30 min. Examine in ultraviolet light at 365 nm.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

6 - 16.5	94 → 85	6 → 15
16.5 - 22	85 → 76	15 → 24
22 - 25	76 → 59	24 → 41
25 - 27	59 → 94	41 → 6

Flow rate 1.0 ml/min.

Detection Spectrophotometer at 350 nm.

Injection 10 µl.

System suitability Reference solution (b):

- *elution order*: when the chromatogram is recorded in the prescribed conditions, the components elute in the order indicated in the composition of reference solution (b);
- *resolution*: minimum 3 between the peaks due to troxerutin and quercitrin.

Using the retention time from the chromatogram obtained with reference solution (a), locate rutin on the chromatogram obtained with the test solution.

Calculate the percentage content of rutin from the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1} \times \frac{100}{100 - d}$$

A_1 = area of the peak due to rutin in the chromatogram obtained with the test solution;

A_2 = area of the peak due to rutoside trihydrate in the chromatogram obtained with reference solution (a);

M_1 = mass of the drug to be examined, in grams;

M_2 = mass of *rutoside trihydrate CRS*, in grams;

p = purity of *rutoside trihydrate CRS*, in per cent;

d = loss on drying, in per cent.

Ph Eur

Butcher's Broom

General Notices

(Ph Eur monograph 1847)

Ph Eur

DEFINITION

Dried, whole or fragmented underground parts of *Ruscus aculeatus* L.

Content

Minimum 1.0 per cent of total sapogenins, expressed as ruscogenins [mixture of neoruscogenin ($C_{27}H_{40}O_4$; M_r 428.6) and ruscogenin ($C_{27}H_{42}O_4$; M_r 430.6)] (dried drug).

IDENTIFICATION

A. The rhizome consists of yellowish, branched, articulated, somewhat knotty pieces, cylindrical or subconical, about 5-10 cm long and about 5 mm thick. The surface is marked with thin annulations about 1-3 mm wide, separated from one another; rounded scars of the aerial stems are present on the upper surface. On the lower surface numerous roots, or their scars, occur; the roots are about 2 mm in diameter and similar in colour to the rhizome. The outer layer is easily detached, revealing a yellowish-white, very hard central cylinder.

B. Reduce to a powder (355) (*2.9.12*). The powder is yellowish. Examine under a microscope using *chloral hydrate solution R* . The powder shows groups of sclereids of the rhizome, variously-shaped cells, ranging from rounded to elongated or rectangular; the walls are moderately thickened and distinctly beaded, with large, rounded to oval pits. Fragments of the endodermis composed of a single layer of irregularly-thickened cells. Groups of rounded parenchymatous cells, thickened at the corners, with small, triangular intercellular spaces; thin-walled parenchyma containing raphides of calcium oxalate. Groups of thick-walled fibres and small vessels, up to about 50 µm in diameter, the walls showing numerous small, slit-shaped pits.

TESTS

Foreign matter (*2.8.2*)

Maximum 5 per cent.

Loss on drying (*2.2.32*)

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 12.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*)

Maximum 5.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution To 2.000 g of the powdered drug (355) (*2.9.12*), add 60 ml of *anhydrous ethanol R* , 15 ml of *water R* and 0.2 g of *potassium hydroxide R* . Extract under reflux on a water-bath for 4 h. Allow to cool and filter into a 100 ml volumetric flask. Rinse the extraction flask and the residue in the filter with 3 quantities, each of 10 ml, of *anhydrous ethanol R* and add the rinsings to the volumetric flask. Dilute to 100.0 ml with *anhydrous ethanol R* . Introduce 25.0 ml of the solution into a round-bottomed flask fitted to a rotary evaporator and evaporate to dryness. Dissolve the residue in 10 ml of *butanol R* , add 3 ml of *hydrochloric acid R1* and 8 ml of *water R* . Heat under reflux on a water-bath for 1 h. Allow to cool and transfer the liquid into a separating funnel, rinse the round-bottomed flask with 2 quantities, each of 10 ml, of *butanol R* . Add the rinsings to the separating funnel. Extract with 3 quantities, each of 20 ml, of *butanol R* saturated with *water R.* Combine the butanolic extracts and evaporate to dryness using a rotary evaporator. Dissolve the residue in 20 ml of *methanol R* and transfer to a 100 ml volumetric flask. Rinse the extraction flask with 2 quantities, each of 20 ml then 10 ml of *methanol R* and add the rinsings to the volumetric flask. Dilute to 100 ml with *methanol R.*

Reference solution Dissolve 5.0 mg of *ruscogenins CRS* in 100 ml of *methanol R*.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

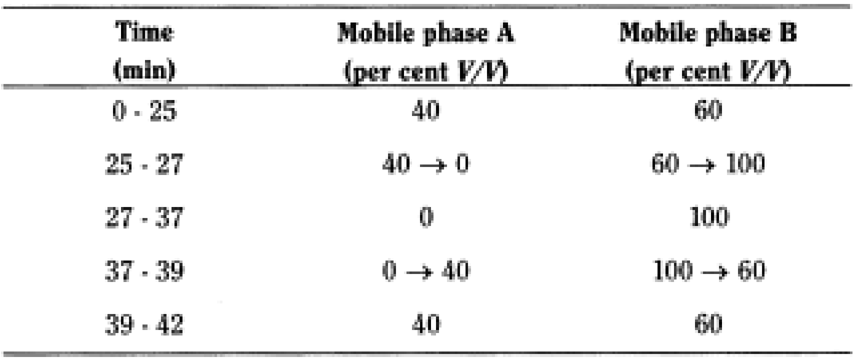
- *mobile phase B*: *acetonitrile for chromatography R;*



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 25	40	60
25 - 27	40 → 0	60 → 100
27 - 37	0	100
37 - 39	0 → 40	100 → 60
39 - 42	40	60

Flow rate 1.2 ml/min.

Detection Spectrophotometer at 203 nm.

Injection 20 µl.

Retention time With reference to neoruscogenin (retention time = about 16 min): ruscogenin = about 1.2.

System suitability Reference solution:

- *resolution*: minimum 1.5 between the peaks due to neoruscogenin and ruscogenin.

Calculate the percentage content of sapogenins expressed as ruscogenins (neoruscogenin and ruscogenin) in the test solution by comparing the areas of the peaks in the chromatograms obtained with the test solution and the reference solution.

Ph Eur

Calendula Flower

General Notices

(Ph Eur monograph 1297)

Ph Eur

DEFINITION

Whole or cut, dried, and fully opened flowers that have been detached from the receptacle of the cultivated, double-flowered varieties of *Calendula officinalis* L.

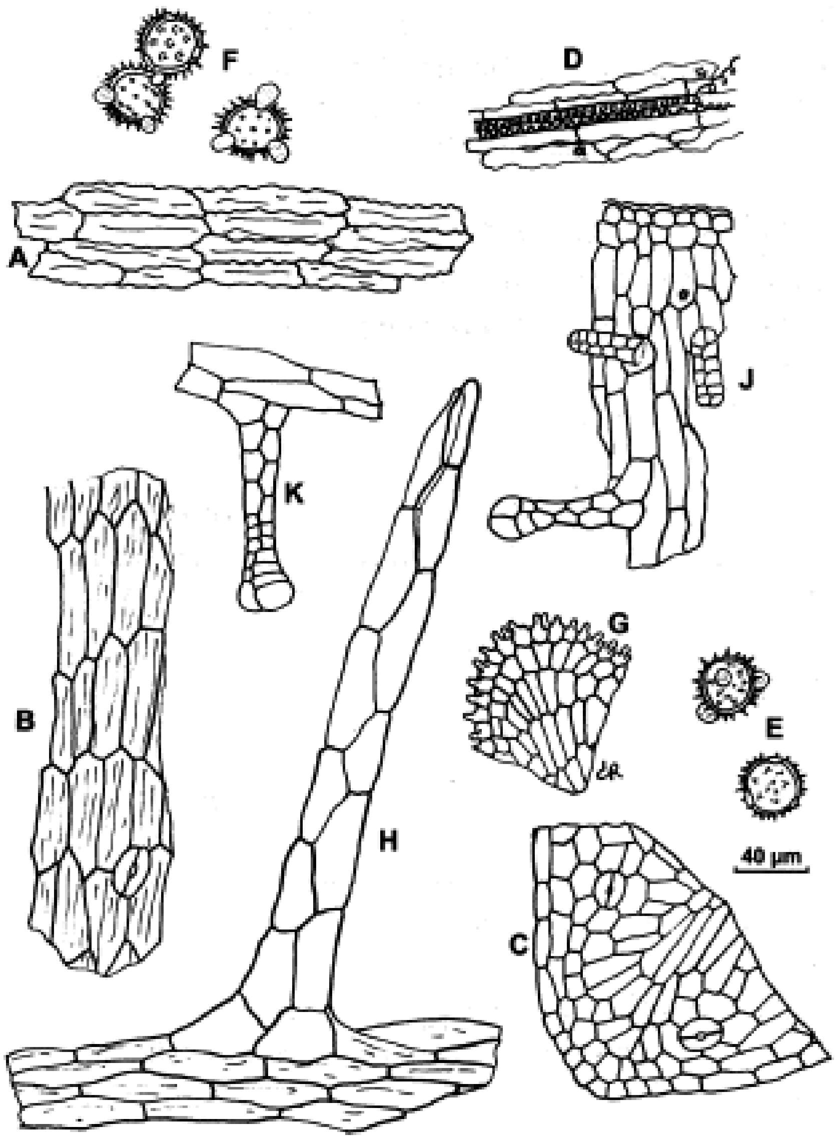
Content

Minimum 0.4 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried drug).

IDENTIFICATION

A. The ligulate florets consist of a yellow or orange-yellow ligule, about 3-5 mm wide and about 7 mm in the middle part, with a 3-toothed apex and a hairy, partly sickle-shaped, yellowish-brown or orange-brown tube with a projecting style and a bifid stigma occasionally with a partly bent yellowish-brown or orange-brown ovary. The tubular florets, about 5 mm long, are present and consist of the yellow, orange-red or reddish-violet 5-lobed corolla and the yellowish-brown or orange-brown tube, hairy in its lower part, mostly with a partly bent yellowish-brown or orange-brown ovary.

B. Reduce to a powder (355) (*2.9.12*). The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: fragments of the corollas containing light yellow oil droplets, some with fairly large anomocytic stomata (*2.8.3*), others containing prisms and very small cluster crystals of calcium oxalate; covering trichomes biseriate, multicellular and conical, and glandular trichomes with a uniseriate or biseriate, multicellular stalk and a large, ovoid, biseriate and multicellular head; spherical pollen grains up to about 40 µm in diameter with a sharply spiny exine and 3 germinal pores; occasional fragments of the stigmas with short, bulbous papillae.



A and B. Epidermis of the corolla

C. Epidermis at the apex of the corolla showing anomocytic stomata

D. Fragments of vessel tissue attached to parenchyma cells containing cluster crystals of calcium oxalate

E and F. Pollen grains

G. Fragment of the stigma

H. Covering trichome (usually only fragments observed)

J. Cells from the base of the corolla and glandular trichomes

K. Glandular trichome

Figure 1297.-1. – *Illustration of powdered herbal drug of calendula flower (see Identification B)*

C. Thin-layer chromatography *(2.2.27)* .

Test solution Mix 1.0 g of the powdered drug (500) (*2.9.12*) and 10 ml of *methanol R* and heat on a water-bath under a reflux condenser for 10 min. Cool and filter.

Reference solution Dissolve 1.0 mg of *caffeic acid R* , 1.0 mg of *chlorogenic acid R* and

2.5 mg of *rutin R* in 10 ml of *methanol R*.

Plate *TLC silica gel plate R.*

Mobile phase *anhydrous formic acid R, water R, ethyl acetate R* (10:10:80 *V/V/V*).

Application 20 µl of the test solution and 10 µl of the reference solution, as bands.

Development Over a path of 10 cm.

Drying At 100-105 °C.

Detection Spray the still-warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R in methanol R* and then spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*; allow to dry in air for 30 min and examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the reference solution shows in the lower part a yellowish-brown fluorescent zone (rutin), in the middle part a light bluish fluorescent zone (chlorogenic acid) and in the upper part a light bluish fluorescent zone (caffeic acid). The chromatogram obtained with the test solution shows a yellowish-brown fluorescent zone corresponding in position to the zone due to rutin in the chromatogram obtained with the reference solution, below and directly above it, it shows a yellowish-green fluorescent zone and a light bluish fluorescent zone corresponding to the zone due to chlorogenic acid in the chromatogram obtained with the reference solution, a yellowish-green fluorescent zone above it and a light bluish fluorescent zone shortly below the zone due to caffeic acid in the chromatogram obtained with the reference solution. Further zones are present.

TESTS

Foreign matter *(2.8.2)*

Maximum 5 per cent of bracts and maximum 2 per cent of other foreign matter.

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (500) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 10.0 per cent.

ASSAY

Stock solution Into a 100 ml round-bottomed flask introduce 0.800 g of the powdered drug (500) *(2.9.12)*, 1 ml of a 5 g/l solution of *hexamethylenetetramine R*, 20 ml of *acetone R* and 7 ml of *hydrochloric acid R1*. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a plug of absorbent cotton into a 100 ml volumetric flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 ml, of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool to room temperature, filter the liquid through a plug of absorbent cotton, then filter the combined acetone solution through a filter-paper into the volumetric flask, and dilute to 100.0 ml with *acetone R* by rinsing the flask and filter. Introduce 20.0 ml of this solution into a separating funnel, add 20 ml of *water R* and extract the mixture with 1 quantity of 15 ml and then with 3 quantities, each of 10 ml, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, rinse with 2 quantities, each of 50 ml, of *water R,* filter the extract over 10 g of *anhydrous sodium sulphate R* into a 50 ml volumetric flask and dilute to 50.0 ml with *ethyl acetate R* .

Test solution To 10.0 ml of the stock solution add 1 ml of *aluminium chloride reagent R* and dilute to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R* .

Compensation liquid Dilute 10.0 ml of the stock solution to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

After 30 min, measure the absorbance *(2.2.25)* of the test solution at 425 nm, by comparison with the compensation liquid.

Calculate the percentage content of flavonoids, expressed as hyperoside, using the following expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of hyperoside to be 500.

A = absorbance at 425 nm

m = mass of the drug to be examined, in grams

Ph Eur

Cape Aloes

General Notices

(Ph Eur monograph 0258)

Preparation

Standardised Aloes Dry Extract

Ph Eur

DEFINITION

Concentrated and dried juice of the leaves of various species of *Aloe*, mainly *Aloe ferox* Miller and its hybrids.

Content

Minimum 18.0 per cent of hydroxyanthracene derivatives, expressed as barbaloin ($C_{21}H_{22}O_9$; M_r 418.4) (dried drug).

CHARACTERS

Appearance

Dark brown masses tinged with green and having a shiny conchoidal fracture, or greenish-brown powder.

Solubility

Partly soluble in boiling water, soluble in hot ethanol (96 per cent).

IDENTIFICATION

A. Examine the chromatograms obtained in the test for Barbados aloes.

Results The chromatogram obtained with the test solution shows in the central part a yellow fluorescent zone (barbaloin) similar in position to the zone due to barbaloin in the chromatogram obtained with the reference solution and in the lower part 2 yellow fluorescent zones (aloinosides A and B) and 1 blue fluorescent zone (aloesine).

B. Shake 1 g of the powdered drug with 100 ml of boiling *water R* . Cool, add 1 g of *talc R* and filter. To 10 ml of the filtrate add 0.25 g of *disodium tetraborate R* and heat to dissolve. Pour 2 ml of the solution into 20 ml of *water R* . A yellowish-green fluorescence appears which is particularly marked in ultraviolet light at 365 nm.

C. To 5 ml of the filtrate obtained in identification test B add 1 ml of freshly prepared bromine *water R* . A yellow precipitate is formed. The supernatant liquid is not violet.

TESTS

Barbados aloes

Thin-layer chromatography *(2.2.27)* .

Test solution To 0.25 g of the powdered drug add 20 ml of *methanol R* and heat to boiling in a water-bath. Shake for a few minutes and decant the solution. Store at about 4 °C and use within 24 h.

Reference solution Dissolve 25 mg of *barbaloin R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel G plate R.*

Mobile phase *water R, methanol R, ethyl acetate R* (13:17:100 *V/V/V*).

Application 10 µl, as bands of 20 mm by maximum 3 mm.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with a 100 g/l solution of *potassium hydroxide R* in *methanol R* . Heat at 110 °C for 5 min and examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the test solution shows no violet fluorescent zone just below the zone due to barbaloin.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug by drying in an oven at 105 °C.

Total ash *(2.4.16)*

Maximum 2.0 per cent.

ASSAY

Carry out the assay protected from bright light.

Introduce 0.400 g of powdered drug (180) *(2.9.12)* into a 250 ml conical flask. Moisten with 2 ml of *methanol R* , add 5 ml of *water R* warmed to about 60 °C, mix, then add a further 75 ml of *water R* at about 60 °C and shake for 30 min. Cool, filter into a volumetric flask, rinse the conical flask and filter with 20 ml of *water R* , add the rinsings to the volumetric flask and dilute to 1000.0 ml with *water R* . Transfer 10.0 ml of this solution to a 100 ml round-bottomed flask containing 1 ml of a 600 g/l solution of *ferric chloride R* and 6 ml of *hydrochloric acid R* . Heat in a water-bath under a reflux condenser for 4 h, with the water level above that of the liquid in the flask. Allow to cool, transfer the solution to a separating funnel, rinse the flask successively with 4 ml of *water R* , 4 ml of *1 M sodium hydroxide* and 4 ml of *water R* and add the rinsings to the separating funnel. Shake the contents of the separating funnel with 3 quantities, each of 20 ml, of *ether R* . Wash the combined ether layers with 2 quantities, each of 10 ml, of *water R* . Discard the washings and dilute the organic phase to 100.0 ml with *ether R* . Evaporate 20.0 ml of the solution carefully to dryness on a water-bath and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance *(2.2.25)* at 512 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of barbaloin from the following expression:

$$\frac{A \times 19.6}{m}$$

i.e. taking the specific absorbance of hydroxyanthracene derivatives, as barbaloin, to be 255.

A = absorbance at 512 nm,

m = mass of the substance to be examined in grams.

STORAGE

In an airtight container.

Ph Eur

Capsicum

General Notices

(Ph Eur monograph 1859)

Ph Eur

DEFINITION

Dried ripe fruits of *Capsicum annuum* L. var. *minimum* (Miller) Heiser and small-fruited varieties of *Capsicum frutescens* L.

Content

Minimum 0.4 per cent of total capsaicinoids, expressed as capsaicin ($C_{18}H_{27}NO_3$; M_r 305.4) (dried drug).

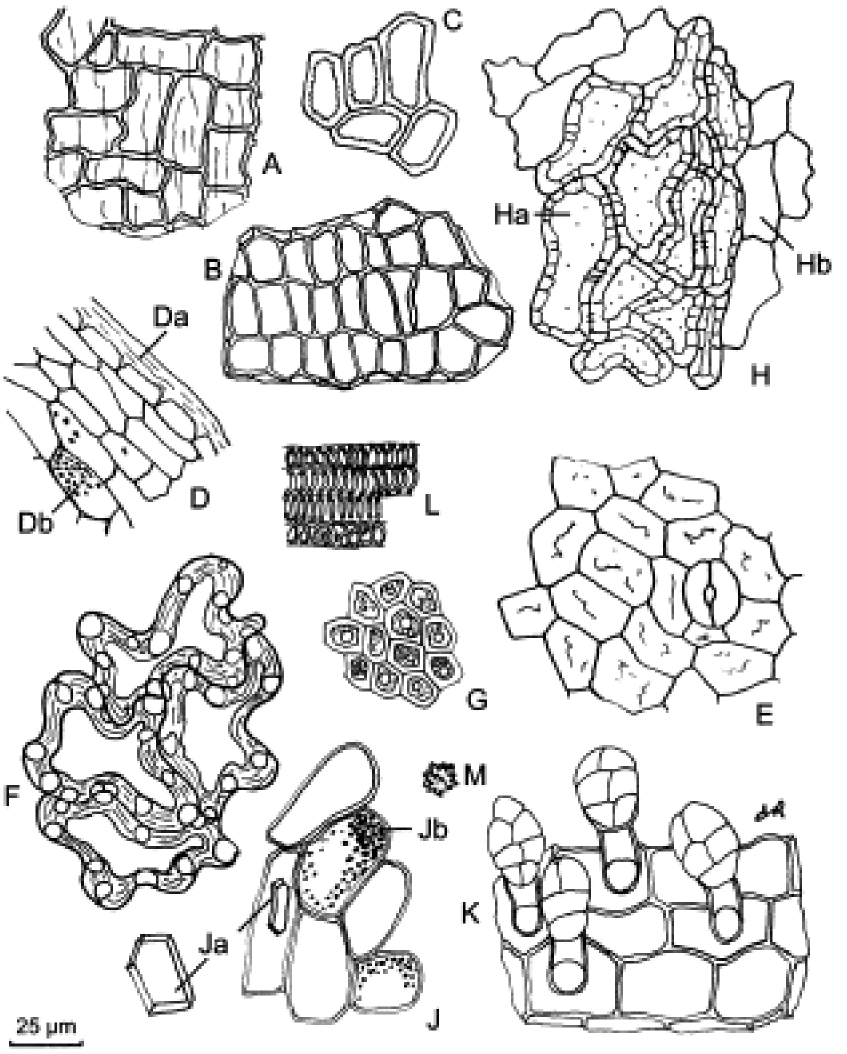
CHARACTERS

Extremely pungent taste.

IDENTIFICATION

A. The fruit is yellowish-orange or reddish-brown, oblong conical with an obtuse apex, about 1-3 cm long and up to 1 cm in diameter at the widest part, occasionally attached to a 5-toothed inferior calyx and a straight pedicel. Pericarp somewhat shrivelled, glabrous, enclosing about 10-20 flat, reniform seeds 3-4 mm long, either loose or attached to a reddish dissepiment.

B. Reduce to a powder (355) *(2.9.12)*. The powder is orange. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: fragments of the pericarp having an outer epicarp with cells often arranged in rows of 5 to 7, cuticle uniformly striated, parenchymatous cells frequently containing droplets of red oil, occasionally containing microsphenoidal crystals of calcium oxalate, endocarp with characteristic island groups of sclerenchymatous cells, the groups being separated by thin-walled parenchymatous cells; fragments of the seeds having an episperm composed of large, greenish-yellow, sinuous-walled sclereids with thin outer walls and strongly and unevenly thickened radial and inner walls which are conspicuously pitted, endosperm parenchymatous cells with drops of fixed oil and aleurone grains 3-6 µm in diameter; occasional fragments from the calyx having an outer epidermis with anisocytic stomata *(2.8.3)* , inner epidermis with many trichomes but no stomata, trichomes glandular, with uniseriate stalks and multicellular heads, mesophyll with many idioblasts containing microsphenoidal crystals of calcium oxalate.



A, B, C. Epicarp: cells with striated cuticle (A); cells arranged in rows (B) and cells close to the peduncle (C)

D. Epicarp in transverse section showing cuticle (Da), accompanied by parenchyma containing microcrystals of calcium oxalate (Db)

E. Outer epidermis of the calyx with anisocytic stoma

F. Episperm

G. Endosperm with aleurone grains

H. Fragment of endocarp in transverse section with sclerenchymatous cells (Ha) and thin-walled parenchymatous cells (Hb)

J. Mesophyll of the calyx with prisms (Ja), microcrystals (Jb) and cluster crystals of calcium oxalate

K. Inner epidermis of the calyx with glandular trichomes

L. Vessels

M. Calcium oxalate cluster

Figure 1859.-1. – *Illustration of powdered herbal drug of capsicum (see identification B)*

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 0.50 g of the powdered drug (500) *(2.9.12)* add 5.0 ml of *ether R* , shake for 5 min and filter.

Reference solution Dissolve 2 mg of *capsaicin R* and 2 mg of *dihydrocapsaicin R* in 5.0 ml of *ether R* .

Plate *TLC octadecylsilyl silica gel plate R.*

Mobile phase *water R, methanol R* (20:80 *V/V*).

Application 20 µl as bands.

Development Over a path of 12 cm.

Drying In air.

Detection Spray with a 5 g/l solution of *dichloroquinonechlorimide R* in *methanol R* . Expose to ammonia vapour until blue zones appear. Examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

TESTS

Nonivamide

Liquid chromatography *(2.2.29)* .

Test solution To 2.5 g of the powdered drug (500) *(2.9.12)* add 100 ml of *methanol R* . Allow to macerate for 30 min. Place in an ultrasonic bath for 15 min. Filter into a 100 ml volumetric flask, rinse the flask and filter with *methanol R* , then dilute to 100.0 ml with the same solvent.

Reference solution Dissolve 20.0 mg of *capsaicin CRS* and 4.0 mg of *nonivamide CRS* in *methanol R* and dilute to 100.0 ml with the same solvent.

Column:

— *size: l* = 0.25 m, Ø = 4.6 mm;

— *stationary phase: phenylsilyl silica gel for chromatography R* (5 µm);

— *temperature*: 30 °C.

Mobile phase Mix 40 volumes of *acetonitrile R* and 60 volumes of a 1 g/l solution of *phosphoric acid R* .

Flow rate 1.0 ml/min.

Detection Spectrophotometer at 225 nm.

Injection 10 µl.

Elution order nordihydrocapsaicin, nonivamide, capsaicin, dihydrocapsaicin.

System suitability Reference solution:

— *resolution*: minimum 1.5 between the peaks due to nonivamide and capsaicin.

Calculate the percentage content of nonivamide using the following expression:

$$\frac{F_1 \times m_2 \times p_1}{F_2 \times m_1}$$

F_1 = area of the peak corresponding to nonivamide in the chromatogram obtained with the test solution;

F_2 = area of the peak corresponding to nonivamide in the chromatogram obtained with the reference solution;

m_1 = mass of the drug to be examined, in grams;

m_2 = mass of *nonivamide CRS* used to prepare the reference solution, in grams;

p_1 = percentage content of nonivamide in *nonivamide CRS*.

Limit:

— *nonivamide*: maximum 5.0 per cent of the total capsaicinoid content.

Foreign matter ***(2.8.2)***

Fruits of *C. annuum* L. var. *longum* (Sendtn.) are absent.

Loss on drying ***(2.2.32)***

Maximum 11.0 per cent, determined on 1.000 g of the powdered drug (500) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash ***(2.4.16)***

Maximum 10.0 per cent.

ASSAY

Liquid chromatography *(2.2.29)* as described in the test for nonivamide.

Calculate the percentage content of total capsaicinoids, expressed as capsaicin, using the following expression:

$$\frac{(F_3 + F_5 + F_6) \times m_4 \times p_2}{F_4 \times m_3}$$

F_3 = area of the peak corresponding to capsaicin in the chromatogram obtained with the test solution;

F_4 = area of the peak corresponding to capsaicin in the chromatogram obtained with the reference solution;

F_5 = area of the peak corresponding to dihydrocapsaicin in the chromatogram obtained with the test solution;

F_6 = area of the peak corresponding to nordihydrocapsaicin in the chromatogram obtained with the test solution;

m_3 = mass of the drug to be examined, in grams;

m_4 = mass of *capsaicin CRS* used to prepare the reference solution, in grams;

p_2 = percentage content of capsaicin in *capsaicin CRS*.

Ph Eur

Caraway Oil

General Notices

(Ph Eur monograph 1817)

Ph Eur

DEFINITION

Oil obtained by steam distillation from the dry fruits of *Carum carvi* L.

CHARACTERS

Appearance

Clear, colourless or yellow liquid.

IDENTIFICATION

First identification *B.*

Second identification *A.*

A. Thin-layer chromatography *(2.2.27)* .

Test solution Dissolve 40 µl of the substance to be examined in 1.0 ml of *toluene R* .

Reference solution Dissolve 10 µl of *carvone R* and 5 µl of *carveol R* in 1.0 ml of *toluene R* .

Plate *TLC silica gel F* $_{254}$ *plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *ethyl acetate R*, *toluene R* (5:95 *V/V*).

Application 10 µl [or 2 µl] as bands.

Development Over a path of 10 cm [or 5 cm].

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

Results A See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

	A violet-blue zone
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density *(2.2.5)*

0.904 to 0.920.

Refractive index *(2.2.6)*

1.484 to 1.490.

Optical rotation *(2.2.7)*

+ 65 ° to + 81 °.

Acid value *(2.5.1)*

Maximum 1.0, determined on 5.00 g.

Chromatographic profile

Gas chromatography *(2.2.28)* : use the normalisation procedure.

Test solution Dissolve 0.200 g of the substance to be examined in *heptane R* and dilute to 10.0 ml with the same solvent.

Reference solution (a) Dissolve 5 µl of β*-myrcene R* , 80 µl of *limonene R* , 5 µl of *dihydrocarvone R* , 100 µl of *carvone R* and 5 µl of *carveol R* in *heptane R* and dilute to 10.0 ml with the same solvent.

Reference solution (b) Dissolve 10 µl of *carvone R in heptane R* and dilute to 10 ml with the same solvent. Dilute 0.1 ml of this solution to 10 ml with *heptane R.*

Column:

- *material*: fused silica,
- *size*: *l* = 30 m, Ø = 0.53 mm,
- *stationary phase: macrogol 20 000 R* , (film thickness 1 µm).

Carrier gas *helium for chromatography R.*

Flow rate 1.5 ml/min.

Split ratio 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 5	60
	5 - 68	60 → 250
	68 - 75	250
Injection port		250
Detector		260

Detection Flame ionisation.

Injection 1.0 µl.

Elution order Order indicated in the composition of reference solution (a). Record the retention times of these substances.

System suitability Reference solution (a):

- *resolution*: minimum 4.5 between the peaks due to β-myrcene and limonene.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Limits:

- *β-myrcene* : 0.1 per cent to 1.0 per cent,
- *limonene* : 30.0 per cent to 45.0 per cent,
- *trans-dihydrocarvone*: maximum 2.5 per cent,
- *carvone* : 50.0 per cent to 65.0 per cent,
- *trans-carveol* : maximum 2.5 per cent.
- *disregard limit*: the area of the peak in the chromatogram obtained with reference solution (b).

Chiral purity

Gas chromatography *(2.2.28)* .

Test solution Dissolve 20 mg of the substance to be examined in *heptane R* and dilute to 10.0 ml with the same solvent.

Reference solution Dissolve 10 mg of (-)- *carvone R* and 10 mg of *carvone R1* in *heptane R* and dilute to 10.0 ml with the same solvent.

Column:
- *material*: fused silica,
- *size*: *l* = 30 m, Ø = 0.25 mm,
- *stationary phase: modified β-cyclodextrine for chiral chromatography R1* (film thickness 0.25 µm).

Carrier gas *helium for chromatography R* .

Flow rate 2.0 ml/min.

Split ratio 1:30.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 80	50 → 170
Injection port		230
Detector		230

Detection Flame ionisation.

Injection 1 µl.

System suitability Reference solution:

- *resolution*: minimum 2.4 between the peaks due to (-)-carvone (1st peak) and *carvone R1* (2nd peak).

Calculate the percentage content of the (-)-carvone from the following expression:

$$\frac{A_1}{A_1 + A_2} \times 100$$

A_1 = area of the peak due to (-)-carvone,

A_2 = area of the peak due to carvone R1.

Limit:

- (-)- *carvone* : maximum 1 per cent.

STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

Ph Eur

Caraway

General Notices

(Caraway Fruit, Ph Eur monograph 1080)

When Powdered Caraway is prescribed or demanded, material complying with the appropriate requirements below and containing not less than 2.5% v/w (25 ml/kg) of essential oil shall be dispensed or supplied.

Ph Eur

DEFINITION

Whole, dry mericarp of *Carum carvi* L.

Content

Minimum 30 ml/kg of essential oil (anhydrous drug).

CHARACTERS

Odour reminiscent of carvone.

IDENTIFICATION

A. The fruit is a cremocarp of almost cylindrical shape. It is generally 3-6.5 mm long and 1-1.5 mm wide. The mericarps, usually free, are greyish-brown or brown, glabrous, mostly sickle-shaped, with both ends sharply terminated. Each bears 5 prominent narrow ridges. When cut transversely the profile shows an almost regular pentagon and 4 vittae on the dorsal surface and 2 on the commissural surface may be seen with a lens.

B. Reduce to a powder (355) *(2.9.12).* The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: fragments of the secretory cells composed of yellowish-brown or brown, thin-walled, polygonal secretory cells, frequently associated with a layer of thin-walled, transversely elongated cells, 8-12 µm wide; fragments of the epicarp with thick-walled cells and occasional anomocytic stomata *(2.8.3);* numerous endosperm fragments containing aleurone grains, droplets of fatty oil and microcrystals of calcium oxalate in rosette formation; spiral vessels accompanied by sclerenchymatous fibres; rarely some fibre bundles from the carpophore; groups of rectangular to sub-rectangular sclereids from the mesocarp with moderately thickened and pitted walls may be present.

C. Thin-layer chromatography *(2.2.27)* .

Test solution Shake 0.5 g of the powdered drug (710) *(2.9.12)* with 5.0 ml of *ethyl acetate R* for 2-3 min. Filter over 2 g of *anhydrous sodium sulphate R.*

Reference solution Dissolve 2 µl of *carvone R* and 5 µl of *olive oil R* in 1.0 ml of *ethyl acetate R* .

Plate *TLC silica gel plate R* .

Mobile phase *ethyl acetate R*, *toluene R* (5:95 *V/V*).

Application 20 µl of the test solution and 10 µl of the reference solution, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

Results A The chromatograms obtained with the test solution and with the reference solution show a quenching zone (carvone) in the central part against a light background.

Detection B Spray with *anisaldehyde solution R* and, while observing, heat at 100-105 °C for 2-4 min; examine in daylight.

Results B The zones due to carvone are dark orange-brown; the chromatogram obtained with the test solution shows above the zone due to carvone a violet zone similar in position and colour to the zone due to triglycerides of olive oil in the chromatogram obtained with the reference solution; the chromatogram obtained with the test solution shows close to the solvent front a weak violet zone due to terpene hydrocarbons and in the lower part some weak, mostly violet-greyish and brownish zones.

TESTS

Water *(2.2.13)*

Maximum 100 ml/kg, determined on 10.0 g of powdered drug.

Total ash *(2.4.16)*

Maximum 7.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs *(2.8.12)* . Use 10.0 g of drug reduced to a powder (710) *(2.9.12)* immediately before the determination, a 500 ml round-bottomed flask, 200 ml of *water R* as the distillation liquid, and 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 90 min.

Ph Eur

Cardamom Fruit

General Notices

In making preparations of Cardamom, only the seed is used. The seed is removed from the fruit, immediately powdered or bruised and used immediately in making the preparation. Cardamom seed, after removal from the fruit, should not be stored.

DEFINITION

Cardamom Fruit consists of the dried, nearly ripe fruit of *Elettaria cardamomum* Maton var. *minuscula* Burkill.

CHARACTERISTICS

Odour and taste of the seeds, strongly aromatic.

Macroscopical Fruit: a trilocular inferior capsule, up to about 2 cm long, ovoid or oblong, dull green to pale buff, plump or slightly shrunken, obtusely triangular in cross section, nearly smooth or longitudinally striated. Seeds in each loculus in two rows, forming an adherent mass attached to the axile placenta. Seed: pale to dark reddish brown, about 4 mm long and 3 mm broad, irregularly angular, marked with six to eight transverse wrinkles, with a longitudinal channel containing the raphe, each seed enveloped by a colourless, membranous aril. Transversely cut surface of seed showing a brown testa, white starchy perisperm, grooved on one side, yellowish endosperm and a paler embryo.

Microscopical Seed: aril composed of flattened, thin-walled, parenchymatous cells. Testa composed of the following layers: (i) outer epidermis of thick-walled, narrow, axially elongated cells; (ii) a layer of collapsed parenchyma subjacent to the outer epidermis; (iii) a single layer (two or three layers near the raphe) of large, thin-walled, rectangular cells containing volatile oil; (iv) two or three layers of parenchyma; (v) layers of thin-walled, flattened cells; (vi) distinctive sclerenchymatous layer of closely packed brown, thick-walled cells, each with a bowl-shaped cavity in the upper part containing a warty silica body; (vii) inner layer consisting of flattened cells. Perisperm: cells thin-walled, packed with numerous starch granules up to 6 µm in diameter and, in a small cavity, one to seven prisms of calcium oxalate about 10 to 30 µm long. Endosperm parenchymatous, thin-walled, with a granular hyaline mass of protein in each cell. Embryo: cells small, containing aleurone grains.

TESTS

Foreign matter

Of the fruit, not more than 1.0%; of the separated seeds, not more than 3.0%, Appendix XI D.

Volatile oil

In the seeds, not less than 4.0% v/w, Appendix XI E, Method I. Use 20 g of the unground seeds and distil for 5 hours.

Acid-insoluble ash

Of the seeds, not more than 3.5%, Appendix XI K.

Ash

Of the seeds, not more than 6.0%, Appendix XI J.

Cardamom Oil

General Notices

Preparations

Aromatic Cardamom Tincture

Compound Cardamom Tincture

DEFINITION

Cardamom Oil is obtained by distillation from crushed Cardamom Fruit.

CHARACTERISTICS

A clear, colourless or pale yellow liquid, visibly free from water; odour, that of Cardamom Fruit.

TESTS

Ester value

90 to 156, Appendix X C.

Optical rotation

+20° to +40°, Appendix V F.

Refractive index

1.461 to 1.467, Appendix V E.

Solubility in ethanol

Soluble, at 20°, in 6 volumes of *ethanol (70%)*, Appendix X M.

Weight per ml

0.917 to 0.940 g, Appendix V G.

STORAGE

Cardamom Oil should be kept in a well-filled container and protected from light.

Cascara Dry Extract

General Notices

DEFINITION

Cascara Dry Extract is prepared by extracting Cascara with Purified Water and removing the solvent. It contains not less than 13.5% of hydroxyanthracene derivatives, of which not less than 40% consists of cascarosides, both calculated as cascaroside A with reference to the dried substance.

The extract complies with the requirements stated under Extracts and with the following requirements.

TESTS

Frangula

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 100 volumes of *ethyl acetate*, 17 volumes of *methanol* and 13 volumes of *water* as the mobile phase. Apply separately to the plate 10 µl of each of two solutions prepared in the following manner. For solution (1) boil a quantity containing the equivalent of 32 mg of total hydroxyanthracene derivatives with 5 ml of *ethanol (70%)*, cool and centrifuge. Decant the supernatant liquid and use within 30 minutes. For solution (2) dissolve 20 mg of *barbaloin* in 10 ml of *ethanol (70%)*. After removal of the plate, dry it in a current of air until the solvent has evaporated, spray immediately with a 0.1% w/v solution of N,N-*dimethyl*-p-*nitrosoaniline* in *pyridine*, then spray with a 5% w/v solution of *potassium hydroxide* in *ethanol (50%)* and heat at 105° for 15 minutes. In the chromatogram obtained with solution (1) no spot is observed with an Rf value of 1.7 to 1.8 relative to the principal spot in the chromatogram obtained with solution (2).

Loss on drying

Not more than 7.0%.

ASSAY

Carry out the following procedure protected from light. To 0.5 g add 80 ml of *ethanol (70%)*, shake, allow to stand overnight, add sufficient *ethanol (70%)* to produce 100 ml, shake and filter. Transfer 10 ml of the filtrate to a separating funnel, add 0.1 ml of 1M *hydrochloric acid* and shake with two 20 ml quantities of *carbon tetrachloride*. Wash the combined carbon tetrachloride layers with 5 ml of *water* and add the washings to the aqueous solution. Extract the aqueous solution with four 30 ml quantities of water-saturated ethyl acetate, freshly prepared by shaking 150 ml of *ethyl acetate* with 15 ml of *water* for 3 minutes and allowing to separate. Use the combined ethyl acetate extracts for the determination of hydroxyanthracene glycosides other than cascarosides and the aqueous solution for the determination of cascarosides.

For hydroxyanthracene glycosides other than cascarosides

Remove the solvent from the combined ethyl acetate extracts and evaporate just to dryness. Dissolve the residue in 0.5 ml of *methanol*, transfer to a flask with the aid of warm *water*, cool and add sufficient *water* to produce 50 ml. Add 20 ml to a mixture of 2 g of *iron(III) chloride hexahydrate* and 12 ml of *hydrochloric acid* and heat under a reflux condenser in a water bath for 4 hours, maintaining the level of the water above that of the liquid in the flask. Allow to cool, transfer to a separating funnel, wash the flask successively with 4 ml of 1M *sodium hydroxide* and 4 ml of *water* and add the washings to the separating funnel. Extract with three 30 ml quantities of *carbon tetrachloride*, wash the combined carbon tetrachloride layers with two 10 ml quantities of *water*, discard the washings and add sufficient *carbon tetrachloride* to produce 100 ml. Evaporate 20 ml to dryness on a water bath, dissolve the residue in 10 ml of a 0.5% w/v solution of *magnesium acetate* in *methanol* and measure the *absorbance* of the resulting solution at 440 nm and at 515 nm, Appendix II B, using *methanol* in the reference cell.

Calculate the content of hydroxyanthracene glycosides, as cascaroside A, from the absorbance at 515 nm taking 169 as the value of A (1%, 1 cm). The result of the assay is not valid unless the ratio of the absorbance at 515 nm to that at 440 nm is at least 2.6.

For cascarosides

To the aqueous solution reserved from the preliminary extraction add sufficient *water* to produce 50 ml and carry out the Assay for hydroxyanthracene glycosides other than cascarosides, beginning at the words 'Add 20 ml ...'. Calculate the content of cascarosides, as cascaroside A, from the *absorbance* at 515 nm, Appendix II B, taking 169 as the value of A (1%, 1 cm). The result of the assay is not valid unless the ratio of the absorbance at 515 nm to that at 440 nm is at least 2.7.

LABELLING

The label states the percentage of total hydroxyanthracene derivatives.

Cascara

General Notices

(Ph Eur monograph 0105)

Preparation

Cascara Dry Extract

When Powdered Cascara is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter shall be dispensed or supplied.

Ph Eur

DEFINITION

Dried, whole or fragmented bark of *Rhamnus purshianus* D.C. (*Frangula purshiana* (D.C.) A. Gray ex J. C. Cooper).

Content

Minimum 8.0 per cent of hydroxyanthracene glycosides of which minimum 60 per cent consists of cascarosides, both expressed as cascaroside A ($C_{27}H_{32}O_{14}$; M_r 580.5) (dried drug).

IDENTIFICATION

A. The bark occurs in slightly channelled or nearly flat pieces, usually 1-5 mm in thickness, usually varying greatly in length and width. The outer surface is grey or dark greyish-brown and shows occasional lenticels that are orientated transversally. It is usually more or less completely covered by a whitish coat of lichens, epiphytic moss and foliaceous liverwort. The inner surface is yellow or reddish-brown or almost black with fine longitudinal striations; it turns red when treated with alkali. The yellow fracture is short and granular in the outer part and somewhat fibrous at the inner part.

B. Reduce to a powder (355) *(2.9.12)*. The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: bundles of partly lignified phloem fibres accompanied by crystal sheaths containing prisms of calcium oxalate; groups of sclereids accompanied by crystal sheaths; cluster crystals of calcium oxalate; some parenchymatous cells contain a yellow substance which becomes deep red when treated with alkali; cork cells and, frequently, epiphytes; the latter may be liverworts, entire or in fragments, having a lamina one-cell thick without a midrib and composed of isodiametric cells, or leaves of mosses, having a lamina one-cell thick composed of elongated cells and possessing a midrib several cells thick.

C. Examine the chromatograms obtained in test A for "Other species of *Rhamnus*;

anthrones".

Results The chromatogram obtained with the test solution shows several reddish-brown zones with different intensities: there are 4 faint zones, 3 being situated at about the mid-point of the chromatogram and 1 in the lower third and there is a strong zone in the upper third of the chromatogram. Examine in ultraviolet light at 365 nm. The chromatogram obtained with the test solution shows several zones with the same fluorescence, situated above and particularly below (cascarosides) that due to barbaloin in the chromatogram obtained with the reference solution.

D. Heat 0.2 g of the powdered drug (180) *(2.9.12)* with 50 ml of *water R* on a water-bath for 15 min. Allow to cool and filter. To 10 ml of the filtrate add 20 ml of *hydrochloric acid R1* and heat on a water-bath for 15 min. Allow to cool, transfer to a separating funnel and shake with 3 quantities, each of 20 ml, of *ether R*. Reserve the aqueous layer (solution A). Combine the 3 ether extracts and shake with 10 ml of *dilute ammonia R2*. The aqueous layer becomes reddish-violet. Transfer solution A to a small flask, add 5 g of *ferric chloride R* and heat on a water-bath for 30 min. Allow to cool, transfer to a separating funnel and shake with 15 ml of *ether R*. Wash the ether layer with 10 ml of *water R*, discard the water and shake the ether layer with 5 ml of *dilute ammonia R2*. A red colour develops in the aqueous layer.

TESTS

Other species of *Rhamnus*; anthrones

Thin-layer chromatography *(2.2.27)*.

Test solution To 0.5 g of the powdered drug (180) *(2.9.12)* add 5 ml of *ethanol (70 per cent V/V) R* and heat to boiling. Cool and centrifuge. Decant the supernatant solution immediately and use within 30 min.

Reference solution Dissolve 20 mg of *barbaloin R* in *ethanol (70 per cent V/V) R* and dilute to 10 ml with the same solvent.

Plates *TLC silica gel plate R* (2 plates).

Mobile phase *water R, methanol R, ethyl acetate R* (13:17:100 *V/V/V*).

A. Application: 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air for 5 min.

Detection Spray with about 10 ml of a 50 g/l solution of *potassium hydroxide R* in *ethanol (50 per cent V/V) R* and heat at 100-105 °C for 15 min. Examine immediately after heating.

Results The chromatogram obtained with the reference solution shows, in the central part, a reddish-brown zone due to barbaloin. Examine in ultraviolet light at 365 nm. The zone due to barbaloin shows intense yellowish-brown fluorescence. In the chromatogram obtained with the test solution, no zone with orange-brown fluorescence is seen between the zone due to barbaloin and the zones due to cascarosides.

B. Application: 10 µl of the test solution, as a band.

Development Over a path of 10 cm.

Drying In air for maximum 5 min.

Detection Spray immediately with a 5 g/l solution of *nitrotetrazolium blue R* in *methanol R*. Examine immediately.

Results No violet or greyish-blue zones appear.

Foreign matter ***(2.8.2)***

Maximum 1 per cent.

Loss on drying ***(2.2.32)***

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (180) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash ***(2.4.16)***

Maximum 7.0 per cent.

ASSAY

Carry out the assay protected from bright light in 24 h.

Stir 1.00 g of the powdered drug (180) *(2.9.12)* into 100 ml of boiling *water R* and continue boiling and stirring for 5 min. Allow to cool, dilute to 100.0 ml with *water R*, shake, filter and discard the first 20 ml of filtrate. Transfer 10.0 ml of the filtrate to a separating funnel, add 0.1 ml of *1 M hydrochloric acid* and shake with 2 quantities, each of 20 ml, of a mixture of 1 volume of *ether R* and 3 volumes of *hexane R*. Wash the combined organic extracts with 5 ml of *water R*, discard the organic layer and return the rinsings to the aqueous layer. Shake the combined aqueous layers with 4 quantities, each of 30 ml, of *ethyl acetate R* freshly saturated with *water R* (to 150 ml of *ethyl acetate R* add 15 ml of *water R*, shake for 3 min and allow to stand) on each occasion allowing separation to take place until the organic layer is clear. Combine the ethyl acetate extracts. Use the aqueous layer for the assay for cascarosides and the organic layer for the assay for hydroxyanthracene glycosides other than cascarosides.

Hydroxyanthracene glycosides other than cascarosides

Transfer the organic layer to a suitable flask and remove the solvent by distillation, evaporating almost to dryness. Dissolve the residue in 0.3-0.5 ml of *methanol R* and transfer to a volumetric flask, rinsing the 1st flask with warm *water R* and adding the rinsings to the methanolic solution. Allow to cool and dilute to 50.0 ml with *water R*. Transfer 20.0 ml of this solution to a 100 ml round-bottomed flask with a ground-glass neck and containing 2 g of *ferric chloride R* and 12 ml of *hydrochloric acid R*. Attach a reflux condenser and place the flask in a water-bath so that the level of the water is above that of the liquid in the flask and heat for 4 h. Allow to cool, transfer the solution to a separating funnel and rinse the flask successively with 3-4 ml of *1 M sodium hydroxide* and 3-4 ml of *water R*, adding the rinsings to the separating funnel. Shake the contents of the separating funnel with 3 quantities, each of 30 ml, of a mixture of 1 volume of *ether R* and 3 volumes of *hexane R*. Wash the combined organic layers with 2 quantities, each of 10 ml, of *water R* and discard the rinsings. Dilute the organic phase to 100.0 ml with the mixture of ether and hexane. Take 20.0 ml, evaporate carefully to dryness on a water-bath and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance *(2.2.25)* at 440 nm and 515 nm using *methanol R* as the compensation liquid. If the ratio of the absorbance at 515 nm to that at 440 nm is less than 2.4, the assay is invalid.

Calculate the percentage content of hydroxyanthracene glycosides other than cascarosides, expressed as cascaroside A, using the following expression:

$$\frac{A \times 6.95}{m}$$

i.e. taking the specific absorbance to be 180.

A = absorbance at 515 nm,

m = mass of the substance to be examined, in grams.

Cascarosides

Dilute the aqueous layer to 50.0 ml with *water R* . Treat 20.0 ml of this solution as described above in the assay of hydroxyanthracene glycosides other than cascarosides. Measure the absorbance *(2.2.25)* of the test solution at 440 nm and 515 nm. If the ratio of the absorbance at 515 nm to that at 440 nm is less than 2.4, the assay is invalid.

Calculate the percentage content of cascarosides, expressed as cascaroside A, using the following expression:

$$\frac{A \times 6.95}{m}$$

i.e. taking the specific absorbance to be 180.

A = absorbance at 515 nm,

m = mass of the substance to be examined, in grams.

Ph Eur

Cassia Oil

General Notices

(Ph Eur monograph 1496)

8007-80-5

Ph Eur

DEFINITION

Essential oil obtained by steam distillation of the leaves and young branches of *Cinnamomum cassia* Blume (*C. aromaticum* Nees).

CHARACTERS

Appearance

Clear, mobile, yellow or reddish-brown liquid.

Characteristic odour reminiscent of cinnamic aldehyde.

IDENTIFICATION

First identification *B.*

Second identification *A.*

A. Thin-layer chromatography *(2.2.27)* .

Test solution Dissolve 0.5 ml of the oil to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution Dissolve 50 µl of *trans-cinnamic aldehyde R* , 10 µl of *eugenol R* and 50 mg of *coumarin R* in *acetone R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel plate R.*

Mobile phase *methanol R, toluene R* (10:90 *V/V*).

Application 10 µl as bands.

Development Over a path of 15 cm.

Drying In air.

Detection A Examine in ultraviolet light at 365 nm.

Results A The zone of blue fluorescence in the chromatogram obtained with the test solution is similar in position and colour to the zone in the chromatogram obtained with the reference solution (coumarin).

Detection B Spray with *anisaldehyde solution R* ; examine in daylight while heating at 100-105 °C for 5-10 min.

Results B The chromatogram obtained with the reference solution shows in its upper part a violet zone (eugenol) and above this zone a greenish-blue zone (*trans*-cinnamic aldehyde). The chromatogram obtained with the test solution shows a zone similar in position and colour to the zone due to *trans*-cinnamic aldehyde in the chromatogram obtained with the reference solution and may show a very faint zone due to eugenol. Other faint zones are present.

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The principal peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution. Eugenol may be absent from the chromatogram obtained with the test solution.

TESTS

Relative density *(2.2.5)*

1.052 to 1.070.

Refractive index *(2.2.6)*

1.600 to 1.614.

Optical rotation *(2.2.7)*

- 1 ° to + 1 °.

Chromatographic profile

Gas chromatography *(2.2.28)* : use the normalisation procedure.

Test solution The oil to be examined.

Reference solution Dissolve 100 µl of *trans-cinnamic aldehyde R* , 10 µl of *cinnamyl acetate R* , 10 µl of *eugenol R* , 10 µl of *trans-2-methoxycinnamaldehyde R* and 20 mg of *coumarin R* in 1 ml of *acetone R* .

Column:

— *material*: fused silica;

— *size: l* = 60 m, Ø = about 0.25 mm;

— *stationary phase*: bonded *macrogol 20 000 R* .

Carrier gas *helium for chromatography R.*

Flow rate 1.5 ml/min.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	60
	10 - 75	60 → 190
	75 - 160	190
Injection port		200
Detector		240

Detection Flame ionisation.

Injection 0.2 µl.

Elution order Order indicated in the composition of the reference solution, depending on the operating conditions and the state of the column, coumarin may elute before or after trans-2-methoxycinnamaldehyde; record the retention times of these substances.

System suitability Reference solution:

— *resolution*: minimum 1.5 between the peaks due to trans-2-methoxycinnamaldehyde and coumarin.

Identification of components Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of each of these components. The percentages are within the following ranges:

— *trans-cinnamic aldehyde* : 70 per cent to 90 per cent;

— *cinnamyl acetate* : 1.0 per cent to 6.0 per cent;

— *eugenol* : less than 0.5 per cent;

— *trans-2-methoxycinnamaldehyde* : 3.0 per cent to 15 per cent;

— *coumarin* : 1.5 per cent to 4.0 per cent.

STORAGE

Protected from heat.

Bitter taste.

IDENTIFICATION

A. The hollow cylindrical, light green to dark brown stem has longitudinal ridges, and is branched only in its upper part. The sessile leaves are entire, decussately arranged, and have an ovate to lanceolate lamina, up to about 3 cm long. Both surfaces are glabrous and green to brownish-green. The inflorescence is diaxially branched. The tubular calyx is green and has 5 lanceolate, acuminate teeth. The corolla consists of a whitish tube divided into 5 elongated lanceolate pink to reddish lobes, about 5-8 mm long. 5 stamens are present attached to the top of the corolla tube. The ovary is superior and has a short style, a broad bifid stigma and numerous ovules. Cylindrical capsules, about 7-10 mm long, with small brown markedly rough seeds are frequently present.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greenish-yellow or brownish. Examine under a microscope, using *chloral hydrate solution R* . The powder shows the following diagnostic characters: fragments from the stem with lignified groups of fibres associated with narrow vessels, tracheidal vessels occasional vessels with spiral thickening; pitted parenchyma of the pith and medullary rays; fragments of leaf lamina with sinuous epidermal cells and striated cuticle, especially over the margins and surrounding the stomata; numerous stomata, mainly anisocytic *(2.8.3)* ; fragments of the palisade mesophyll, each cell containing a single prism crystal or, less frequently, a cluster crystal of calcium oxalate; fragments of calyx and corolla, those of the calyx with straight-walled epidermal cells, those of the inner epidermis of the corolla with obtuse papillae and radially striated cuticle; parts of the endothecium with reticulate or ridge-shaped wall thickenings; triangularly rounded or elliptical, yellow pollen grains, about 30 µm in diameter, with a distinctly pitted exine and 3 germinal pores; fragments of the wall of the fruit capsule composed of crossed layers of fusiform cells; oil droplets from the seeds, fragments of the epidermis of the testa showing large, brown reticulations and a pitted surface.

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 25 ml of *methanol R,* shake for 15 min and filter. Evaporate the filtrate to dryness under reduced pressure and at a temperature not exceeding 50 °C. Take up the residue with small quantities of *methanol R* so as to obtain 5 ml of solution, which may contain a sediment.

Reference solution Dissolve 1 mg of *rutin R* and 1 mg of *swertiamarin R* in *methanol R* and dilute to 1 ml with the same solvent.

Plate *TLC silica gel F_{254} plate R (5-40 µm) [or TLC silica gel F_{254} plate* R (2-10 µm)].

Mobile phase *water R, anhydrous formic acid R, ethyl formate R* (4:8:88 *V/V/V*).

Application 10 µl [or 5 µl] as bands.

Development In an unsaturated tank over a path of 12 cm [or 6 cm].

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

Results A See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other less intense quenching zones may be present in the chromatogram obtained with the test solution.

TESTS

Foreign matter *(2.8.2)*

Maximum 3 per cent.

Bitterness value *(2.8.15)*

Minimum 2000.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 6.0 per cent.

Ph Eur

Centella

General Notices

(Ph Eur monograph 1498)

Ph Eur

DEFINITION

Dried, fragmented aerial parts of *Centella asiatica* (L.) Urban.

Content

Minimum 6.0 per cent of total triterpenoid derivatives, expressed as asiaticoside ($C_{48}H_{78}O_{19}$; M_r 959.15) (dried drug).

CHARACTERS

The leaves are very variable in size; the petiole is usually 5-10, sometimes 15, times longer than the lamina, which is 10-40 mm long and 20-40 mm, sometimes up to 70 mm, wide.

IDENTIFICATION

A. The leaves are alternate, sometimes grouped together at the nodes, reniform or orbicular or oblong-elliptic and have palmate nervation, usually with 7 veins, and a crenate margin. Young leaves show a few trichomes on the lower surface while adult leaves are glabrous. The inflorescence, if present, is a single umbel which usually consists of 3 flowers, rarely 2 or 4; the flowers are very small (about 2 mm) pentamerous and have an inferior ovary; the fruit, a brownish-grey, orbicular cremocarp, up to 5 mm long, is very flattened laterally and has 7-9 prominent curved ridges.

B. Reduce the drug to a powder (355) *(2.9.12)*. The powder is greenish-grey. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: numerous fragments of leaf epidermis with polygonal cells having an irregularly striated cuticle, and paracytic stomata *(2.8.3)* that are more numerous in the lower epidermis; fragments of petiole epidermis with elongated cells; uniseriate, long, flexuous unicellular covering trichomes, occasionally multicellular; young leaves; spiral vessels; resiniferous canals; calcium oxalate prisms and macles up to 40 µm in diameter; bundles of narrow septate fibres from the stem; fragments of the fruit: layers of wide cells in a parquetry arrangement, annular vessels, parenchyma cells containing simple or compound starch granules.

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 5.0 g of the powdered drug (355) *(2.9.12)* add 50 ml of *ethanol (30 per cent V/V) R*; heat to boiling under a reflux condenser and centrifuge.

Reference solution Dissolve 5 mg of *asiaticoside R in methanol R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel G plate R* .

Mobile phase *acetic acid R, formic acid R, water R, ethyl acetate R* (11:11:27:100 *V/V/V/V*).

Application 10 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R* and heat at 100-105 °C; examine in daylight.

Results The chromatograms obtained with the reference solution and the test solution show in the lower third a greenish-blue zone (asiaticoside). The chromatogram obtained with the test solution shows also below this zone a violet zone (madecassoside); near the solvent front it shows a light blue zone (asiatic acid) and just below a pinkish-violet zone (madecassic acid) ; in the lower half it shows brown, grey and brownish-green zones between the starting point and the zone due to madecassoside, and other brownish-yellow or light yellow zones above the zone due to asiaticoside.

TESTS

Foreign matter *(2.8.2)*

Maximum 7 per cent, of which maximum 5 per cent of underground organs and maximum 2 per cent of other foreign matter.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 12.0 per cent.

ASSAY

Liquid chromatography *(2.2.29).*

Test solution Place 5.0 g of the powdered drug (355) *(2.9.12)* in a cellulose fingerstall in a continuous extraction apparatus (Soxhlet type). Add 100 ml of *methanol R* and heat for 8 h. Cool and dilute the extract to 100.0 ml with *methanol R* . Filter through a 0.45 µm filter. Dilute 2.0 ml of the filtrate to 20.0 ml with *methanol R* .

Reference solution Dissolve 20.0 mg of *asiaticoside R in methanol R* , if necessary using sonication, and dilute to 20.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with *methanol R* .

Column:

— *size*: *l* = 0.25 m, Ø = 4 mm;

— *stationary phase: octadecylsilyl silica gel for chromatography R* (5 µm).

Phase mobile:

— *mobile phase A: acetonitrile for chromatography R* ;

— *mobile phase B*: dilute 3 ml of *phosphoric acid R* to 1000 ml with *water R;*

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 65	22	78
65 - 66	55	45
66 - 76	95	5
76 - 85	22	78

Flow rate 1.0 ml/min.

Detection Spectrophotometer at 200 nm.

Injection 20 µl.

Relative retention with reference to the solvent: madecassoside = about 5.8; asiaticoside = about 8.1; madecassic acid = about 17.6; Asiatic acid = about 21.7.

Calculate the response factor R_F of asiaticoside using the following expression:

$$\frac{A_1 \times V_1 \times 100}{m_1 \times HPLC_\mathrm{P}}$$

A_1 = area of the peak due to asiaticoside in the chromatogram obtained with the reference solution;

V_1 = volume of the reference solution, in millilitres

m_1 = mass of asiaticoside in the reference solution, in milligrams;

$HPLC_P$ = purity determined for asiaticoside.

Calculate the mean response factor for asiaticoside using the following expression:

$$\frac{\sum_{i=1}^{N} \mathrm{RF}_i}{N}$$

$\sum_{i=1}^{N} \mathrm{RF}_i$ = sum of response factors of asiaticoside for the chromatograms obtained with the reference solution;

N = number of injections of reference solution ($N = 4$, at least).

Calculate the percentage content of total triterpenoid derivatives, expressed as asiaticoside, using the following expression:

$$\frac{V}{m}\left[\frac{A + (B \times 1.017) + (C \times 0.526) + (D \times 0.509)}{\overline{\mathrm{RF}}}\right]$$

V = volume of the test solution, in millilitres;

m = mass of the substance to be examined in the test solution, in milligrams;

A = area of the peak due to asiaticoside in the chromatogram obtained with the test solution;

B = area of the peak due to madecassoside in the chromatogram obtained with the test solution;

C = area of the peak due to madecassic acid in the chromatogram obtained with the test solution;

D = area of the peak due to asiatic acid in the chromatogram obtained with the test solution;

$\overline{\mathrm{RF}}$ = mean response factor of asiaticoside.

Ph Eur

Ceylon Cinnamon Bark Oil

General Notices

Cinnamon Oil

(Ph Eur monograph 1501)

Preparation

Concentrated Cinnamon Water

Ph Eur

DEFINITION

Essential oil obtained by steam distillation of the bark of the shoots of *Cinnamomum zeylanicum* Nees (*C. Verum* J.S. Presl.).

CHARACTERS

Appearance

Clear, mobile, light yellow liquid becoming reddish over time.

It has a characteristic odour reminiscent of cinnamic aldehyde.

IDENTIFICATION

First identification *B.*

Second identification *A.*

A. Thin-layer chromatography *(2.2.27)* .

Test solution Dissolve 1 ml of the essential oil to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution Dissolve 50 µl of *trans-cinnamic aldehyde R* , 10 µl of *eugenol R* , 10 µl of *linalol R* and 10 µl of β*-caryophyllene R* in *ethanol (96 per cent) R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel plate R.*

Mobile phase *methanol R, toluene R* (10:90 *V/V*).

Application 10 µl as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R* ; examine in daylight while heating at 100-105 °C for 5-10 min.

Results The zones in the chromatogram obtained with the test solution are similar in position and colour to those in the chromatogram obtained with the reference solution.

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The principal peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution. Safrole, coumarin and cineole may be absent from the chromatogram obtained with the test solution.

TESTS

Relative density *(2.2.5)*

1.000 to 1.030.

Refractive index *(2.2.6)*

1.572 to 1.591.

Optical rotation *(2.2.7)*

- 2° to + 1°.

Chromatographic profile

Gas chromatography *(2.2.28)* : use the normalisation procedure.

Test solution The essential oil to be examined.

Reference solution Dissolve 10 µl of *cineole R* , 10 µl of *linalol R* , 10 µl of *β-caryophyllene R* , 10 µl of *safrole R*, 100 µl of *trans-cinnamic aldehyde R* , 10 µl of *eugenol R* , 20 mg of *coumarin R* , 10 µl of *trans-2-methoxycinnamaldehyde R* and 10 µl of *benzyl benzoate R* in 1 ml of *acetone R* .

Column:

— *material*: fused silica;

— *size:* *l* = 60 m, Ø = 0.25 mm;

— *stationary phase*: bonded *macrogol 20 000 R* .

Carrier gas *helium for chromatography R.*

Flow rate 1.5 ml/min.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	60
	10 - 75	60 → 190
	75 - 200	190
Injection port		200
Detector		240

Detection Flame ionisation.

Injection 0.2 µl.

Elution order Order indicated in the composition of the reference solution; depending on the operating conditions and the state of the column, coumarin may elute before or after trans-2-methoxycinnamaldehyde; record the retention times of these substances.

System suitability Reference solution:

— *resolution*: minimum 1.5 between the peaks due to linalol and β-caryophyllene.

Identification of components Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of each of these components. The percentages are within the following ranges:

— *cineole* : less than 3.0 per cent;

— *linalol* : 1.0 per cent to 6.0 per cent;

— *β-caryophyllene* : 1.0 per cent to 4.0 per cent;

— *safrole*: less than 0.5 per cent;

— *trans-cinnamic aldehyde* : 55 per cent to 75 per cent;

— *eugenol* : less than 7.5 per cent;

— *coumarin* : less than 0.5 per cent;

— *trans-2-methoxycinnamaldehyde* : 0.1 per cent to 1.0 per cent;

— *benzyl benzoate* : less than 1.0 per cent.

STORAGE

Protected from heat.

Injection 0.2 µl.

Elution order The order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability Reference solution:

- *resolution*: minimum of 1.5 between the peaks due to linalol and β-caryophyllene.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of these components.

The percentages are within the following ranges:

- *cineole* : less than 1.0 per cent,
- *linalol* : 1.5 per cent to 3.5 per cent,
- β-*caryophyllene* : 1.5 per cent to 7.0 per cent,
- *safrole*: less than 3.0 per cent,
- *trans-cinnamic aldehyde* : less than 3.0 per cent,
- *cinnamyl acetate* : less than 2.0 per cent,
- *eugenol :* 70 per cent to 85 per cent,
- *coumarin:* less than 1.0 per cent.

STORAGE

In a well-filled, airtight container , protected from light and heat.

Ph Eur

Chamomile Flowers

General Notices

(Roman Chamomile Flower, Ph Eur monograph 0380)

Ph Eur

DEFINITION

Dried flower-heads of the cultivated double variety of *Chamaemelum nobile* (L.) All. (*Anthemis nobilis* L.).

Content

Minimum 7 ml/kg of essential oil (dried drug).

CHARACTERS

The flower-heads are white or yellowish-grey, composed of solitary hemispherical capitula, made up of a solid conical receptacle bearing the florets, each subtended by a transparent small palea.

Strong and characteristic odour.

IDENTIFICATION

A. The capitula have a diameter of 8-20 mm; the receptacle is solid; the base of the receptacle is surrounded by an involucre consisting of 2-3 rows of compact and imbricated bracts with scarious margins. Most florets are ligulate, but a few pale yellow tubular florets occur in the central region. Ligulate florets are white, dull, lanceolate and reflexed with a dark brown, inferior ovary, a filiform style and a bifid stigma; tubular florets have a five-toothed corolla tube, 5 syngenesious, epipetalous stamens and a gynoecium similar to that of the ligulate florets.

B. Separate the capitulum into its different parts. Examine under a microscope using *chloral hydrate solution R.* All parts of the flower-heads are covered with numerous small yellow glistening glandular trichomes. The involucral bracts and paleae have epidermal cells in longitudinal rows, sclerified at the base and they are covered with conical trichomes, about 500 µm long, each composed of 3-4 very short base cells and a long, bent, terminal cell about 20 µm wide. The corolla of the ligulate flowers consists of papillary cells with cuticular striations. The ovaries of both kinds of florets have at their base a sclerous ring consisting of a single row of cells. The receptacle and the ovaries contain small clusters of calcium oxalate. The pollen grains have a diameter of about 35 µm and are rounded or triangular with 3 germinal pores and a spiny exine.

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 0.5 g of the powdered drug (710) *(2.9.12)* add 10 ml of *methanol R* and heat with shaking in a water-bath at 60 °C for 5 min. Allow to cool and filter.

Reference solution Dissolve 2.5 mg of *apigenin R* and 2.5 mg of *apigenin-7-glucoside R* in 10 ml of *methanol R*.

Plate *TLC silica gel plate R*.

Mobile phase *glacial acetic acid R, water R, butanol R* (17:17:66 *V/V/V*).

Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying At 100-105 °C for 5 min.

Detection Spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, using about 10 ml for a plate 200 mm square; subsequently spray with the same volume of a 50 g/l solution of *macrogol 400 R* in *methanol R*; allow to stand for about 30 min and examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the reference solution shows in the upper third a yellowish-green fluorescent zone (apigenin) and in the middle third a yellowish fluorescent zone (apigenin-7-glucoside). The chromatogram obtained with the test solution shows a yellowish-green fluorescent zone and a yellowish fluorescent zone similar in position and fluorescence to the zones due to apigenin and apigenin-7-glucoside in the chromatogram obtained with the reference solution; above the apigenin-7-glucoside zone there is a brownish fluorescent zone (luteolin); immediately below the apigenin-7-glucoside zone there is a light brownish fluorescent zone (apiin); immediately below the apiin zone there is a bright blue fluorescent zone and below this zone a bright blue fluorescent zone; other faint zones may be present.

TESTS

Diameter of the flower-heads: maximum 3 per cent of flower-heads have a diameter smaller than 8 mm.

Deteriorated flower-heads: brown or darkened flower-heads are absent.

Loss on drying *(2.2.32)*

Maximum 11.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 8.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs *(2.8.12)*. Use 20.0 g of whole drug, a 500 ml round-bottomed flask, 250 ml of *water R* as the distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 3-3.5 ml/min for 3 h.

Ph Eur

Cinchona Bark

General Notices

Cinchona; Red Cinchona Bark

(Ph Eur monograph 0174)

When Powdered Cinchona is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter shall be dispensed or supplied.

Ph Eur

DEFINITION

Whole or cut, dried bark of *Cinchona pubescens* Vahl (*Cinchona succirubra* Pav.), of *Cinchona calisaya* Wedd., of *Cinchona ledgeriana* Moens ex Trimen or of their varieties or hybrids.

Content

Minimum 6.5 per cent of total alkaloids, of which 30 per cent to 60 per cent consists of quinine-type alkaloids (dried drug).

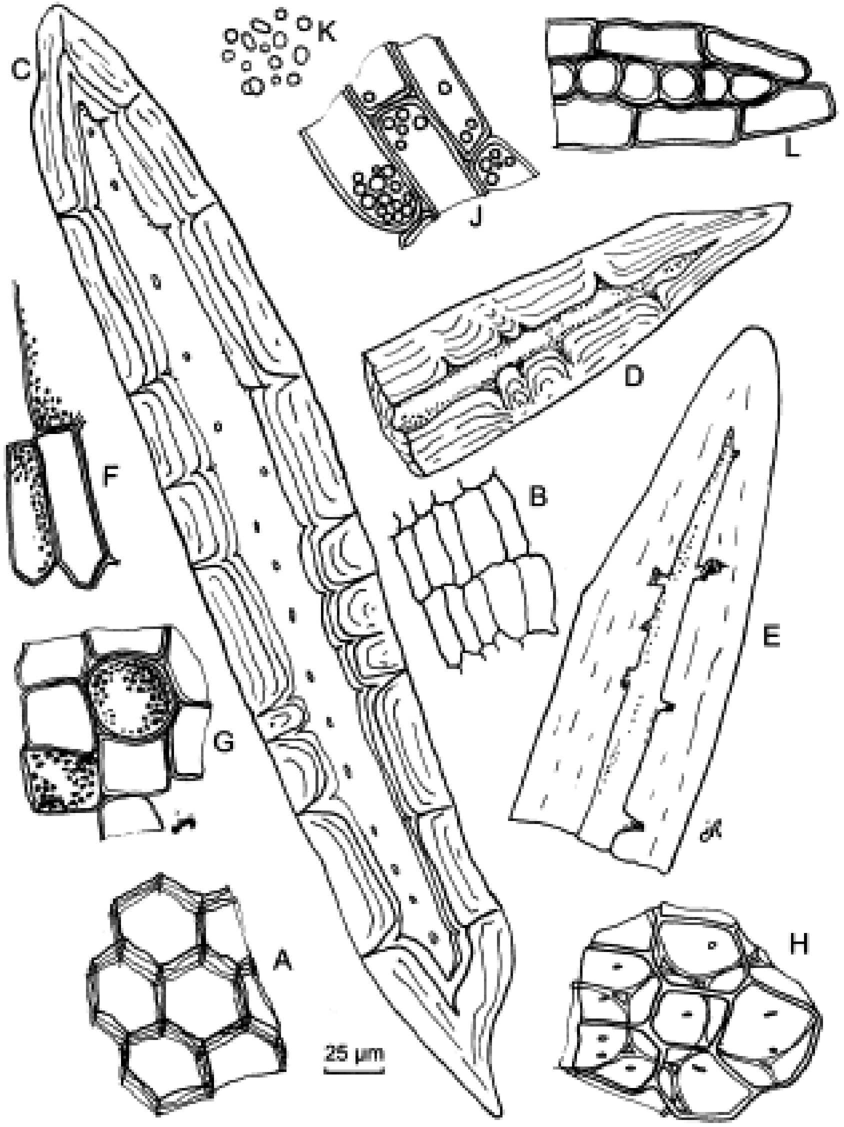
CHARACTERS

Intense bitter, somewhat astringent taste.

IDENTIFICATION

A. The stem and branch bark is supplied in quilled or curved pieces 2-6 mm thick. The outer surface is dull brownish-grey or grey and frequently bears lichens; it is usually rough, marked with transverse fissures and longitudinally furrowed or wrinkled; exfoliation of the outer surface occurs in some varieties. The inner surface is striated and deep reddish-brown; the fracture is short in the outer part and fibrous in the inner part.

B. Reduce to a powder (355) *(2.9.12)*. The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: thin-walled cork cells filled with reddish-brown contents; yellow, spindle-shaped striated phloem fibres up to 90 µm in diameter and up to 1300 µm in length, very thick-walled with an uneven lumen and with conspicuous, funnel-shaped pits; parenchymatous idioblasts filled with microprisms of calcium oxalate; clusters of thin-walled phloem parenchyma cells. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R* . The powder shows a few starch granules 6-10 µm in diameter; mostly simple but occasionally with 2 or 3 components.



A, B. Cork cells in surface view (A) and in transverse section (B)

C, D, E. Phloem fibres

F, G. Parenchymatous idioblasts filled with microprisms of calcium oxalate

H. Parenchymatous cells

J. Parenchymatous cells containing starch granules

K. Starch granules

L. Phloem parenchyma with medullary ray in tangential section

Figure 0174.-1. – *Illustration of powdered herbal drug of cinchona bark (see Identification B)*

C. Thin-layer chromatography *(2.2.27)* .

Test solution   To 0.10 g of the powdered drug (180) *(2.9.12)* in a test-tube add 0.1 ml of *concentrated ammonia R* and 5 ml of *methylene chloride R* . Shake vigorously occasionally during 30 min and filter. Evaporate the filtrate to dryness on a water-bath and dissolve the residue in 1 ml of *anhydrous ethanol R* .

Reference solution Dissolve 17.5 mg of *quinine R*, 2.5 mg of *quinidine R*, 10 mg of *cinchonine R* and 10 mg of *cinchonidine R* in 5 ml of *anhydrous ethanol R*.

Plate *TLC silica gel plate R.*

Mobile phase *diethylamine R, ethyl acetate R, toluene R* (10:20:70 *V/V/V*).

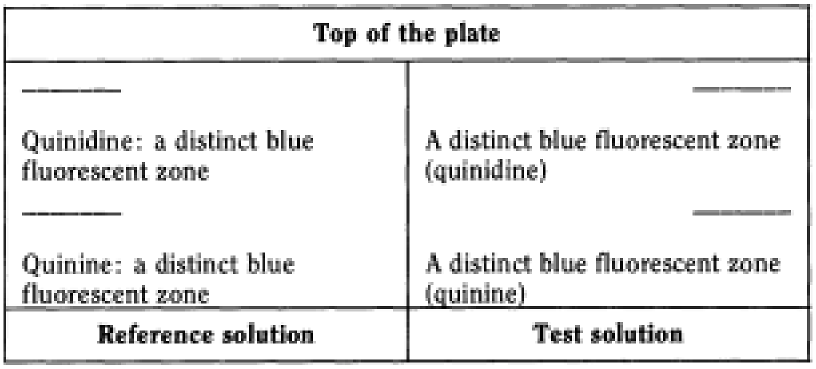
Application 10 µl, as bands.

Development Twice over a path of 15 cm.

Drying At 100-105 °C, then allow to cool.

Detection A Spray with *anhydrous formic acid R* and allow to dry in air; examine in ultraviolet light at 365 nm.

Results A See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones are present in the chromatogram obtained with the test solution.



Top of the plate	
———	———
Quinidine: a distinct blue fluorescent zone	A distinct blue fluorescent zone (quinidine)

TESTS

Total ash ***(2.4.16)***

Maximum 6.0 per cent.

Loss on drying ***(2.2.32)***

Maximum 10 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

ASSAY

Test solution In a 250 ml conical flask mix 1.000 g of the powdered drug (180) *(2.9.12)* with 10 ml of *water R* and 7 ml of *dilute hydrochloric acid R* . Heat in a water-bath for 30 min, allow to cool and add 25 ml of *methylene chloride R* , 50 ml of *ether R* and 5 ml of a 200 g/l solution of *sodium hydroxide R* . Shake the mixture repeatedly for 30 min, add 3 g of *powdered tragacanth R* and shake until the mixture becomes clear. Filter through a plug of absorbent cotton and rinse the flask and the cotton with 5 quantities, each of 20 ml, of a mixture of 1 volume of *methylene chloride R* and 2 volumes of *ether R* . Combine the filtrate and washings, evaporate to dryness and dissolve the residue in 10.0 ml of *anhydrous ethanol R* . Evaporate 5.0 ml of this solution to dryness, dissolve the residue in *0.1 M hydrochloric acid* and dilute to 1000.0 ml with the same acid.

Reference solutions Dissolve separately 30.0 mg of *quinine R* and 30.0 mg of *cinchonine R* in *0.1 M hydrochloric acid* and dilute each solution to 1000.0 ml with the same acid.

Measure the absorbances *(2.2.25)* of the 3 solutions at 316 nm and 348 nm using *0.1 M hydrochloric acid* as the compensation liquid.

Calculate the percentage content of alkaloids using the following equations:

$$x = \frac{[A_{316} \times A_{348c}] - [A_{316c} \times A_{348}]}{[A_{316q} \times A_{348c}] - [A_{316c} \times A_{348q}]} \times \frac{100}{m} \times \frac{2}{1000}$$

$$y = \frac{[A_{316} \times A_{348q}] - [A_{316q} \times A_{348}]}{[A_{316c} \times A_{348q}] - [A_{316q} \times A_{348c}]} \times \frac{100}{m} \times \frac{2}{1000}$$

m = mass of the drug used, in grams;

x = percentage content of quinine-type alkaloids;

y = percentage content of cinchonine-type alkaloids;

A_{316} = absorbance of the test solution at 316 nm;

A_{348} = absorbance of the test solution at 348 nm;

A_{316c} = absorbance of the reference solution containing cinchonine at 316 nm, corrected to a concentration of 1 mg/1000 ml;

A_{316q} = absorbance of the reference solution containing quinine at 316 nm, corrected to a concentration of 1 mg/1000 ml;

A_{348c} = absorbance of the reference solution containing cinchonine at 348 nm, corrected to a concentration of 1 mg/1000 ml;

A_{348q} = absorbance of the reference solution containing quinine at 348 nm, corrected to a concentration of 1 mg/1000 ml.

Calculate the content of total alkaloids ($x + y$), and calculate the relative content of quinine-type alkaloids using the following expression:

$$\frac{100x}{x + y}$$

Ph Eur

Cinchona Liquid Extract, Standardised

General Notices

(Ph Eur monograph 1818)

Ph Eur

DEFINITION

Liquid extract produced from *Cinchona bark (0174).*

Content

Minimum 4.0 per cent and maximum 5.0 per cent of total alkaloids, of which 30 per cent to 60 per cent are alkaloids of the quinine type ($C_{20}H_{24}N_2O_2$; M_r 324.4).

PRODUCTION

Standardised cinchona liquid extract is produced from the herbal drug by an appropriate procedure using:

— ethanol (30 per cent *V/V* to 90 per cent *V/V*), or;

— a mixture of diluted hydrochloric acid, ethanol (96 per cent *V/V*), glycerol, water (1:2:5:20 *V/V).*

CHARACTERS

Appearance

Brownish-red liquid.

It has a bitter, astringent taste.

IDENTIFICATION

Thin-layer chromatography (2.2.27).

Test solution Dilute 1 ml of the extract to be examined in 1 ml of *anhydrous ethanol R*.

Reference solution Dissolve 2.5 mg of *quinidine R*, 10 mg of *cinchonidine R*, 10 mg of *cinchonine R* and 17.5 mg of *quinine R* in 5 ml of *anhydrous ethanol R*.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *diethylamine R*, *ethyl acetate R*, *toluene R* (10:20:70 *V/V/V*).

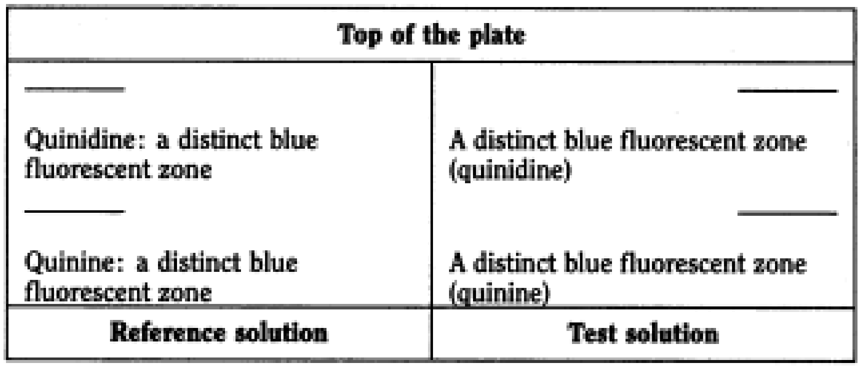
Application 10 µl [or 2 µl] as bands.

Development Twice over a path of 15 cm [or 6 cm].

Drying At 100-105 °C then allow to cool.

Detection A Spray with a 50 g/l solution of *anhydrous formic acid R* and allow to dry in air; examine in ultraviolet light at 365 nm.

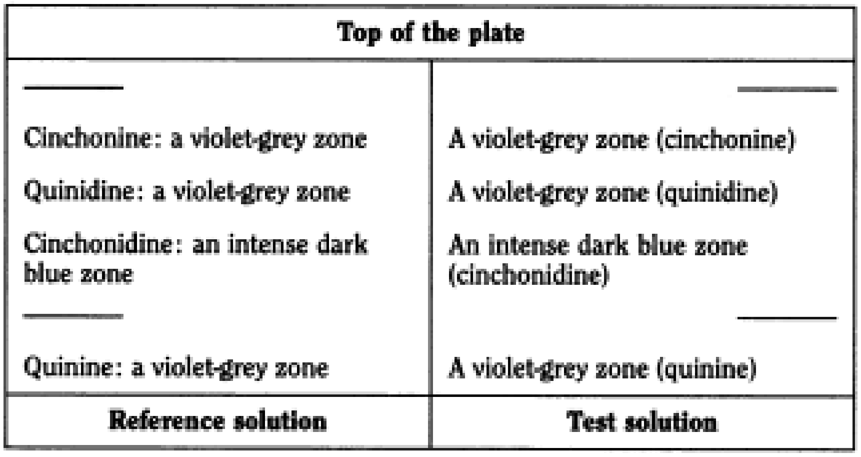
Results A See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
———	———
Quinidine: a distinct blue fluorescent zone	A distinct blue fluorescent zone (quinidine)
———	———
Quinine: a distinct blue fluorescent zone	A distinct blue fluorescent zone (quinine)
Reference solution	**Test solution**

Detection B Spray with *iodoplatinate reagent R* .

Results B See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
———	———
Cinchonine: a violet-grey zone	A violet-grey zone (cinchonine)
Quinidine: a violet-grey zone	A violet-grey zone (quinidine)
Cinchonidine: an intense dark blue zone	An intense dark blue zone (cinchonidine)
———	———
Quinine: a violet-grey zone	A violet-grey zone (quinine)
Reference solution	**Test solution**

TESTS

Ethanol *(2.9.10)*

95 per cent to 105 per cent of the content stated on the label.

Methanol and 2-propanol *(2.9.11)*

Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

Dry residue ***(2.8.16)***

Minimum 12.0 per cent for glycerol-free standardised cinchona liquid extract and minimum 30.0 per cent for glycerol-containing standardised cinchona extract, determined on 2.0 g.

ASSAY

Test solution In a 250 ml conical flask, mix about 1.000 g of the extract to be examined with 10 ml of *water R* and 7 ml of *dilute hydrochloric acid R*. Heat in a water-bath for 30 min, allow to cool and add 25 ml of *methylene chloride R*, 50 ml of *ether R* and 5 ml of a 200 g/l solution of *sodium hydroxide R*. Shake the mixture frequently for 30 min, add 3 g of powdered *tragacanth R* and shake until the mixture becomes clear. Filter through a plug of absorbent cotton, rinse the flask and the cotton with 5 quantities, each of 20 ml, of a mixture of 1 volume of *methylene chloride R* and 2 volumes of *ether R*. Combine the filtrate and washings, evaporate to dryness and dissolve the residue in 10.0 ml of *ethanol (96 per cent) R*. Evaporate 5.0 ml of this solution to dryness, dissolve the residue in *0.1 M hydrochloric acid* and dilute to 1000.0 ml with the same acid.

Reference solution (a) Dissolve 30.0 mg of *cinchonine R* in *0.1 M hydrochloric acid* and dilute to 1000.0 ml with the same acid.

Reference solution (b) Dissolve 30.0 mg of *quinine R* in *0.1 M hydrochloric acid* and dilute to 1000.0 ml with the same acid.

Measure the absorbances (*2.2.25*) of the 3 solutions at 316 nm and 348 nm, using *0.1 M hydrochloric acid* as the compensation liquid.

Calculate the percentage content of alkaloids from the following equations:

$$n_1 = \frac{[A_1 \times A_{2a}] - [A_{1a} \times A_2]}{[A_{1b} \times A_{2a}] - [A_{1a} \times A_{2b}]} \times \frac{100}{m} \times \frac{2}{1000}$$

$$n_2 = \frac{[A_1 \times A_{2b}] - [A_{1b} \times A_2]}{[A_{1a} \times A_{2b}] - [A_{1b} \times A_{2a}]} \times \frac{100}{m} \times \frac{2}{1000}$$

m = mass of the liquid extract to be examined in grams

n_1 = percentage content of quinine-type alkaloids

n_2 = percentage content of cinchonine-type alkaloids

A_1 = absorbance of the test solution at 316 nm

A_2 = absorbance of the test solution at 348 nm

A_{1a} = absorbance of reference solution (a) at 316 nm, corrected to a concentration of 1 mg/1000 ml

A_{1b} = absorbance of reference solution (b) at 316 nm, corrected to a concentration of 1 mg/1000 ml

A_{2a} = absorbance of reference solution (a) at 348 nm, corrected to a concentration of 1 mg/1000 ml

A_{2b} = absorbance of reference solution (b) at 348 nm, corrected to a concentration of 1 mg/1000 ml

Calculate the content of total alkaloids ($n_1 + n_2$), and the relative content of quinine-type alkaloids, from the following expression:

$$\frac{n_1 \times 100}{n_1 + n_2}$$

LABELLING

The label states the solvent composition used for the production.

Ph Eur

Cinnamon Tincture

General Notices

(Ph Eur monograph 1819)

Ph Eur

DEFINITION

Tincture produced from *Cinnamon (0387)*.

PRODUCTION

The tincture is produced from 1 part of the drug and 5 parts of ethanol (70 per cent *V/V*) by an appropriate procedure.

CHARACTERS

Appearance

Clear, brownish-red liquid, with a characteristic odour.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)* .

Test solution Place 10 ml of the tincture to be examined, 10 ml of *saturated sodium chloride solution R* and 5 ml of *toluene R* in a ground glass-stoppered tube. Shake for 2 min and centrifuge for 10 min. Use the organic layer.

Reference solution Dissolve 5 µl of *eugenol R* , 25 µl of *trans-cinnamic aldehyde R* and 5 µl of *trans-2-methoxycinnamaldehyde R* in *toluene R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel G plate R.*

Mobile phase *methylene chloride R.*

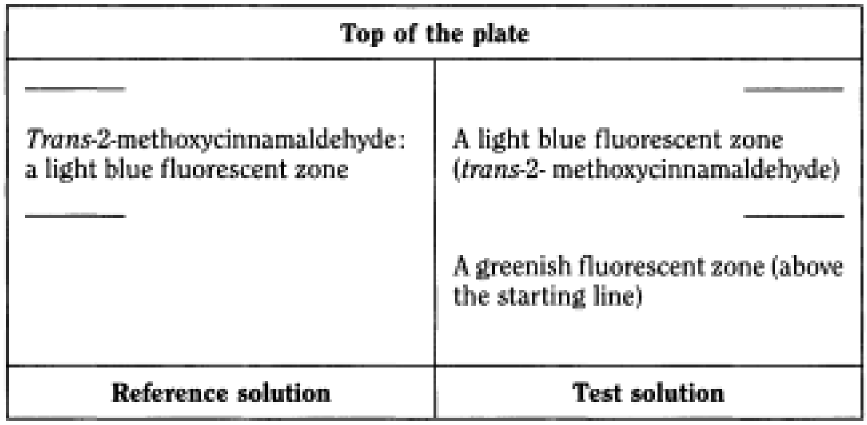
Application 20 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection A Examine in ultraviolet light at 365 nm.

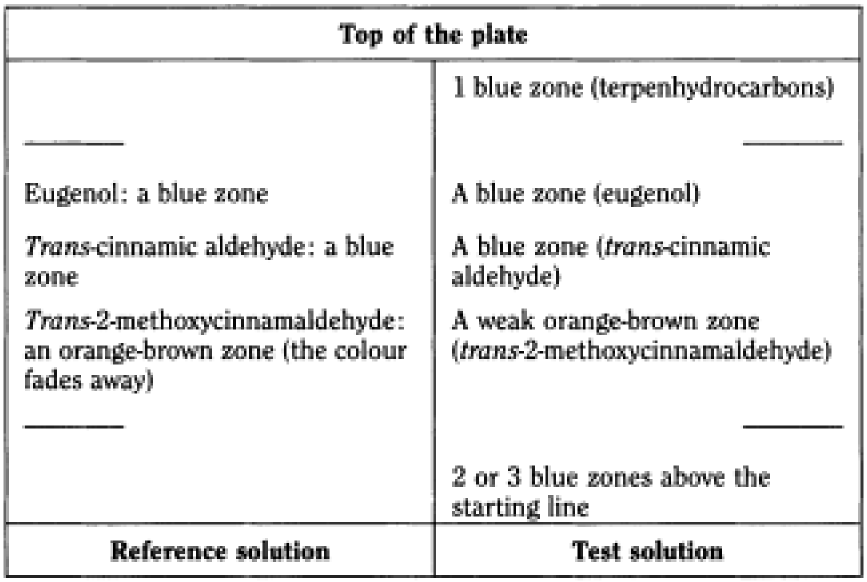
Results A See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
———	———
Trans-2-methoxycinnamaldehyde: a light blue fluorescent zone	A light blue fluorescent zone (*trans*-2- methoxycinnamaldehyde)
———	———
	A greenish fluorescent zone (above the starting line)
Reference solution	**Test solution**

Detection B Spray with a 200 g/l solution of *phosphomolybdic acid R* in *ethanol R* . Examine in daylight while heating at 100-105 °C for 5-10 min.

Results B See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	1 blue zone (terpenhydrocarbons)
———	———
Eugenol: a blue zone	A blue zone (eugenol)
Trans-cinnamic aldehyde: a blue zone	A blue zone (*trans*-cinnamic aldehyde)
Trans-2-methoxycinnamaldehyde: an orange-brown zone (the colour fades away)	A weak orange-brown zone (*trans*-2-methoxycinnamaldehyde)
———	———
	2 or 3 blue zones above the starting line
Reference solution	**Test solution**

TESTS

Ethanol *(2.9.10)*

64 per cent *V/V* to 70 per cent *V/V*.

Methanol and 2-propanol *(2.9.11)*

Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

Dry residue *(2.8.16)*

Minimum 1.5 per cent *m/m*, determined on 5.0 g.

Cinnamon

General Notices

Cinnamon Bark; Ceylon Cinnamon

(Ph Eur monograph 0387)

When Powdered Cinnamon is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and containing not less than 1.0% v/w (10 ml/kg) of essential oil shall be dispensed or supplied.

Ph Eur

DEFINITION

Dried bark, freed from the outer cork and the underlying parenchyma, and shoots grown on cut stock of *Cinnamomum zeylanicum* Nees.

Content

Minimum 12 ml/kg of essential oil.

CHARACTERS

Characteristic, aromatic odour.

IDENTIFICATION

A. The bark is about 0.2-0.8 mm thick and occurs in closely-packed compound quills made up of single or double quills. The outer surface is smooth, yellowish-brown with faint scars marking the position of leaves and axillary buds and has fine, whitish and wavy longitudinal striations. The inner surface is slightly darker and longitudinally striated. The fracture is short and fibrous.

B Reduce to a powder (355) *(2.9.12)*. The powder is yellowish or reddish-brown. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: groups of rounded sclereids with pitted, channelled and moderately thickened walls; numerous colourless single fibres, often whole with narrow lumen and thickened, lignified walls and few pits; small acicular crystals of calcium oxalate. Cork fragments are absent or very rare. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R* ; the powder shows abundant starch granules.

C. Thin-layer chromatography *(2.2.27)* .

Test solution Shake 0.1 g of powdered drug (500) (*2.9.12*) with 2 ml of *methylene chloride R* for 15 min. Filter and evaporate the filtrate carefully almost to dryness on a water-bath.

Dissolve the residue in 0.4 ml of *toluene R*.

Reference solution Dissolve 50 µl of *cinnamic aldehyde R* and 10 µl *of eugenol R* in *toluene R*, then dilute to 10 ml with the same solvent.

Plate *TLC silica gel GF $_{254}$ plate R*.

Mobile phase *methylene chloride R*.

Application 10 µl as bands of 20 mm by 3 mm.

Development Over a path of 10 cm.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm and mark the quenching zones, then, examine in ultraviolet light at 365 nm and mark the fluorescent zones.

Results A In ultraviolet light at 254 nm, the chromatograms obtained with the test solution and the reference solution show a quenching zone due to cinnamaldehyde in the median part and just above it a weaker quenching zone due to eugenol. In ultraviolet light at 365 nm, the chromatogram obtained with the test solution shows a zone of light blue fluorescence due to *o*-methoxy-cinnamaldehyde just below the zone due to cinnamaldehyde.

Detection B Spray with *phloroglucinol solution R*.

Results B The zone due to cinnamaldehyde is yellowish-brown and the zone due to *o*-methoxycinn-amaldehyde is violet.

TESTS

Total ash *(2.4.16)*

Maximum 6.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs *(2.8.12)*. Use a 500 ml flask, 200 ml of *0.1 M hydrochloric acid* as the distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Powder the drug (710) *(2.9.12)* and proceed immediately with the determination, using 20.0 g. Distil at a rate of 2.5-3.5 ml/min for 3 h.

Ph Eur

Citronella Oil

General Notices

(Ph Eur monograph 1609)

Ph Eur

DEFINITION

Oil obtained by steam distillation from the fresh or partially dried aerial parts of *Cymbopogon winterianus* Jowitt.

CHARACTERS

Pale yellow to brown-yellow liquid, with a very strong odour of citronellal.

IDENTIFICATION

First identification *B.*

Second identification *A.*

A. Thin-layer chromatography *(2.2.27)* .

Test solution Dilute 0.1 g of citronella oil in 10.0 ml of *alcohol R* .

Reference solution Dilute 20 µl of *citronellal R* in 10.0 ml of *alcohol R* .

Plate *TLC silica gel plate R* .

Mobile phase *ethyl acetate R, toluene R* (10:90 *V/V*).

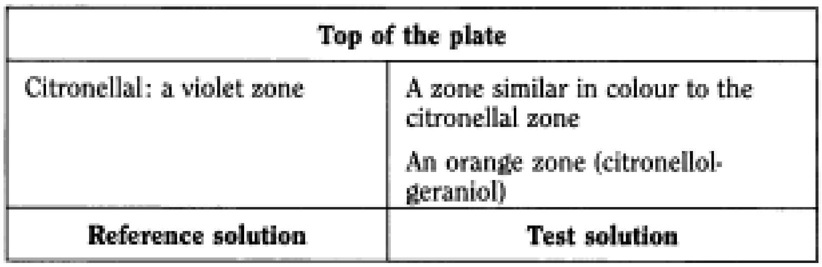
Application 5 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R* and heat at 100-105 °C for 10 min. Examine in ultraviolet light at 365 nm.

Result See below the sequence of the zones present in the chromatograms obtained with the reference and test solutions. Furthermore, other zones are present in the chromatogram obtained with the test solution.



Top of the plate	
Citronellal: a violet zone	A zone similar in colour to the citronellal zone An orange zone (citronellol-geraniol)
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution. Neral and geranial may be absent in the chromatogram obtained with the test solution.

TESTS

Relative density *(2.2.5)*

0.881 to 0.895.

Refractive index *(2.2.6)*

1.463 to 1.475.

Optical rotation *(2.2.7)*

- 4° to + 1.5°.

Chromatographic profile

Gas chromatography *(2.2.28)* : use the normalisation procedure.

Test solution The substance to be examined.

Reference solution Dilute 25 µl of *limonene R*, 100 µl of *citronellal R*, 25 µl of *citronellyl acetate R*, 25 µl of *citral R*, 25 µl of *geranyl acetate R*, 25 µl of *citronellol R* and 100 µl of *geraniol R* in 5 ml of *hexane R.*

Column:

— *material*: fused silica,

— *size*: *l* = 60 m, Ø = 0.25 mm,

— *stationary phase: macrogol 20 000 R* (0.2 µm).

Carrier gas *helium for chromatography R.*

Flow rate 1.0 ml/min.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 2	80
	2 - 26	80 → 150
	26 - 42	150 → 185
	42 - 49	185 → 250
Injection port		260
Detector		260

Detection Flame ionisation.

Injection 1 µl of the reference solution, 0.2 µl of the test solution.

Elution order The order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability Reference solution:

— *resolution*: minimum of 1.2 between the peaks due to geranyl acetate and citronellol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of each of these components.

The percentages are within the following values:

— *limonene* : 1.0 per cent to 5.0 per cent,

— *citronellal*: 30.0 per cent to 45.0 per cent,

— *citronellyl acetate*: 2.0 per cent to 4.0 per cent,

— *neral:* less than 2.0 per cent,

— *geranial*: less than 2.0 per cent,

— *geranyl acetate* : 3.0 per cent to 8.0 per cent,

— *citronellol*: 9.0 per cent to 15.0 per cent,

— *geraniol* : 20.0 per cent to 25.0 per cent.

STORAGE

In a well-filled container, protected from light.

Ph Eur

Clove Oil

General Notices

(Ph Eur monograph 1091)

Ph Eur

DEFINITION

Essential oil obtained by steam distillation from the dried flower buds of *Syzygium aromaticum* (L.) Merill et L. M. Perry (*Eugenia caryophyllus* (C. Spreng.) Bull. et Harr.).

CHARACTERS

Appearance

Clear, yellow liquid, which becomes brown when exposed to air.

Solubility

Miscible with methylene chloride, with toluene and with fatty oils.

IDENTIFICATION

First identification *B,*

Second identification *A.*

A. Thin-layer chromatography *(2.2.27)* .

Test solution Dissolve 20 µl of the substance to be examined in 2.0 ml of *toluene R.*

Reference solution Dissolve 15 µl of *eugenol R* and 15 µl of *acetyleugenol R* in 2.0 ml of *toluene R.*

Plate *TLC silica gel* F_{254} *plate R* .

Mobile phase *toluene R.*

Application 20 µl of the test solution and 15 µl of the reference solution, as bands.

Development Twice in an unsaturated tank over a path of 10 cm; allow to stand for 5 min between the 2 developments.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm and mark the quenching zones.

Results A The chromatogram obtained with the test solution shows in the middle part a quenching zone (eugenol) that is similar in position to the quenching zone in the chromatogram obtained with the reference solution; just below, there is a weak quenching zone (acetyleugenol) that is similar in position to the zone of acetyleugenol in the chromatogram obtained with the reference solution.

Detection B Spray with *anisaldehyde solution R* and examine in daylight while heating at 100-105 °C for 5-10 min.

Results B The zone due to eugenol in the chromatograms obtained with the test and reference solutions is strong brownish-violet and the zone due to acetyleugenol in the chromatogram obtained with the test solution is faint violet-blue; in the chromatogram obtained with the test solution there are other coloured zones, particularly a faint red zone in the lower part and a reddish-violet zone (β-caryophyllene) in the upper part.

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The 3 principal peaks in chromatogram obtained with the test solution are similar in retention time to the 3 principal peaks in the chromatogram obtained with the reference solution.

TESTS

Relative density *(2.2.5)*

1.030 to 1.063.

Refractive index *(2.2.6)*

1.528 to 1.537.

Optical rotation *(2.2.7)*

0° to - 2°.

Fatty oils and resinified essential oils *(2.8.7)*

It complies with the test.

Solubility in alcohol *(2.8.10)*

1.0 ml is soluble in 2.0 ml and more of *ethanol (70 per cent V/V) R*.

Chromatographic profile.

Gas chromatography *(2.2.28)*. Use the normalisation procedure.

Test solution Dissolve 0.2 g of the substance to be examined in 10 g of *hexane R*.

Reference solution Dissolve 7 mg of β-*caryophyllene R*, 80 mg of *eugenol* R and 4 mg of *acetyleugenol R* in 10 g of *hexane R*.

Column:

— *material*: fused silica;

— *size*: *l* = 60 m, Ø = about 0.25 mm;

— *stationary phase*: *macrogol 20 000 R*.

Carrier gas *helium for chromatography R.*

Flow rate 1.5 ml/min.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 8	60
	8 - 48	60 → 180
	48 - 53	180
Injection port		270
Detector		270

Detection Flame ionisation.

Injection 1.0 µl.

Elution order Order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability Reference solution:

— *resolution*: minimum 1.5 between the peaks due to eugenol and acetyleugenol;

— *number of theoretical plates* : minimum 30 000, calculated for the peak due to β-caryophyllene at 110 °C.

Identification of components Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution on the chromatogram obtained with the test solution.

Determine the percentage content of each of these components. The limits are within the following ranges:

— β-*caryophyllene* : 5.0 per cent to 14.0 per cent;

— *eugenol* : 75.0 per cent to 88.0 per cent;

— *acetyleugenol* : 4.0 per cent to 15.0 per cent.

STORAGE

Protected from heat.

Ph Eur

Clove

General Notices

(Ph Eur monograph 0376)

When Powdered Clove is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter and containing not less than 12.0% v/w (120 ml/kg) of essential oil shall be dispensed or supplied.

Ph Eur

DEFINITION

Whole flower buds of *Syzygium aromaticum* (L.) Merill et L. M. Perry (*Eugenia caryophyllus* (C. Spreng.) Bull. et Harr.) dried until they become reddish-brown.

Content

Minimum 150 ml/kg of essential oil.

CHARACTERS

Characteristic, aromatic odour.

IDENTIFICATION

A. The flower bud is reddish-brown and consists of a quadrangular stalked portion, the hypanthium, 10-12 mm long and 2-3 mm in diameter, surmounted by 4 divergent lobes of sepals which surround a globular head 4-6 mm in diameter. A bilocular ovary containing numerous ovules is situated in the upper part of the hypanthium. The head is globular and dome-shaped, composed of 4 imbricated petals that enclose numerous incurved stamens and a short, erect style with a nectary disc at the base. The hypanthium exudes essential oil when indented with the finger-nail.

B. Reduce to a powder (355) *(2.9.12)*. The powder is dark brown and has the odour and taste of the unground drug. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: fragments of the hypanthium showing the epidermis and underlying parenchyma containing large oil glands; short fibres occurring singly or in small groups, with thickened, lignified walls and few pits; abundant fragments of parenchyma containing cluster crystals of calcium oxalate; numerous triangular pollen grains about 15 µm in diameter with 3 pores in the angles. Starch granules are absent.

C. Thin-layer chromatography *(2.2.27).*

Test solution Shake 0.1 g of the powdered drug (500) *(2.9.12)* with 2 ml of *methylene* *chloride R* for 15 min. Filter and carefully evaporate the filtrate to dryness on a water-bath. Dissolve the residue in 2 ml of *toluene R* .

Reference solution Dissolve 20 µl of *eugenol R* in 2 ml of *toluene R* .

Plate *TLC silica gel GF $_{254}$ plate R.*

Mobile phase *toluene R.*

Application 10 µl of the reference solution and 20 µl of the test solution, as bands of 20 mm by 3 mm.

Development Twice, in an unsaturated tank over a path of 10 cm; allow the plate to stand for 5 min between the 2 developments.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm and mark the quenching zones.

Results A In the chromatogram obtained with the test solution there is in the median part a quenching zone due to eugenol similar in position to the quenching zone in the chromatogram obtained with the reference solution and there may be a weak quenching zone due to acetyleugenol just below the zone due to eugenol.

Detection B Spray with *anisaldehyde solution R* using 10 ml for a plate 200 mm square and heat at 100-105 °C for 5-10 min. Examine in daylight.

Results B The zones due to eugenol in the chromatograms obtained with the test and reference solutions are strong brownish-violet and the zone due to acetyleugenol in the chromatogram obtained with the test solution is faint violet-blue. In the chromatogram obtained with the test solution there are other coloured zones, particularly a faint red zone in the lower part and a reddish-violet zone due to caryophyllene in the upper part.

TESTS

Foreign matter *(2.8.2)*

Maximum 6 per cent of peduncles, petioles and fruits, maximum 2 per cent of deteriorated cloves and maximum 0.5 per cent of other foreign matter.

Total ash *(2.4.16)*

Maximum 7.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs *(2.8.12)* . Use a 250 ml flask, 100 ml of *water R* as the distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Grind 5.0 g of the drug with 5.0 g of *diatomaceous earth R* to form a fine, homogeneous powder and proceed immediately with the determination using 4.0 g of the mixture. Distil at a rate of 2.5-3.5 ml/min for 2 h.

Ph Eur

Cochineal

General Notices

DEFINITION

Cochineal is the dried female insect, *Dactylopius coccus* Costa, containing eggs and larvae.

CHARACTERISTICS

Odour, characteristic.

Macroscopical Purplish black or purplish grey; about 3.5 to 5.5 mm long and 3 to 4.5 mm wide, plano-convex and somewhat oval in outline; the convex dorsal surface is transversely wrinkled and shows about 11 segments; the flat or slightly concave ventral surface carries upon the anterior part two seven-jointed straight antennae, three pairs of short legs, each terminating in a single claw, and a mouth from which projects the remains of a long filiform proboscis; these appendages are frequently more or less broken. Easily reduced to powder, which is dark red or puce.

Microscopical Scattered irregularly over the whole dermis are numerous solitary and grouped, short, tubular wax glands; within each insect are found numerous larvae, which are characterised by their proboscides appearing as two circular coils.

TESTS

Colour value

To 0.5 g in *moderately fine powder* add 60 ml of *phosphate buffer pH 8.0* and heat on a water bath for 30 minutes. Cool, add sufficient *phosphate buffer pH 8.0* to produce 100 ml and filter. Dilute 5 ml of the filtrate to 100 ml with *phosphate buffer pH 8.0*. The *absorbance* of the resulting solution at the maximum at 530 nm is not less than 0.25, Appendix II B.

Foreign matter

Complies with the test for *foreign matter*, Appendix XI D.

Water-insoluble matter

When the insects are placed in *water*, no insoluble powder separates.

Ash

Not more than 7.0%, Appendix XI J.

Microbial contamination

1 g is free from *Escherichia coli*; 10 g is free from Salmonella, Appendix XVI B1.

Cola

General Notices

(Ph Eur monograph 1504)

Ph Eur

DEFINITION

Whole or fragmented dried seeds, freed from the testa, of *Cola nitida* (Vent.) Schott et Endl. (*C. vera* K. Schum.) and its varieties, as well as of *Cola acuminata* (P. Beauv.) Schott et Endl. (*Sterculia acuminata* P. Beauv.).

Content

Minimum 1.5 per cent of caffeine (M_r 194.2) (dried drug).

IDENTIFICATION

A. The kernels have an oblong, somewhat obtuse, sub-tetragonal shape, with deformations resulting from mutual pressure inside the fruit; they vary in size and mass, ranging from 5-15 g; the outside is hard, smooth and very dark brown, the inside is more reddish-brown. In C. *nitida* and its varieties, the kernels are divided in 2 parts, almost plano-convex, corresponding to the cotyledons and usually occurring separated in the commercial drug; the cotyledons are 3-4 cm long, 2-2.5 cm wide and 1-2 cm thick. In C. *acuminata*, the cotyledons are smaller and divided into 4-6 irregular parts.

B. Reduce to a powder (355) *(2.9.12)*. The powder is reddish-brown. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows the following diagnostic characters: numerous ovoid or reniform starch granules, 5-25 µm in size, with concentric striations and a stellate, slightly eccentric hilum; fragments of cotyledon tissue showing large, thick-walled, reddish polygonal cells filled with starch granules; occasional fragments of the external epidermis of the cotyledons.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 5 ml of *ethanol (60 per cent V/V) R*. Shake mechanically at 40 °C for 30 min and filter.

Reference solution (a) Dissolve 25 mg of *caffeine R* in 10 ml of *ethanol (60 per cent V/V) R*.

Reference solution (b) Dissolve 50 mg of *theobromine R* in 10 ml of the mobile phase. Filter.

Plate *TLC silica gel F_{254} plate R*.

Mobile phase *water R, methanol R, ethyl acetate R* (10:13:77 *V/V/V*).

Application 20 µl, as bands.

Development Over a path of 10 cm.

Drying In air for 5 min.

Detection A Examine in ultraviolet light at 254 nm.

Results A The chromatogram obtained with the test solution shows 2 principal quenching zones which are similar in position to the zones in the chromatograms obtained with reference solutions (a) and (b).

Detection B Spray with a mixture of equal volumes of *ethanol (96 per cent) R* and *hydrochloric acid R* and then with a solution prepared immediately before use by dissolving 1 g of *iodine R* and 1 g of *potassium iodide R* in 100 ml of *ethanol (96 per cent) R*.

Results B The chromatogram obtained with the test solution shows a reddish-brown principal zone similar in position and colour to the zone in the chromatogram obtained with reference solution (a).

TESTS

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 2.00 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 9.0 per cent.

ASSAY

Liquid chromatography (*2.2.29)* .

Test solution To 1.00 g (m1) of the powdered drug (355) *(2.9.12)*, add 50 ml of *methanol R*. Heat under a reflux condenser on a water-bath for 30 min. Allow to cool and filter. Rinse the filter with 10 ml of *methanol R*. Take up the residue with 50 ml of *methanol R*. Proceed as before. Combine the filtrates and the washings in a 200.0 ml volumetric flask and dilute to 200.0 ml with *methanol R*. Transfer 20.0 ml of this solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with the mobile phase, transfer to a 50.0 ml volumetric flask and dilute to 50.0 ml with the mobile phase.

Reference solution In a 100.0 ml volumetric flask, dissolve 30.0 mg (m_2) of *caffeine CRS* and 15.0 mg of *theobromine R* in the mobile phase and dilute to 100.0 ml with the mobile phase. Transfer 10.0 ml of this solution to a 100.0 ml volumetric flask and dilute to 100.0 ml with the mobile phase.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase: octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase *methanol R, water R* (25:75 *V/V*).

Flow rate 1 ml/min.

Detection Spectrophotometer at 272 nm.

Injection The chosen volume of each solution; loop injector.

System suitability Reference solution:

— *resolution*: minimum 2.5 between the peaks due to caffeine and theobromine. If necessary, adjust the volume of *water R* in the mobile phase.

Calculate the caffeine content using the following expression:

$$\frac{m_2 \times A_1 \times 50}{m_1 \times A_2}$$

A_1 = area of the peak due to caffeine in the chromatogram obtained with the test solution,

A_2 = area of the peak due to caffeine in the chromatogram obtained with the reference solution,

m_1 = mass of the drug to be examined in the test solution, in grams,

m_2 = mass of *caffeine CRS* in the reference solution, in grams.

Ph Eur

Colophony

General Notices

(Ph Eur monograph 1862)

Ph Eur

DEFINITION

Residue remaining after distillation of the volatile oil from the oleoresin obtained from various species of *Pinus*.

IDENTIFICATION

A. Translucent, pale yellow to brownish-yellow, angular, irregularly-shaped, brittle, glassy pieces of different sizes the surfaces of which bear conchoidal markings.

B. Thin-layer chromatography *(2.2.27)* .

Test solution Dissolve 1 g in 10 ml of *methanol R* by gently warming.

Reference solution Dissolve 10 mg of *thymol R* and 10 mg of *linalol R* in 10 ml of *methanol R* .

Plate *TLC silica gel plate R* .

Mobile phase *methylene chloride* R.

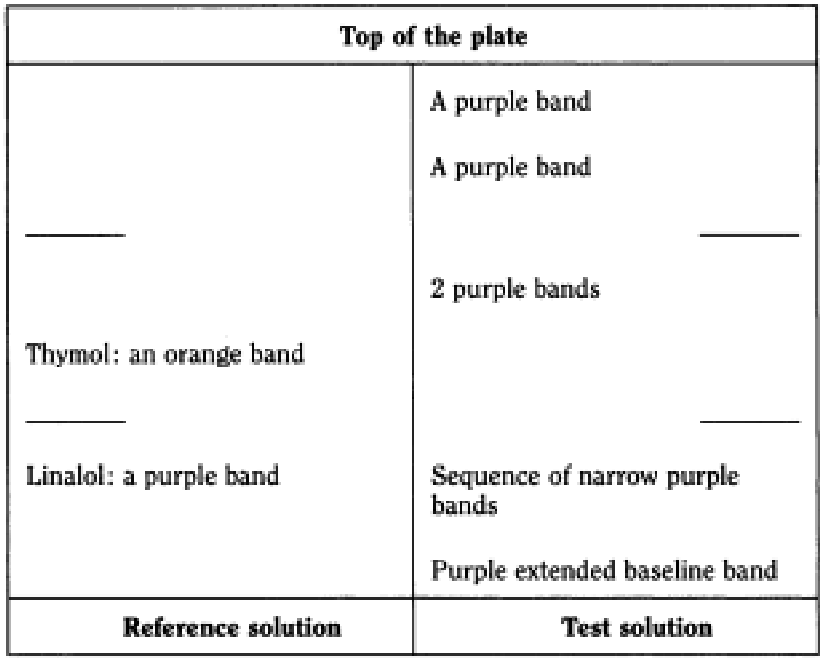
Application 10 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R* and heat at 100-105 °C for 10 min; examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other coloured zones are present in the chromatogram obtained with the test solution.



Top of the plate	
	A purple band
	A purple band
———	———
	2 purple bands
Thymol: an orange band	
———	———
Linalol: a purple band	Sequence of narrow purple bands

Reference solution	**Test solution**

TESTS

Acid value *(2.5.1)*

145 to 180, determined on 1.0 g.

Total ash *(2.4.16)*

Maximum 0.2 per cent.

STORAGE

Do not reduce to a powder.

Ph Eur

Compound Gentian Infusion

General Notices

DEFINITION

Concentrated Compound Gentian Infusion	100 ml
Water	Sufficient to produce 1000 ml

The infusion complies with the requirements stated under Infusions.

CONCENTRATED COMPOUND GENTIAN INFUSION

DEFINITION

Gentian, cut small and bruised	125 g
Dried Bitter-orange Peel, cut small	125 g
Dried Lemon Peel, cut small	125 g
Ethanol (25 per cent)	1200 ml

Extemporaneous preparation

The following directions apply.

Macerate the Gentian, the Dried Bitter-orange Peel and the Dried Lemon Peel in a covered vessel for 48 hours with 1000 ml of the Ethanol (25 per cent); express the liquid. To the pressed marc add 200 ml of the Ethanol (25 per cent), macerate for 24 hours, press and add the liquid to the product of the first pressing. Allow to stand for not less than 14 days; filter.

TESTS

Ethanol content

20 to 24% v/v, Appendix VIII F.

Total solids

Not less than 9.5% w/v, Appendix XI A.

Coriander Oil

General Notices

(Ph Eur monograph 1820)

Ph Eur

DEFINITION

Essential oil obtained by steam distillation from the fruits of *Coriandrum sativum* L.

CHARACTERS

Appearance

Clear, colourless or pale yellow liquid.

It has a characteristic spicy odour.

IDENTIFICATION

First identification *B.*

Second identification *A.*

A. Examine by thin-layer chromatography (2.2.27).

Test solution Dissolve 10 µl of the substance to be examined in 1.0 ml of *toluene R* .

Reference solution Dissolve 10 µl *linalol R* and 2 µl of *geranyl acetate R* in 1.0 ml of *toluene R.*

Plate *TLC silica gel plate R.*

Mobile phase *ethyl acetate R, toluene R* (5:95 *V/V*).

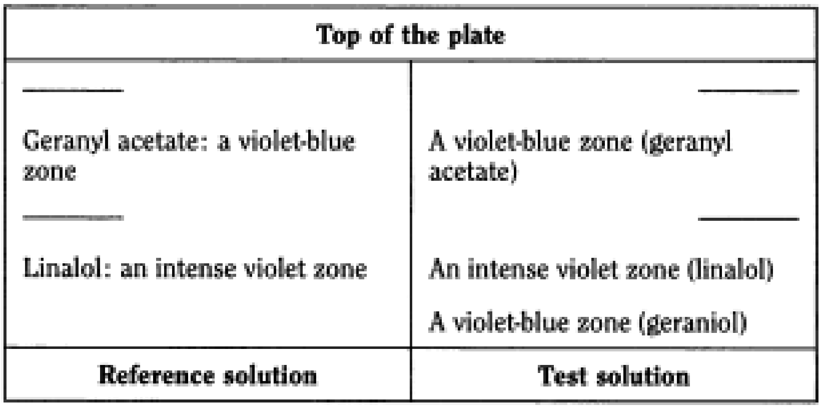
Application 10 µl as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R* and heat at 100-105 °C for 10-15 min. Examine immediately in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
———	———
Geranyl acetate: a violet-blue zone	A violet-blue zone (geranyl acetate)
———	———
Linalol: an intense violet zone	An intense violet zone (linalol)
	A violet-blue zone (geraniol)
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density *(2.2.5)*

0.860 to 0.880.

Refractive index *(2.2.6)*

1.462 to 1.470.

Optical rotation *(2.2.7)*

+ 7° to + 13°.

Acid value *(2.5.1)*

Maximum 3.0, determined on 5.00 g of the substance to be examined.

Chromatographic profile

Gas chromatography *(2.2.28)* : use the normalisation procedure.

Test solution The substance to be examined.

Reference solution (a) Dissolve 10 µl of *α-pinene R* , 10 µl of *limonene R* , 10 µl of *γ-terpinene R* , 10 µl of *p-cymene R* , 10 mg of *camphor* R, 20 µl of *linalol R,* 10 µl of *α-terpineol R* , 10 µl of *geranyl acetate R* and 10 µl of *geraniol R* in 1 ml of *hexane R* .

Reference solution (b) Dissolve 5 µl of *geraniol R* in *hexane R* and dilute to 10 ml with the same solvent.

Column:

— *material:* fused silica;

— *size*: *l* = 60 m, Ø = 0.25 mm;

— *stationary phase: macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas *helium for chromatography R* .

Flow rate 1 ml/min.

Split ratio 1:65.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	60
	10 - 75	60 → 190
	75 - 120	190
Injection port		220
Detector		240

Detection Flame ionisation.

Injection 0.2 µl.

Elution order Order indicated in the composition of reference solution (a). Record the retention times of these substances.

System suitability Reference solution (a):

— *resolution*: minimum 1.5 between the peaks due to linalol and camphor.

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

Determine the percentage content of each of these components. The percentages are within the following ranges:

— *α-pinene* : 3.0 per cent to 7.0 per cent;

— *limonene* : 1.5 per cent to 5.0 per cent;

— *γ-terpinene* : 1.5 per cent to 8.0 per cent;

— *p-cymene* : 0.5 per cent to 4.0 per cent;

— *camphor* : 3.0 per cent to 6.0 per cent;

— *linalol* : 65.0 per cent to 78.0 per cent;

— *α-terpineol* : 0.1 per cent to 1.5 per cent;

— *geranyl acetate* : 0.5 per cent to 4.0 per cent;

— *geraniol* : 0.5 per cent to 3.0 per cent;

— *disregard limit*: area of the peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Chiral purity

Gas chromatography *(2.2.28)* .

Test solution Dissolve 0.02 g of the substance to be examined in *pentane R* and dilute to 10 ml with the same solvent.

Reference solution Dissolve 10 µl of *linalol R* and 5 mg of *borneol R* in *pentane R* and dilute to 10 ml with the same solvent.

Column:

— *material*: fused silica;

— *size*: *l* = 25 m, Ø = 0.25 mm;

— *stationary phase*: *modified* β*-cyclodextrin* for *chiral chromatography R* (film thickness 0.25 µm).

Carrier gas *helium for chromatography R* .

Flow rate 1.3 ml/min.

Split ratio 1:30.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 65	50 → 180
Injection port		230
Detector		230

Detection Flame ionisation.

Injection 1 µl.

System suitability Reference solution:

— *resolution*: minimum 5.5 between the peaks due to (*R*)-linalol (1st peak) and (*S*)-linalol (2nd peak) and minimum 2.9 between the peaks due to (*S*)-linalol and borneol (3rd peak).

Limit Calculate the percentage content of (*R*)-linalol from the expression:

$$\frac{A_R}{A_S + A_R} \times 100$$

A_S = area of the peak due to (*S*)-linalol,

A_R = area of the peak due to (*R*)-linalol.

— (*R*)- *linalol* : maximum 14 per cent.

STORAGE

In a well-filled, airtight container , protected from light and at a temperature not exceeding 25 °C.

Coriander

General Notices

(Ph Eur monograph 1304)

When Powdered Coriander is prescribed or demanded, material complying with the appropriate requirements below but containing not less than 0.2% v/w of essential oil shall be dispensed or supplied.

Ph Eur

DEFINITION

Dried cremocarp of *Coriandrum sativum* L.

Content

Minimum 3 ml/kg of essential oil (dried drug).

CHARACTERS

The cremocarp is brown or light brown and is more or less spherical, about 1.5-5 mm in diameter, or oval form 2-6 mm long.

IDENTIFICATION

A. The mericarps are usually tightly connected. The cremocarp is glabrous and has 10 wavy, slightly raised primary ridges and 8 straight, more prominent secondary ridges. The stylopod crowns the apex. The mericarps are concave on the internal surface. A small fragment of the pedicel may be present.

B. Reduce to a powder (355) *(2.9.12)*. The powder is brown. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: numerous oil droplets; fragments of endosperm with small thick-walled regular cells containing microcrystals and microrosettes of calcium oxalate and oil droplets; fragments of endocarp with very narrow cells having a parquetry arrangement and usually associated with a layer of thin-walled rectangular sclereids of the mesocarp; fragments from the sclerenchymatous layer of the mesocarp with short, strongly thickened, pitted, fusiform cells occurring in layers with the cells of adjacent layers approximately at right angles to one another; fragments of parenchyma with small, thick-walled cells; occasional fragments of vascular bundles.

C. Thin-layer chromatography *(2.2.27)* .

Test solution Shake 0.50 g of the freshly powdered drug (355) *(2.9.12)* with 5.0 ml of *hexane R* for 2-3 min and filter over 2 g of *anhydrous sodium sulphate R* .

Reference solution Dissolve 15 µl of *linalol R* and 25 µl of *olive oil R* in 5.0 ml of *hexane R* immediately before use.

Plate *TLC silica gel plate R.*

Mobile phase e*thyl acetate R, toluene R* (5:95 *V/V*).

Application 20 µl of the test solution and 10 µl of the reference solution, as bands.

Development Twice over a path of 10 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R* and examine in daylight while heating at 100-105 °C for 5-10 min.

Results The chromatogram obtained with the reference solution shows in the lower half a violet or greyish-violet zone (linalol) and in the upper half a bluish-violet zone (triglycerides). The chromatogram obtained with the test solution shows zones similar in position and colour to the zones in the chromatogram obtained with the reference solution. Several violet-grey or brownish zones, including the zone due to geraniol, are between the starting point and the zone due to linalol in the chromatogram obtained with the reference solution. It may also show several faint violet-grey zones between the zone due to triglycerides and that due to linalol in the chromatogram obtained with the reference solution.

TESTS

Foreign matter *(2.8.2)*

It complies with the test. None of the cremocarps show perforations due to animals.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 8.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs *(2.8.12)* . Use a 500 ml round-bottomed flask, 200 ml of *water R* as the distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Reduce the drug to a coarse powder and immediately use 30.0 g for the determination. Distil at a rate of 2-3 ml/min for 2 h.

Ph Eur

Couch Grass Rhizome

General Notices

(Ph Eur monograph 1306)

Ph Eur

DEFINITION

Whole or cut, washed and dried rhizome of *Agropyron repens* (L.) Beauv. (*Elymus repens* (L.) Gould); the adventitious roots are removed.

IDENTIFICATION

A. The shiny yellowish, light brown or yellowish-brown pieces of the rhizome are 2 mm to 3 mm thick and longitudinally furrowed. At the nodes are the remains of very thin, more or less branched roots and whitish or brownish scale-like leaves; the internodes, up to 6 cm long, are furrowed and hollow inside. The transverse section of the nodes shows a yellowish medulla.

B. Reduce to a powder (355) *(2.9.12)*. The powder is whitish-yellow. Examine under a microscope, using *chloral hydrate solution R* . The powder shows the following diagnostic characters: fragments of the epidermis covered with a thick cuticle and composed of rectangular and elongated thick-walled cells with pitted slightly wavy walls which alternate with small rounded to almost square cells; U-shaped thickened endodermic cells; numerous fragments of moderately thickened fibres and groups of vessels with slit-shaped pits or with spiral and annular thickening.

TESTS

Cynodon dactylon, Imperata cylindrical

Examine under a microscope using *iodine solution R1* . No blue starch grains are visible.

Foreign matter *(2.8.2)*

Maximum 15 per cent of greyish-black pieces of rhizome in the cut drug.

Water-soluble extractive

Minimum 25 per cent.

To 5.0 g of the powdered drug (355) (*2.9.12*) add 200 ml of boiling *water R* . Allow to stand for 10 min, shaking occasionally. Allow to cool, dilute to 200.0 ml with *water R* and filter. Evaporate 20.0 ml of the filtrate to dryness on a water-bath. Dry the residue in an oven at 100-105 °C. The residue weighs a minimum of 0.125 g.

Loss on drying ***(2.2.32)***

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash ***(2.4.16)***

Maximum 5.0 per cent.

Ash insoluble in hydrochloric acid ***(2.8.1)***

Maximum 1.5 per cent.

Ph Eur

Dementholised Mint Oil

General Notices

(Partly Dementholised Mint Oil, Ph Eur monograph 1838)

Ph Eur

DEFINITION

Essential oil obtained by steam distillation from the fresh, flowering aerial parts, recently gathered from *Mentha canadensis* L. (syn. *M. arvensis* L. var. *glabrata* (Benth) Fern., *M. arvensis* var. *piperascens* Malinv. ex Holmes), followed by partial separation of menthol by crystallisation.

CHARACTERS

Appearance

Colourless or pale yellow to greenish-yellow liquid.

It has a characteristic odour.

IDENTIFICATION

First identification *B.*

Second identification *A.*

A. Thin-layer chromatography *(2.2.27)*.

Test solution Dissolve 0.1 ml of the substance to be examined in 1.0 ml of *toluene R*.

Reference solution Dissolve 4 µl of *carvone R*, 4 µl of *pulegone R*, 10 µl of *menthyl acetate R*, 20 µl of *cineole R and* 50 mg of *menthol R* in 5 ml of *toluene R*.

Plate *TLC silica gel F_{254} plate R.*

Mobile phase *ethyl acetate R, toluene R* (5:95 *V/V*).

Application 10 µl, as bands.

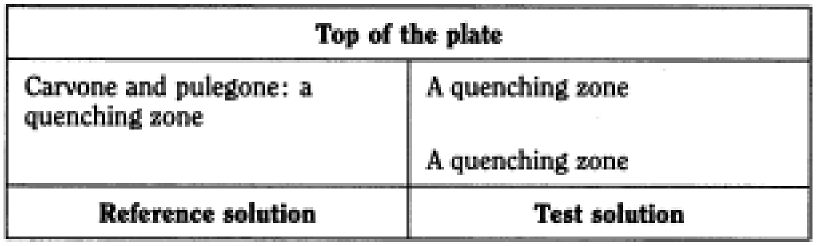
Development Over a path of 15 cm.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

Results A

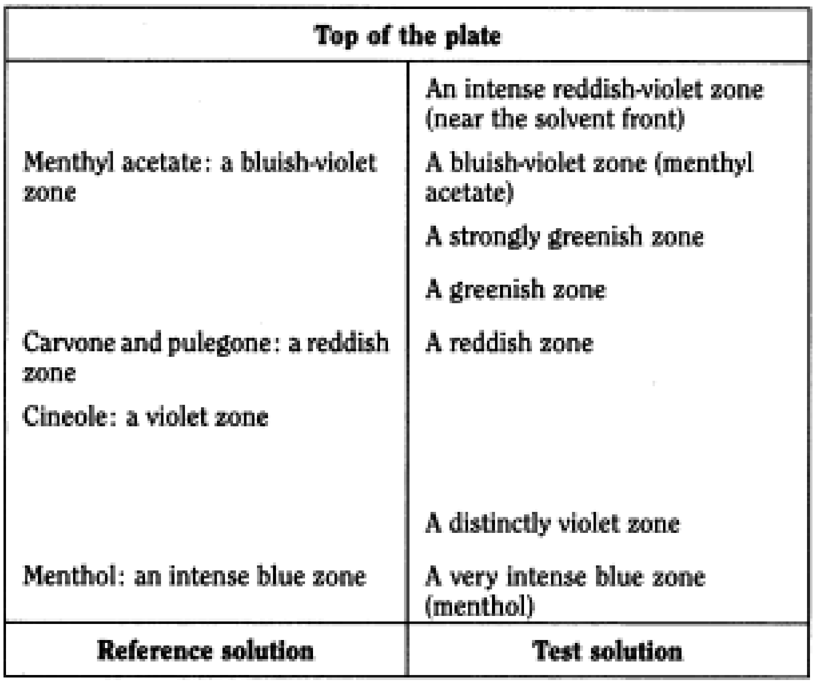
See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, a quenching zone may be present in the upper third of the chromatogram obtained with the test solution.



Top of the plate	
Carvone and pulegone: a quenching zone	A quenching zone
	A quenching zone
Reference solution	**Test solution**

Detection B Spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min. Examine immediately in daylight.

Results B See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, the zone due to cineole in the reference solution is absent in the chromatogram obtained with the test solution. No yellowish-brown zone below the intense reddish-violet zone is present in the chromatogram obtained with the test solution.



Top of the plate	
	An intense reddish-violet zone (near the solvent front)
Menthyl acetate: a bluish-violet zone	A bluish-violet zone (menthyl acetate)
	A strongly greenish zone
	A greenish zone
Carvone and pulegone: a reddish zone	A reddish zone
Cineole: a violet zone	
	A distinctly violet zone
Menthol: an intense blue zone	A very intense blue zone (menthol)
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are approximately similar in retention time to those in the chromatogram obtained with the reference solution. Carvone may be absent from the chromatogram obtained with the test solution.

TESTS

Relative density ***(2.2.5)***

0.888 to 0.910.

Refractive index ***(2.2.6)***

1.456 to 1.470.

Optical rotation ***(2.2.7)***

- 16.0° to - 34.0°.

Acid value ***(2.5.1)***

Maximum 1.0, determined on 5.00 g of the substance to be examined dissolved in 50 ml of the prescribed mixture of solvents.

Chromatographic profile

Gas chromatography *(2.2.28)*: use the normalisation procedure.

Test solution Dissolve 0.20 g of the substance to be examined in *hexane R* and dilute to 10.0 ml with the same solvent.

Reference solution Dissolve 10 mg of *limonene R*, 20 mg of *cineole R*, 40 mg of *menthone R*, 10 mg of *isomenthone R*, 40 mg of *menthyl acetate R*, 20 mg of *isopulegol R*, 60 mg of *menthol R*, 20 mg of *pulegone R* and 10 mg of *carvone R* in *hexane R* and dilute to 10.0 ml with the same solvent.

Column:

- *material*: fused silica,
- *size*: *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm,
- *stationary phase*: *macrogol 20 000 R*.

Carrier gas *helium for chromatography R.*

Flow rate 1.5 ml/min.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	60
	10 - 70	60 → 180
	70 - 75	180
Injection port		200
Detector		220

Detection Flame ionisation.

Injection 1.0 µl.

Elution order Order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability Reference solution:

— *resolution*: minimum 1.5 between the peaks due to limonene and cineole.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of these components. The percentages are within the following ranges:

— *limonene*: 1.5 per cent to 7.0 per cent,

— *cineole*: maximum 1.5 per cent,

— *menthone*: 17.0 per cent to 35.0 per cent,

— *isomenthone*: 5.0 per cent to 13.0 per cent,

— *menthyl acetate*: 1.5 per cent to 7.0 per cent,

— *isopulegol*: 1.0 per cent to 3.0 per cent,

— *menthol*: 30.0 per cent to 50.0 per cent,

— *pulegone*: maximum 2.5 per cent,

— *carvone*: maximum 2.0 per cent.

The ratio of cineole content to limonene content is less than 1.

STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

Ph Eur

Devil's Claw Dry Extract

General Notices

(Ph Eur monograph 1871)

Ph Eur

DEFINITION

Dry extract obtained from *Devil's claw root (1095)*.

Content

Minimum 1.5 per cent of harpagoside ($C_{24}H_{30}O_{11}$; M_r 494.5) (dried extract).

PRODUCTION

The extract is produced from the herbal drug by an appropriate procedure using either water or a hydroalcoholic solvent that is at most equivalent in strength to ethanol (95 per cent *V/V*).

CHARACTERS

Appearance

Light brown powder.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)* .

Test solution To 1.0 g of the extract to be examined add 10 ml of *methanol R* and heat in a water-bath at 60 °C for 10 min. Cool and filter.

Reference solution Dissolve 1.0 mg of *harpagoside R* and 2.5 mg of *fructose R* in 1.0 ml of *methanol R* .

Plate *TLC silica gel plate R.*

Mobile phase *water R, methanol R, ethyl acetate R* (8:15:77 *V/V/V*).

Application 20 µl as bands.

Development Over a path of 10 cm.

Drying In a current of warm air.

Detection Spray with a 10 g/l solution of *phloroglucinol R* in *ethanol (96 per cent) R* and then with *hydrochloric acid R* ; heat at 80 °C for 5-10 min and examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

ASSAY

Liquid chromatography *(2.2.29)* .

Test solution Introduce 0.350 g of the extract to be examined into a 100 ml volumetric flask, add 90 ml of *methanol R* and sonicate for 20 min. Cool to room temperature, dilute to 100.0 ml with *methanol R* and filter through a membrane filter (0.2 µm).

Reference solution Dissolve the contents of 1 vial of *harpagoside CRS* in *methanol R* and dilute to 10.0 ml with the same solvent.

Column:

— *size: l* = 0.10 m, Ø = 4.0 mm;

— *stationary phase: octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase *methanol R, water R* (50:50 *V/V*).

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 278 nm.

Injection 10 µl.

Run time 3 times the retention time of harpagoside.

Retention time Harpagoside = about 7 min.

Calculate the percentage content of harpagoside using the following expression:

$$\frac{A_1 \times m_2 \times 1000}{A_2 \times m_1}$$

A_1 = area of the peak due to harpagoside in the chromatogram obtained with the test solution;

A_2 = area of the peak due to harpagoside in the chromatogram obtained with the reference solution;

m_1 = mass of the extract to be examined used to prepare the test solution, in grams;

m_2 = mass of harpagoside contained in 1 vial of *harpagoside CRS*, in grams.

Ph Eur

Devil's Claw

General Notices

Harpagophytum

(Devil's Claw Root, Ph Eur monograph 1095)

Ph Eur

DEFINITION

Devil's claw root consists of the cut and dried, tuberous secondary roots of *Harpagophytum procumbens* DC. and/or *Harpagophytum zeyheri* Decne.

Content

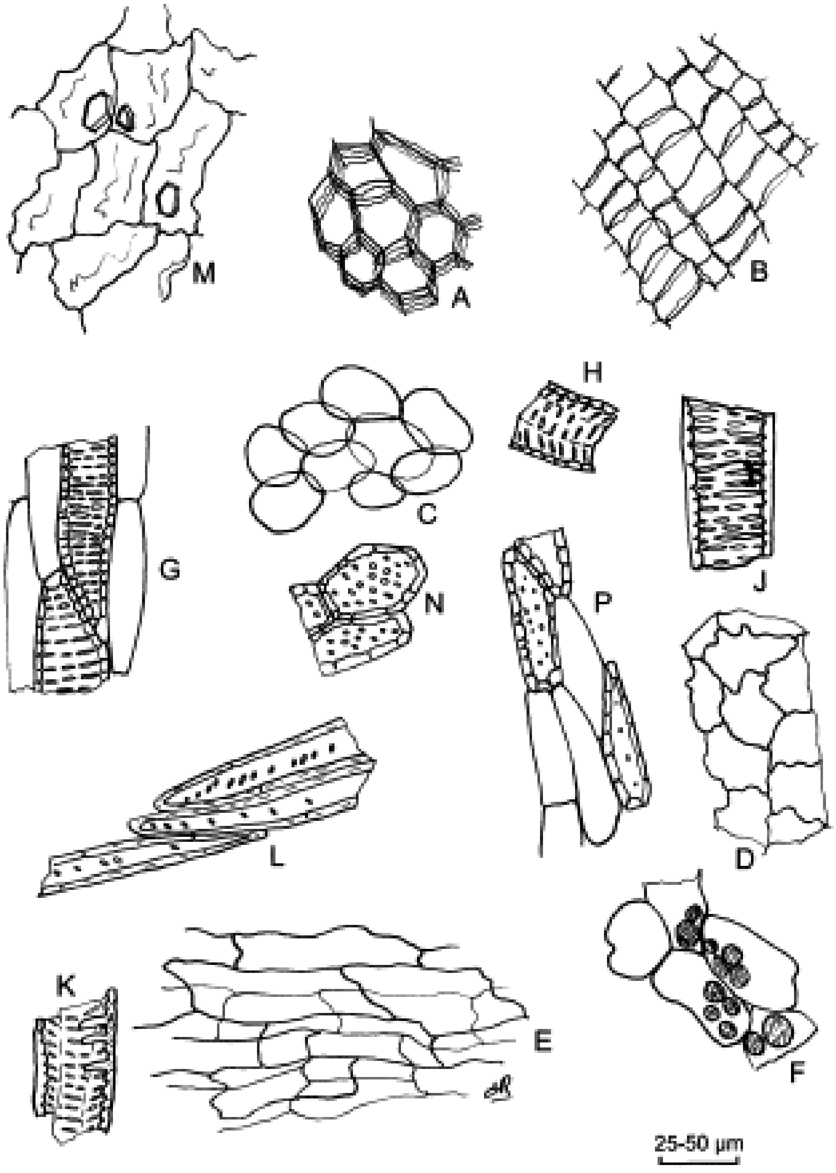
Minimum 1.2 per cent of harpagoside ($C_{24}H_{30}O_{11}$; M_r 494.5) (dried drug).

CHARACTERS

Devil's claw root is greyish-brown to dark brown.

IDENTIFICATION

A. It consists of thick, fan-shaped or rounded slices or of roughly crushed discs. The darker outer surface is traversed by tortuous longitudinal wrinkles. The paler cut surface shows a dark cambial zone and xylem bundles distinctly aligned in radial rows. The central cylinder shows fine concentric striations. Seen under a lens, the cut surface presents yellow to brownish-red granules.



A, B. Fragments of cork layer in surface view (A) and in transverse section (B)

C, D, E, F. Fragments of cortical parenchyma; fragment containing yellow droplets (F)

G, H, J, K. Vessels with reticulate or pitted thickenings

L. Lignified parenchyma from the central cylinder

M. Parenchyma containing prisms of calcium oxalate

N, P. Rectangular or polygonal sclereids

Figure 1095.-1. – *Illustration of powdered herbal drug of devil's claw root (see identification B)*

B. Reduce to a powder (355) *(2.9.12)*. The powder is brownish-yellow. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: fragments of cork layer consisting of yellowish-brown, thin-walled cells; fragments of cortical parenchyma consisting of large, thin-walled cells, sometimes containing reddish-brown granular inclusions and isolated yellow droplets; fragments of reticulately thickened or pitted vessels and fragments of lignified parenchyma, sometimes associated with vessels from the central cylinder; prism crystals and rare small needles of calcium oxalate in the parenchyma. The powder may show rectangular or polygonal sclereids with dark reddish-brown contents. With a solution of phloroglucinol in hydrochloric acid, the parenchyma turns green.

C. Thin-layer chromatography *(2.2.27)* .

Test solution Heat 1.0 g of the powdered drug (355) *(2.9.12)* with 10 ml of *methanol R* on a water-bath at 60 °C for 10 min. Filter and reduce the filtrate to about 2 ml under reduced pressure at a temperature not exceeding 40 °C.

Reference solution Dissolve 1 mg of *harpagoside R* and 2.5 mg of *fructose R* in 1 ml of *methanol R* .

Plate *TLC silica gel plate* R (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *water R, methanol R, ethyl acetate R* (8:15:77 *V/V/V*).

Application 20 µl [or 5 µl], as bands.

Development Over a path of 10 cm [or 7.5 cm].

Drying In a current of warm air.

Detection A Examine in ultraviolet light at 254 nm.

Results A See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. The chromatogram obtained with the test solution shows other distinct zones, mainly above the zone due to harpagoside. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

TESTS

Starch

Examine the powdered drug (355) *(2.9.12)* under a microscope using *water R* . Add *iodine solution R1* . No blue colour develops.

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C.

Total ash *(2.4.16)*

Maximum 10.0 per cent.

ASSAY

Liquid chromatography *(2.2.29)* .

Test solution To 0.500 g of the powdered drug (355) *(2.9.12)* add 100.0 ml of *methanol R* . Shake for 4 h and filter through a membrane filter (nominal pore size: 0.45 µm).

Reference solution Dissolve the contents of a vial of *harpagoside CRS* in *methanol R* and dilute to 10.0 ml with the same solvent.

Column:
— *size: l* = 0.10 m, Ø = 4.0 mm;
— *stationary phase: octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase *methanol R, water R* (50:50 *V/V*).

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 278 nm.

Injection 10 µl.

Run time 3 times the retention time of harpagoside.

Retention time harpagoside = about 7 min.

Calculate the percentage content of harpagoside using the following expression:

$$\frac{m_2 \times A_1 \times 1000}{A_2 \times m_1}$$

A_1 = area of the peak due to harpagoside in the chromatogram obtained with the test solution;

A_2 = area of the peak due to harpagoside in the chromatogram obtained with the reference solution;

m_1 = mass of the drug to be examined used to prepare the test solution, in grams;

m_2 = mass of *harpagoside CRS* in the reference solution, in grams.

Ph Eur

Digitalis Leaf

General Notices

Digitalis

(Ph Eur monograph 0117)

When Powdered Digitalis is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter shall be dispensed or supplied.

Ph Eur

DEFINITION

Dried leaf of *Digitalis purpurea L*.

Content

Minimum 0.3 per cent of cardenolic glycosides, expressed as digitoxin (M_r 765) (dried drug).

CHARACTERS

Faint but characteristic odour.

The whole leaf is about 10-40 cm long and 4-15 cm wide. The lamina is ovate lanceolate or broadly ovate. The winged petiole is from 1/4 as long as to equal in length to the lamina.

IDENTIFICATION

A. The leaf is brittle and often occurs broken. The upper surface is green and the lower surface is greyish-green. The apex is subacute and the margin is irregularly crenate, dentate or serrate. The base is decurrent. The venation is pinnate, the lateral veins being prominent especially on the lower surface, leaving the midrib at about 45° and anastomosing near the margin; a veinlet terminates in each tooth of the margin and the lower veins run down the winged petiole. The upper surface is rugose and pubescent; the lower surface shows a network of raised veinlets and is densely pubescent.

B. Reduce to a powder (355) *(2.9.12)*. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: epidermal cells with anticlinal walls which are straight or slightly sinuous on the upper surface and markedly sinuous on the lower surface; the cuticle is smooth. Trichomes are of 2 types: uniseriate, bluntly pointed non-glandular, usually of 3-5 cells, often with 1 or more collapsed cells, walls mostly finely warty or faintly striated; glandular trichomes usually with a unicellular, sometimes a multicellular uniseriate stalk and a unicellular or bicellular or exceptionally tetracellular head. Anomocytic stomata *(2.8.3)* are absent or very rare on the upper surface, numerous on the lower surface. Calcium oxalate crystals and sclerenchyma are absent.

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 1.0 g of the powdered drug (180) *(2.9.12)* add a mixture of 20 ml of *ethanol (50 per cent V/V) R* and 10 ml of *lead acetate solution R* . Boil for 2 min, allow to cool and centrifuge. Shake the supernatant solution with 2 quantities, each of 15 ml, of *chloroform R* ; separate the 2 layers by centrifugation if necessary. Dry the chloroform layers over *anhydrous sodium sulphate R* and filter. Evaporate 10 ml of the solution to dryness on a water-bath and dissolve the residue in 1 ml of a mixture of equal volumes of *chloroform R* and *methanol R* .

Reference solution Dissolve 5 mg of *purpureaglycoside A CRS*, 2 mg of *purpureaglycoside B CRS*, 5 mg of *digitoxin R* and 2 mg of *gitoxin R* in a mixture of equal volumes of *chloroform R* and *methanol R* , then dilute to 10 ml with the same mixture of solvents.

Plate *TLC silica gel G plate R.*

Mobile phase *water R, methanol R, ethyl acetate R* (7.5:10:75 *V/V/V*).

Application 20 µl, as bands of 2 cm by 0.3 cm.

Development Over a path of 10 cm.

Drying Until the solvents have evaporated.

Detection Spray with a mixture of 2 volumes of a 10 g/l solution of *chloramine R* and 8 volumes of a 250 g/l solution of *trichloroacetic acid R* in *ethanol (96 per cent) R* , then heat at 100-105 °C for 10 min. Examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the reference solution shows a zone of light blue fluorescence in the lower part of the chromatogram, due to purpureaglycoside B, and just above it, a zone of brownish-yellow fluorescence due to purpureaglycoside A. A zone of light blue fluorescence, due to gitoxin, appears in the middle of the chromatogram and above it a zone of brownish-yellow fluorescence, due to digitoxin. The zones in the chromatogram obtained with the test solution are similar in position, colour and size to the zones in the chromatogram obtained with the reference solution. Other zones of fluorescence may also appear in the chromatogram obtained with the test solution.

D. Evaporate 5 ml of the chloroformic solution obtained in identification test C to dryness on a water-bath. To the residue add 2 ml of *dinitrobenzoic acid solution R* and 1 ml of *1 M sodium hydroxide* . A reddish-violet colour develops within 5 min.

E. Evaporate 5 ml of the chloroformic solution obtained in identification test C to dryness on a water-bath. To the residue add 3 ml of *xanthydrol solution R* and heat on a water-bath for 3 min. A red colour develops.

TESTS

Foreign matter *(2.8.2)*

There are no leaves with few or no trichomes and epidermal cells showing, in surface view, beaded anticlinal walls (*Digitalis lanata*).

Loss on drying *(2.2.32)*

Maximum 6.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C.

Total ash *(2.4.16)*

Maximum 12.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 5.0 per cent.

ASSAY

Shake 0.250 g of the powdered drug (180) *(2.9.12)* with 50.0 ml of *water R* for 1 h. Add 5.0 ml of a 150 g/l solution of *lead acetate R* , shake and after a few minutes add 7.5 ml of a 40 g/l solution of *disodium hydrogen phosphate R* . Filter through a pleated paper filter. Heat 50.0 ml of the filtrate with 5 ml of hydrochloric acid (150 g/l HCl) under a reflux condenser on a water-bath for 1 h. Transfer to a separating funnel, rinse the flask with 2 quantities, each of 5 ml, of *water R* and shake with 3 quantities, each of 25 ml, of *chloroform R* . Dry the combined chloroform layers over *anhydrous sodium sulphate R* and dilute to 100.0 ml with *chloroform R* . Evaporate 40.0 ml of the chloroformic solution to dryness, dissolve the residue in 7 ml of *ethanol (50 per cent V/V) R*, add 2 ml of *dinitrobenzoic acid solution R* and 1 ml of *1 M sodium hydroxide* . At the same time prepare a reference solution as follows. Dissolve 50.0 mg of *digitoxin CRS* in *ethanol (96 per cent) R* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with *ethanol (96 per cent) R* . To 5.0 ml of the resulting solution add 25 ml of *water R* and 3 ml of hydrochloric acid (150 g/l HCl). Heat the solution under a reflux condenser on a water-bath for 1 h and complete the preparation as described above. Measure the absorbance *(2.2.25)* of the 2 solutions at 540 nm several times during the first 12 min until the maximum is reached, using as the compensation liquid a mixture of 7 ml of *ethanol (50 per cent V/V) R*, 2 ml of *dinitrobenzoic acid solution R* and 1 ml of *1 M sodium hydroxide* .

From the absorbances measured and the concentrations of the solutions, calculate the content of cardenolic glycosides, expressed as digitoxin.

STORAGE

Protected from moisture.

Ph Eur

Dill Oil

General Notices

DEFINITION

Dill Oil is obtained by distillation from the dried ripe fruits of *Anethum graveolens* L.

CHARACTERISTICS

A clear, colourless or pale yellow liquid, visibly free from water; odour, characteristic of the crushed fruit.

TESTS

Optical rotation

+70° to +80°, Appendix V F.

Refractive index

1.481 to 1.492, Appendix V E.

Solubility in ethanol

Soluble, at 20°, in 1 volume or more of *ethanol (90%)* and in 10 volumes or more of *ethanol (80%)*, Appendix X M.

Weight per ml

0.895 to 0.910 g, Appendix V G.

Content of carvone

43.0 to 63.0% w/w when determined by the following method. To 1.5 g in a glass-stoppered tube (approximately 150 mm × 25 mm) add 10 ml of a solution prepared in the following manner. Dissolve 7.0 g of *hydroxylamine hydrochloride* in 90 ml of *ethanol (90%)*, warming gently if necessary, add 1.6 ml of *dimethyl yellow solution* and sufficient 1M *potassium hydroxide* in *ethanol (90%)* to produce a pure yellow colour and dilute to 100 ml with *ethanol (90%)*. Titrate with 1M *potassium hydroxide in ethanol (90%) VS* until the red colour changes to yellow. Place the tube in a water bath at 75° to 80° and, at 5-minute intervals, neutralise with 1M *potassium hydroxide in ethanol (90%) VS* ; after 40 minutes complete the titration to the full yellow colour of the indicator. This procedure gives an approximate value for the carvone content of the oil. Repeat the procedure, using as the colour standard for the end point of the titration the titrated liquid of the first determination with the addition of 0.5 ml of 1M *potassium hydroxide in ethanol (90%) VS* . Calculate the content of carvone from the second determination. Each ml of 1M *potassium hydroxide in ethanol (90%) VS* is equivalent to 151.4 mg of carvone, $C_{10}H_{14}O$.

STORAGE

Dill Oil should be kept in a well-filled container and protected from light. It darkens in colour on storage.

Dog Rose

General Notices

(Ph Eur monograph 1510)

Ph Eur

DEFINITION

Rose hips made up by the receptacle and the remains of the dried sepals of *Rosa canina* L., *R. pendulina* L. and other *Rosa* species, with the achenes removed.

Content

Minimum 0.3 per cent of ascorbic acid ($C_6H_8O_6$; M_r 176.1) (dried drug).

IDENTIFICATION

A. It consists of fragments of the fleshy, hollow, urceolate receptacle, bearing the remains of the reduced sepals, light pink or orange-pink, the convex outer surface shiny and strongly wrinkled; bearing on its lighter inner surface abundant bristle-like hairs.

B. Reduce to a powder (355) *(2.9.12)*. The powder is orange-yellow. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: numerous fragments of receptacle, the outer epidermis with orange-yellow contents and a thick cuticle, the inner epidermis composed of thin-walled cells containing cluster crystals and occasional prisms of calcium oxalate; scattered lignified cells, isodiametric, with thickened and pitted walls forming the trichome bases; abundant long, unicellar trichomes, up to 2 mm long and 30-45 µm thick, tapering towards each end, walls heavily thickened and with a waxy cuticle which may show fissures in a spiral arrangement; numerous oily orange-yellow globules.

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 5 g of the powdered drug (355) *(2.9.12)* add 25 ml of *ethanol (96 per cent) R* . Shake for 30 min and filter.

Reference solution Dissolve 10 mg of *ascorbic acid R* in 5.0 ml of *ethanol (60 per cent V/V) R*.

Plate *TLC silica gel* F_{254} *plate R* .

Mobile phase *acetic acid R, acetone R, methanol R, toluene R* (5:5:20:70 *V/V/V/V*).

Application 20 µl of the test solution and 2 µl of the reference solution.

Development Over a path of 15 cm.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

Results A The chromatogram obtained with the test solution shows a quenching zone similar in position to the principal zone in the chromatogram obtained with the reference solution.

Detection B Spray with a 0.2 g/l solution of *dichlorophenolindophenol, sodium salt R* in *ethanol (96 per cent) R*. Examine in daylight.

Results B The chromatogram obtained with the test solution shows a white zone on a pink background similar in position and colour to the principal zone in the chromatogram obtained with the reference solution. The chromatogram also shows an intense orange-yellow zone near the solvent front and a yellow zone in the upper third (carotenoids).

TESTS

Foreign matter *(2.8.2)*

Maximum 1 per cent.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C.

Total ash *(2.4.16)*

Maximum 7.0 per cent.

ASSAY

Test solution In a round-bottomed flask, weigh 0.500 g of the freshly powdered drug (710) *(2.9.12)*. Add a solution of 1.0 g of *oxalic acid R* in 50.0 ml of *methanol R*. Boil under a reflux condenser for 10 min, and cool in iced water until the temperature reaches 15-20 °C. Filter. Transfer 2.0 ml of the filtrate to a 50 ml conical flask. Add successively, with gentle shaking after each addition, 2.0 ml of *dichlorophenolindophenol standard solution R* and then, exactly 60 s later, 0.5 ml of a 100 g/l solution of *thiourea R* in *ethanol (50 per cent V/V) R* and 0.7 ml of *dinitrophenylhydrazine-sulphuric acid solution R*. Heat under a reflux condenser at 50 °C for 75 min, and place immediately in iced water for 5 min. Add dropwise 5.0 ml of a mixture of 12 ml of *water R* and 50 ml of *sulphuric acid R*, taking care to carry out the addition over a period of minimum 90 s and maximum 120 s while maintaining vigorous stirring in iced water. Allow to stand for 30 min at room temperature and measure the absorbance *(2.2.25)* at 520 nm using solution A as compensation liquid.

Solution A Treat 2.0 ml of the filtrate obtained during the preparation of the test solution as described but adding the *dinitrophenylhydrazine-sulphuric acid solution R* just before the absorbance is measured.

Reference solution Dissolve 40.0 mg of *ascorbic acid R* in a freshly prepared 20 g/l solution of *oxalic acid R* in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of this solution to 100.0 ml with a freshly prepared 20 g/l solution of *oxalic acid R* in *methanol R*. Treat 2.0 ml of the solution as described above for the filtrate obtained during the preparation of the test solution. Measure the absorbance *(2.2.25)* at 520 nm using solution B as the compensation liquid.

Solution B Treat 2.0 ml of the reference solution as described above for solution A.

Calculate the percentage content of ascorbic acid from the following expression:

$$\frac{2.5 \times A_1 \times m_2}{A_2 \times m_1}$$

A_1 = absorbance of the test solution;

A_2 = absorbance of the reference solution;

m_1 = mass of the substance to be examined, in grams;

m_2 = mass of ascorbic acid used, in grams.

Ph Eur

Dried Bilberry

General Notices

(Dried Bilberry Fruit, Ph Eur monograph 1588)

Ph Eur

DEFINITION

Dried ripe fruit of *Vaccinium myrtillus* L.

Content

Minimum 1.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1) (dried drug).

CHARACTERS

Sweet and slightly astringent taste.

IDENTIFICATION

A. Dried bilberry is a dark blue, subglobular, shrunken berry about 5 mm in diameter, with a scar at the lower end and surmounted by the persistent calyx, which appears as a circular fold and the remains of the style. The deep violet, fleshy mesocarp contains numerous small, brown, ovoid seeds.

B. Reduce to a powder (355) *(2.9.12)*. The powder is violet-brown. Examine under a microscope using *chloral hydrate solution R* . The powder shows: violet-pink sclereids from the endocarp and the mesocarp, usually aggregated, with thick, channelled walls; reddish-brown fragments of the epicarp consisting of polygonal cells with moderately thickened walls; brownish-yellow fragments of the outer seed testa made up of elongated cells with U-shaped thickened walls; clusters and prisms crystals of various size of calcium oxalate.

C. Thin-layer chromatography *(2.2.27)*

Test solution To 2 g of the powdered drug (355) *(2.9.12)* add 20 ml of *methanol R* . Shake for 15 min and filter.

Reference solution Dissolve 5 mg of *chrysanthemin R* in 10 ml of *methanol R* .

Plate *TLC silica gel plate R.*

Mobile phase *anhydrous formic acid R, water R, butanol R* (16:19:65 *V/V/V*).

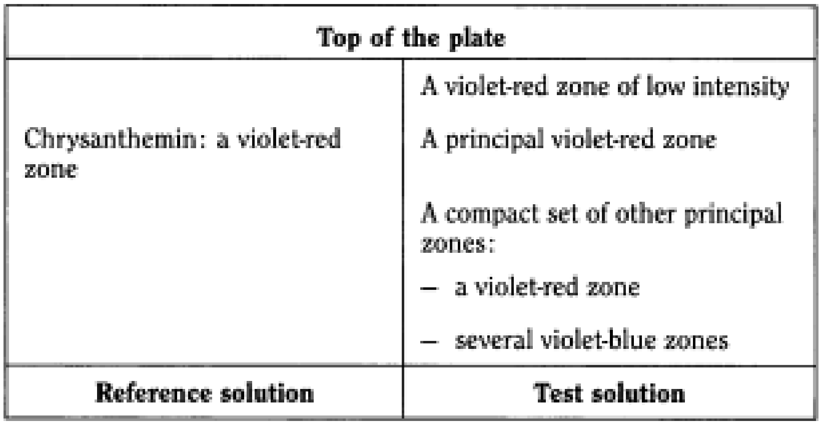
Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference and test solutions.



Top of the plate	
	A violet-red zone of low intensity
Chrysanthemin: a violet-red zone	A principal violet-red zone
	A compact set of other principal zones: – a violet-red zone – several violet-blue zones
Reference solution	**Test solution**

TESTS

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 5.0 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs *(2.8.14)* . Use 1.500 g of the powdered drug (355) *(2.9.12)*.

Ph Eur

Dried Bitter-Orange Peel

General Notices

(Bitter-Orange Epicarp and Mesocarp, Ph Eur monograph 1603)

Preparations

Orange Peel Infusion

Orange Tincture

Ph Eur

DEFINITION

Dried epicarp and mesocarp of the ripe fruit of *Citrus aurantium* L. ssp. *aurantium* (*C. aurantium* L. ssp. *amara* Engl.) partly freed from the white spongy tissue of the mesocarp and endocarp.

Content

Minimum 20 ml/kg of essential oil (anhydrous drug).

CHARACTERS

Aromatic odour and spicy bitter taste.

IDENTIFICATION

A. The drug consists of elliptical to irregular pieces 5 cm to 8 cm long, 3 cm to 5 cm broad and about 3 mm thick. The outer surface is yellowish to reddish-brown and distinctly punctate, the inner surface is yellowish to brownish-white.

B. Reduce to a powder (355) (*2.9.12*). The powder is light brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows small polygonal cells with slightly thickened anticlinal walls, filled with orange-red chromatophores, and very occasional anomocytic stomata (*2.8.3*); fragments of the hypodermis showing collenchymatous thickening; groups of parenchyma with each cell containing a prism crystal of calcium oxalate; fragments of lysigenous oil glands; parenchyma containing crystals of hesperidin which dissolve in a 20 g/l *potassium hydroxide R* solution giving a yellow colour.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (710) (*2.9.12*) add 10 ml of *methanol R* and heat in a water-bath at 65 °C for 5 min shaking frequently. Allow to cool and filter.

Reference solution Dissolve 1.0 mg of *naringin R* and 1.0 mg of *caffeic acid R* in 1 ml of *methanol R*.

Plate TLC silica gel plate R.

Mobile phase *water R*, *anhydrous formic acid R*, *ethyl acetate R* (10:15:75 *V/V/V*).

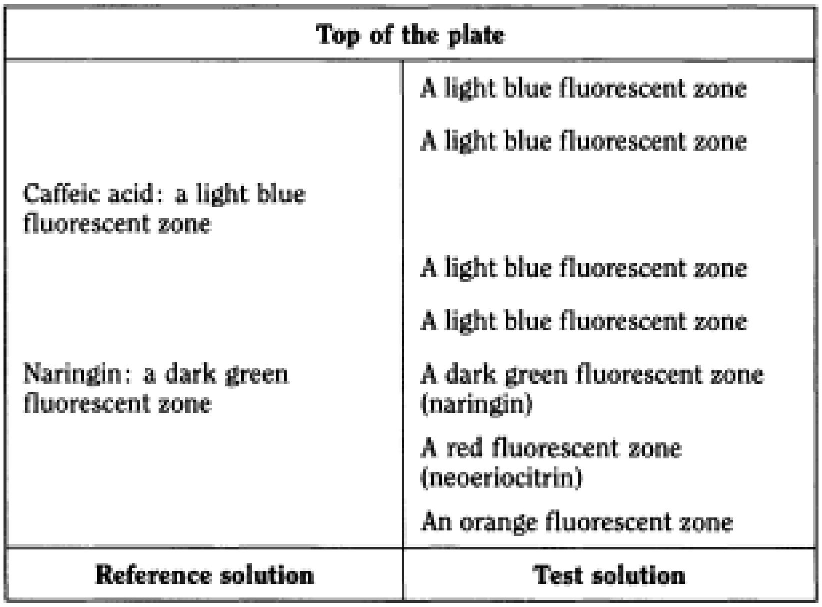
Application 20 µl, as bands.

Development Over a path of 10 cm.

Drying In air, and heat in an oven at 110-120 °C for 5 min.

Detection Spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. After at least 1 h, examine in ultraviolet light at 365 nm.

Results See below the sequence of the zones present in the chromatograms obtained with the reference and test solutions. Furthermore, other fluorescent zones are present in the chromatogram obtained with the test solution.



Top of the plate	
	A light blue fluorescent zone
	A light blue fluorescent zone
Caffeic acid: a light blue fluorescent zone	
	A light blue fluorescent zone
	A light blue fluorescent zone
Naringin: a dark green fluorescent zone	A dark green fluorescent zone (naringin)
	A red fluorescent zone (neoeriocitrin)
	An orange fluorescent zone
Reference solution	**Test solution**

TESTS

Water (*2.2.13*)

Maximum 10.0 per cent, determined on 20.0 g of powdered drug (355) (*2.9.12*) by distillation.

Total ash (*2.4.16*)

Maximum 7.0 per cent

Extractable matter

Minimum 6.0 per cent.

To 2.000 g of the powdered drug (250) (*2.9.12*) add a mixture of 3 ml of *water R* and 7 ml of *alcohol R* and extract for 2 h, shaking frequently. Filter, evaporate 2.000 g of the filtrate to dryness on a water-bath and dry in an oven at 100-105 °C for 3 h. Allow to cool in a dessicator over *diphosphorus pentoxide R* and weigh. The residue weighs a minimum of 120 mg.

ASSAY

Carry out the determination of essential oil in herbal drugs (*2.8.12*). Use a 500 ml round-bottomed flask, 200 ml of *water R* as the distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Reduce the drug to a powder (710) (*2.9.12*) and immediately use 15.0 g for the determination. Distil at a rate of 2-3 ml/min for 90 min.

Ph Eur

Dried Lemon Peel

General Notices

DEFINITION

Dried Lemon Peel is the dried outer part of the pericarp of the ripe, or nearly ripe, fruit of *Citrus limon* (L.) Burm. f.

CHARACTERISTICS

It has the macroscopical and microscopical characters described under Identification tests A and B.

IDENTIFICATION

A. Dried Lemon Peel consists of strips or pieces, showing a marked thickening of the epicarp around the calyx. The outer surface is yellow and somewhat rough from the presence of numerous minute pits, each corresponding to an oil gland; the inner surface with only a small remnant of white, spongy pericarp. Fracture, short.

B. Prepare thin cross sections from material softened by soaking in *water* and examine under a microscope using *chloral hydrate solution*. The sections show a yellow epidermis composed of small, thin-walled cells and an underlying parenchyma with numerous large oil glands and scattered small strands of vascular tissue; prismatic crystals of calcium oxalate occur throughout the parenchyma and are particularly abundant in the layers adjacent to the epidermis.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel plate* and a mixture of 10 volumes of *anhydrous formic acid*, 10 volumes of *water*, 30 volumes of *butan-2-one* and 50 volumes of *ethyl acetate* as the mobile phase. Apply separately to the plate, as bands, 20 µl of each of the following solutions. For solution (1) add 1 g of freshly cut peel to 10 ml of *methanol* and heat in a water-bath at 65° for 5 minutes, shaking frequently. Allow to cool and filter. Solution (2) contains 0.01% w/v each of *caffeic acid* and *naringin* and 0.025% w/v of *rutin* in *methanol*. Dry the plate at 105° and spray the warm plate with a 1% w/v solution of *diphenylboric acid aminoethyl ester* in *methanol* and then with a 5% w/v solution of *polyethylene glycol 400* in *methanol*. Allow the plate to stand for 30 minutes and examine under *ultraviolet light (365 nm).* The chromatogram obtained with solution (1) exhibits a yellowish-brown fluorescent zone corresponding in colour and position to the zone for rutin in the chromatogram obtained with solution (2); above it an intense red fluorescent zone and further above a very weak greenish fluorescent zone corresponding in colour and position to the zone for naringin in the chromatogram obtained with solution (2). Other coloured zones are present in the chromatogram obtained with solution (1).

TESTS

Volatile oil

Not less than 2.0% v/w (1.7% w/w), Appendix XI E, using 300 ml of *water* as the distillation liquid and no xylene in the graduated tube. Use 20 g, soaked in *water* and macerated in a suitable blender, and distil for 3 hours.

Dwarf Pine Oil

General Notices

(Ph Eur monograph 2377)

Ph Eur

DEFINITION

Essential oil obtained by steam distillation of the fresh leaves and twigs of *Pinus mugo* Turra. A suitable antioxidant may be added.

CHARACTERS

Appearance

Clear, colourless or pale yellow liquid.

IDENTIFICATION

First identification *B.*

Second identification *A.*

A. Thin-layer chromatography (*2.2.27*).

Test solution Dilute 1 ml of the substance to be examined to 10 ml with *toluene R.*

Reference solution Dissolve 10 mg of *borneol R* and 10 µl of *bornyl acetate R* in *toluene R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *ethyl acetate R*, *toluene R* (5:95 *V/V*).

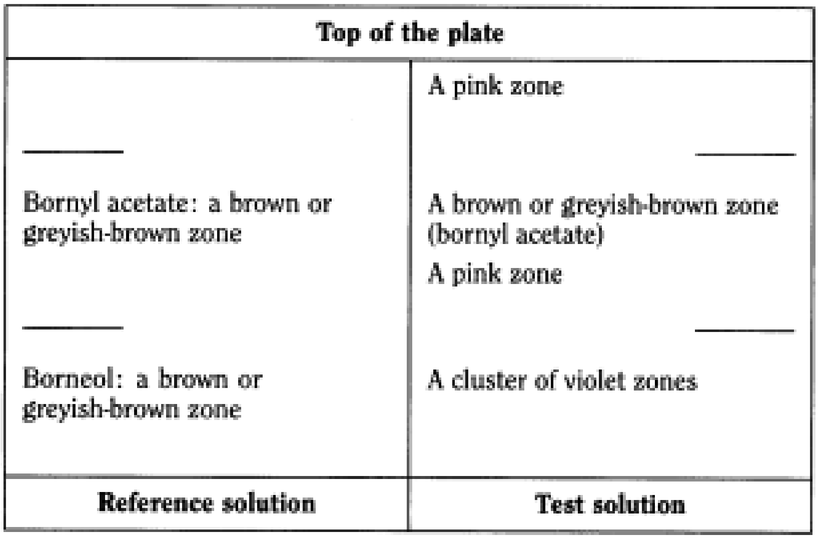
Application 10 µl [or 2 µl], as bands.

Development Over a path of 15 cm [or 6 cm].

Drying In air.

Detection Spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A pink zone
———	———
Bornyl acetate: a brown or greyish-brown zone	A brown or greyish-brown zone (bornyl acetate) A pink zone
———	———
Borneol: a brown or greyish-brown zone	A cluster of violet zones
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a).

TESTS

Relative density (*2.2.5*)

0.857 to 0.868.

Refractive index (*2.2.*6)

1.474 to 1.480.

Optical rotation (*2.2.7*)

- 7° to - 15°.

Acid value (*2.5.1*)

Maximum 1.0.

Peroxide value (*2.5.5*)

Maximum 20.

Fatty oils and resinified oils (*2.8.7*)

It complies with the test.

Chromatographic profile

Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution Dilute 200 µl of the substance to be examined to 10.0 ml with *heptane R*.

Reference solution (a) Dilute 30 µl of α-*pinene R*, 5 mg of *camphene R*, 10 µl of β-*pinene R*, 20 µl of *car-3-ene R*, 5 µl of β-*myrcene R*, 10 µl of *limonene R*, 5 µl of *p-cymene R*, 10 µl of *terpinolene R*, 5 µl of *bornyl acetate R* and 5 µl of β-*caryophyllene R* in *heptane R* and dilute to 5 ml with the same solvent.

Reference solution (b) Dissolve 5 mg of *camphene R* in *heptane R* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of this solution to 10.0 ml with *heptane R*.

Column:
- *material*: fused silica;
- *size: l* = 60 m, Ø = 0.25 mm;
- *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas *helium for chromatography R*.

Flow rate 1.5 ml/min.

Split ratio 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	65
	10 - 41	65 → 220
	41 - 50	220
Injection port		220
Detector		250

Detection Flame ionisation.

Injection 1 µl.

Elution order Order indicated in the composition of reference solution (a); record the retention times of these substances.

System suitability Reference solution (a):
- *resolution*: minimum 1.5 between the peaks due to car-3-ene and β-myrcene.

Identification of components: using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution; the peak due to β-phellandrene is eluted after the peak due to limonene with a relative retention of about 1.03 with reference to limonene.

Determine the percentage content of each of these components. The limits are within the following ranges:
- α-*pinene*: 10.0 per cent to 30.0 per cent;
- *camphene*: maximum 2.0 per cent;
- β-*pinene*: 3.0 per cent to 14.0 per cent;
- *car-3-ene*: 10.0 per cent to 20.0 per cent;
- β-*myrcene*: 3.0 per cent to 12.0 per cent;

— *limonene*: 8.0 per cent to 14.0 per cent;

— β-*phellandrene*: 10.0 per cent to 19.0 per cent;

— *p-cymene*: maximum 2.5 per cent;

— *terpinolene*: maximum 8.0 per cent;

— *bornyl acetate*: 0.5 per cent to 5.0 per cent;

— β-*caryophyllene*: 0.5 per cent to 5.0 per cent;

— *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

STORAGE

In an inert, well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

Ph Eur

Echinacea Angustifolia Root

General Notices

(Narrow-leaved Coneflower Root, Ph Eur monograph 1821)

Ph Eur

DEFINITION

Dried, whole or cut underground parts of *Echinacea angustifolia* (D.C.).

Content

Minimum 0.5 per cent of echinacoside ($C_{35}H_{46}O_{20}$; M_r 786.5) (dried drug).

IDENTIFICATION

First identification A, B, C.

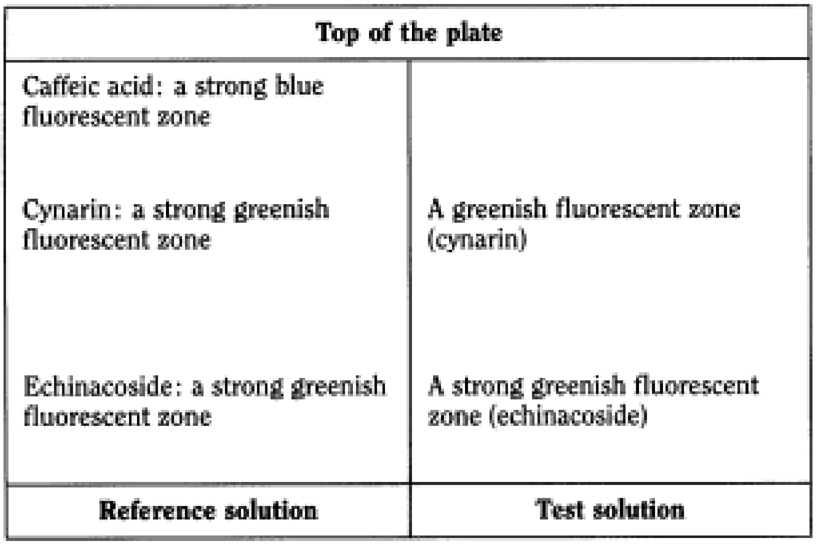
Second identification A, B, D.

A. The root crown is up to about 30 mm in diameter and shows only a few stem bases. The roots are not very numerous, up to about 15 mm in diameter, cylindrical or slightly tapering and sometimes spirally twisted, the outer surface is pale brown to yellowish-brown. The fracture is short, dark brown with a radiate structure.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greyish-brown. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: narrow lignified fibres (up to about 800 µm in length and 50 µm in diameter) joined together in long bundles surrounded by phytomelanin deposits; lignified reticulately or scalariformly thickened vessels (up to about 60 µm in diameter); abundant sclereids occuring singly or, more usually, in groups of 2 to 10, mostly elongated to rectangular, (up to about 150 µm in length and 40 µm wide), with intercellular spaces filled with phytomelanin deposit; fragments of oleoresin canal (80-150 µm in diameter) with yellowish-orange to reddish-brown content; groups of squarish to rectangular cells, about 30-45 µm from the outer layers of the roots; abundant fine-walled pitted parenchyma with sphaerocrystalline masses of inulin.

C. Examine the chromatograms obtained in the test for *Echinacea purpurea*.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint dark blue fluorescent zones may be present between the zones of echinacoside and cynarin in the chromatogram obtained with the test solution.



Top of the plate	
Caffeic acid: a strong blue fluorescent zone	
Cynarin: a strong greenish fluorescent zone	A greenish fluorescent zone (cynarin)
Echinacoside: a strong greenish fluorescent zone	A strong greenish fluorescent zone (echinacoside)
Reference solution	**Test solution**

D. Examine the chromatograms obtained in the assay.

Results The chromatogram obtained with the test solution shows 1 major peak due to echinacoside and a minor peak due to cynarin. Peaks due to caffeic acid, caftaric acid and chlorogenic acid are minor peaks or may be absent.

TESTS

Foreign matter *(2.8.2)*

Maximum 3 per cent.

Echinacea purpurea

Thin layer chromatography *(2.2.27)* .

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 10 ml of *methanol R* , treat in an ultrasonic bath for 5 min. Centrifuge and use the supernatant solution.

Reference solution Dissolve 1 mg of *echinacoside R* , 1 mg of *cynarin R* and 0.5 mg of *caffeic acid R* in 5.0 ml of *methanol R* .

Plate *TLC silica gel F $_{254}$ plate R* (5-40 µm) [or *TLC silica gel F $_{254}$ plate R* (2-10 µm)].

Mobile phase *Anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R* (3:3:9:15 *V/V/V/V*).

Application 25 µl [or 5 µl] of the test solution and 10 µl [or 2 µl] of the reference solution as bands.

Development Over a path of 15 cm [or 5 cm].

Drying In a stream of cold air for about 10 min followed by 2 min at 100-105 °C.

Detection Treat the hot plate using a 5 g/l solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R* ; examine in ultraviolet light at 365 nm after 30 min.

Results The chromatogram obtained with the test solution shows no greenish fluorescent zone just below the zone due to caffeic acid in the chromatogram obtained with the reference solution and no greenish fluorescent zone below the zone due to cynarin in the chromatogram obtained with the reference solution. In the chromatogram obtained with the test solution no zones apart from faint dark blue fluorescent zones are visible between the zones due to echinacoside and cynarin.

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 9.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 3.0 per cent.

ASSAY

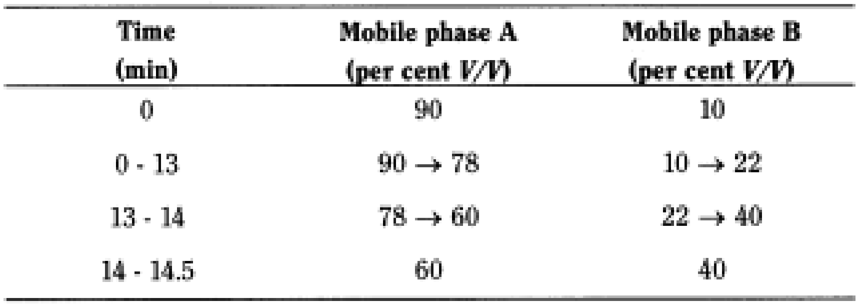
Liquid chromatography *(2.2.29)* .

Test solution In a 100 ml volumetric flask place 0.500 g of powdered drug (355) *(2.9.12)* and add 80 ml of *ethanol (70 per cent V/V) R*. Treat in an ultrasonic bath for 15 min and dilute to 100.0 ml with *ethanol (70 per cent V/V) R*. Mix the suspension and allow to stand for a few minutes so that visible solids settle. Filter a suitable proportion of the solution through a membrane filter (nominal pore size 0.45 µm) before injection.

Reference solution Dissolve 10.0 mg of *chlorogenic acid CRS* and 10.0 mg of *caffeic acid R* in *ethanol (70 per cent V/V) R*, sonicate for 15 min and dilute to 10.0 ml with the same solvent. Dilute 4.0 ml of this solution to 100.0 ml with *ethanol (70 per cent V/V) R*.

Column:
— *size*: *l* = 0.25 m, Ø = 4.6 mm;
— *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
— *temperature*: 35 °C.

Mobile phase:
— *mobile phase A*: *phosphoric acid R, water R* (1:999 *V/V*);
— *mobile phase B*: *acetonitrile R* ;



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0	90	10
0 - 13	90 → 78	10 → 22
13 - 14	78 → 60	22 → 40
14 - 14.5	60	40

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 330 nm.

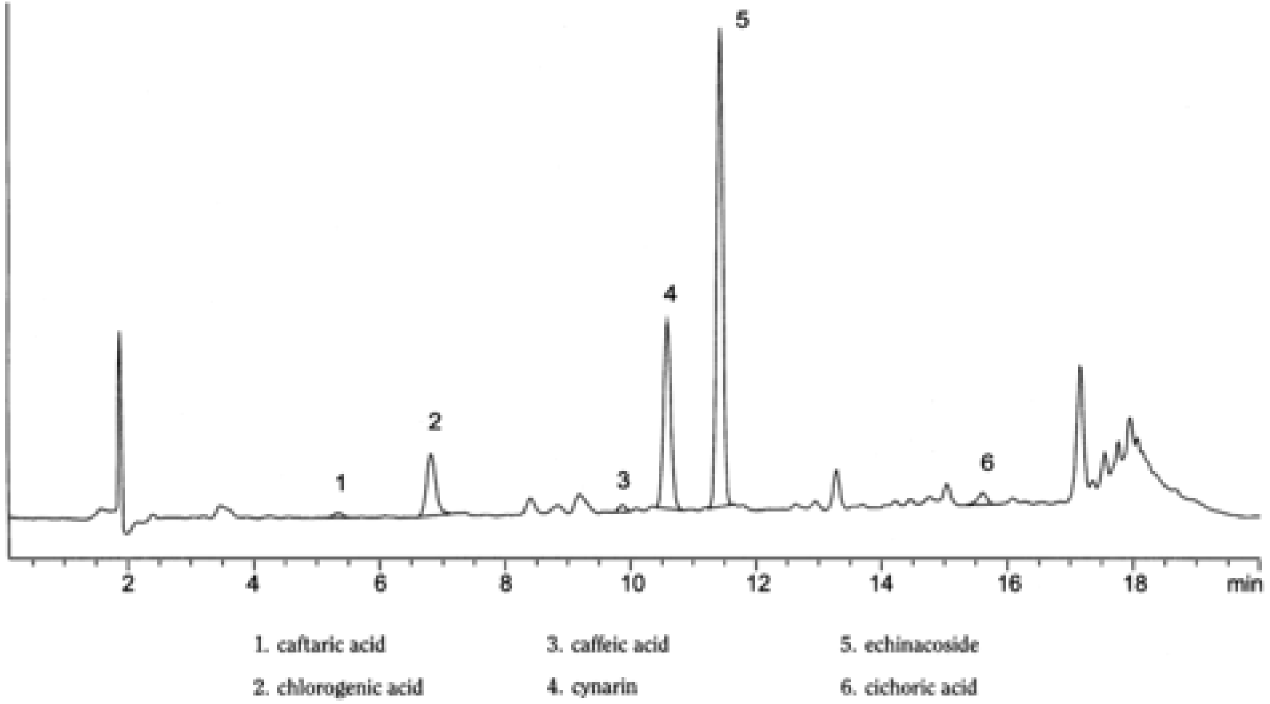


Figure 1821.-1. - *Chromatogram for the assay of echinacoside in narrow-leaved coneflower root*

Injection 10 µl.

Relative retention With reference to chlorogenic acid: caftaric acid = about 0.8; caffeic acid = about 1.5; cynarin = about 1.6; echinacoside = about 1.7; cichoric acid = about 2.3.

System suitability Reference solution:

— *resolution*: minimum 10 between the peaks due to caffeic acid and chlorogenic acid.

Locate the peaks due to caffeic acid and chlorogenic acid using the chromatogram obtained with the reference solution. Locate the peaks due to echinacoside and cynarin using the chromatogram in Figure 1821.–1.

Calculate the percentage content of echinacoside from the following expression:

$$\frac{A_1 \times C_2 \times 100 \times 2.221}{A_2 \times C_1}$$

A_1 = area of the peak due to echinacoside in the chromatogram obtained with the test solution;

A_2 = area of the peak due to chlorogenic acid in the chromatogram obtained with the reference solution;

C_1 = concentration of the test solution, in milligrams per millilitre;

C_2 = concentration of chlorogenic acid in the reference solution, in milligrams per millilitre;

2.221 = peak correlation factor between chlorogenic acid and echinacoside.

STORAGE

Store uncomminuted.

Ph Eur

Echinacea Pallida Root

General Notices

(Pale Coneflower Root, Ph Eur monograph 1822)

Ph Eur

DEFINITION

Dried, whole or cut underground parts of *Echinacea pallida* Nutt.

Content

Minimum 0.5 per cent of echinacoside ($C_{35}H_{46}O_{20}$; M_r 786.5) (dried drug).

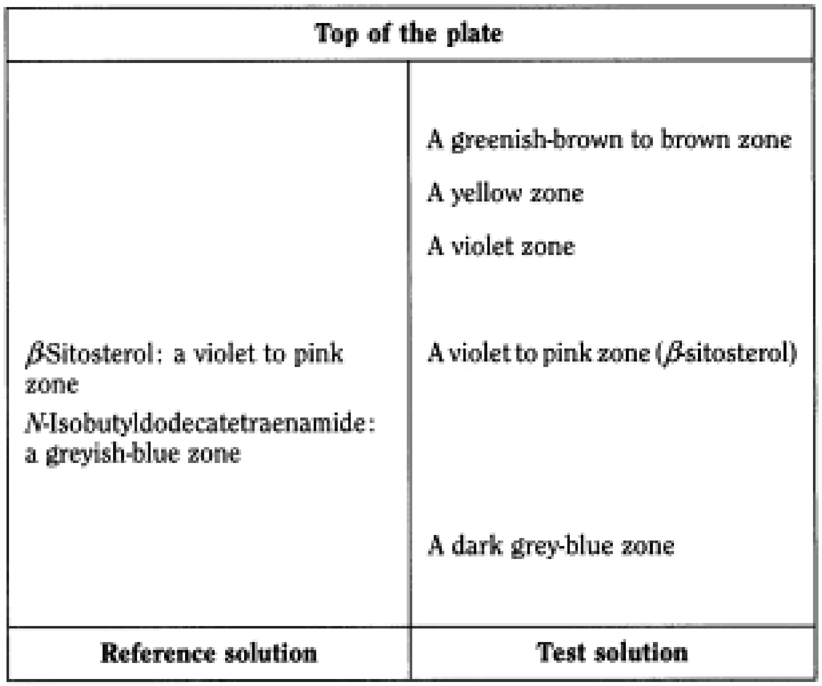
IDENTIFICATION

A. The rhizome and roots are 4-20 mm in diameter, cylindrical and sometimes spirally twisted, longitudinally wrinkled or deeply furrowed; the outer surface is reddish-brown to greyish-brown.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greyish-brown to light yellow. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: short lignified fibres (100-300 µm in length, up to about 80 µm in diameter) occurring singly or joined together in long bundles, sometimes with phytomelanin deposits; lignified reticulately or scalariformly thickened vessels (up to about 70 µm in diameter); abundant sclereids, occurring singly or in small groups of less than 10, varying considerably in shape from rounded to rectangular or irregular, sometimes much elongated and fibre-like and measuring up to 400 µm in length; all the sclereids have associated black, phytomelanin deposits; fragments of oleoresin canals (up to 240 µm in diameter) with yellowish-orange content; groups of squarish to rectangular cells of the outer layers (about 40 × 80 µm); abundant thin-walled pitted parenchyma with sphaerocrystalline masses of inulin.

C. Examine the chromatograms obtained in the test for other *Echinacea* species and *Parthenium integrifolium*.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. The chromatogram obtained with the test solution may also show a weak zone close to the solvent front.



Top of the plate	
	A greenish-brown to brown zone
	A yellow zone
	A violet zone
β-Sitosterol: a violet to pink zone	A violet to pink zone (*β*-sitosterol)
N-Isobutyldodecatetraenamide: a greyish-blue zone	
	A dark grey-blue zone
Reference solution	**Test solution**

D. Examine the chromatograms obtained in the assay.

Results The major peak in the chromatogram obtained with the test solution is due to echinacoside. Peaks due to caftaric acid, caffeic acid, cynarin, chlorogenic acid and cichoric acid are minor peaks or may be absent.

TESTS

Foreign matter ***(2.8.2)***

Maximum 3 per cent.

Other *Echinacea* species and *Parthenium integrifolium*

Thin layer chromatography *(2.2.27)* .

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 10 ml of *methylene chloride R* and sonicate for 5 min. Centrifuge and use the supernatant solution.

Reference solution Dissolve 1 mg of β-*sitosterol R* and a volume of *N-isobutyldodecatetraenamide solution R* corresponding to 1 mg of *N-isobutyldodecatetraenamide R* in *methanol R* and dilute to 5.0 ml with the same solvent.

Plate *TLC silica gel* F_{254} *plate R* (5-40 µm) [or *TLC silica gel* F_{254} *plate R* (2-10 µm)].

Mobile phase *anhydrous formic acid R, cyclohexane R, ethyl acetate R, toluene R* (0.9:3:6:24 *V/V/V/V*)..

Application 25 µl [or 5 µl] of the test solution and 10 µl [or 4 µl] of the reference solution as bands.

Development Over a path of 15 cm [or 5 cm].

Drying In a stream of cold air for about 10 min.

Detection Treat the plate using *anisaldehyde solution R* and heat at 105 °C for 3 min; examine in daylight.

Results The chromatogram obtained with the test solution shows no greyish-blue zone at the position of *N*-isobutyldodecatetraenamide in the chromatogram obtained with the reference solution, and no blue zone at the position of the violet zone due to β-sitosterol in the chromatogram obtained with the reference solution.

Loss on drying ***(2.2.32)***

Ph Eur

Echinacea Purpurea Herb

General Notices

(Purple Coneflower Herb, Ph Eur monograph 1823)

Ph Eur

DEFINITION

Dried, whole or cut flowering aerial parts of *Echinacea purpurea* (L.) Moench.

Content

Minimum 0.1 per cent for the sum of caftaric acid ($C_{13}H_{12}O_9$; M_r 312.2) and cichoric acid ($C_{22}H_{18}O_{12}$; M_r 474.3) (dried drug).

IDENTIFICATION

First identification A, B, C.

Second identification A, B, D.

A. The herbaceous perennial plant is 60-150 cm, rarely up to 180 cm high. The stem is green to red, upright and slightly branched. The leaves are alternate, ovate to ovate-lanceolate, irregularly serrate, rugose on both surfaces, dark green with prominent light green veins; the lamina is thick and shiny. The involucral bracts of the large capitulum are arranged in 2 or 3 rows. The solid receptacle is slightly convex. Each of the outer violet ligulate florets (4-6 cm) and of the inner violet-pink tubular florets is attached to a reddish acute and coriaceous bract, which overtops the tubular florets. The calyx is reduced to a very short crown, one of the sepals is up to 1 mm long.

B. Reduce to a powder (355) *(2.9.12)*. The powder is green. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: whitish-green groups of fibres, 150-200 µm in length, 10-15 µm in diameter, sometimes with black deposits; fragments of leaves in surface view showing anomocytic or anisocytic stomata *(2.8.3)* (about 35-40 µm in length); uniseriate covering trichomes or fragments thereof consisting mainly of 3 or 4 thick-walled cells of which the apical cell is markedly longer than the others; fragments of leaves with rosette-like arranged epidermal cells around the base of the covering trichomes; uniseriate glandular trichomes composed of very thin-walled cells; pitted parenchymatous cells from the pith of the stem as well as pitted elongated cells from the mesocarp of the achenes; fragments of parenchyma from the seeds with oil droplets; fragments of the epidermis of ligulate florets composed of red to violet papillous cells; spheroidal pollen grains, 30-40 µm in diameter, with a spiny exine.

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 10 ml of *methanol R* and sonicate for 5 min. Centrifuge and use the supernatant solution.

Reference solution Dissolve 0.5 mg of *caffeic acid R* and 0.5 mg of *chlorogenic acid R* in 5.0 ml of *methanol R*.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *Anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R* (3:3:9:15 *V/V/V/V*).

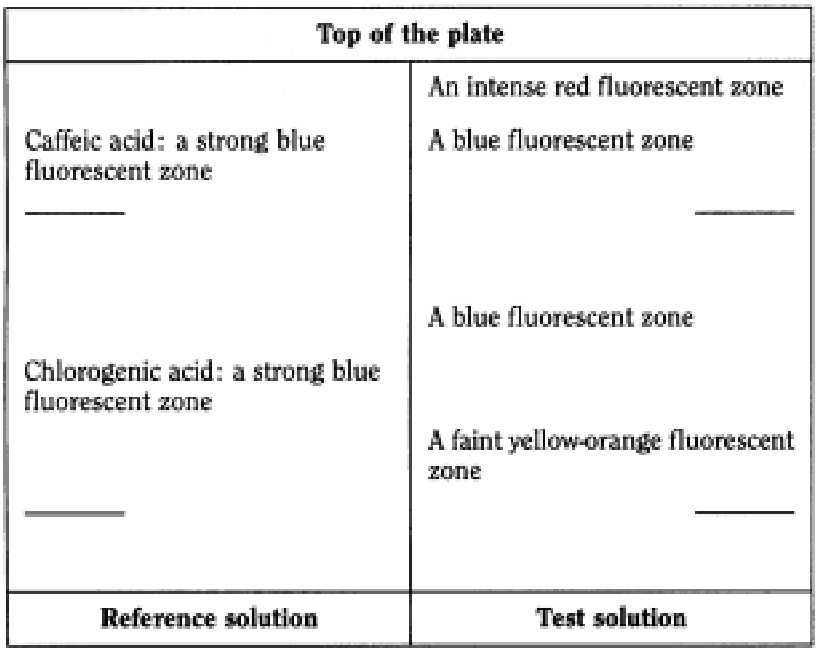
Application 25 µl [or 5 µl] of the test solution and 10 µl [or 2 µl] of the reference solution, as bands.

Development Over a path of 15 cm [or 5 cm].

Drying In a stream of cold air for about 10 min, then at 100 °C for 2 min.

Detection Spray the still-warm plate with a 5 g/l solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*; after 30 min, examine in ultraviolet light at 365 nm.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint blue fluorescent zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	An intense red fluorescent zone
Caffeic acid: a strong blue fluorescent zone	A blue fluorescent zone
———	———
	A blue fluorescent zone
Chlorogenic acid: a strong blue fluorescent zone	
	A faint yellow-orange fluorescent zone
———	———
Reference solution	**Test solution**

D. Examine the chromatograms obtained in the assay. The principal peak in the chromatogram obtained with the test solution is due to cichoric acid and a smaller peak is due to caftaric acid. Peaks due to caffeic acid and chlorogenic acid are minor or may be absent.

TESTS

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Injection 10 µl.

Relative retention With reference to chlorogenic acid (retention time = about 7 min): caftaric acid = about 0.8; caffeic acid = about 1.5; cynarin = about 1.6; echinacoside = about 1.7; cichoric acid = about 2.3.

System suitability Reference solution:

— *resolution*: minimum 5 between the peaks due to caffeic acid and chlorogenic acid.

Locate the peaks due to caffeic acid and chlorogenic acid using the chromatogram obtained with the reference solution. Locate the peaks due to caftaric acid and cichoric acid using the chromatogram in Figure 1823.-1.

Calculate the percentage content of caftaric acid using the following expression:

$$\frac{A_1 \times C_2 \times 100 \times 0.881}{A_2 \times C_1}$$

Calculate the percentage content of cichoric acid using the following expression:

$$\frac{A_3 \times C_2 \times 100 \times 0.695}{A_2 \times C_1}$$

A_1 = area of the peak due to caftaric acid in the chromatogram obtained with the test solution;

A_2 = area of the peak due to chlorogenic acid in the chromatogram obtained with the reference solution;

A_3 = area of the peak due to cichoric acid in the chromatogram obtained with the test solution;

C_1 = concentration of the test solution, in milligrams per millilitre;

C_2 = concentration of chlorogenic acid in the reference solution, in milligrams per millilitre;

0.695 = peak correlation factor based upon the liquid chromatography response observed;

0.881 = peak correlation factor between caftaric acid and chlorogenic acid.

STORAGE

Uncomminuted.

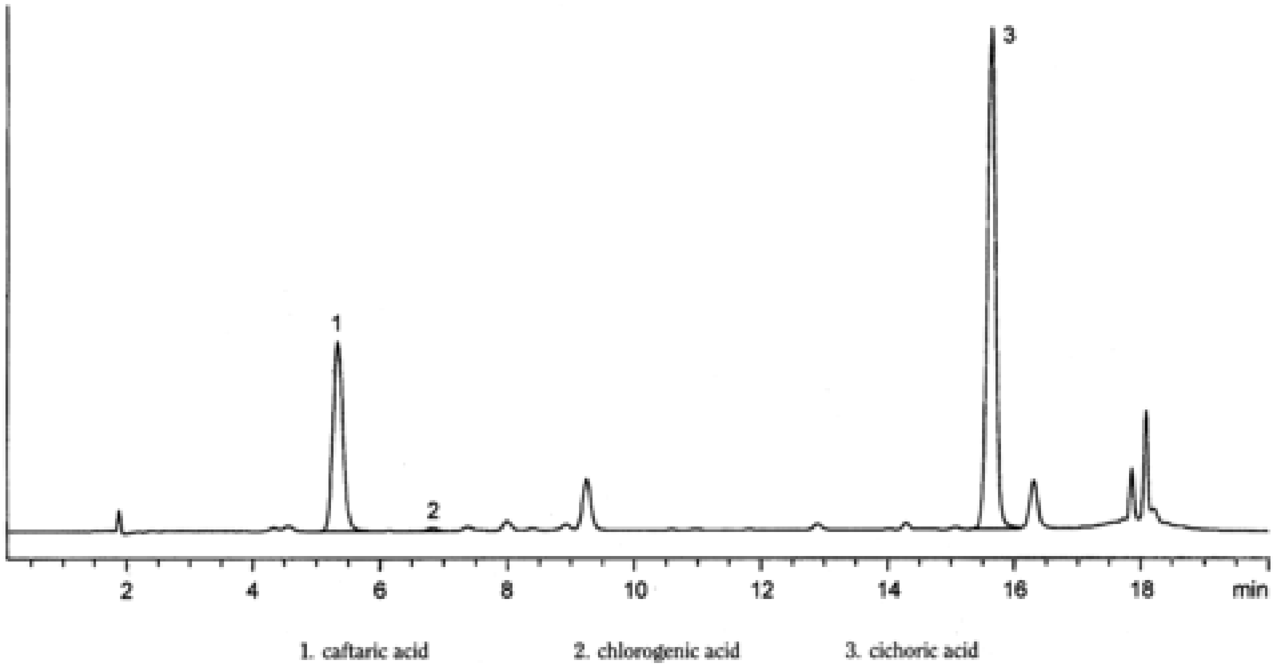

Figure 1823.-1. – *Chromatogram for the assay of caftaric acid and cichoric acid in purple coneflower herb*

Ph Eur

Echinacea Purpurea Root

General Notices

(Purple Coneflower Root, Ph Eur monograph 1824)

Ph Eur

DEFINITION

Dried, whole or cut underground parts of *Echinacea purpurea* (L.) Moench.

Content

Minimum 0.5 per cent for the sum of caftaric acid ($C_{13}H_{12}O_9$; M_r 312.2) and cichoric acid ($C_{22}H_{18}O_{12}$; M_r 474.3) (dried drug).

IDENTIFICATION

First identification *A, B, C, E.*

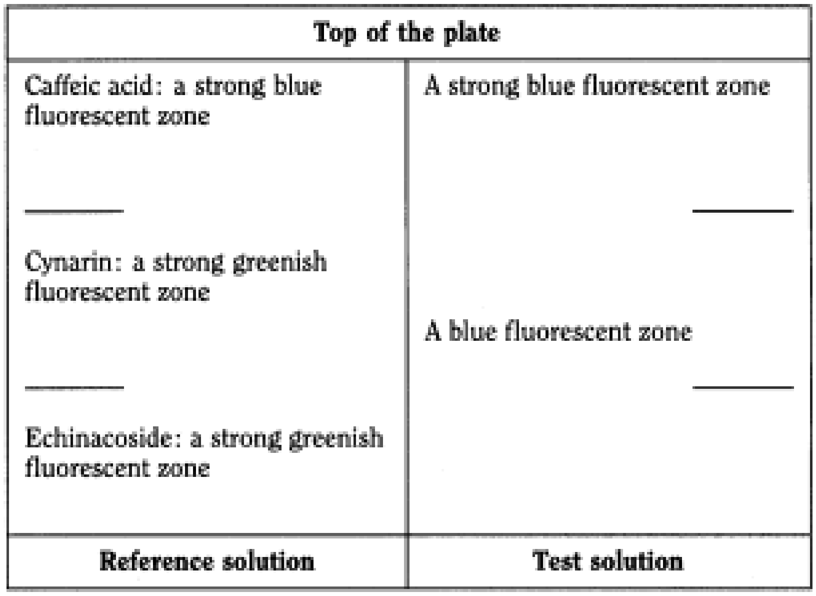
Second identification *A, B, D, E.*

A. The rhizome is up to 15 cm long, branched, reddish-brown to dark brown on the surface and carries many stem bases; the inside is fibrous and white. The numerous roots are spirally twisted, light to dark brown and show a fine cross structuring on the surface.

B. Reduce to a powder (355) *(2.9.12)*. The powder is light yellow to pinkish-beige. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: numerous light-brown spindle-shaped fibres that are joined together in long bundles without black deposits; rare sclereids from the rhizomes and roots, usually occuring singly, those from the rhizomes being isodiametric, about 60 µm in diameter, with black deposits, those from the roots being 50-120 µm in length with no black deposits; secretory cavities up to 180 µm in diameter with yellow oil droplets; squarish to rectangular cells of the outer layers, some with reddish walls; bordered-pitted vessels from the rhizome, 30-40 µm in diameter.

C. Examine the chromatogram obtained in the test for other *Echinacea* species and *Parthenium integrifolium*.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, faint greenish fluorescent zones may be present just below the zone situated in the middle of the chromatogram obtained with the test solution.



Top of the plate	
Caffeic acid: a strong blue fluorescent zone	A strong blue fluorescent zone
_______	_______
Cynarin: a strong greenish fluorescent zone	A blue fluorescent zone
_______	_______
Echinacoside: a strong greenish fluorescent zone	
Reference solution	**Test solution**

D. Examine the chromatograms obtained in the assay. The principal peak in the chromatogram obtained with the test solution is due to cichoric acid and a smaller peak is due to caftaric acid. Peaks due to caffeic acid and chlorogenic acid are minor or may be absent.

E. Thin-layer chromatography *(2.2.27)* .

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 10 ml of *methylene chloride R* and sonicate for 5 min. Centrifuge and use the supernatant solution.

Reference solution
Dissolve 1 mg of β*-sitosterol R* and a volume of *N-isobutyldodecatetraenamide solution R* corresponding to 1 mg of *N-isobutyldodecatetraenamide* R in 5.0 ml of *methanol R* .

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *Anhydrous formic acid R, cyclohexane R, ethyl acetate R, toluene R* (0.9:3:6:24 *V/V/V/V*).

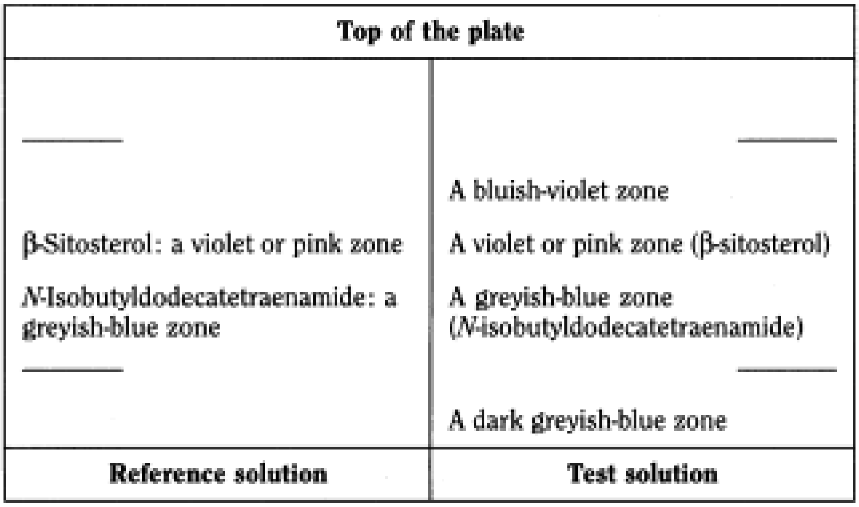
Application 25 µl [or 5 µl], as bands.

Development Over a path of about 15 cm [or 5 cm].

Drying In a stream of cold air for about 10 min.

Detection Dip the plate into *anisaldehyde solution R* for 1 s and heat at 100-105 °C for 3 min; examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
———	———
	A bluish-violet zone

	A dark greyish-blue zone
Reference solution	**Test solution**

TESTS

Other *Echinacea* species and *Parthenium integrifolium*

Thin-layer chromatography *(2.2.27)* .

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 10 ml of *methanol R* and sonicate for 5 min. Centrifuge and use the supernatant solution.

Reference solution Dissolve 1 mg of *echinacoside R* , 1 mg of *cynarin R* and 0.5 mg of *caffeic acid R* in 5.0 ml of *methanol R* .

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R* (3:3:9:15 *V/V/V/V*).

Application 10 µl [or 5 µl] of the test solution and 5 µl [or 2 µl] of the reference solution, as bands.

Development Over a path of 10 cm [or 5 cm].

Drying In a stream of cold air for about 10 min, then at 105 °C for 2 min.

Detection Spray the still-warm plate with a 5 g/l solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R* ; after 30 min, examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the test solution shows no greenish fluorescent zone corresponding to the zone due to echinacoside in the chromatogram obtained with the reference solution, and no greenish fluorescent zone corresponding to the zone due to cynarin in the chromatogram obtained with the reference solution. No other zones apart from very faint dark blue fluorescent zones are seen in the lower half of the chromatogram of the test solution.

Foreign matter *(2.8.2)*

Maximum 3 per cent.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash ***(2.4.16)***

Maximum 9.0 per cent.

Ash insoluble in hydrochloric acid ***(2.8.1)***

Maximum 2.0 per cent.

ASSAY

Liquid chromatography *(2.2.29)* .

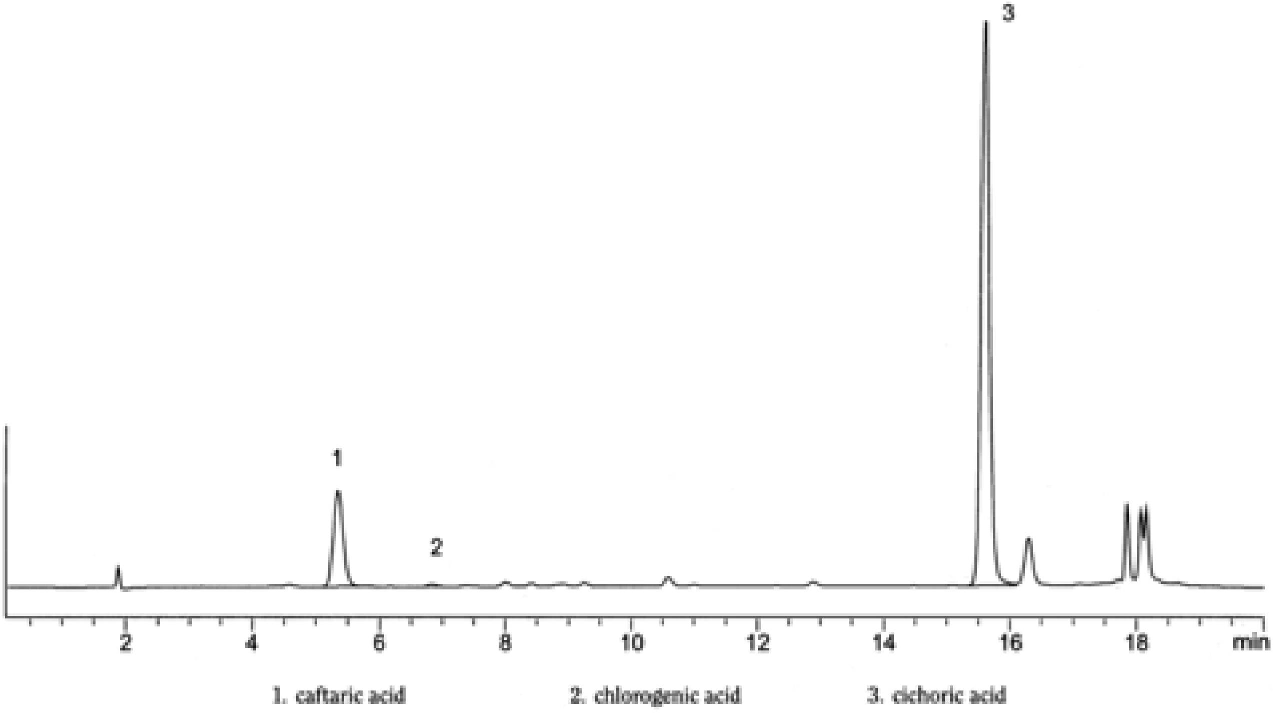

Figure 1824.-1. – *Chromatogram for the assay of caftaric acid and cichoric acid in purple coneflower root*

Test solution In a 100 ml volumetric flask place 0.500 g of the powdered drug (355) *(2.9.12)* and add 80 ml of *ethanol (70 per cent V/V) R*. Sonicate for 15 min and dilute to 100.0 ml with *ethanol (70 per cent V/V) R*. Mix the suspension and allow to stand for a few minutes to allow visible solids to settle.

Reference solution Dissolve 10.0 mg of *chlorogenic acid CRS* and 10.0 mg of *caffeic acid R* in *ethanol (70 per cent V/V) R*, sonicate for 15 min and dilute to 10.0 ml with the same solvent. Dilute 4.0 ml of this solution to 100.0 ml with *ethanol (70 per cent V/V) R*.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 35 °C.

Mobile phase:

— *mobile phase A*: *phosphoric acid R, water R* (1:999 *V/V*);

— *mobile phase B*: *acetonitrile R* ;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0	90	10
0 - 13	90 → 78	10 → 22
13 - 14	78 → 60	22 → 40
14 - 20	60	40

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 330 nm.

Injection 10 µl.

Relative retention With reference to chlorogenic acid (retention time = about 7 min): caftaric acid = about 0.8; caffeic acid = about 1.5; cynarin = about 1.6; echinacoside = about 1.7; cichoric acid = about 2.3.

System suitability Reference solution:

— *resolution*: minimum 5 between the peaks due to caffeic acid and chlorogenic acid.

Locate the peaks due to caffeic acid and chlorogenic acid using the chromatogram obtained with the reference solution. Locate the peaks due to caftaric acid and cichoric acid using the chromatogram in Figure 1824.-1.

Calculate the percentage content of caftaric acid using the following expression:

$$\frac{A_1 \times C_2 \times 100 \times 0.881}{A_2 \times C_1}$$

Calculate the percentage content of cichoric acid using the following expression:

$$\frac{A_3 \times C_2 \times 100 \times 0.695}{A_2 \times C_1}$$

A_1 = area of the peak due to caftaric acid in the chromatogram obtained with the test solution;

A_2 = area of the peak due to chlorogenic acid in the chromatogram obtained with the reference solution;

A_3 = area of the peak due to cichoric acid in the chromatogram obtained with the test solution;

C_1 = concentration of the dried drug in the test solution, in milligrams per millilitre;

C_2 = concentration of chlorogenic acid in the reference solution, in milligrams per millilitre;

0.695 = peak correlation factor based upon the liquid chromatography response observed;

0.881 = peak correlation factor between caftaric acid and chlorogenic acid.

STORAGE

Uncomminuted.

Ph Eur

Elder Flower

General Notices

(Ph Eur monograph 1217)

Ph Eur

DEFINITION

Dried flowers of *Sambucus nigra* L.

Content

Minimum 0.80 per cent of flavonoids, expressed as isoquercitroside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried drug).

IDENTIFICATION

A. The flower, about 5 mm in diameter, has 3 small bracts (hand lens) and may have a peduncle. The 5-toothed calyx is small; the corolla is light yellow, with 5 broadly oval petals fused at their bases into a tube. The filaments of the 5 yellow stamens alternate with the petals. The corolla is often isolated or attached to the stamens, to which it is fused at the base. The ovary is inferior with 3 locules and it bears a short style with 3 obtuse stigmata.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greenish-yellow. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: numerous spherical, sometimes ellipsoidal, pollen grains about 30 µm in diameter, with 3 germinal pores and very finely pitted exine; calyx epidermal cells with a striated cuticle and occasional unicellular marginal teeth from the basal region; corolla fragments with numerous small globules of volatile oil, those of the upper epidermis with slightly thickened and beaded walls and a striated cuticle; mesophyll cells of petals and sepals with idioblasts containing numerous sandy crystals of calcium oxalate.

C. Examine the chromatograms obtained in the test for *Sambucus ebulus*.

Detection In ultraviolet light at 365 nm.

Results The chromatogram obtained with the test solution shows an intense light blue fluorescent zone due to chlorogenic acid, an orange fluorescent zone due to rutin as well as an orange fluorescent zone due to isoquercitrin, which appears slightly above the zone due to hyperoside in the chromatogram obtained with the reference solution. A greenish-blue fluorescent zone appears in the chromatogram obtained with the test solution a little below the caffeic acid zone in the chromatogram obtained with the reference solution. Additional faint fluorescent zones may be present. In daylight, only the orange fluorescent zones due to rutin and isoquercitroside in the chromatogram obtained with the test solution are clearly visible.

TESTS

Foreign matter *(2.8.2)*

Maximum 8 per cent of fragments of coarse pedicels and other foreign matter and maximum 15 per cent of discoloured, brown flowers. Carry out the determination on 10 g.

Sambucus ebulus L

Thin-layer chromatography *(2.2.27)* .

Test solution To 0.5 g of the powdered drug (355) *(2.9.12)* add 10 ml of *methanol R* and heat in a water bath at 65 °C for 5 min, shaking frequently. Allow to cool and filter. Dilute the filtrate to 10 ml with *methanol R* .

Reference solution Dissolve 1 mg of *caffeic acid R* , 1 mg of *chlorogenic acid R* , 2.5 mg of *hyperoside R* and 2.5 mg of *rutin R* in 10 ml of *methanol R* .

Plate *TLC silica gel plate R.*

Mobile phase *anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R* (10:10:30:50 *V/V/V*).

Application 10 µl, as bands.

Development Over a path of 15 cm.

Drying At 100-105 °C.

Detection Spray the plate whilst hot with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* ; subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R* . Allow to dry in air for 30 min and examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the reference solution shows in the lower half, with increasing R_F values, the orange fluorescent zone due to rutin, the light blue fluorescent zone due to chlorogenic acid and the orange-yellow or orange-brown fluorescent zone due to hyperoside. The upper third presents a greenish-blue fluorescent zone due to caffeic acid. The chromatogram obtained with the test solution does not show a pink zone below the zone due to rutin in the chromatogram obtained with the reference solution.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 10.0 per cent.

ASSAY

Stock solution In a 100 ml round-bottomed flask, introduce 0.600 g of the powdered drug (355) *(2.9.12)*, add 1 ml of a 5 g/l solution of *hexamethylenetetramine R* , 20 ml of *acetone R* and 2 ml of *hydrochloric acid R1* . Boil the mixture under a reflux condenser for 30 min. Filter the mixture through a plug of absorbent cotton into a flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 ml, of *acetone R*

, each time boiling under a reflux condenser for 10 min. Allow to cool, filter each extract through the plug of absorbent cotton into the flask. After cooling, filter the combined acetone extracts through a filter paper into a volumetric flask, dilute to 100.0 ml with *acetone R* by rinsing the flask and the filter paper. Introduce 20.0 ml of this solution into a separating funnel, add 20 ml of *water R* and shake the mixture with 1 quantity of 15 ml and then 3 quantities, each of 10 ml, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, wash with 2 quantities, each of 50 ml, of *water R*, and filter the extracts over 10 g of *anhydrous sodium sulphate R* into a volumetric flask and dilute to 50.0 ml with *ethyl acetate R*.

Test solution To 10.0 ml of the stock solution add 1 ml of *aluminium chloride reagent R* and dilute to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Compensation liquid Dilute 10.0 ml of the stock solution to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

After 30 min, measure the absorbance *(2.2.25)* of the test solution at 425 nm, by comparison with the compensation liquid.

Calculate the percentage content of flavonoids, expressed as isoquercitroside, using the following expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of isoquercitroside to be 500.

A = absorbance at 425 nm,

m = mass of the drug to be examined, in grams.

STORAGE

Store protected from light.

Ph Eur

Eleutherococcus

General Notices

Siberian Ginseng

(Ph Eur monograph 1419)

Ph Eur

DEFINITION

Dried, whole or cut underground organs of *Eleutherococcus senticosus* (Rupr. et Maxim.) Maxim.

Content

Minimum 0.08 per cent for the sum of eleutheroside B (M_r 372.4) and eleutheroside E (M_r 742.7).

IDENTIFICATION

A. The rhizome is knotty, of irregular cylindrical shape, 1.5 cm to 4.0 cm in diameter; the surface is rugged, longitudinally wrinkled and greyish-brown to blackish-brown; the bark, about 2 mm thick, closely adheres to the xylem; the heartwood is light brown and the sapwood is pale yellow; the fracture shows short thin fibres in the bark and is coarsely fibrous, especially in the internal part of the xylem. The lower surface bears numerous cylindrical and knotty roots, 3.5 cm to 15 cm long and 0.3 cm to 1.5 cm in diameter; with a smooth, greyish-brown to blackish-brown surface; the bark is about 0.5 mm thick, closely adhering to the pale yellow xylem; the fracture is slightly fibrous; in places where the outer layer has been removed, the outer surface is yellowish-brown.

B. Reduce to a powder (355) *(2.9.12)*. The powder is yellowish-brown. Examine under a microscope, using *chloral hydrate solution R* . The powder shows numerous groups of thick-walled, lignified fibres; fragments of reticulate and bordered pitted vessels with a wide lumen; groups of secretory canals, up to 20 µm in diameter with brown contents; parenchymatous cells containing cluster crystals of calcium oxalate 10 µm to 50 µm in diameter. Examine under a microscope, using a 50 per cent *V/V* solution of *glycerol R* . The powder shows small starch granules, rounded to slightly angular in outline, single compounds or with 2 or 3 components.

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 10 ml of *alcohol (50 per cent V/V) R* and boil under reflux for 1 h. Cool and filter. Evaporate the filtrate to dryness on a water-bath. Dissolve the residue in 2.5 ml of a mixture of 5 volumes of *water R* and 20 volumes of *alcohol (50 per cent V/V) R* and filter.

Reference solution Dissolve 2.0 mg of *esculin R* and 2.0 mg of *catalpol R* in 20 ml of a mixture of 2 volumes of water R and 8 volumes of *alcohol (50 per cent V/V) R* .

Plate *TLC silica gel plate R.*

Mobile phase *water R, methanol R, methylene chloride R* (4:30:70 *V/V/V*).

Application 20 µl, as bands.

Development Over a path of 10 cm.

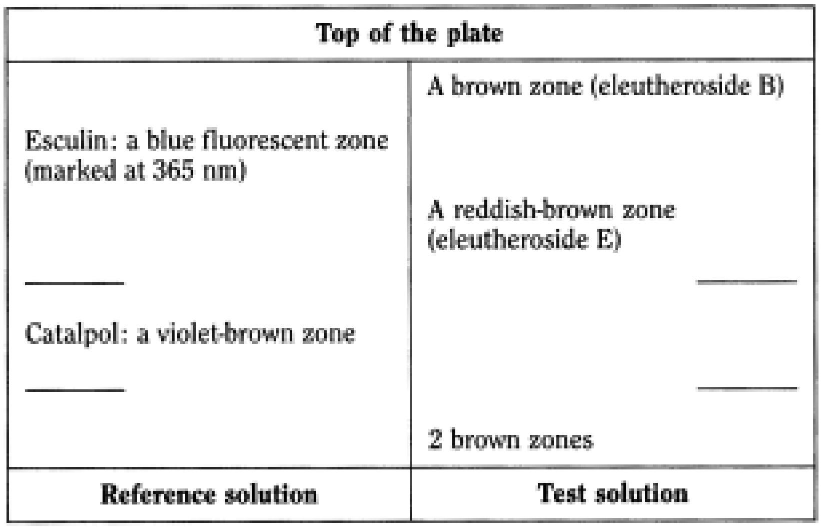
Drying In air.

Detection A Examine in ultraviolet light at 365 nm.

Results A The chromatogram obtained with the reference solution shows in the upper half a blue fluorescent zone (esculin).

Detection B Spray with *anisaldehyde solution R* and examine in daylight while heating at 100-105 °C for 5-10 min.

Results B See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones are present in the chromatogram obtained with the test solution.



Top of the plate	
	A brown zone (eleutheroside B)
Esculin: a blue fluorescent zone (marked at 365 nm)	
	A reddish-brown zone (eleutheroside E)

TESTS

Foreign matter *(2.8.2)*

Maximum 3 per cent.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 8.0 per cent.

ASSAY

Liquid chromatography *(2.2.29)* .

Test solution To 0.500 g of the powdered drug (355) *(2.9.12)* in a 100 ml round-bottomed flask, add 30 ml of a mixture of equal volumes of *alcohol R* and *water R* . Heat in a water-bath at 60 °C for 30 min. Allow to cool and filter through a sintered-glass filter *(2.1.2)* . Collect the liquid in a 250 ml round-bottomed flask. Repeat this operation twice, using the residue obtained in the filtration step instead of the powdered drug. Add both fractions of supernatant liquid to the 250 ml round-bottomed flask. Evaporate under reduced pressure until about 10 ml of supernatant liquid is left in the flask. Transfer the supernatant liquid quantitatively to a 20.0 ml volumetric flask and dilute to 20.0 ml with a mixture of equal volumes of *alcohol R* and *water R* . Filter through a nylon filter (pore size 0.45 µm).

Reference solution (a) Dissolve 10 mg of *ferulic acid R* in a mixture of equal volumes of *methanol R* and *water R* and dilute to 20.0 ml with the same mixture of solvents.

Reference solution (b) Dissolve 10 mg of *caffeic acid R* in a mixture of equal volumes of *methanol R* and *water R* and dilute to 20.0 ml with the same mixture of solvents.

Reference solution (c) Transfer 1 ml of reference solution (a) to a 25 ml volumetric flask and dilute to 25.0 ml with a mixture of equal volumes of *methanol R* and *water R* . Filter through a nylon filter (pore size 0.45 µm).

Reference solution (d) Transfer 1 ml of reference solution (a) and 1 ml of reference solution (b) in a mixture of equal volumes of *methanol R* and *water R* and dilute to 25.0 ml with the same mixture of solvents. Filter through a nylon filter (pore size 0.45 µm).

Precolumn:
— *size: l* = 4 mm, Ø = 4.6 mm,

assay of eleutherococcus

Ph Eur

Essential Oils

General Notices

(Ph Eur monograph 2098)

Ph Eur

The statements in this monograph are intended to be read in conjunction with individual monographs on essential oils in the European Pharmacopoeia. Application of the monograph to other essential oils may be decided by the competent authority.

DEFINITION

Odorous product, usually of complex composition, obtained from a botanically defined plant raw material by steam distillation, dry distillation, or a suitable mechanical process without heating. Essential oils are usually separated from the aqueous phase by a physical process that does not significantly affect their composition.

Essential oils may be subjected to a suitable subsequent treatment. Thus an essential oil may be commercially known as being deterpenated, desesquiterpenated, rectified or 'x'-free.

— A *deterpenated essential oil* is an essential oil from which monoterpene hydrocarbons have been removed, partially or totally.

— A *deterpenated and desesquiterpenated essential oil* is an essential oil from which mono- and sesquiterpene hydrocarbons have been removed, partially or totally.

— A *rectified essential oil* is an essential oil that has been subjected to fractional distillation to remove certain constituents or modify the content.

— An *x-free essential oil* is an essential oil that has been subjected to partial or complete removal of one or more constituents.

PRODUCTION

Depending on the monograph, the plant raw material may be fresh, wilted, dried, whole, broken or ground.

Steam distillation The essential oil is produced by the passage of steam through the plant raw material in a suitable apparatus. The steam may be introduced from an external source or generated by boiling water below the raw material or by boiling water in which the raw material is immersed. The steam and oil vapours are condensed. The water and essential oil are separated by decantation.

Dry distillation The essential oil is produced by high-temperature heating of stems or barks in a suitable apparatus without the addition of water or steam.

Mechanical process The essential oil, usually known as 'cold-pressed', is produced by a mechanical process without any heating. It is mainly applied to *Citrus* fruit and involves expression of the oil from the pericarp and subsequent separation by physical means.

In certain cases, a suitable antioxidant may be added to the essential oil.

CHARACTERS

The appearance and the odour of the essential oil is determined.

IDENTIFICATION

Essential oils are identified by their gas chromatographic profile, or failing this, by any other test that may be required (for example, a test by thin-layer chromatography).

TESTS

GENERAL TESTS

The essential oil complies with the prescribed limits for the following tests.

Relative density ***(2.2.5)***

Refractive index ***(2.2.6)***

Optical rotation ***(2.2.7)***

Fatty oils and resinified essential oils ***(2.8.7)***

SUPPLEMENTARY TESTS

If necessary, the essential oil complies with the prescribed limits for the following tests.

Freezing point ***(2.2.18)***

Acid value ***(2.5.1)***

Peroxide value ***(2.5.5)***

Foreign esters ***(2.8.6)***

Residue on evaporation ***(2.8.9)***

Water ***(2.8.5)***

Solubility in alcohol ***(2.8.10)***

Falsification

If appropriate, a test for one or more falsifications may be carried out by thin-layer chromatography *(2.2.27)* , by gas chromatography *(2.2.28)* using a chiral column if necessary, or by any other suitable method.

Chromatographic profile

Gas chromatography *(2.2.28)* : use the normalisation procedure.

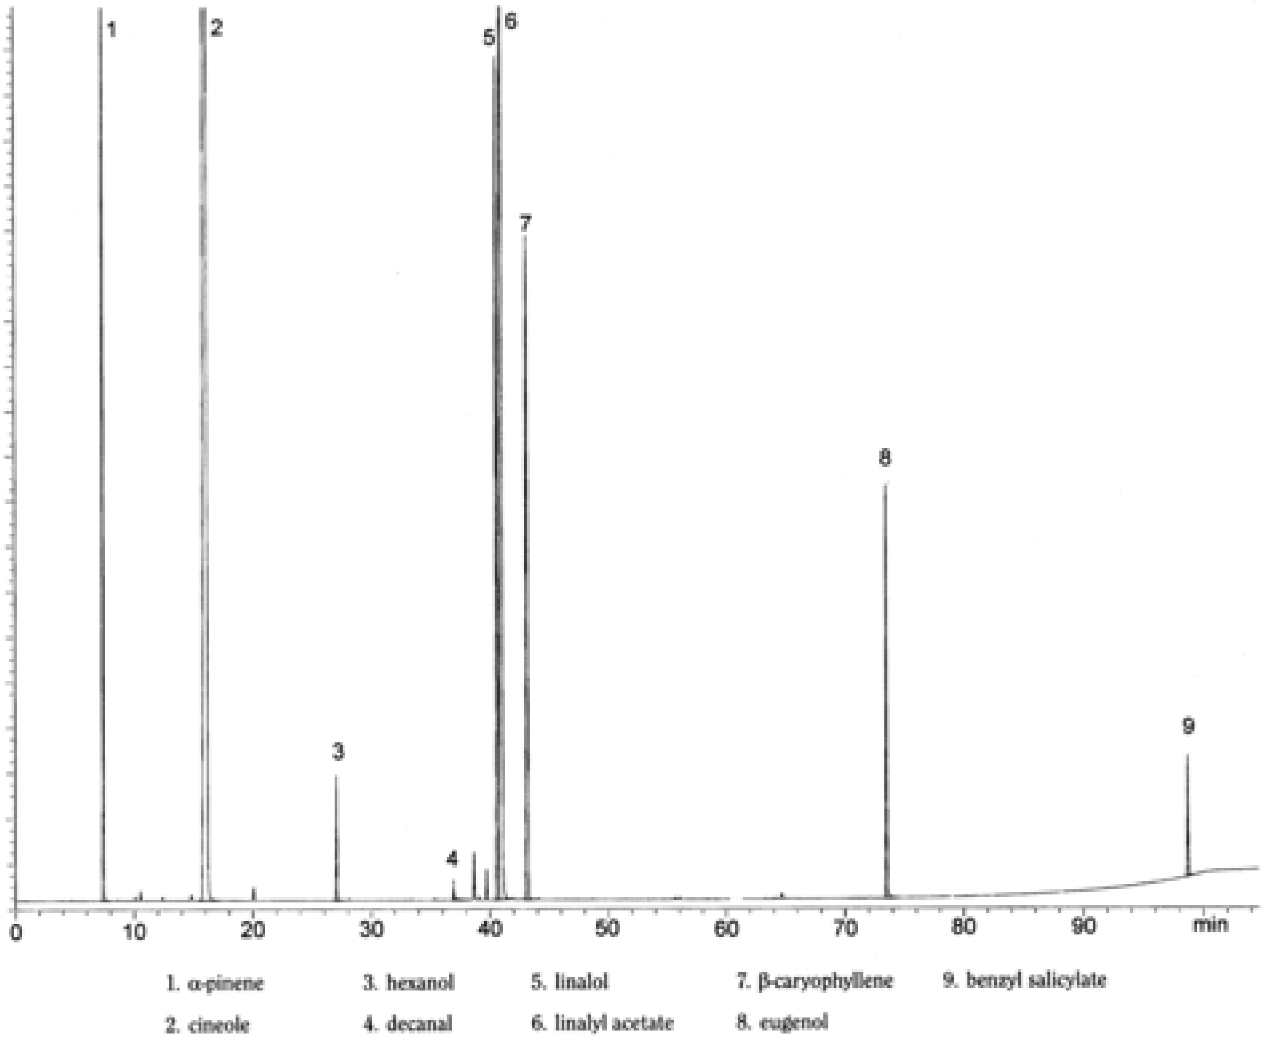

Figure 2098.-1. – *Chromatogram for the test for chromatographic profile of essential oils*

In addition to the system suitability test given in the specific monograph, it is necessary to check the suitability of the chromatographic system using the following test, which is to be carried out periodically within the framework of performance qualification.

The chromatogram shown in Figure 2098.-1 is given as an example.

Reference solution *essential oil CRS*. If necessary, the reference solution can be diluted with *heptane R* .

Column:

- *material*: fused silica;
- *size: l* = 60 m, Ø = 0.25 mm;
- *stationary phase: macrogol 20 000 R* (0.25 µm).

Carrier gas *helium for chromatography R.*

Flow rate 1.5 ml/min.

Split ratio 1:500. The split ratio/injection volume can be adjusted in order to fit the specific equipment used, provided that the column load stays the same.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 15	70
	15 - 100	70 → 240
	100 - 105	240
Injection port		250
Detector		270

Detection Flame ionisation.

Injection 1 µl.

Identification of components Use the chromatogram supplied with *essential oil CRS*.

System suitability Reference solution:

— *resolution*: minimum 1.5 between the peaks due to linalol and linalyl acetate;

— *signal-to-noise ratio* : minimum 100 for the peak due to decanal;

— *limits*: the percentage content of each of the 9 components is within the limits stated on the leaflet provided with *essential oil CRS*.

STORAGE

In a well-filled, airtight container, protected from light.

LABELLING

The label states:

— the scientific name of the plant raw material used;

— where applicable, the type and/or the chemotype of the essential oil;

— where applicable, the method of production;

— where applicable, the name and concentration of any added antioxidant;

— where applicable, additional processing steps that are not specified under Definition.

Ph Eur

Eucalyptus Leaf

General Notices

(Ph Eur monograph 1320)

Ph Eur

DEFINITION

Whole or cut dried leaves of older branches of *Eucalyptus globulus* Labill.

Content

Minimum 20 ml/kg of essential oil for the whole drug (anhydrous drug) and minimum 15 ml/kg of essential oil for the cut drug (anhydrous drug).

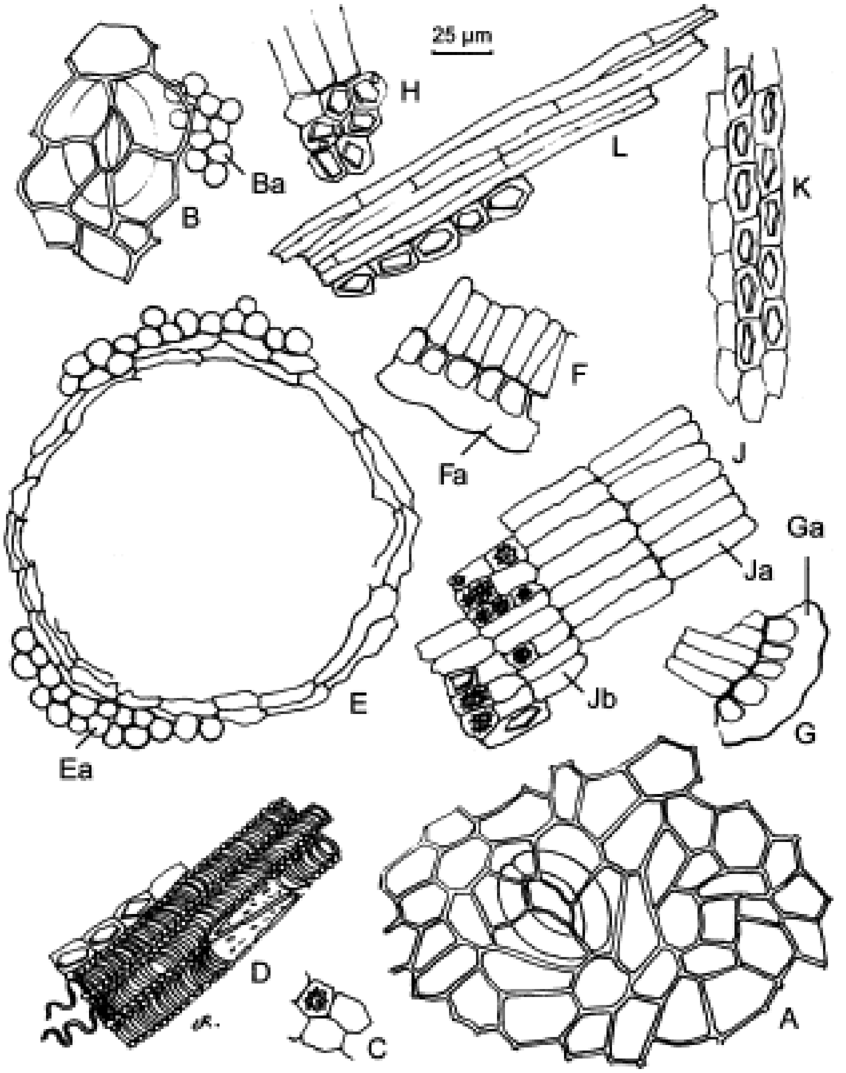
CHARACTERS

Aromatic odour of cineole.

IDENTIFICATION

A. The leaves which are mainly greyish-green and relatively thick are elongated, elliptical and slightly sickle-shaped and usually up to 25 cm in length, and up to 5 cm in width. The petiole is twisted, strongly wrinkled and is 2-3 cm, rarely 5 cm, in length. The coriaceous, stiff leaves are entire and glabrous and have a yellowish-green mid rib. Lateral veins anastomose near the margin to a continuous line. The margin is even and somewhat thickened. On both surfaces are minute, irregularly distributed, warty dark brown spots. Small oil glands may be seen in transmitted light.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greyish-green. Examine under a microscope, using *chloral hydrate solution R* . The powder shows the following diagnostic characters: fragments of glabrous lamina with small thick-walled epidermal cells bearing a thick cuticle, numerous anomocytic stomata *(2.8.3)* of more than 80 µm in diameter and occasionally groups of brown cork cells, 300 µm in diameter and brownish-black in their centre; fragments of isobilateral mesophyll with 2-3 layers of palisade parenchyma on each side and in the centre several layers of spongy mesophyll with elongated cells with the same orientation as the palisade cells and containing prisms and cluster crystals of calcium oxalate; fragments of mesophyll containing large schizogenous oil glands.



A. Thick-walled epidermal cells and anomocytic stomata, in surface view

B. Thick-walled epidermal cells and anomocytic stomata, with attached palisade parenchyma (Ba), in surface view

C. Parenchyma cells with cluster crystal of calcium oxalate

D. Vascular tissue

E. Schizogenous oil gland with attached palisade parenchyma (Ea)

F and G. Epidermis covered by a thick cuticle (Fa and Ga), in transverse section

H and J. Palisade parenchyma (Ja) with attached spongy mesophyll (Jb) containing prisms and cluster crystals of calcium oxalate

K. Cells containing prisms of calcium oxalate

L. Fibres

Figure 1320.-1. – ***Illustration of powdered herbal drug of eucalyptus leaf (see Identification B)***

C. Thin-layer chromatography *(2.2.27)* .

Test solution Shake 0.5 g of the freshly powdered drug (355) *(2.9.12)* with 5 ml of *toluene R* for 2-3 min and filter over about 2 g of *anhydrous sodium sulphate R* .

Reference solution Dissolve 50 µl of *cineole R* in *toluene R* and dilute to 5 ml with the same solvent.

Plate *TLC silica gel plate R* .

Mobile phase *ethyl acetate R* , *toluene R* (10:90 V/V).

Application 10 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R* . Examine in daylight while heating at 100-105 °C for 5-10 min.

Results The chromatogram obtained with the reference solution shows in the middle a zone due to cineole. The main zone in the chromatogram obtained with the test solution is similar in position and colour to the zone due to cineole in the chromatogram obtained with the reference solution, it also shows an intense violet zone (hydrocarbons) near the solvent front and there may also be other fainter zones.

TESTS

Foreign matter *(2.8.2)*

Maximum 3 per cent of dark and brown leaves, maximum 5 per cent of stems and maximum 2 per cent of other foreign matter. Cordate or ovate sessile leaves of young branches, with numerous glands on both sides, visible as points in transmitted light, are not present. Determine by using 30 g of the drug to be examined.

Water *(2.2.13)*

Maximum 100 ml/kg, determined on 20.0 g of powdered drug (355) *(2.9.12)*.

Total ash *(2.4.16)*

Maximum 6.0 per cent.

ASSAY

Carry out the determination of essential oil in herbal drugs *(2.8.12)* . Use 10.0 g of the drug, cut immediately before determination, a 500 ml round-bottomed flask, 200 ml of *water R* and 100 ml of *glycerol R* as the distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

Ph Eur

Eucalyptus Oil

General Notices

(Ph Eur monograph 0390)

Ph Eur

DEFINITION

Essential oil obtained by steam distillation and rectification from the fresh leaves or the fresh terminal branchlets of various species of *Eucalyptus* rich in 1,8-cineole. The species mainly used are *Eucalyptus globulus* Labill., *Eucalyptus polybractea* R.T. Baker and *Eucalyptus smithii* R.T. Baker.

CHARACTERS

Appearance

Colourless or pale yellow liquid.

Aromatic and camphoraceous odour, pungent and camphoraceous taste.

IDENTIFICATION

First identification *B.*

Second identification *A.*

A. Thin-layer chromatography *(2.2.27)* .

Test solution Dissolve 0.1 g of the substance to be examined in *toluene R* and dilute to 10 ml with the same solvent.

Reference solution Dissolve 50 µl of *cineole R* in *toluene R* and dilute to 5 ml with the same solvent.

Plate *TLC silica gel plate R.*

Mobile phase *ethyl acetate R, toluene R* (10:90 *V/V*).

Application 10 µl as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R* and examine in daylight while heating at 100-105 °C for 5-10 min.

Results The chromatogram obtained with the reference solution shows in the middle part a zone due to cineole; the chromatogram obtained with the test solution shows a main zone similar in position and colour to the zone due to cineole in the chromatogram obtained with the reference solution. Other weaker zones may be present.

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The chromatogram obtained with the test solution shows 5 principal peaks similar in retention time to the 5 principal peaks in the chromatogram obtained with the reference solution.

TESTS

Relative density *(2.2.5)*

0.906 to 0.927.

Refractive index *(2.2.6)*

1.458 to 1.470.

Optical rotation *(2.2.7)*

0° to + 10°.

Solubility in alcohol *(2.8.10)*

It is soluble in 5 volumes of *ethanol (70 per cent V/V) R*.

Aldehydes

To 10 ml in a ground-glass-stoppered tube 25 mm in diameter and 150 mm long, add 5 ml of *toluene R* and 4 ml of *alcoholic hydroxylamine solution R*. Shake vigorously and titrate immediately with *0.5 M potassium hydroxide in alcohol (60 per cent V/V)* until the red colour changes to yellow. Continue the titration with shaking; the end-point is reached when the pure yellow colour of the indicator is permanent in the lower layer after shaking vigorously for 2 min and allowing separation to take place. The reaction is complete in about 15 min. Repeat the titration using a further 10 ml of the substance to be examined and, as a reference solution for the end-point, the titrated liquid from the 1st determination to which has been added 0.5 ml of *0.5 M potassium hydroxide in alcohol (60 per cent V/V)*. Not more than 2.0 ml of *0.5 M potassium hydroxide in alcohol (60 per cent V/V)* is required in the 2nd titration.

Chromatographic profile

Gas chromatography *(2.2.28)* : use the normalisation procedure.

Test solution The substance to be examined.

Reference solution Dissolve 80 µl of *α-pinene R*, 10 µl of *β-pinene R*, 10 µl of *sabinene R*, 10 µl of *α-phellandrene R*, 10 µl of *limonene R*, 0.8 ml of *cineole R* and 10 mg of *camphor R* in 10 ml of *acetone R*.

Column:

- *material*: fused silica;
- *size: l* = 60 m, Ø = about 0.25 mm;
- *stationary phase*: bonded *macrogol 20 000 R*.

Carrier gas *helium for chromatography R.*

Flow rate 1.5 ml/min.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 5	60
	5 - 33	60 → 200
	33 - 38	200
Injection port		220
Detector		220

Detection Flame ionisation.

Injection 0.5 µl.

Elution order Order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability Reference solution:

— *resolution*: minimum 1.5 between the peaks due to limonene and cineole;

— *number of theoretical plates* : minimum 30 000, calculated for the peak due to limonene at 110 °C.

Identification of components Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of each of these components. The percentages are within the following ranges:

— α-*pinene* : traces to 9.0 per cent;

— β-*pinene* : less than 1.5 per cent;

— *sabinene* : less than 0.3 per cent;

— α-*phellandrene* : less than 1.5 per cent;

— *limonene* : traces to 12.0 per cent;

— *1,8-cineole* : minimum 70.0 per cent;

— *camphor* : less than 0.1 per cent.

STORAGE

At a temperature not exceeding 25 °C.

European Goldenrod

General Notices

(Ph Eur monograph 1893)

Ph Eur

DEFINITION

Whole or cut, dried, flowering aerial parts of *Solidago virgaurea* L.

Content

Minimum 0.5 per cent and maximum 1.5 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried drug).

IDENTIFICATION

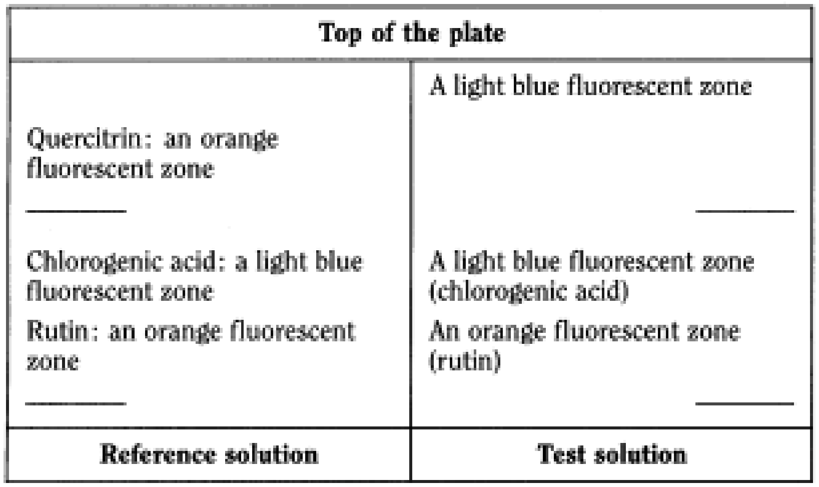
A. The stem is cylindrical, striated, the lower part often reddish-violet, sometimes entirely glabrous or pubescent with short, bent, apically directed hairs. The basal leaves are obovate to oblanceolate, with a serrate margin, and taper at the base into a long, winged petiole; the cauline leaves are alternate, smaller than the basal leaves and more elliptical in outline, with an entire or slightly toothed margin; they are sessile or with only a short petiole. Both surfaces of the leaves are glabrous or only slightly pubescent with a prominent reticulate venation on the lower surface. The capitula form a tightly packed panicle. At the base of the pedicels there are 2, small, linear bracts with scarious margins. The involucre consists of 2-4 rows of loosely-arranged, imbricate bracts, each bract greenish-yellow with a smooth and shiny inner surface, the outer surface hairy or glabrous, with a scarious margin. Each capitulum contains from 6-12 widely separated female ray florets, about twice as long as the bracts, and about 10-30 hermaphrodite, tubular florets. All florets are yellow. The brown, inferior ovary tapers towards the base and has a ribbed surface, covered with scattered hairs; it is surmounted by a whitish pappus composed of smooth or rough, bristly hairs.

B. Reduce to a powder (355) *(2.9.12)*. The powder is light green. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of the leaf in surface view, those of the upper epidermis composed of polygonal cells with straight, beaded walls and distinct cuticular striations, those of the lower epidermis more sinuous with fewer striations and numerous anomocytic stomata *(2.8.3)*; occasional leaf fragments showing cells containing small, isolated cluster crystals of calcium oxalate; uniseriate, conical covering trichomes from the leaves and the bracts with up to about 10 cells, some of the shorter trichomes showing a terminal cell extended and pennant-like; occasional glandular trichomes with a 1 or 2 celled stalk and a unicellular, elongated head; rare paired, covering trichomes from the ovary with a distinctly pitted central wall and a bifid apex; abundant pappus hairs and their fragments, multiseriate with the marginal cells overlapping outwards; groups of fibres and vascular tissue from the stems; fragments of the epidermis of the petals with striated cuticle and occasional long, biseriate glandular trichomes; pollen grains spherical, with 3 pores and a spiny exine.

C. Thin-layer chromatography *(2.2.27)* as described in the test for *Solidago gigantea* and

Solidago canadensis.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A light blue fluorescent zone
Quercitrin: an orange fluorescent zone	
———	———
Chlorogenic acid: a light blue fluorescent zone	A light blue fluorescent zone (chlorogenic acid)
Rutin: an orange fluorescent zone	An orange fluorescent zone (rutin)
———	———
Reference solution	**Test solution**

TESTS

Foreign matter *(2.8.2)*

Maximum 5 per cent of brown coloured matter and maximum 5 per cent of other foreign matter.

Solidago gigantea and *Solidago Canadensis*

Thin-layer chromatography *(2.2.27)*.

Test solution To 0.75 g of the powdered drug (355) *(2.9.12)* add 5 ml of *methanol R* and heat on a water-bath under a reflux condenser for 10 min. Cool and filter.

Reference solution Dissolve 1.0 mg of *chlorogenic acid R*, 2.5 mg of *quercitrin R* and 2.5 mg of *rutin R* in 10 ml of *methanol R*.

Plate TLC silica gel plate R.

Mobile phase anhydrous formic acid R, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (6:6:18:30 *V/V/V/V*).

Application 20 µl as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray the plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Examine in ultraviolet light at 365 nm after 30 min.

Results The chromatogram obtained with the test solution shows no strong orange fluorescent zone similar in position to the zone of quercitrin in the chromatogram obtained with the reference solution.

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 8.0 per cent.

ASSAY

Stock solution In a 100 ml round-bottomed flask, place 0.200 g of the powdered drug (355) *(2.9.12)*, add 1 ml of a 5 g/l solution of *hexamethylenetetramine R*, 20 ml of *acetone R* and 2 ml of *hydrochloric acid R1*. Boil the mixture in a water-bath under a reflux condenser for 30 min. Filter the liquid through a small plug of absorbent cotton into a 100 ml flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 ml, of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool. Filter the combined acetone extracts through filter paper, dilute to 100.0 ml with *acetone R*, rinsing the volumetric flask and the filter paper with acetone. Introduce 20.0 ml of the solution into a suitable separating funnel, add 20 ml of *water R* and shake the mixture with 1 quantity of 15 ml and then with 3 quantities, each of 10 ml, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, wash twice with 50 ml of *water R* and filter the extracts over 10 g of *anhydrous sodium sulphate R* into a volumetric flask. Dilute to 50.0 ml with *ethyl acetate R*, rinsing the separating funnel and the sodium sulphate.

Test solution To 10.0 ml of the stock solution add 1.0 ml of *aluminium chloride reagent R* and dilute to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Compensation liquid Dilute 10.0 ml of the stock solution to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

After 30 min, measure the absorbance *(2.2.25)* of the test solution at 425 nm by comparison with the compensation liquid.

Calculate the percentage content of flavonoids, expressed as hyperoside, from the following expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of hyperoside to be 500.

A = measured absorbance at 425 nm,

m = mass of the drug to be examined, in grams.

Ph Eur

EXTRACTS

General Notices

(Ph Eur monograph 0765)

Extracts comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

DEFINITION

Extracts are preparations of liquid (liquid extracts and tinctures), semi-solid (soft extracts and oleoresins) or solid (dry extracts) consistency, obtained from herbal drugs or animal matter, which are usually in a dry state.

Where medicinal products are manufactured using extracts of animal origin, the requirements of chapter *5.1.7*. *Viral safety* apply.

Different types of extract may be distinguished. Standardised extracts are adjusted within an acceptable tolerance to a given content of constituents with known therapeutic activity; standardisation is achieved by adjustment of the extract with inert material or by blending batches of extracts. Quantified extracts are adjusted to a defined range of constituents; adjustments are made by blending batches of extracts. Other extracts are essentially defined by their production process (state of the herbal drug or animal matter to be extracted, solvent, extraction conditions) and their specifications.

PRODUCTION

Extracts are prepared by suitable methods using ethanol or other suitable solvents. Different batches of the herbal drug or animal matter may be blended prior to extraction. The herbal drug or animal matter to be extracted may undergo a preliminary treatment, for example, inactivation of enzymes, grinding or defatting. In addition, unwanted matter may be removed after extraction.

Herbal drugs, animal matter and organic solvents used for the preparation of extracts comply with any relevant monograph of the Pharmacopoeia. For soft and dry extracts where the organic solvent is removed by evaporation, recovered or recycled solvent may be used, provided that the recovery procedures are controlled and monitored to ensure that solvents meet appropriate standards before re-use or admixture with other approved materials. Water used for the preparation of extracts is of a suitable quality. Except for the test for bacterial endotoxins, water complying with the section on Purified water in bulk in the monograph on *Purified water (0008)* is suitable. Potable water may be suitable if it complies with a defined specification that allows the consistent production of a suitable extract.

Where applicable, concentration to the intended consistency is carried out using suitable methods, usually under reduced pressure and at a temperature at which deterioration of the constituents is reduced to a minimum. Essential oils that have been separated during processing may be restored to the extracts at an appropriate stage in the manufacturing process. Suitable excipients may be added at various stages of the manufacturing process, for example to improve technological qualities such as homogeneity or consistency. Suitable stabilisers and antimicrobial preservatives may also be added.

Extraction with a given solvent leads to typical proportions of characterised constituents in the extractable matter; during production of standardised and quantified extracts, purification procedures may be applied that increase these proportions with respect to the expected values; such extracts are referred to as 'refined'.

IDENTIFICATION

Extracts are identified using a suitable method.

TESTS

Where applicable, as a result of analysis of the herbal drug or animal matter used for production and in view of the production process, tests for microbiological quality (*5.1.4*), heavy metals, aflatoxins and pesticide residues (*2.8.13*) in the extracts may be necessary.

ASSAY

Wherever possible, extracts are assayed by a suitable method.

LABELLING

The label states:

— the herbal drug or animal matter used;

— whether the extract is liquid, soft or dry, or whether it is a tincture;

— for standardised extracts, the content of constituents with known therapeutic activity;

— for quantified extracts, the content of constituents (markers) used for quantification;

— the ratio of the starting material to the genuine extract (extract without excipients) (DER);

— the solvent or solvents used for extraction;

— where applicable, that a fresh herbal drug or fresh animal matter has been used;

— where applicable, that the extract is 'refined';

— the name and amount of any excipient used including stabilisers and antimicrobial reservatives;

— where applicable, the percentage of dry residue.

LIQUID EXTRACTS – EXTRACTA FLUIDA

DEFINITION

Liquid extracts are liquid preparations of which, in general, 1 part by mass or volume is equivalent to 1 part by mass of the dried herbal drug or animal matter. These preparations are adjusted, if necessary, so that they satisfy the requirements for content of solvent, and, where applicable, for constituents.

PRODUCTION

Liquid extracts are prepared by using ethanol of a suitable concentration or water to extract the herbal drug or animal matter, or by dissolving a soft or dry extract (which has been produced using the same strength of extraction solvent as is used in preparing the liquid extract by direct extraction) of the herbal drug or animal matter in either ethanol of a suitable concentration or water. Liquid extracts may be filtered, if necessary.

A slight sediment may form on standing, which is acceptable as long as the composition of the liquid extract is not changed significantly.

TESTS

Relative density *(2.2.5)*

Where applicable, the liquid extract complies with the limits prescribed in the monograph.

Ethanol *(2.9.10)*

For alcoholic liquid extracts, carry out the determination of ethanol content. The ethanol content complies with that prescribed.

Methanol and 2-propanol *(2.9.11)*

Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol for alcoholic liquid extracts, unless otherwise prescribed.

Dry residue *(2.8.16)*

Where applicable, the liquid extract complies with the limits prescribed in the monograph, corrected if necessary, taking into account any excipient used.

STORAGE

Protected from light.

LABELLING

The label states in addition to the requirements listed above:

— where applicable, the ethanol content in per cent *V/V* in the final extract.

TINCTURES – TINCTURAE

DEFINITION

Tinctures are liquid preparations that are usually obtained using either 1 part of herbal drug or animal matter and 10 parts of extraction solvent, or 1 part of herbal drug or animal matter and 5 parts of extraction solvent.

PRODUCTION

Tinctures are prepared by maceration or percolation (outline methodology is given below) using only ethanol of a suitable concentration for extraction of the herbal drug or animal matter, or by dissolving a soft or dry extract (which has been produced using the same strength of extraction solvent as is used in preparing the tincture by direct extraction) of the herbal drug or animal matter in ethanol of a suitable concentration. Tinctures are filtered, if necessary.

Tinctures are usually clear. A slight sediment may form on standing, which is acceptable as long as the composition of the tincture is not changed significantly.

Production by maceration

Unless otherwise prescribed, reduce the herbal drug or animal matter to be extracted to pieces of suitable size, mix thoroughly with the prescribed extraction solvent and allow to stand in a closed container for an appropriate time. The residue is separated from the extraction solvent and, if necessary, pressed out. In the latter case, the 2 liquids obtained are combined.

Production by percolation

If necessary, reduce the herbal drug or animal matter to be extracted to pieces of suitable size. Mix thoroughly with a portion of the prescribed extraction solvent and allow to stand for an appropriate time. Transfer to a percolator and allow the percolate to flow at room temperature slowly making sure that the herbal drug or animal matter to be extracted is always covered with the remaining extraction solvent. The residue may be pressed out and the expressed liquid combined with the percolate.

TESTS

Relative density *(2.2.5)*

Where applicable, the tincture complies with the limits prescribed in the monograph.

Ethanol *(2.9.10)*

The ethanol content complies with that prescribed.

Methanol and 2-propanol *(2.9.11)*

Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol, unless otherwise prescribed.

Dry residue *(2.8.16)*

Where applicable, the tincture complies with the limits prescribed in the monograph, corrected if necessary, taking into account any excipient used.

STORAGE

Protected from light.

LABELLING

The label states in addition to the requirements listed above:

— for tinctures other than standardised and quantified tinctures, the ratio of starting material to extraction liquid or of starting material to final tincture;

— the ethanol content in per cent *V/V* in the final tincture.

SOFT EXTRACTS – EXTRACTA SPISSA

DEFINITION

Soft extracts are semi-solid preparations obtained by evaporation or partial evaporation of the solvent used for extraction.

TESTS

Dry residue ***(2.8.16)***

The soft extract complies with the limits prescribed in the monograph.

Solvents

Residual solvents are controlled as described in chapter *5.4*, unless otherwise prescribed or justified and authorised.

STORAGE

Protected from light.

OLEORESINS – OLEORESINA

DEFINITION

Oleoresins are semi-solid extracts composed of a resin in solution in an essential and/or fatty oil and are obtained by evaporation of the solvent(s) used for their production.

This monograph applies to oleoresins produced by extraction and not to natural oleoresins.

TESTS

Water ***(2.2.13)***

The oleoresin complies with the limits prescribed in the monograph.

Solvents

Residual solvents are controlled as described in chapter *5.4*, unless otherwise prescribed or justified and authorised.

STORAGE

In an airtight container , protected from light.

DRY EXTRACTS – EXTRACTA SICCA

DEFINITION

Dry extracts are solid preparations obtained by evaporation of the solvent used for their production. Dry extracts have a loss on drying of not greater than 5 per cent *m/m*, unless a loss on drying with a different limit or a test on water is prescribed in the monograph.

TESTS

Water *(2.2.13)*

Where applicable, the dry extract complies with the limits prescribed in the monograph.

Loss on drying *(2.8.17)*

Where applicable, the dry extract complies with the limits prescribed in the monograph.

Solvents

Residual solvents are controlled as described in chapter *5.4*, unless otherwise prescribed or justified and authorised.

STORAGE

In an airtight container , protected from light.

Ph Eur

Fenugreek

General Notices

(Ph Eur monograph 1323)

Ph Eur

DEFINITION

Dried, ripe seeds of *Trigonella foenum-graecum* L.

CHARACTERS

Strong characteristic aromatic odour.

IDENTIFICATION

A. The seed is hard, flattened, brown or reddish-brown and more or less rhomboidal with rounded edges. It is 3-5 mm long, 2-3 mm wide and 1.5-2 mm thick. The widest surfaces are marked by a groove that divides the seed into 2 unequal parts. The smaller part contains the radicle; the larger part contains the cotyledons.

B. Reduce to a powder (355) *(2.9.12)*. The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: fragments of the testa in sectional view with thick cuticle covering lageniform epidermal cells, with an underlying hypodermis of large cells, narrower at the upper end and constricted in the middle, with bar-like thickenings of the radial walls; yellowish-brown fragments of the epidermis in surface view, composed of small, polygonal cells with thickened and pitted walls, frequently associated with the hypodermal cells, circular in outline with thickened and closely beaded walls; fragments of the hypodermis viewed from below, composed of polygonal cells whose bar-like thickenings extend to the upper and lower walls; parenchyma of the testa with elongated, rectangular cells with slightly thickened and beaded walls; fragments of endosperm with irregularly thickened, sometimes elongated cells, containing mucilage.

C. Thin-layer chromatography *(2.2.27)* .

Test solution Place 1.0 g of the powdered drug (710) *(2.9.12)* in a 25 ml conical flask and add 5.0 ml of *methanol R* . Heat in a water-bath at 65 °C for 5 min. Cool and filter.

Reference solution Dissolve 3.0 mg of *trigonelline hydrochloride R* in 1.0 ml of *methanol R* .

Plate *TLC silica gel* F_{254} *plate R* .

Mobile phase *water R* , *methanol R* (30:70 *V/V*).

Application 20 µl of the test solution and 10 µl of the reference solution, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

Results A The chromatogram obtained with the test solution shows in its lower half a quenching zone similar in position and fluorescence to the zone in the chromatogram obtained with the reference solution.

Detection B Spray with *potassium iodobismuthate solution R2*.

Results B The chromatogram obtained with the test solution shows an intense orange-red zone similar in position and colour to the zone in the chromatogram obtained with the reference solution. It also shows in its upper half, a broad light brownish-yellow zone (triglycerides).

TESTS

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Minimum 5.0 per cent.

Swelling index *(2.8.4)*

Minimum 6, determined on the powdered drug (710) *(2.9.12)*.

Ph Eur

Feverfew

General Notices

(Ph Eur monograph 1516)

Ph Eur

DEFINITION

Dried, whole or fragmented aerial parts of *Tanacetum parthenium* (L.) Schultz Bip.

Content

Minimum 0.20 per cent of parthenolide ($C_{15}H_{20}O_3$; M_r 248.3) (dried drug).

CHARACTERS

Camphoraceous odour.

IDENTIFICATION

A. The leafy, more or less branched stem has a diameter of up to 5 mm; it is almost quadrangular, channelled longitudinally and slightly pubescent. The leaves are ovate, 2-5 cm long, sometimes up to 10 cm, yellowish-green, petiolate and alternate. They are pinnate or bipinnate, deeply divided into 5-9 segments, each with a coarsely crenate margin and an obtuse apex. Both surfaces are somewhat pubescent and the midrib is prominent on the lower surface. When present, the flowering heads are 12-22 mm in diameter with long pedicels; they are clustered into broad corymbs consisting of 5-30 flower-heads. The hemispherical involucre is 6-8 mm wide and consists of many overlapping bracts, which are rather narrow, obtuse and scarious and have membranous margins. The central flowers are yellow, hermaphrodite, tube-shaped with 5 teeth and have 5 stamens inserted in the corolla; the filaments of the stamens are separate from each other but the anthers are fused into a tube through which passes the style, bearing 2 stigmatic branches. The peripheral flowers are female and have a white, three-toothed ligule, 2-7 mm long. The fruit is an achene, 1.2-1.5 mm long, brown when ripe, with 5-10 white longitudinal ribs. It is glandular and bears a short, crenate, membranous crown.

B. Reduce to a powder (355) *(2.9.12)*. The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: numerous large, multicellular, uniseriate covering trichomes consisting of a rhomboidal basal cell, 3-5 smaller, thick-walled rectangular cells and a very long, flat, slender terminal cell, often curved at a right angle to the axis of the basal cell; glandular trichomes with a short, biseriate, 2-4 celled stalk and a biseriate head of 4 cells around which the cuticle forms a bladder-like covering; epidermal cells with very sinuous, anticlinal walls, a striated cuticle and anomocytic stomata *(2.8.3)* ; numerous spirally and annularly thickened vessels; stratified parenchyma and collenchyma. Fragments of disc florets containing pale yellow amorphous masses and small rosette crystals of calcium oxalate may be present; spherical pollen grains about 25 µm in diameter, with 3 pores and a spiny exine may be present.

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 1 g of the powdered drug (355) *(2.9.12)* add 20 ml of *methanol R* . Heat in a water-bath at 60 °C for 15 min. Allow to cool and filter. Evaporate to dryness under reduced pressure and dissolve the residue in 2 ml of *methanol R* .

Reference solution Dissolve 5 mg of *parthenolide R* in *methanol R* and dilute to 5 ml with the same solvent.

Plate *TLC silica gel plate R* .

Mobile phase *acetone R* , *toluene R* (15:85 *V/V*).

Application 20 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with a 5 g/l solution of *vanillin R* in a mixture of 20 volumes of *anhydrous ethanol R* and 80 volumes of *sulphuric acid R* . Examine in daylight after 5 min.

Results The chromatogram obtained with the test solution shows in its central part a blue principal zone that is similar in position, colour and size to the principal zone in the chromatogram obtained with the reference solution, and somewhat below the principal zone a 2nd blue zone may be present; 1 or 2 blue zones are also present in its lower third; other violet zones may be present.

TESTS

Foreign matter *(2.8.2)*

Maximum 10.0 per cent of stem with a diameter greater than 5 mm and maximum 2.0 per cent of other foreign matter.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 12.0 per cent.

ASSAY

Liquid chromatography *(2.2.29)* .

Test solution Completely reduce about 50 g of the drug to be examined to a powder (355) *(2.9.12)*. After homogenisation, introduce 1.00 g of the powdered drug into a flask and add 40 ml of *methanol R* . Heat in a water-bath at 60 °C for 10 min. Allow to cool and filter. Rinse the filter with 15 ml of *methanol R* . Take up the residue with 40 ml of *methanol R* . Repeat the operation. Collect the filtrates and rinsings and evaporate to dryness under reduced pressure.

Take up the residue with *methanol R* and dilute to 20.0 ml with the same solvent. Dilute 10.0 ml of this solution to 50.0 ml with the mobile phase. Filter (0.45 µm).

Reference solution Dissolve 5.0 mg of *parthenolide R* in *methanol R* and dilute to 10.0 ml with the same solvent. Dilute 2.0 ml of this solution to 50.0 ml with the mobile phase.

Column:

— *size:* l = 0.25 m, Ø = 4.6 mm;

— *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase *acetonitrile R* , *water R* (40:60 *V/V*).

Flow rate 1 ml/min.

Detection Spectrophotometer at 220 nm.

Injection 20 µl.

Retention time Parthenolide = about 11.5 min.

Calculate the percentage content of parthenolide using the following expression:

$$\frac{A_1 \times m_2 \times 40}{A_2 \times m_1}$$

A_1 = area of the peak due to parthenolide in the chromatogram obtained with the test solution;

A_2 = area of the peak due to parthenolide in the chromatogram obtained with the reference solution;

m_1 = mass of the drug to be examined in the test solution, in grams;

m_2 = mass of parthenolide in the reference solution, in grams.

Ph Eur

Fig

General Notices

DEFINITION

The sun-dried succulent fruit of *Ficus carica* L.

CHARACTERISTICS

Odour, pleasantly fruity; taste, sweet.

Macroscopical Fruit compound: soft, fleshy, brown or yellowish brown, sometimes covered with a saccharine efflorescence; at the summit a small opening surrounded by scales and at the base a short, stalk-like prolongation; fruit up to about 5 cm in length and breadth, consisting of a hollow receptacle bearing on the inner surface numerous drupelets, each containing a stone about 1.5 to 2.0 mm long; seed containing endosperm and a curved embryo.

Microscopical Receptacle: epidermal cells polyhedral, stomata raised, trichomes unicellular, thick walled, of varying length up to about 300 µm; hypodermis composed of rounded polyhedral cells, some containing small rosette crystals of calcium oxalate; aerenchyma made up of large, irregular cells, forming the greater part of the receptacle, containing large rosette crystals of calcium oxalate and interspersed with numerous latex tubes, about 30 to 50 µm wide, and slender vascular bundles. Pericarp: epicarp consisting of radially elongated cells with mucilaginous outer walls; mesocarp of delicate, often disorganised cells; endocarp of radially elongated sclereids with pitted walls. Endosperm and embryo: small cells containing aleurone grains and fixed oil; starch absent.

Water-soluble extractive

Not less than 60.0% when determined by the following method. To 25 g, minced, add 500 ml of *water*, boil under a reflux condenser for 1 hour, cool and filter. To 20 ml of the filtrate add 20 g of washed and ignited sand, evaporate to dryness in a tared, flat bottomed shallow dish and dry the residue to constant weight at 100°. Calculate the water-soluble extractive by subtracting the weight of sand from the weight of the residue obtained.

STORAGE

Figs should be stored in a dry place.

Frangula Bark

General Notices

(Ph Eur monograph 0025)

Preparation

Standardised Frangula Bark Dry Extract

When Powdered Frangula Bark is prescribed or demanded, material complying with the requirements below, with the exception of Identification test A and the test for Foreign matter, shall be dispensed or supplied.

Ph Eur

DEFINITION

Dried, whole or fragmented bark of the stems and branches of *Rhamnus frangula* L. (*Frangula alnus* Miller).

Content

Minimum 7.0 per cent of glucofrangulins, expressed as glucofrangulin A ($C_{27}H_{30}O_{14}$; M_r 578.5) (dried drug).

IDENTIFICATION

A. The bark occurs in curved, almost flat or rolled fragments or in single or double quilled pieces usually 0.5-2 mm thick and variable in length and width. The greyish-brown or dark brown outer surface is wrinkled longitudinally and covered with numerous greyish, transversely elongated lenticels; when the outer layers are removed, a dark red layer is exposed. The orange-brown or reddish-brown inner surface is smooth and bears fine longitudinal striations; it becomes red when treated with alkali. The fracture is short, fibrous in the inner part.

B. Reduce to a powder (355) *(2.9.12)*. The powder is yellowish or reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: numerous phloem fibres, partially lignified, in groups with crystal sheaths containing calcium oxalate prisms; reddish-brown fragments of cork; fragments of parenchyma containing calcium oxalate cluster crystals. Sclereids are absent.

C. Examine the chromatogram obtained in test B for "Other species of *Rhamnus*; anthrones" in daylight.

Results The chromatogram obtained with the test solution shows 2 orange-brown zones (glucofrangulins) in the lower third and 2-4 red zones (frangulins, not always clearly separated, and above them frangula-emodin) in the upper third.

D. To about 50 mg of the powdered drug (180) *(2.9.12)* add 25 ml of *dilute hydrochloric acid R* and heat the mixture on a water-bath for 15 min. Allow to cool, shake with 20 ml of *ether R* and discard the aqueous layer. Shake the ether layer with 10 ml of *dilute ammonia R1*. The aqueous layer becomes reddish-violet.

TESTS

Other species of *Rhamnus*; anthrones

Thin-layer chromatography *(2.2.27)*.

Test solution To 0.5 g of the powdered drug (180) *(2.9.12)* add 5 ml of *ethanol (70 per cent V/V) R* and heat to boiling. Cool and centrifuge. Decant the supernatant solution immediately and use within 30 min.

Reference solution Dissolve 20 mg of *barbaloin R* in *ethanol (70 per cent V/V) R* and dilute to 10 ml with the same solvent.

Plates *TLC silica gel plate R* (2 plates).

Mobile phase *water R*, *methanol R*, *ethyl acetate R* (13:17:100 *V/V/V*).

A. *Application*: 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air for 5 min.

Detection Spray with a 50 g/l solution of *potassium hydroxide R* in *ethanol (50 per cent V/V) R*, and heat at 100-105 °C for 15 min. Examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the reference solution shows a brownish-yellow zone due to barbaloin in the central part. The chromatogram obtained with the test solution shows no zones of intense yellow fluorescence and no zone of orange or reddish fluorescence similar in position to the zone due to barbaloin in the chromatogram obtained with the reference solution.

B. *Application*: 10 µl of the test solution, as a band.

Development Over a path of 10 cm.

Drying In air for maximum 5 min.

Detection Spray immediately with a 5 g/l solution of *nitrotetrazolium blue R* in *methanol R*. Examine immediately.

Results No violet or greyish-blue zones appear.

Foreign matter *(2.8.2)*

Maximum 1 per cent.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash ***(2.4.16)***

Maximum 6.0 per cent.

ASSAY

Carry out the assay protected from bright light.

In a tared, round-bottomed flask with a ground-glass neck, weigh 0.250 g of powdered drug (180) *(2.9.12)*. Add 25.0 ml of a 70 per cent *V/V* solution of *methanol R*; mix and weigh. Heat in a water-bath under a reflux condenser for 15 min. Allow to cool, weigh and adjust to the original mass with a 70 per cent *V/V* solution of *methanol R*. Filter and transfer 5.0 ml of the filtrate to a separating funnel. Add 50 ml of *water R* and 0.1 ml of *hydrochloric acid R*. Shake with 5 quantities, each of 20 ml, of *light petroleum R*. Allow the layers to separate and transfer the aqueous layer to a 100 ml volumetric flask. Combine the light petroleum layers and wash with 2 quantities, each of 15 ml, of *water R*. Use this water for washing the separating funnel and add it to the aqueous solution in the volumetric flask. Add 5 ml of a 50 g/l solution of *sodium carbonate R* and dilute to 100.0 ml with *water R*. Discard the light petroleum layer. Transfer 40.0 ml of the aqueous solution to a 200 ml round-bottomed flask with a ground-glass neck. Add 20 ml of a 200 g/l solution of *ferric chloride R* and heat under a reflux condenser for 20 min in a water-bath with the water level above that of the liquid in the flask. Add 2 ml of *hydrochloric acid R* and continue heating for 20 min, shaking frequently, until the precipitate is dissolved. Allow to cool, transfer the mixture to a separating funnel and shake with 3 quantities, each of 25 ml, of *ether R*, previously used to rinse the flask. Combine the ether extracts and wash with 2 quantities, each of 15 ml, of *water R*. Transfer the ether layer to a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 20.0 ml carefully to dryness and dissolve the residue in 10.0 ml of a 5 g/l solution *of magnesium acetate R* in *methanol R*. Measure the absorbance *(2.2.25)* at 515 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of glucofrangulins, expressed as glucofrangulin A, using the following expression:

$$\frac{A \times 3.06}{m}$$

i.e. taking the specific absorbance of glucofrangulin A to be 204.

A = absorbance at 515 nm,

m = mass of the substance to be examined, in grams.

Ph Eur

Fresh Bilberry Fruit Dry Extract, Refined and Standardised

General Notices

(Ph Eur monograph 2394)

Ph Eur

DEFINITION

Refined and standardised dry extract produced from *Bilberry fruit, fresh (1602)*.

Content

32.4 per cent to 39.6 per cent of anthocyanins, expressed as cyanidin 3-*O*-glucoside chloride [chrysanthemin ($C_{21}H_{21}ClO_{11}$; M_r 484.8)] (dried extract).

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (96 per cent *V/V*) or methanol (100 per cent). Refinement may be performed by ion-exchange chromatography.

CHARACTERS

Appearance

Dark reddish-violet, amorphous, hygroscopic powder.

IDENTIFICATION

First identification *B.*

Second identification *A.*

A. Thin-layer chromatography *(2.2.27)* .

Test solution Dissolve 0.10 g of the extract to be examined in 25 ml of *methanol R* . Stir for 15 min and filter.

Reference solution Dissolve 2 mg of *chrysanthemin R* and 2 mg of *myrtillin R* in 5 ml of *methanol R* .

Plate TLC plate coated with *cellulose for chromatography R* (5-40 µm) [or TLC plate coated with *cellulose for chromatography R* (2-10 µm)].

Mobile phase:
— *mobile phase A*: *hydrochloric acid R, acetic acid R, water R* (3:15:82 *V/V/V*);

— *mobile phase B*: *water R, acetic acid R* (40:60 *V/V*).

Application 10 µl [or 2 µl] as bands of 10 mm [or 6 mm].

Development A Over a path of 10 cm [or 6 cm] with mobile phase A.

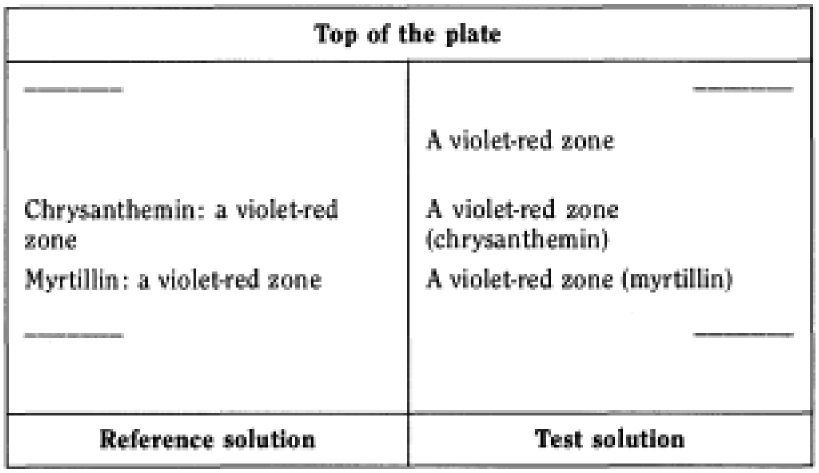
Drying A In warm air.

Development B Over a path of 10 cm [or 6 cm] with mobile phase B.

Drying B In air.

Detection Examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
———	———
	A violet-red zone
Chrysanthemin: a violet-red zone	A violet-red zone (chrysanthemin)
Myrtillin: a violet-red zone	A violet-red zone (myrtillin)
———	———
Reference solution	**Test solution**

B. Liquid chromatography *(2.2.29)* as described in the test for total anthocyanidins.

The characteristic anthocyanin peaks (peaks 1-8, 10-15 and 17) in the chromatogram obtained with the test solution are similar in their retention times to those in the chromatogram obtained with reference solution (b).

TESTS

Loss on drying *(2.8.17)*

Maximum 4.5 per cent.

Total ash *(2.4.16)*

Maximum 2.0 per cent.

Total anthocyanidins

Liquid chromatography *(2.2.29)* . *Maintain the solutions at 4 ‘C*.

Solvent mixture *hydrochloric acid R, methanol R* (2:98 *V/V*).

Test solution Dissolve 125.0 mg of the extract to be examined in the solvent mixture and dilute to 25.0 ml with the solvent mixture. Dilute 5.0 ml of this solution to 20.0 ml with *dilute* *phosphoric acid R* .

Reference solution (a) Dissolve 10.0 mg of *cyanidin chloride CRS* in the solvent mixture and dilute to 25.0 ml with the solvent mixture. Dilute 2.0 ml of this solution to 100.0 ml with *dilute phosphoric acid R* .

Reference solution (b) Dissolve 125.0 mg of *bilberry dry extract CRS* in the solvent mixture and dilute to 25.0 ml with the solvent mixture. Dilute 5.0 ml of this solution to 20.0 ml with *dilute phosphoric acid R* .

Column:

— *size: l* = 0.250 m, Ø = 4.6 mm;

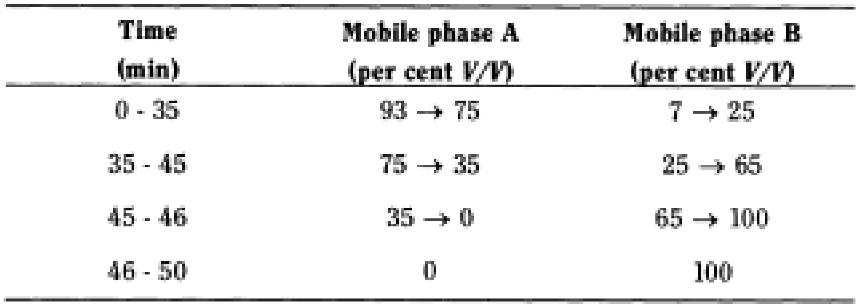
— *stationary phase: octadecylsilyl silica gel for chromatography R* (5 µm);

— *temperature*: 30 °C.

Mobile phase:

— *mobile phase A*: *anhydrous formic acid R, water R* (8.5:91.5 *V/V*);

— *mobile phase B*: *anhydrous formic acid R, acetonitrile R, methanol R, water R* , (8.5:22.5:22.5:41.5 *V/V/V/V*);



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 35	93 → 75	7 → 25
35 - 45	75 → 35	25 → 65
45 - 46	35 → 0	65 → 100
46 - 50	0	100

Flow rate 1.0 ml/min.

Detection Spectrophotometer at 535 nm.

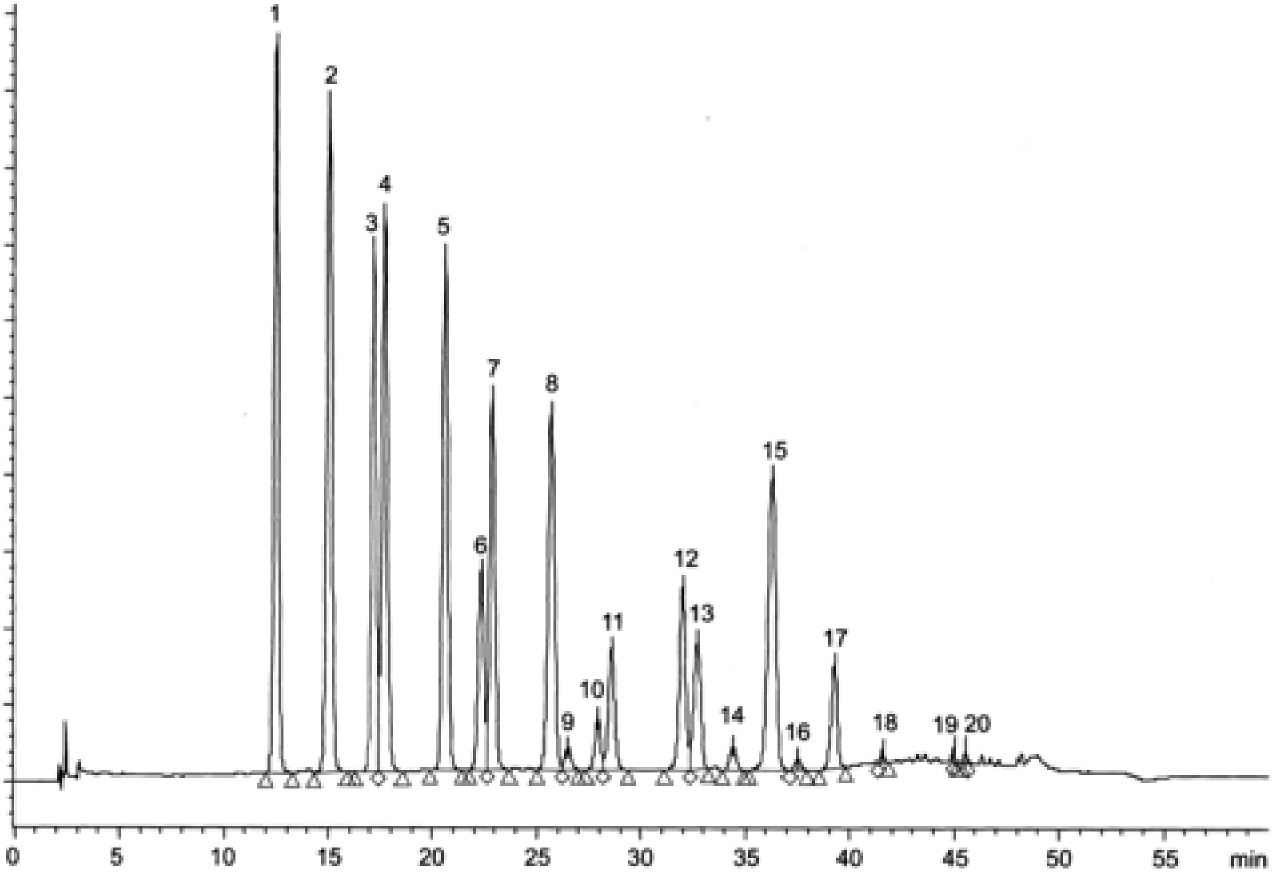
Injection 10 µl.

Identification of peaks Use the chromatogram supplied with *bilberry dry extract CRS* and the chromatograms obtained with reference solutions (a) and (b) to identify the peaks due to the anthocyanins and the anthocyanidins.

Retention times The retention times and the elution order of the peaks are similar to those shown in the chromatogram (Figure 2394.-1).

System suitability Reference solution (b):

— *peak-to-valley ratio* : minimum 2.0, where H_c = height above the baseline of the peak due to cyanidin 3-*O*-galactoside (peak 3) and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to delphinidin 3-*O*-arabinoside (peak 4).



1. delphinidin 3-*O*-galactoside chloride
2. myrtillin (delphinidin 3-*O*-glucoside chloride)
3. cyanidin 3-*O*-galactoside chloride
4. delphinidin 3-*O*-arabinoside chloride
5. chrysanthemin (cyanidin 3-*O*-glucoside chloride)
6. petunidin 3-*O*-galactoside chloride
7. cyanidin 3-*O*-arabinoside chloride
8. petunidin 3-*O*-glucoside chloride
9. delphinidin chloride
10. peonidin 3-*O*-galactoside chloride
11. petunidin 3-*O*-arabinoside chloride
12. peonidin 3-*O*-glucoside chloride
13. malvidin 3-*O*-galactoside chloride
14. peonidin 3-*O*-arabinoside chloride
15. malvidin 3-*O*-glucoside chloride
16. cyanidin chloride
17. malvidin 3-*O*-arabinoside chloride
18. petunidin chloride
19. peonidin chloride
20. malvidin chloride

Figure 2394.-1. – *Chromatogram for the assay of refined and standardised fresh bilberry fruit dry extract*

Calculate the percentage content of total anthocyanidins, expressed as cyanidin chloride, using the following expression:

$$\frac{A_1 \times m_2 \times 100 \times p}{m_1 \times A_2 \times 1250}$$

A_1 = sum of the areas of the peaks due to the anthocyanidins (peaks 9, 16, 18-20) in the chromatogram obtained with the test solution;

A_2 = area of the peak due to cyanidin chloride (peak 16) in the chromatogram obtained with reference solution (a);

m_1 = mass of the extract to be examined used to prepare the test solution, in grams;

m_2 = mass of *cyanidin chloride CRS* used to prepare reference solution (a), in grams;

p = percentage content of cyanidin chloride in *cyanidin chloride CRS*.

Limits Not more than 1.0 per cent of total anthocyanidins, expressed as cyanidin chloride.

ASSAY

Liquid chromatography *(2.2.29)* as described in the test for total anthocyanidins with the following modification.

Injection Test solution and reference solution (b).

Calculate the percentage content of total anthocyanins expressed as cyanidin 3-*O*-glucoside chloride, using the following expression:

$$\frac{A_1 \times m_2 \times p}{m_1 \times A_2}$$

A_1 = sum of the areas of the peaks due to the anthocyanins (peaks 1-8, 10-15 and 17) in the chromatogram obtained with the test solution;

A_2 = area of the peak due to cyanidin 3-*O*-glucoside chloride (peak 5) in the chromatogram obtained with reference solution (b);

m_1 = mass of the extract to be examined used to prepare the test solution, in grams;

m_2 = mass of *bilberry dry extract CRS* used to prepare reference solution (b), in grams;

p = percentage content of cyanidin 3-*O*-glucoside chloride in *bilberry dry extract CRS*.

Ph Eur

Fresh Bilberry

General Notices

(Fresh Bilberry Fruit, Ph Eur monograph 1602)

Ph Eur

DEFINITION

Fresh or frozen, ripe fruit of *Vaccinium myrtillus* L.

Content

Minimum 0.30 per cent of anthocyanins, expressed as cyanidin 3-*O*-glucoside chloride (chrysanthemin, $C_{21}H_{21}ClO_{11}$; M_r 484.8) (dried drug).

CHARACTERS

Sweet and slightly astringent taste.

IDENTIFICATION

A. The fresh fruit is a blackish-blue globular berry about 5 mm in diameter. Its lower end shows a scar or, rarely, a fragment of the pedicel. The upper end is flattened and surmounted by the remains of the persistent style and of the calyx, which appears as a circular fold. The violet, fleshy mesocarp includes 4 to 5 locules containing numerous small, brown, ovoid seeds.

B. The crushed fresh fruit is violet-red. Examine under a microscope using *chloral hydrate solution R*. It shows violet-pink sclereids from the endocarp and the mesocarp, usually aggregated, with thick, channelled walls; reddish-brown fragments of the epicarp consisting of polygonal cells with moderately thickened walls; brownish-yellow fragments of the outer layer of the testa composed of elongated cells with U-shaped thickened walls; cluster crystals of calcium oxalate.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 5 g of the freshly crushed drug, add 20 ml of *methanol R*. Stir for 15 min and filter.

Reference solution Dissolve 5 mg of *chrysanthemin R* in 10 ml of *methanol R*.

Plate *TLC silica gel plate R.*

Mobile phase *anhydrous formic acid R*, *water R*, *butanol R* (16:19:65 *V/V/V*).

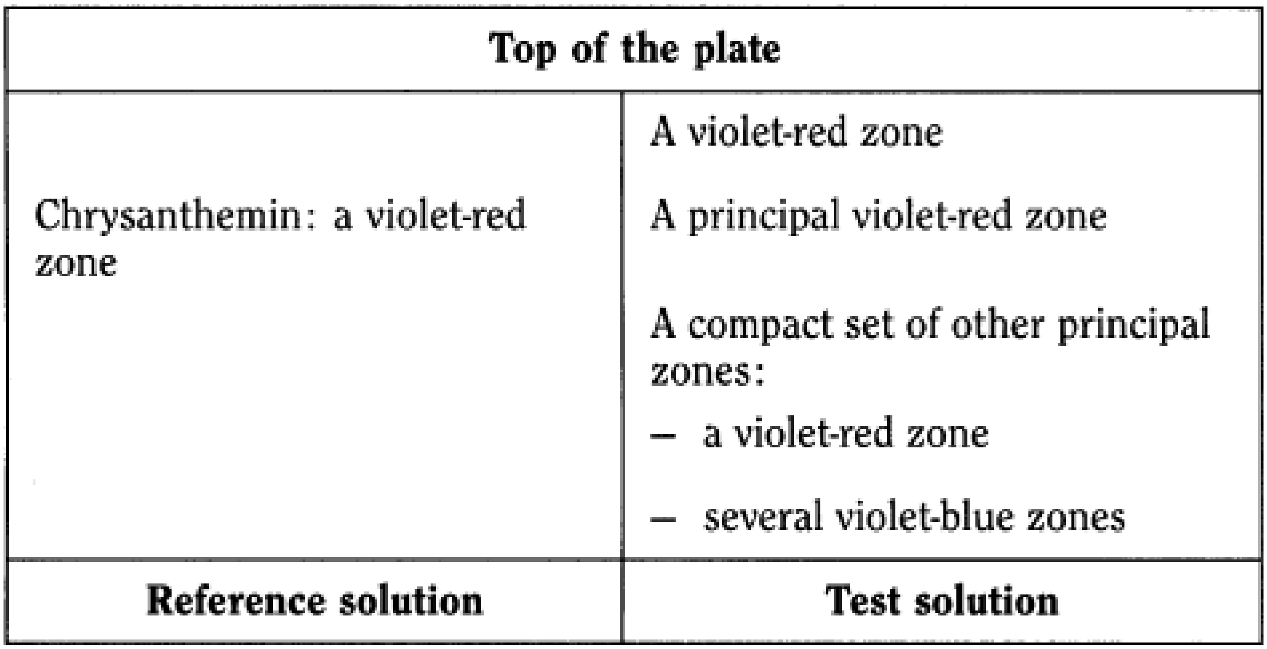
Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
	A violet-red zone
Chrysanthemin: a violet-red zone	A principal violet-red zone
	A compact set of other principal zones: – a violet-red zone – several violet-blue zones
Reference solution	**Test solution**

TESTS

Total ash (*2.4.16*)

Maximum 0.6 per cent.

Loss on drying (*2.2.32*)

80.0 per cent to 90.0 per cent, determined on 5.000 g of the freshly crushed drug by drying in an oven at 105 °C.

ASSAY

Crush 50 g extemporaneously. To about 5.00 g of the crushed, accurately weighed drug, add 95 ml of *methanol R* . Stir mechanically for 30 min. Filter into a 100.0 ml volumetric flask. Rinse the filter and dilute to 100.0 ml with *methanol R* . Prepare a 50-fold dilution of this solution in a 0.1 per cent *V/V* solution of *hydrochloric acid R* in *methanol R* .

Measure the absorbance (*2.2.25*) of the solution at 528 nm, using a 0.1 per cent *V/V* solution of *hydrochloric acid R* in *methanol R* as the compensation liquid.

Calculate the percentage content of anthocyanins, expressed as cyanidin 3-*O*-glucoside chloride, using the following expression:

$$\frac{A \times 5000}{718 \times m}$$

718 = specific absorbance of cyanidin 3-*O*-glucoside chloride at 528 nm

A = absorbance at 528 nm

m = mass of the substance to be examined in grams.

STORAGE

When frozen, store at or below - 18 °C.

Ph Eur

Fumitory

General Notices

(Ph Eur monograph 1869)

Ph Eur

DEFINITION

Whole or fragmented, dried aerial parts of *Fumaria officinalis* L. harvested in full bloom.

Content

Minimum 0.40 per cent of total alkaloids, expressed as protopine ($C_{20}H_{19}NO_5$; M_r 353.4) (dried drug).

IDENTIFICATION

A. The hollow, angular stem is light green or greenish-brown. The leaves are alternate, bipinnatisect with 2 or 3 leaf segments, the ultimate lobes lanceolate to obovate; they are greenish-blue and glabrous on both surfaces. The flowers are small and occur in loose racemes; each has a short pedicel and is subtended by a leafy bract; they are pink to purplish-red, dark purple to brown at the apex; the calyx is short, composed of 2 petalloid sepals and the corolla is tubular with 4 petals, the upper petal slightly spurred; there are 6 stamens united by their filaments into 2 groups of 3. The greenish-brown, indehiscent fruits are globular or keel-shaped, truncated or slightly emarginate at the apex, and each contains a small brown seed.

B. Reduce to a powder (355) *(2.9.12)*. The powder is green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the leaf lamina in surface view with the upper epidermis composed of irregularly polygonal cells, some of which contain masses of very small sandy crystals; the cells of the lower epidermis having more wavy walls; anomocytic stomata *(2.8.3)* on both surfaces; marginal cells at the apex of the lamina elongated to form blunt papillae; groups of lignified fibres and reticulate and bordered-pitted vessels from the stem; fragments of the epidermis of the petals composed of polygonal cells with sinuous to wavy anticlinical walls and no papillae; pollen grains spherical, about 30 µm in diameter, with a pitted exine and 6 large pores; polygonal cells of the epicarp with a thick, warty cuticle.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 2 g of the powdered drug (355) *(2.9.12)* add 15 ml of *0.05 M sulphuric acid* and stir for 15 min. Filter. Dilute the filtrate to 20 ml with *0.05 M sulphuric acid* . Add 1 ml of *concentrated ammonia R* and 10 ml of *ethyl acetate R*. Stir and centrifuge. Collect the upper organic layer. Repeat the extraction in the same manner. Collect the organic layers and dry over *anhydrous sodium sulphate R*. Evaporate to dryness under reduced pressure. Take up the residue with *0.5 ml of methanol R*.

Reference solution Dissolve 5 mg of *protopine hydrochloride R* and 5 mg of *quinine R* in 10 ml of *methanol R.*

Plate *TLC silica gel plate R*.

Mobile phase *concentrated ammonia R*, *ethanol (96 per cent) R*, *acetone R*, *toluene R* (2:6:40:52 *V/V/V/V*).

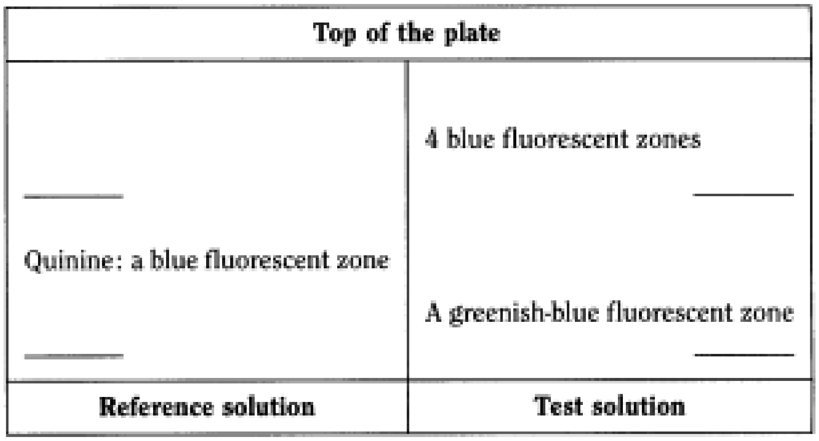
Application 30 µl as bands.

Development Over a path of 15 cm.

Drying In air.

Detection A Examine in ultraviolet light at 365 nm.

Results A See below the sequence of zones present in the chromatogram obtained with the reference solution and the test solution. Furthermore, other blue fluorescent zones are present in the chromatogram obtained with the test solution.



Top of the plate	
	4 blue fluorescent zones
_______	_______
Quinine: a blue fluorescent zone	
	A greenish-blue fluorescent zone

Reference solution	**Test solution**

TESTS

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C.

Total ash *(2.4.16)*

Maximum 15.0 per cent.

ASSAY

To 5.000 g of the powdered drug (355) *(2.9.12)* add 5 ml of *dilute ammonia R1* and 50 ml of *ethyl acetate R*. Shake for 15 min. Filter. Repeat the procedure in the same manner and combine the filtrates. Evaporate the filtrates to dryness under reduced pressure. Dissolve the residue by sonication for 10 min in 50 ml of *0.05 M sulphuric acid*. Filter. Dilute the filtrate to 100 ml with *0.05 M sulphuric acid*. Adjust to pH 9-10 with *concentrated ammonia R* and then add 50 ml of *ethyl acetate R*. Shake gently. Collect the upper organic layer, after centrifugation if necessary. Repeat the procedure in the same manner. Combine the organic layers and dry over *anhydrous sodium sulphate R*. Evaporate to dryness under reduced pressure. Take up the residue with 100 ml of *anhydrous acetic acid R*. Titrate with *0.02 M perchloric acid*, determining the end-point potentiometrically *(2.2.20)*.

1 ml of *0.02 M perchloric acid* is equivalent to 7.068 mg of protopine.

Calculate the percentage content of total alkaloids expressed as protopine from the following expression:

$$\frac{n \times 706.8}{m}$$

n = volume of *0.02 M perchloric acid* used, in millilitres,

m = mass of the drug to be examined, in milligrams.

Ph Eur

Garlic Powder

General Notices

(Ph Eur monograph 1216)

Ph Eur

DEFINITION

Bulbs of *Allium sativum* L., cut, freeze-dried or dried at a temperature not exceeding 65 °C and powdered.

Content

Minimum 0.45 per cent of allicin ($C_6H_{10}OS_2$; M_r 162.3) (dried drug).

CHARACTERS

Appearance

Light yellowish powder.

IDENTIFICATION

A. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: numerous fragments of parenchyma and groups of spiral or annular vessels accompanied by thin-walled parenchyma.

B. Thin-layer chromatography *(2.2.27)*.

Test solution To 1.0 g of garlic powder add 5.0 ml of *methanol R*, shake for 60 s and filter.

Reference solution Dissolve 5 mg of *alanine R* in 10 ml of *water R* and dilute to 20 ml with *methanol R*.

Plate *TLC silica gel plate R*.

Mobile phase *glacial acetic acid R*, *propanol R*, *water R*, *anhydrous ethanol R* (20:20:20:40 *V/V/V/V*).

Application 20 µl of the test solution and 10 µl of the reference solution, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with a 2 g/l solution of *ninhydrin R* in a mixture of 5 volumes of *glacial acetic acid R* and 95 volumes of *butanol R* and heat at 105-110 °C for 5-10 min; examine in daylight.

Results The chromatogram obtained with the reference solution shows a violet zone (alanine) in its central third. The chromatogram obtained with the test solution shows a violet or brownish-red zone similar in position to that in the chromatogram obtained with the reference solution and corresponding to alliin; above and below this zone are other, generally fainter, violet zones.

TESTS

Starch

Examine the powdered drug under a microscope using *water R*. Add *iodine solution R1*. No blue colour develops.

Loss on drying *(2.2.32)*

Maximum 7.0 per cent, determined on 1.000 g of the powdered drug by drying in an oven at 105 °C.

Total ash *(2.4.16)*

Maximum 5.0 per cent.

ASSAY

Liquid chromatography *(2.2.29) Carry out the assay as quickly as possible*.

Internal standard solution Dissolve 20.0 mg of *butyl parahydroxybenzoate CRS* in 100.0 ml of a mixture of equal volumes of *methanol R* and *water R*.

Test solution To 0.800 g of garlic powder add 20.0 ml of *water R* and homogenise the mixture in an ultrasonic bath at 4 °C for 5 min. Allow to stand at room temperature for 30 min. Then centrifuge for 30 min. Dilute 10.0 ml of the supernatant to 25.0 ml with a mixture of 40 volumes of a 1 per cent *V/V* solution of *anhydrous formic acid R* and 60 volumes of *methanol R* (stock solution). Shake and centrifuge for 5 min. Place 0.50 ml of the internal standard solution in a volumetric flask and dilute to 10.0 ml with the stock solution.

Precolumn:

- *size:* l = 20 mm, Ø = 4 mm,
- *stationary phase*: silanised *octadecylsilyl silica gel for chromatography R* (5 µm).

Column:

- *size:* l = 0.25 m, Ø = 4 mm,
- *stationary phase*: silanised *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase Mix 40 volumes of a 1 per cent *V/V* solution of *anhydrous formic acid R* and 60 volumes of *methanol R*.

Flow rate 0.8 ml/min.

Detection Spectrophotometer at 254 nm.

Injection Loop injector, 1 µl of the internal standard solution and 10 µl of the test solution.

Calculate the percentage of allicin using the following expression:

$$\frac{S_1 \times m_2 \times 22.75}{S_2 \times m_1}$$

S_1 = area of the peak due to allicin (principal peak) in the chromatogram obtained with the test solution,

S_2 = area of the peak due to butyl parahydroxybenzoate in the chromatogram obtained with the test solution,

m_1 = mass of the drug to be examined, in grams,

m_2 = mass of butyl parahydroxybenzoate in 100.0 ml of the internal standard solution, in grams. 1 mg of butylparahydroxybenzoate corresponds to 8.65 mg of allicin.

Ph Eur

Gentian Tincture

General Notices

(Ph Eur monograph 1870)

Ph Eur

DEFINITION

Tincture produced from *Gentian root (0392)* .

PRODUCTION

The tincture is produced from 1 part of the comminuted drug and 5 parts of ethanol (70 per cent *V/V*) by a suitable procedure.

CHARACTERS

Appearance

Yellowish-brown or reddish-brown liquid.

It has a strong bitter taste.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution The tincture to be examined.

Reference solution Dissolve 5 mg of *phenazone R* and 5 mg of *hyperoside R* in 10 ml of *methanol R*.

Plate *TLC silica gel F_{254} plate R* .

Mobile phase *water R*, *anhydrous formic acid R*, *ethyl formate R* (4:8:88 *V/V/V*).

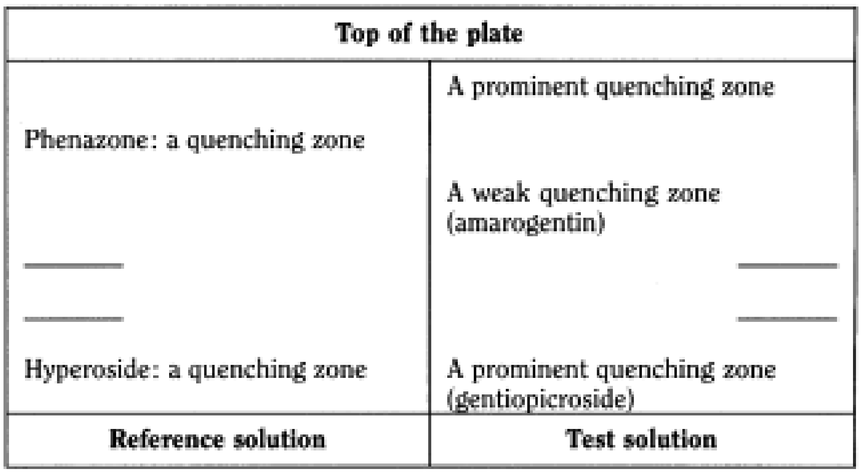
Application 20 µl, as bands.

Development Over a path of 8 cm, in an unsaturated tank.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

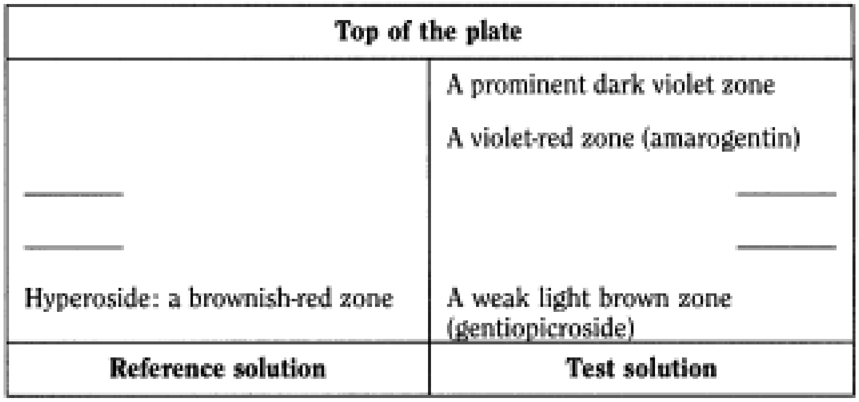
Results A See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A prominent quenching zone
Phenazone: a quenching zone	
	A weak quenching zone (amarogentin)
_______	_______
_______	_______
Hyperoside: a quenching zone	A prominent quenching zone (gentiopicroside)
Reference solution	**Test solution**

Detection B Spray with a 10 per cent *V/V* solution of *potassium hydroxide R* in *methanol R* and then with a freshly prepared 2 g/l solution of *fast blue B salt R* in a mixture of *ethanol R* and *water R* (50:50 *V/V*). Examine in daylight.

Results B See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A prominent dark violet zone
	A violet-red zone (amarogentin)
_______	_______
_______	_______
Hyperoside: a brownish-red zone	A weak light brown zone (gentiopicroside)
Reference solution	**Test solution**

TESTS

Ethanol content (*2.9.10*)

62 per cent *V/V* to 67 per cent *V/V*.

Bitterness value (*2.8.15*)

Minimum 1000.

Dry residue (*2.8.16*)

Minimum 5.0 per cent *m/m*, determined on 3.00 g.

Ph Eur

Gentian

General Notices

(Gentian Root, Ph Eur monograph 0392)

Preparation

Compound Gentian Infusion

When Powdered Gentian is prescribed or demanded, material complying with the requirements below with the exception of Identification test A shall be dispensed or supplied.

Ph Eur

DEFINITION

Dried, fragmented underground organs of *Gentiana lutea* L.

CHARACTERS

Characteristic odour.

Strong and persistent bitter taste.

Gentian root occurs as single or branched subcylindrical pieces of various lengths and usually 10-40 mm thick but occasionally up to 80 mm thick at the crown.

IDENTIFICATION

A. The surface is brownish-grey, and the colour of a transverse section is yellowish or reddish-yellow, but not reddish-brown. The root is longitudinally wrinkled and bears occasional rootlet scars. The branches of the rhizome frequently bear a terminal bud and are always encircled by closely arranged leaf scars. The rhizome and root are brittle when dry and break with a short fracture but they absorb moisture readily to become flexible. The smoothed, transversely cut surface shows a bark, occupying about one-third of the radius, separated by the well-marked cambium from an indistinctly radiate and mainly parenchymatous xylem.

B. Reduce to a powder (355) *(2.9.12)*. The powder is light brown or yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the subero-phellodermic layer, consisting of thin-walled yellowish-brown cork cells and thick-walled collenchyma (phello-derm); fragments of cortical and ligneous parenchymatous cells with moderately thickened walls containing droplets of oil and small prisms and minute needles of calcium oxalate; fragments of lignified vessels with spiral or reticulate thickening.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 25 ml of *methanol R*, shake for 15 min and filter. Evaporate the filtrate to dryness under reduced pressure, at a temperature not exceeding 50 °C. Take up the residue with small quantities of *methanol R* so as to obtain 5 ml of a solution, which may contain a sediment.

Reference solution Dissolve 5 mg of *phenazone R* and 5 mg of *hyperoside R* in 10 ml of *methanol R*.

Plate *TLC silica gel F_{254} plate R*.

Mobile phase *water R*, *anhydrous formic acid R*, *ethyl formate R* (4:8:88 *V/V/V*).

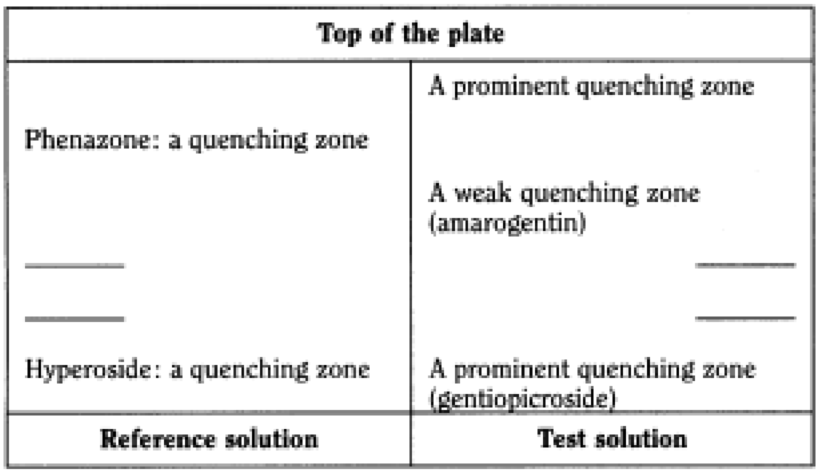
Application 20 µl, as bands.

Development In an unsaturated tank, over a path of 8 cm.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

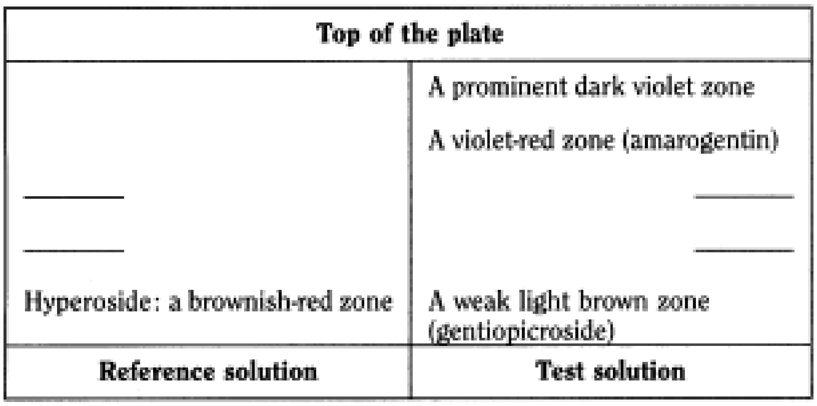
Results A See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A prominent quenching zone
Phenazone: a quenching zone	
	A weak quenching zone (amarogentin)
_______	_______
_______	_______
Hyperoside: a quenching zone	A prominent quenching zone (gentiopicroside)
Reference solution	**Test solution**

Detection B Spray with a 100 g/l solution of *potassium hydroxide R* in *methanol R* and then with a freshly prepared 2 g/l solution of *fast blue B salt R* in a mixture of 50 volumes of *anhydrous ethanol R* and 50 volumes of *water R*. Examine in daylight.

Results B See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A prominent dark violet zone
	A violet-red zone (amarogentin)
_______	_______
_______	_______
Hyperoside: a brownish-red zone	A weak light brown zone (gentiopicroside)
Reference solution	**Test solution**

TESTS

Other species of *Gentiana*

Examine the chromatograms obtained in identification test C, detection B.

Results The chromatogram obtained with the test solution does not show violet zones immediately above the zone due to amarogentine.

Total ash *(2.4.16)*

Maximum 6.0 per cent.

Bitterness value *(2.8.15)*

Minimum 10 000.

Water-soluble extractive

Minimum 33 per cent.

To 5.0 g of powdered drug (710) *(2.9.12)* add 200 ml of boiling *water R*. Allow to stand for 10 min, shaking occasionally. Allow to cool, dilute to 200.0 ml with *water R* and filter. Evaporate 20.0 ml of the filtrate to dryness on a water-bath. Dry the residue in an oven at 100-105 °C. The residue weighs a minimum of 0.165 g.

Ph Eur

Ginger

General Notices

(Ph Eur monograph 1522)

Preparation

Strong Ginger Tincture

Ginger may be known in commerce as unbleached ginger. When Powdered Ginger is prescribed or demanded, material complying with the appropriate requirements below shall be dispensed or supplied.

Ph Eur

DEFINITION

Dried, whole or cut rhizome of *Zingiber officinale* Roscoe, with the cork removed, either completely or from the wide flat surfaces only.

Content

Minimum 15 ml/kg of essential oil (anhydrous drug).

CHARACTERS

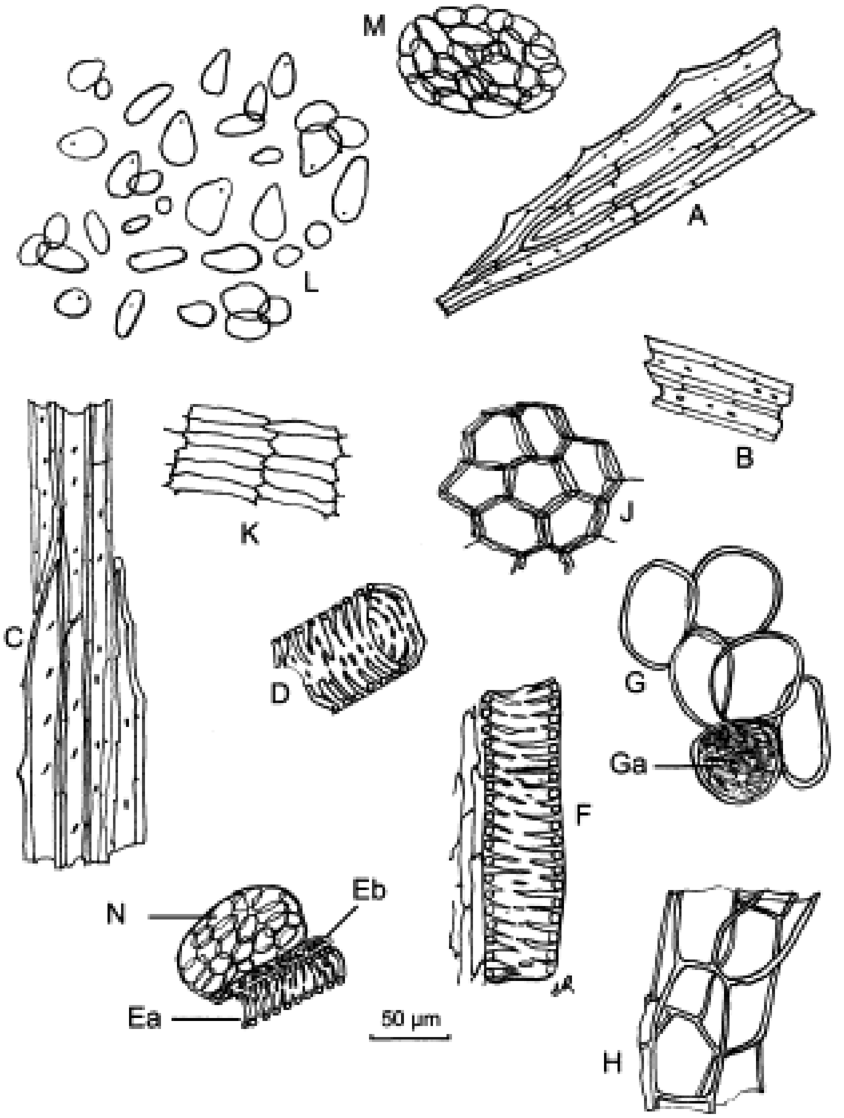
Characteristic aromatic odour.

Spicy and burning taste.

IDENTIFICATION

A. The rhizome is laterally compressed, bearing short, flattened, obovate oblique branches on the upper side, each sometimes having a depressed scar at the apex; the whole rhizomes are about 5-10 cm long, 1.5-3 cm or 4 cm wide and 1-1.5 cm thick, sometimes split longitudinally. The scraped rhizome with a light-brown external surface shows longitudinal striations and occasional loose fibres; the outer surface of the unscraped rhizome varies from pale to dark brown and is more or less covered with cork which shows conspicuous, narrow, longitudinal and transverse ridges; the cork readily exfoliates from the lateral surfaces but persists between the branches. The fracture is short and starchy with projecting fibres. The smoothed transversely cut surface exhibits a narrow cortex separated by an endodermis from a much wider stele; it shows numerous, scattered, fibrovascular bundles and abundant scattered oleoresin cells with yellow contents. The unscraped rhizome shows, in addition, an outer layer of dark brown cork.

B. Reduce to a powder (355) *(2.9.12)*. The powder is pale yellow or brownish. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: groups of large, thin-walled, septate fibres, with one wall frequently dentate; fairly large vessels with reticulate thickening and often accompanied by narrow, thin-walled cells containing brown pigment; abundant thin-walled parenchyma of the ground tissue, some cells containing brown oleoresin; fragments of brown cork, usually seen in surface view. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows abundant starch granules, simple, flattened, oblong or oval or irregular, up to about 50 µm long and 25 µm wide, with a small point hilum situated at the narrower end; occasional granules show faint, transverse striations.



A, B, C. Groups of septate fibres, sometimes with dentate walls

D, E, F. Vessels with reticulate thickening (Ea), sometimes accompanied by cells with brown contents (Eb)

G, H. Parenchyma with cells containing oleoresin (Ga)

J, K. Fragments of cork, in surface view (J) and in transverse section (K)

L, M, N. Starch granules, free (L) and in parenchymatous cells (M, N)

Figure 1522.-1. – *Illustration of powdered herbal drug of ginger (see Identification B)*

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 1.0 g of the powdered drug (710) *(2.9.12)* add 5 ml of *methanol R*. Shake for 15 min and filter.

Reference solution Dissolve 10 µl of *citral R* and 10 mg of *resorcinol R* in 10 ml of *methanol R*. Prepare the solution immediately before use.

Plate *TLC silica gel plate R.*

Mobile phase *hexane R, ether R* (40:60 *V/V*).

Application 20 µl, as bands.

Development In an unsaturated tank, over a path of 15 cm.

Drying In air.

Detection Spray with a 10 g/l solution of *vanillin R* in *sulphuric acid R* and examine in daylight while heating at 100-105 °C for 10 min.

Results The chromatogram obtained with the reference solution shows in the lower half an intense red zone (resorcinol) and in the upper half 2 violet zones (citral). The chromatogram obtained with the test solution shows below the zone due to resorcinol in the chromatogram obtained with the reference solution 2 intense violet zones (gingerols) and in the middle, between the zones due to resorcinol and citral in the chromatogram obtained with the reference solution, 2 other less intense violet zones (shogaols). Other zones may be present.

TESTS

Water *(2.2.13)*

Maximum 100 ml/kg, determined by distillation on 20.0 g of the powdered drug (710) *(2.9.12)*.

Total ash *(2.4.16)*

Maximum 6.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs *(2.8.12)*. Use 20.0 g of the freshly, coarsely powdered drug, a 1000 ml round-bottomed flask, 10 drops of *liquid paraffin R* or other antifoam, 500 ml of *water R* as distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 4 h.

Ph Eur

Ginkgo Dry Extract, Refined and Quantified

General Notices

(Ph Eur monograph 1827)

Ph Eur

DEFINITION

Refined and quantified dry extract produced from *Ginkgo leaf (1828).*

Content:

— *flavonoids, expressed as flavone glycosides (M_r 756.7):* 22.0 per cent to 27.0 per cent (dried extract);

— *bilobalide*: 2.6 per cent to 3.2 per cent (dried extract);

— *ginkgolides A, B and C*: 2.8 per cent to 3.4 per cent (dried extract);

— *ginkgolic acids*: maximum 5 ppm (dried extract).

PRODUCTION

The extract is produced from the herbal drug by an appropriate procedure using organic solvents and their mixtures with water, physical separation steps as well as other suitable processes.

CHARACTERS

Appearance

Bright yellow-brown, powder or friable mass.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)*.

Test solution Dissolve 20.0 mg of the extract to be examined in 10 ml of a mixture of 2 volumes of *water R* and 8 volumes of *methanol R.*

Reference solution Dissolve 1.0 mg of *chlorogenic acid R* and 3.0 mg of *rutin R* in 20 ml of *methanol R.*

Plate *TLC silica gel plate R* (5-40 µm) or [*TLC silica gel plate R* (2-10 µm)].

Mobile phase *anhydrous formic acid R*, *glacial acetic acid R*, *water R*, *ethyl acetate R* (7.5:7.5:17.5:67.5 *V/V/V/V*).

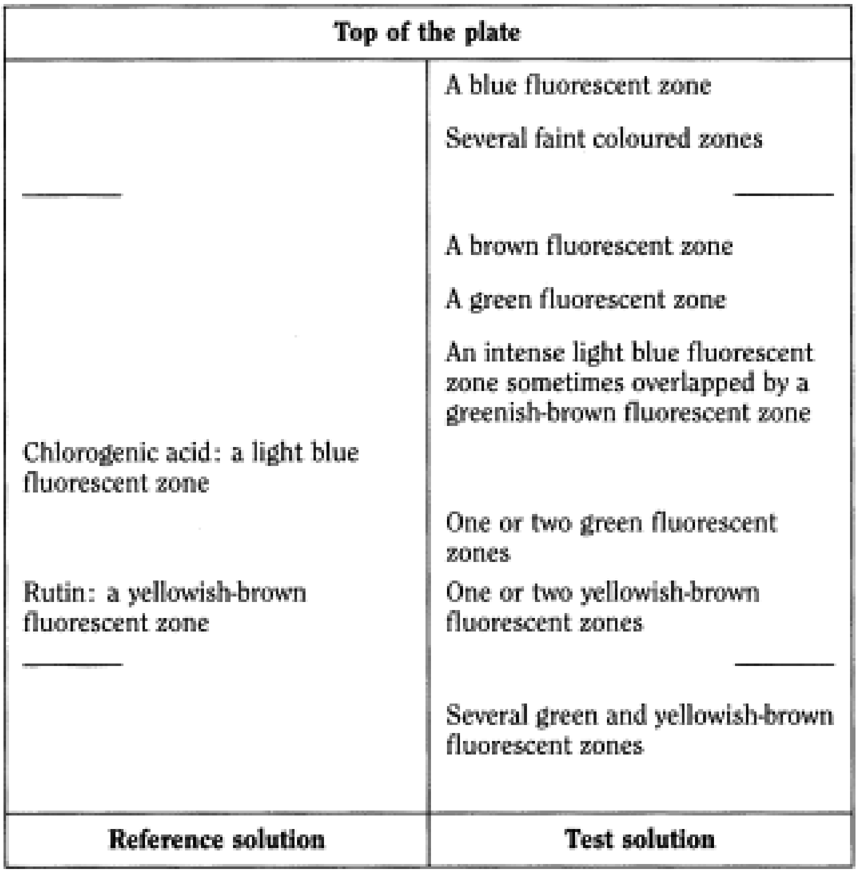
Application 20 µl [or 5 µl], as bands.

Development Over a path of 17 cm [or 6 cm].

Drying At 100-105 °C.

Detection Spray the plate whilst still hot with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*; allow to dry in air for about 30 min and examine in ultraviolet light at 365 nm.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other, weaker fluorescent zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A blue fluorescent zone
	Several faint coloured zones
_______	_______
	A brown fluorescent zone
	A green fluorescent zone
	An intense light blue fluorescent zone sometimes overlapped by a greenish-brown fluorescent zone
Chlorogenic acid: a light blue fluorescent zone	
	One or two green fluorescent zones
Rutin: a yellowish-brown fluorescent zone	One or two yellowish-brown fluorescent zones
_______	_______
	Several green and yellowish-brown fluorescent zones
Reference solution	**Test solution**

ASSAY

Flavonoids

Liquid chromatography *(2.2.29)*.

Test solution Dissolve 0.200 g of the extract to be examined in 20 ml of *methanol R*. Add 15.0 ml of *dilute hydrochloric acid R* and 5 ml of *water R* and dilute to 50.0 ml with *methanol R*. Transfer 10.0 ml of this solution into a 10 ml brown-glass vial. Close the vial with a tight rubber membrane stopper and secure with an aluminium crimped cap. Heat on a water-bath for 25 min. Allow to cool to 20 °C.

Reference solution Dissolve 10.0 mg of *quercetin dihydrate CRS* in 20 ml of *methanol R.* Add 15.0 ml of *dilute hydrochloric acid R* and 5 ml of *water R* and dilute to 50.0 ml with *methanol R.*

Column:

— *size:* *l* = 0.125 m, Ø = 4 mm;

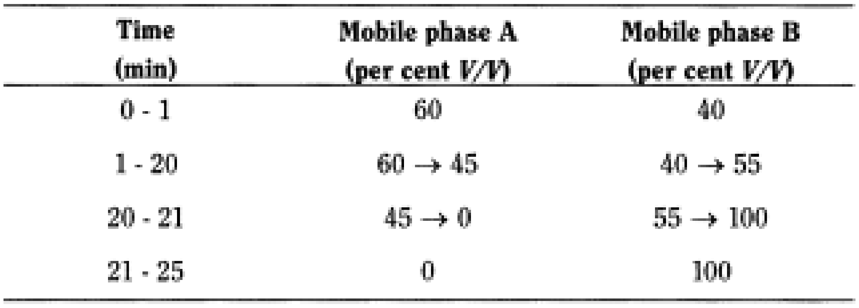
— *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);

— *temperature*: 25 °C.

Mobile phase:

— *mobile phase A*: 0.3 g/l solution of *phosphoric acid R* adjusted to pH 2.0;

— *mobile phase B*: *methanol R;*



Time (min)	**Mobile phase A (per cent *V/V*)**	**Mobile phase B (per cent *V/V*)**
0 - 1	60	40
1 - 20	60 → 45	40 → 55
20 - 21	45 → 0	55 → 100
21 - 25	0	100

Flow rate 1.0 ml/min.

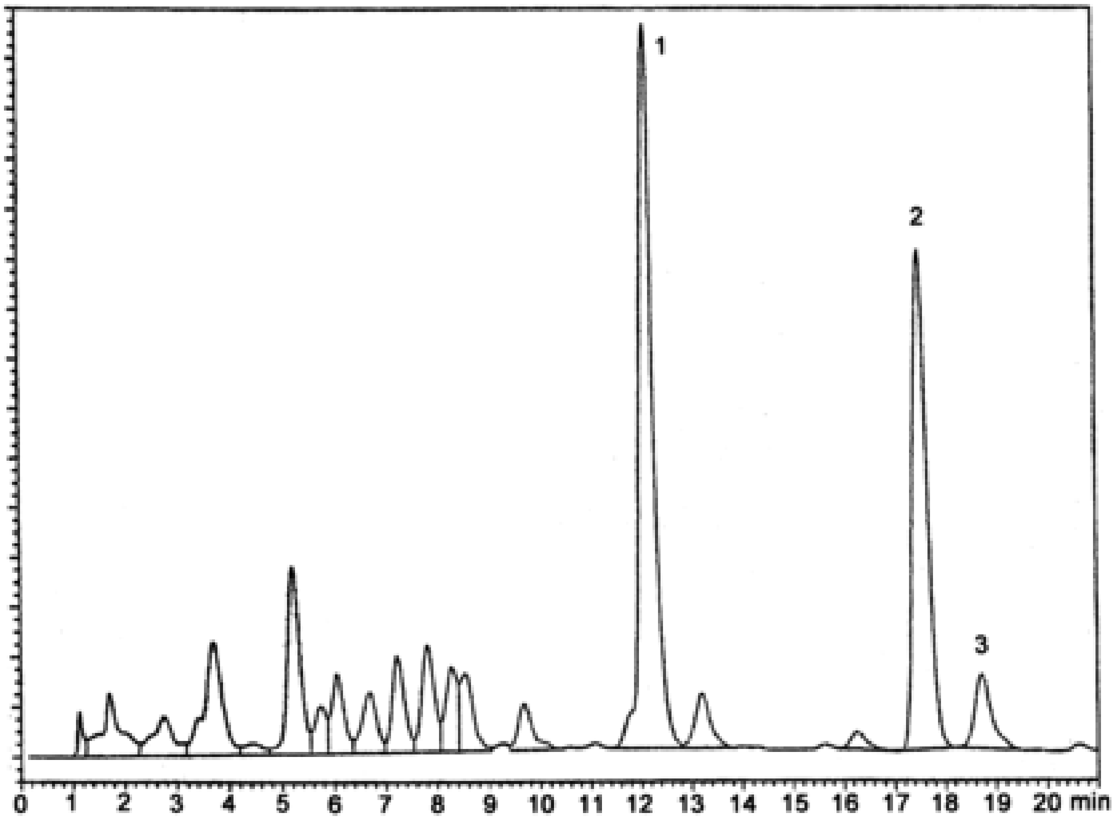
Detector Spectrophotometer at 370 nm.

Injection 10 µl.

Relative retention With reference to quercetin (retention time = about 12.5 min): kaempferol = about 1.4; isorhamnetin = about 1.5.

System suitability Test solution:

— *resolution*: minimum 1.5 between the peaks due to kaempferol and isorhamnetin.



1. quercetin 2. kaempferol 3. isorhamnetin

Figure 1827.-1. – *Chromatogram for the assay of flavonoids in refined and quantified ginkgo dry extract*

Determine the sum of the areas including all the peaks from the peak due to quercetin to the peak due to isorhamnetin in the chromatogram obtained with the test solution (see Figure 1827.-1).

Calculate the percentage content of flavonoids, expressed as flavone glycosides, using the following expression:

$$\frac{F_1 \times m_1 \times 2.514 \times p}{F_2 \times m_2}$$

F_1 = sum of the areas of all the peaks from the peak due to quercetin to the peak due to isorhamnetin in the chromatogram obtained with the test solution

F_2 = area of the peak due to quercetin in the chromatogram obtained with the reference solution

m_1 = mass of *quercetin dihydrate CRS* in the reference solution, in grams

m_2 = mass of the extract to be examined used to prepare the test solution, in grams

p = percentage content of anhydrous quercetin in *quercetin dihydrate CRS*.

Terpene lactones

Liquid chromatography (*2.2.29*).

Test solution Place 0.120 g of the extract to be examined in a 25 ml beaker and dissolve it in 10 ml of *phosphate buffer solution pH 5.8 R* by stirring. Transfer the solution into a chromatography column, about 0.15 m long and about 30 mm in internal diameter, containing 15 g of *kieselguhr for chromatography R*. Wash the beaker with 2 quantities, each of 5 ml, of *phosphate buffer solution pH 5.8 R* and transfer the washings to the chromatography column. Allow to stand for 15 min. Elute with 100 ml of *ethyl acetate R*. Evaporate the eluate to dryness at a pressure not exceeding 4 kPa in a water-bath at 50 °C. The residue of solvent is eliminated by an air-current. Take up the residue in 2.5 ml of the mobile phase.

Reference solution (a) Dissolve 30.0 mg of *benzyl alcohol CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b) Place 0.120 g of the *ginkgo dry extract for peak identification CRS* in a 25 ml beaker and dissolve it in 10 ml of *phosphate buffer solution pH 5.8 R* by stirring, then proceed as described for the test solution.

Column:
- *size: l* = 0.25 m, Ø = 4 mm;
- *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 25 °C.

Mobile phase *tetrahydrofuran R*, *methanol R, water R* (10:20:75 *V/V/V*).

Flow rate 1.0 ml/min.

Detection Refractometer maintained at 35 °C.

Injection 100 µl.

Identification of peaks Use the chromatogram supplied with *ginkgo dry extract for peak identification CRS* and the chromatogram obtained with the reference solution (b) to identify the peaks due to bilobalide and ginkgolides A, B and C.

System suitability:
- the chromatogram obtained with reference solution (b) is similar to the chromatogram supplied with *ginkgo dry extract for peak identification CRS.*

Calculate the percentage content of bilobalide, using the following expression:

$$\frac{F_1 \times m_1 \times p \times 0.025 \times 1.20}{F_5 \times m_2}$$

Calculate the percentage content of ginkgolide A, using the following expression:

$$\frac{F_2 \times m_1 \times p \times 0.025 \times 1.22}{F_5 \times m_2}$$

Calculate the percentage content of ginkgolide B, using the following expression:

$$\frac{F_3 \times m_1 \times p \times 0.025 \times 1.19}{F_5 \times m_2}$$

Calculate the percentage content of ginkgolide C, using the following expression:

$$\frac{F_4 \times m_1 \times p \times 0.025 \times 1.27}{F_5 \times m_2}$$

F_1 = area of the peak due to bilobalide in the chromatogram obtained with the test solution

F_2 = area of the peak due to ginkgolide A in the chromatogram obtained with the test solution

F_3 = area of the peak due to ginkgolide B in the chromatogram obtained with the test solution

F_4 = area of the peak due to ginkgolide C in the chromatogram obtained with the test solution

F_5 = area of the peak due to benzyl alcohol in the chromatogram obtained with reference solution (a)

m_1 = mass of *benzyl alcohol CRS* in reference solution (a), in grams

m_2 = mass of the extract to be examined used to prepare the test solution, in grams

p = percentage content of benzyl alcohol in *benzyl alcohol CRS*

Calculate the percentage content of the sum of ginkgolides A, B and C, using the following expression:

$$G_A + G_B + G_C$$

G_A = percentage content of ginkgolide A

G_B = percentage content of ginkgolide B

G_C = percentage content of ginkgolide C.

Ginkgolic acids

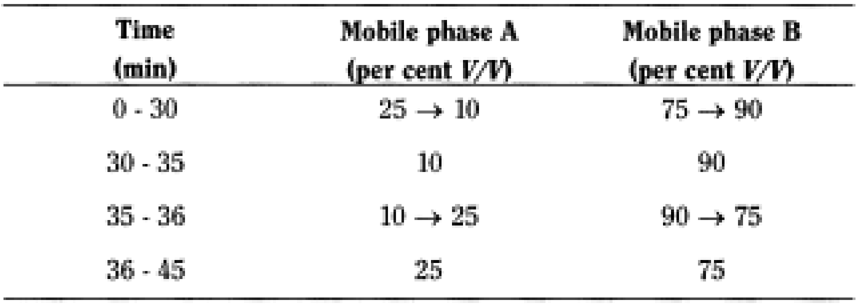
Liquid chromatography *(2.2.29)*.

Test solution Dissolve 0.500 g of the powdered extract to be examined in 8 ml of *methanol R*, sonicating if necessary, and dilute to 10.0 ml with the same solvent. Centrifuge if necessary.

Reference solution Dissolve 10.0 mg of *ginkgolic acids CRS* in 8 ml of *methanol R*, sonicating if necessary, and dilute to 10.0 ml with the same solvent. Dilute 2.0 ml of this solution to 10.0 ml with *methanol R*.

Column:
- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 35 °C.

Mobile phase:
- *mobile phase A*: dilute 0.1 ml of *trifluoroacetic acid R* to 1000 ml with *water R*;
- *mobile phase B*: dilute 0.1 ml of *trifluoroacetic acid R* to 1000 ml with *acetonitrile R;*



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 30	25 → 10	75 → 90
30 - 35	10	90
35 - 36	10 → 25	90 → 75
36 - 45	25	75

Flow rate 1.0 ml/min.

Detection Spectrophotometer at 210 nm.

Injection 50 µl.

Identification of components Use the chromatogram supplied with *ginkgolic acids CRS* and the chromatogram obtained with the test solution to identify the peaks due to ginkgolic acids C13, C15 and C17.

System suitability Reference solution:

- *resolution*: minimum 2.0 between the peaks due to ginkgolic acids C13 and C15;
- *symmetry factor*: 0.8 to 2.0 for the peaks due to ginkgolic acids C13, C15 and C17.

Calculate the content in ppm of ginkgolic acids expressed as ginkgolic acid C17, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 2000}{A_2 \times m_1}$$

A_1 = sum of the areas of the peaks due to the ginkgolic acids C13, C15 and C17 in the chromatogram obtained with the test solution

A_2 = area of the peak due to ginkgolic acid C17 in the chromatogram obtained with the reference solution

m_1 = mass of the extract to be examined used to prepare the test solution, in grams

m_2 = mass of *ginkgolic acids CRS* used to prepare the reference solution, in grams

p = percentage content of ginkgolic acid C17 in *ginkgolic acids CRS.*

Ph Eur

Ginkgo Leaf

General Notices

(Ph Eur monograph 1828)

Ph Eur

DEFINITION

Whole or fragmented, dried leaf of *Ginkgo biloba* L.

Content

Not less than 0.5 per cent of flavonoids, calculated as flavone glycosides (M_r 757) (dried drug) .

CHARACTERS

Greyish or yellowish-green or yellowish-brown.

IDENTIFICATION

A. The upper surface of ginkgo leaf is slightly darker than the lower surface. The petioles of the leaf are about 4 cm to 9 cm long. The lamina is about 4 cm to 10 cm wide, fan-shaped, usually bilobate or sometimes undivided. Both surfaces are smooth, and the venation dichotomous, the veins appearing to radiate from the base; they are equally prominent on both surfaces. The distal margin is incised, irregularly and to different degrees, and irregularly lobate or emarginate. The lateral margins are entire and taper towards the base.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greyish or yellowish-green or yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows irregularly-shaped fragments of the lamina in surface view, the upper epidermis consisting of elongated cells with irregularly sinuous walls, the lower epidermal cells smaller, with a finely striated cuticle and each cell shortly papillose; stomata about 60 µm, large, deeply sunken with 6 to 8 subsidiary cells, are more numerous in the lower epidermis; abundant large cluster crystals of calcium oxalate of various sizes in the mesophyll; fragments of fibro-vascular tissue from the petiole and veins.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 2.0 g of the powdered drug (710) *(2.9.12)* add 10 ml of *methanol R*. Heat in a water-bath at 65 °C for 10 min. Shake frequently. Allow to cool to room temperature and filter.

Reference solution Dissolve 1.0 mg of *chlorogenic acid R* and 3.0 mg of *rutin R* in 20 ml of *methanol R.*

Plate TLC silica gel plate R.

Mobile phase anhydrous formic acid R, *glacial acetic acid R*, *water R*, *ethyl acetate R* (7.5:7.5:17.5:67.5 *V/V/V/V*).

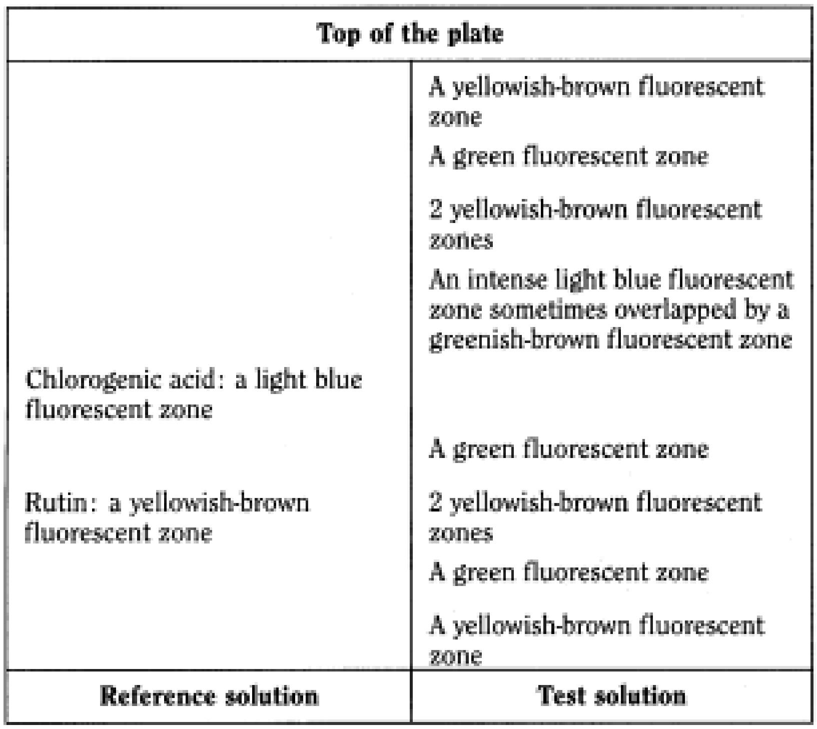
Application 20 µl, as bands.

Development Over a path of 17 cm.

Drying At 100-105 °C.

Detection Spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Subsequently spray with the same volume of a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for about 30 min. Examine in ultraviolet light at 365 nm.

Results See below the sequence of the zones present in the chromatograms obtained with the reference and test solutions. Furthermore, other weaker fluorescent zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A yellowish-brown fluorescent zone
	A green fluorescent zone
	2 yellowish-brown fluorescent zones
	An intense light blue fluorescent zone sometimes overlapped by a greenish-brown fluorescent zone
Chlorogenic acid: a light blue fluorescent zone

Rutin: a yellowish-brown fluorescent zone	2 yellowish-brown fluorescent zones
	A green fluorescent zone
	A yellowish-brown fluorescent zone
Reference solution	**Test solution**

TESTS

Foreign matter *(2.8.2)*

Maximum 5 per cent of stems and 2 per cent of other foreign matter.

Loss on drying *(2.2.32)*

Maximum 11.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 11.0 per cent.

ASSAY

Flavonoids

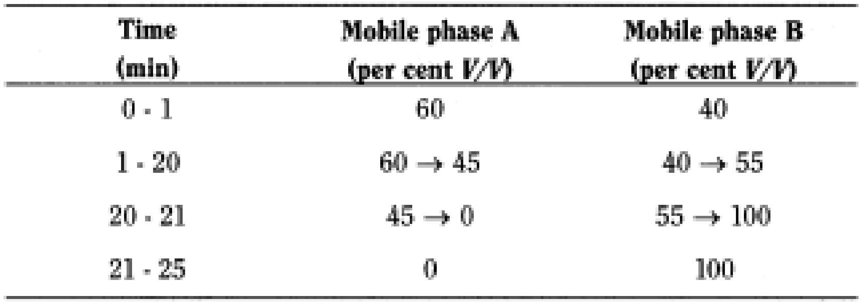
Liquid chromatography *(2.2.29)*.

Test solution Heat 2.500 g of the powdered drug (710) *(2.9.12)* in 50 ml of a 60 per cent *V/V* solution of *acetone R* under a reflux condenser for 30 min. Filter and collect the filtrate. Extract the drug residue a second time in the same manner, using 40 ml of a 60 per cent *V/V* solution of *acetone R* and filter. Collect the filtrates and dilute to 100.0 ml with a 60 per cent *V/V* solution of *acetone R*. Evaporate 50.0 ml of the solution to eliminate the acetone and transfer to a 50.0 ml vial, rinsing with 30 ml of *methanol R*. Add 4.4 ml of *hydrochloric acid R1*, dilute to 50.0 ml with *water R* and centrifuge. Place 10 ml of the supernatant liquid in a 10 ml brown-glass vial. Close with a rubber seal and an aluminium cap and heat on a water-bath for 25 min. Allow to cool to room temperature.

Reference solution Dissolve 10.0 mg of *quercetin dihydrate R* in 20 ml of *methanol R*. Add 15.0 ml of *dilute hydrochloric acid R* and 5 ml of *water R* and dilute to 50.0 ml with *methanol R*.

Column:
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),
- *size*: *l* = 0.125 m, Ø = 4 mm,
- *temperature*: 25 °C.

Mobile phase:
- *mobile phase A*: 0.3 g/l solution of *phosphoric acid R* adjusted to pH 2.0,
- *mobile phase B*: *methanol R*,



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 1	60	40
1 - 20	60 → 45	40 → 55
20 - 21	45 → 0	55 → 100
21 - 25	0	100

Flow rate 1.0 ml/min.

Detector Spectrophotometer at 370 nm.

Injection 10 µl.

Relative retention With reference to quercetin (retention time = about 12.5 min): kaempferol = about 1.4; isorhamnetin = about 1.5.

System suitability:
- *resolution*: minimum 1.5 between the peaks due to kaempferol and to isorhamnetin.

Do not take into account peaks eluting before the quercetin peak or after the isorhamnetin peak in the chromatogram obtained with the test solution.

Calculate the percentage content of flavonoids, expressed as flavone glycosides, from the expression:

$$2 \times \frac{F_1 \times m_1 \times 2.514 \times p}{F_2 \times m_2}$$

F_1 = sum of the areas of all the considered peaks in the chromatogram obtained with the test solution,

F_2 = area of the peak corresponding to quercetin in the chromatogram obtained with the reference solution,

m_1 = mass of quercetin used to prepare the reference solution, in grams,

m_2 = mass of the drug to be examined used to prepare the test solution, in grams,

p = percentage content of anhydrous quercetin in *quercetin dihydrate R*.

Ph Eur

Ginseng

General Notices

(Ph Eur monograph 1523)

Ph Eur

DEFINITION

Whole or cut dried root, designated white ginseng; treated with steam and then dried, designated red ginseng, of *Panax ginseng* C. A. Meyer.

Content

Minimum 0.40 per cent for the sum of ginsenosides Rg1 ($C_{42}H_{72}O_{14},2H_2O$; M_r 837) and Rb1 ($C_{54}H_{92}O_{23},3H_2O$; M_r 1163) (dried drug).

IDENTIFICATION

A. The principal root is fusiform or cylindrical, sometimes branched, up to about 20 cm long and 2.5 cm in diameter, and may be curved or markedly re-curved. The surface is pale yellow to cream in white ginseng, brownish-red in red ginseng and shows longitudinal ridges. Stem scars may be seen at the crown. The fracture is short. The transversely-cut surface shows a wide outer zone with scattered orange-red resin canals and a finely radiate inner region. The rootlets, numerous in the lower part of white ginseng, are normally absent in red ginseng.

B. Reduce to a powder (355) *(2.9.12)*. The powder is light yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following characters: abundant fragments of thin-walled parenchymatous cells and fragments of large secretory canals containing yellowish-brown resin, non-lignified tracheids and partially-lignified vessels with spiral or reticulate thickening, isolated or in groups; scattered cluster crystals of calcium oxalate. Examine under a microscope using a mixture of equal volumes of *glycerol R* and *water R*. The starch granules are very abundant, simple or 2 or 3 compound, and range from 1 µm to 10 µm in diameter. In red ginseng the starch granules are often deformed and destroyed by treating with steam, or may be absent.

C. Thin-layer chromatography *(2.2.27)*.

Test solution Boil 1.0 g of the powdered drug (355) *(2.9.12)* under a reflux condenser with 10 ml of a 70 per cent *V/V* solution of *methanol R* for 15 min. Filter after cooling and dilute to 10.0 ml with *methanol R*.

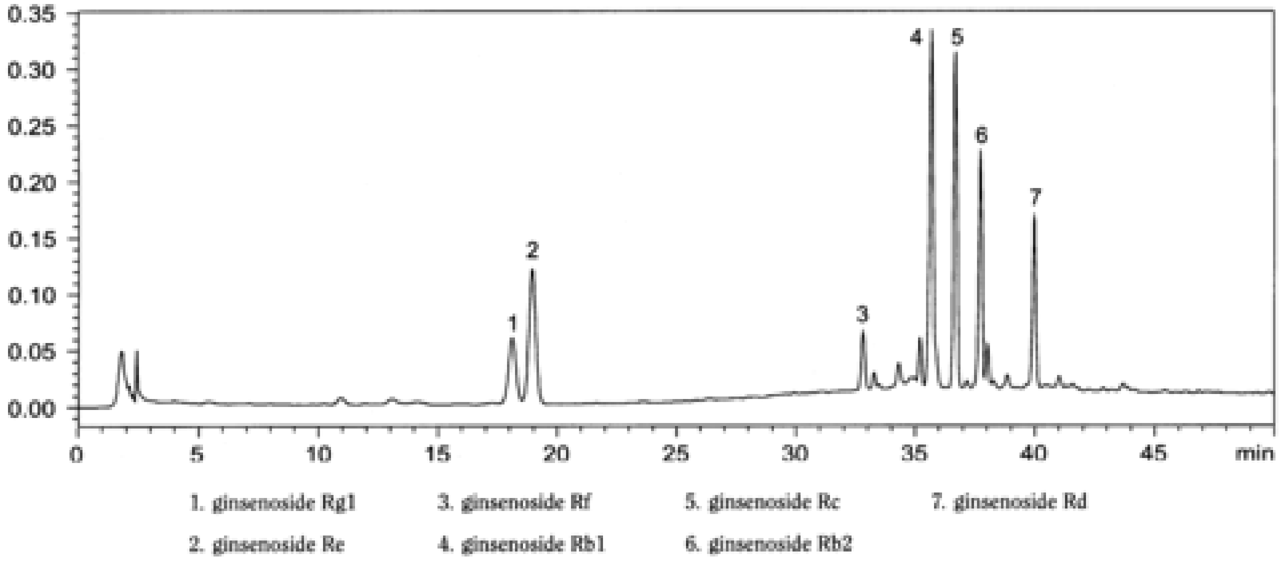


Figure 1523.-1. – *Chromatogram for the assay of ginseng: test solution*

Reference solution Dissolve 5.0 mg of *aescin R* and 5.0 mg of *arbutin R* in 1 ml of *methanol R.*

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *ethyl acetate R*, *water R*, *butanol R* (25:50:100 *V/V/V*), allow the mixture to separate for 10 min. Use the upper layer.

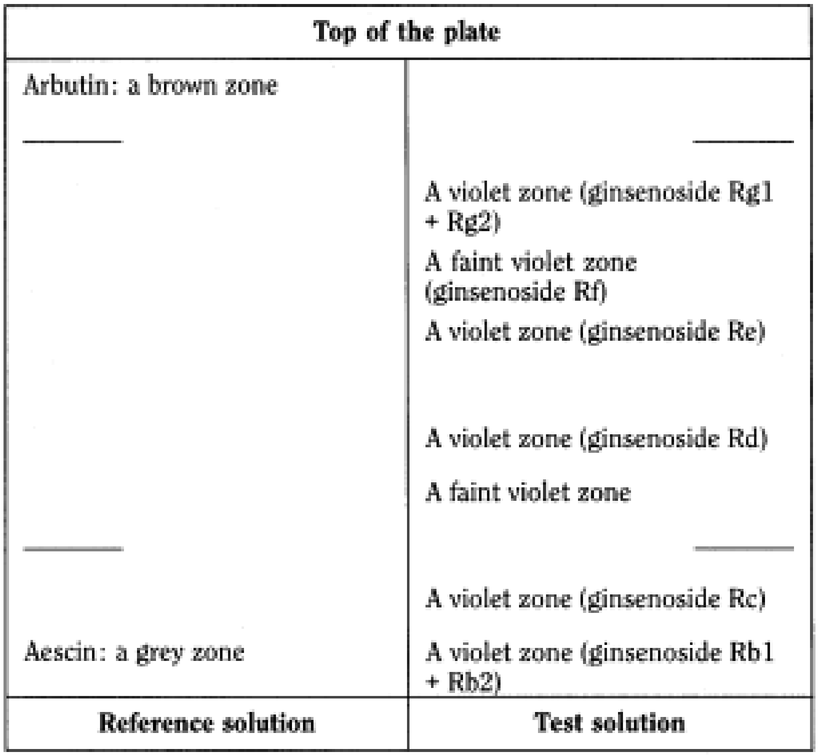
Application 20 µl [or 4 µl] as bands.

Development Over 10 cm [or 5 cm] in an unsaturated tank.

Drying In air.

Detection Spray with *anisaldehyde solution R* and heat at 105-110 °C for 5-10 min. Examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
Arbutin: a brown zone	
———	———
	A violet zone (ginsenoside Rg1 + Rg2)

	A violet zone (ginsenoside Re)
	A violet zone (ginsenoside Rd)
	A faint violet zone
———	———
	A violet zone (ginsenoside Rc)
Aescin: a grey zone	A violet zone (ginsenoside Rb1 + Rb2)
Reference solution	**Test solution**

TESTS

Panax quinquefolium

Examine the chromatograms obtained in the assay. The chromatogram obtained with the test solution shows a peak due to ginsenoside Rf (see Figure 1523.-1). In the case of a substitution by *Panax quinquefolium* no peak due to ginsenoside Rf is present.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C.

Total ash *(2.4.16)*

Maximum 7.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 1.0 per cent.

ASSAY

Liquid chromatography *(2.2.29)*.

Test solution Reduce about 50 g to a powder (355) *(2.9.12)*. Place 1.00 g of the powdered drug and 70 ml of a 50 per cent *V/V* solution of *methanol R* in a 250 ml round-bottomed flask. After adding a few grains of pumice, boil on a water-bath under a reflux condenser for 1 h. After cooling, centrifuge and collect the supernatant liquid. Treat the residue as described above. Mix the collected liquids and evaporate to dryness under reduced pressure at a temperature not exceeding 60 °C. Take up the residue with 20.0 ml of a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*. Dilute 2.0 ml of the solution to 10.0 ml with a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*. Filter through a suitable membrane filter (0.45 µm) before injection.

Reference solution Dissolve 3.0 mg of *ginsenoside Rg1 R*, 3.0 mg of *ginsenoside Re R*, 3.0 mg of *ginsenoside Rf R* and 3.0 mg of *ginsenoside Rb1 R* in *methanol R* and dilute to 10.0 ml with the same solvent.

Column:
— *size: l* = 0.125 m, Ø = 4.6 mm,
— *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),
— *temperature:* 35 °C.

Mobile phase:
— *mobile phase A*: *water R* adjusted to pH 2 with *phosphoric acid R*,
— *mobile phase B*: *acetonitrile R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 8	80	20
8 - 40	80 → 60	20 → 40
40 - 45	60 → 40	40 → 60
45 - 47	40 → 0	60 → 100
47 - 52	0	100
52 - 55	0 → 80	100 → 20

Flow rate 1.0 ml/min.

Detection Spectrophotometer at 203 nm.

Equilibration time 20 min.

Injection 20 µl.

Elution order Order indicated in the composition of the reference solution; record the retention times of these substances.

System suitability Reference solution:

— *resolution*: minimum 1.0 between the peaks due to ginsenoside Rg1 and ginsenoside Re.

Locate the peaks due to ginsenoside Rb1 and ginsenoside Rg1 in the chromatogram obtained with the test solution.

Calculate the percentage content of ginsenosides Rb1 and Rg1 from the expression:

$$\frac{A_1 \times m_2 \times p_1}{A_3 \times m_1 \times 100} + \frac{A_2 \times m_3 \times p_2}{A_4 \times m_1 \times 100}$$

A_1 = area of the peak due to ginsenoside Rb1 in the chromatogram obtained with the test solution,

A_2 = area of the peak due to ginsenoside Rg1 in the chromatogram obtained with the test solution,

A_3 = area of the peak due to ginsenoside Rb1 in the chromatogram obtained with the reference solution,

A_4 = area of the peak due to ginsenoside Rg1 in the chromatogram obtained with the reference solution,

m_1 = mass of the drug to be examined, in grams,

m_2 = mass of ginsenoside Rb1 in the reference solution, in milligrams,

m_3 = mass of ginsenoside Rg1 in the reference solution, in milligrams,

p_1 = percentage content of ginsenoside Rb1 in the reagent,

p_2 = percentage content of ginsenoside Rg1 in the reagent.

Ph Eur

Goldenrod

General Notices

(Ph Eur monograph 1892)

Ph Eur

DEFINITION

Whole or cut, dried, flowering aerial parts of *Solidago gigantea* Ait or *Solidago canadensis* L., their varieties or hybrids and/or mixtures of these.

Content

Minimum 2.5 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried drug).

IDENTIFICATION

A. The stems are greenish-yellow or greenish-brown, partly tinted reddish, roundish, more or less conspicuously grooved, glabrous and smooth in the lower part, slightly or densely pubescent in the upper part. They are solid with a whitish pith.

The leaves are green, sessile, lanceolate, with a serrate margin, 8-12 cm long and about 1-3 cm wide, the upper surface is green and more or less glabrous, the lower surface is greyish-green and pubescent, especially on the veins. The inflorescence consists of a number of unilateral, curved racemes which together form a pyramidal panicle at the end of the stems.

Each capitulum has an involucre composed of linear-lanceolate, imbricated yellowish-green bracts, surrounding a single row of yellow ligulate florets about the same length as the involucre; yellow, radially arranged tubular florets, as long as, or longer, than the ligulate florets; a brownish inferior ovary surmounted by a white pappus of silky hairs.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greyish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows pappus bristles and their fragments, consisting of multiseriate trichomes composed of elongated cells with the tips free from the surface and forming pointed projections over the entire length; fragments of the leaf mesophyll with vascular bundles accompanied by secretory cells; fragments of the leaf epidermis with sinuous to wavy-walled cells and stomata of the anomocytic type *(2.8.3)*; uniseriate covering trichomes with up to 5 or 6 cells, some whip-like with a thicker-walled terminal cell; fragments of the style with long, slender papillae; fragments of the stem with reticulate and spiral vessels; pollen grains, with 3 germinal pores and a spiny exine; numerous whisk-shaped hairs, a few isolated twin-hairs from the ovary, absence of multicellular trichomes with a terminal cell bent at a right angle.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 0.75 g of the powdered drug (355) *(2.9.12)* add 5 ml of *methanol R* and boil in a water-bath under a reflux condenser for 10 min. Cool and filter.

Reference solution Dissolve 1.0 mg of *chlorogenic acid R*, 2.5 mg of *quercitrin R* and 2.5 mg of *rutin R* in 10 ml of *methanol R*.

Plate *TLC silica gel plate R*.

Mobile phase *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (6:6:18:30 *V/V/V/V*).

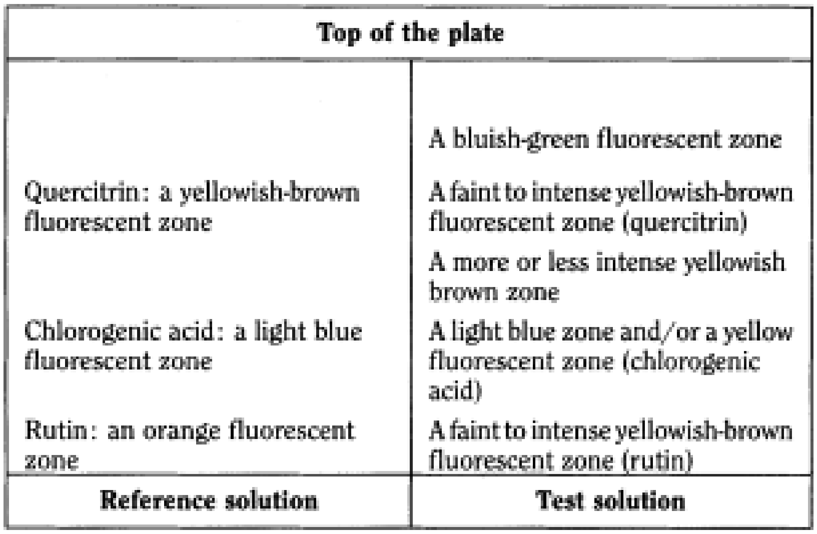
Application 20 µl of the test solution and 10 µl of the reference solution as bands.

Development Over a path of 10 cm.

Drying At 100-105 °C.

Detection Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow to stand for 30 min. Examine in ultraviolet light at 365 nm.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A bluish-green fluorescent zone
Quercitrin: a yellowish-brown fluorescent zone	A faint to intense yellowish-brown fluorescent zone (quercitrin)
	A more or less intense yellowish brown zone
Chlorogenic acid: a light blue fluorescent zone	A light blue zone and/or a yellow fluorescent zone (chlorogenic acid)
Rutin: an orange fluorescent zone	A faint to intense yellowish-brown fluorescent zone (rutin)
Reference solution	**Test solution**

TESTS

Foreign matter *(2.8.2)*

Maximum 5 per cent of brownish parts and maximum 2 per cent of other foreign matter.

Loss on drying *(2.2.32)*

Maximum 10 per cent, determined on 0.500 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 7.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 1.0 per cent.

ASSAY

Stock solution In a 100 ml round-bottomed flask, introduce 0.200 g of the powdered drug (250) *(2.9.12)*, add 1 ml of a 5 g/l solution of *hexamethylenetetramine R*, 20 ml of *acetone R* and 2 ml of *hydrochloric acid R1*. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a small plug of absorbent cotton into a 100 ml flask. Add the absorbent cotton to the residue in the round-bottomed flask, extract with 2 quantities, each of 20 ml of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool. Filter the combined acetone extracts through a filter paper into a volumetric flask. Rinse the flask and the filter paper and dilute to 100.0 ml with *acetone R*. Introduce 20.0 ml of the solution into a separating funnel, add 20 ml of *water R* and shake the mixture with 1 quantity of 15 ml and then 3 quantities, each of 10 ml, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, wash twice with 50 ml of *water R* and filter the extracts over 10 g of *anhydrous sodium sulphate R* into a volumetric flask. Dilute to 50.0 ml with *ethyl acetate R*, rinsing the separating funnel and the sodium sulphate.

Test solution To 10.0 ml of the stock solution add 1.0 ml of *aluminium chloride reagent R* and dilute to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Compensation solution Dilute 10.0 ml of the stock solution to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Measure the absorbance of the test solution *(2.2.25)* at 425 nm after 30 min by comparison with the compensation solution.

Calculate the percentage content of flavonoids, expressed as hyperoside, from the expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the value of the specific absorbance of hyperoside to be 500.

A = absorbance measured at 425 nm,

m = mass of the drug to be examined, in grams.

Ph Eur

Goldenseal Root

General Notices

(Goldenseal Rhizome, Ph Eur monograph 1831)

Ph Eur

DEFINITION

Whole or cut, dried rhizome and root of *Hydrastis canadensis* L.

Content:

— *hydrastine* ($C_{21}H_{21}NO_6$; M_r 383.4): minimum 2.5 per cent (dried drug);

— *berberine* ($C_{20}H_{19}NO_5$; M_r 353.4): minimum 3.0 per cent (dried drug).

IDENTIFICATION

A. The rhizome is tortuous and knotty, about 5 cm long and 5-10 mm thick. The surface is yellowish or brownish-grey, irregularly wrinkled, and bears the remains of numerous slender, wiry roots; stem bases and scale leaves occur on the upper surface. The fracture is short and resinous. The transversely-cut surface is yellowish-brown and shows a fairly wide bark, a ring of from about 12 to 20 widely separated xylem bundles and a large, central pith.

B. Reduce to a powder (180) *(2.9.12)*. The powder is greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: abundant thin-walled fragments of parenchyma; occasional fragments of yellowish-brown cork from the rhizome and roots; groups of small vessels with conspicuous perforations in the oblique end walls and with simple or bordered, slit-shaped pits; infrequent groups of thin-walled, pitted fibres, usually found associated with the vessels; numerous ovoid or spherical, orange-brown granular masses. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows abundant starch granules, mostly simple but sometimes compound with up to 4 components; the granules are small, spherical or ovoid, up to about 10 µm in diameter, occasionally with a small, rounded or slit-shaped hilum.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 250 mg of powdered drug (180) *(2.9.12)* add 4 ml of a mixture of 20 ml of *water R* and 80 ml of *methanol R*. Sonicate for 10 min and filter. Wash the residue with 2 quantities, each of 2 ml, of *methanol R*. Combine the solutions and dilute to 20 ml with *methanol R*.

Reference solution Dissolve 5 mg of *hydrastine hydrochloride R* and 5 mg of *berberine chloride R* in 20 ml of *methanol R*.

Plate *TLC silica gel plate R*.

Mobile phase *anhydrous formic acid R*, *water R*, *ethyl acetate R* (10:10:80 *V/V/V*).

Application 20 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Examine in ultraviolet light at 365 nm.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

TESTS

Loss on drying ***(2.2.32)***

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (180) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash ***(2.4.16)***

Maximum 8.0 per cent.

Ash insoluble in hydrochloric acid ***(2.8.1)***

Maximum 4.0 per cent.

ASSAY

Liquid chromatography *(2.2.29)*.

Test solution To 1.000 g of the powdered drug (355) *(2.9.12)* in a 100 ml round-bottomed flask, add 50 ml of a 1 per cent *V/V* solution of *concentrated ammonia R* in *ethanol (96 per cent) R* and boil the mixture under a reflux condenser for 30 min. Allow to cool to room temperature and filter the liquid through a plug of absorbent cotton into a flask. Add the plug of absorbent cotton to the residue in the round-bottomed flask and repeat the extraction with a further 2 quantities, each of 30 ml, of a 1 per cent *V/V* solution of *concentrated ammonia R* in *ethanol (96 per cent) R*, each time boiling under a reflux condenser for 10 min and filtering through a plug of absorbent cotton in the same flask as previously. Filter the combined filtrates through a filter paper into a 250 ml round-bottomed flask, and rinse flask and filter with 20 ml of a 1 per cent *V/V* solution of *concentrated ammonia R* in *ethanol (96 per cent) R.* Evaporate the filtrate to dryness *in vacuo* in a water-bath at 55 °C. Dissolve the residue in 50.0 ml of the mobile phase. Dilute 10.0 ml of this solution to 250.0 ml with the mobile phase.

Reference solution Dissolve 10 mg of *hydrastine hydrochloride R* and 10 mg of *berberine chloride R* in *methanol R* and dilute to 100.0 ml with the same solvent.

Column:
- *size*: *l* = 0.125 m, Ø = 4 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase Dissolve 9.93 g of *potassium dihydrogen phosphate R* in 730 ml of *water R*, add 270 ml of *acetonitrile R* and mix.

Flow rate 1.2 ml/min.

Detection Spectrophotometer at 235 nm.

Injection 10 µl.

System suitability Reference solution:

- *elution order*: order indicated in the composition of the reference solution; record the retention times of these substances;
- *resolution*: minimum 1.5 between the peaks due to hydrastine and berberine.

Using the retention times determined from the chromatogram obtained with the reference solution, locate in the chromatogram obtained with the test solution the components of the reference solution.

Calculate the percentage content of each alkaloid (hydrastine and berberine) using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1} \times 12.5$$

A_1 = area of the peak due to hydrastine or berberine in the chromatogram obtained with the test solution

A_2 = area of the peak due to hydrastine or berberine in the chromatogram obtained with the reference solution

m_1 = mass of the drug to be examined, in grams

m_2 = mass of hydrastine hydrochloride or berberine chloride in the reference solution, in grams

p = percentage content of hydrastine in *hydrastine hydrochloride R* or berberine in *berberine chloride R*.

Ph Eur

Greater Burnet Root

General Notices

(Ph Eur monograph 2385)

Ph Eur

DEFINITION

Whole or fragmented, dried underground parts of *Sanguisorba officinalis* L. without rootlets.

Content

Minimum 5.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1) (dried drug).

CHARACTERS

The adventitious roots are about 5-25 cm long and up to 2 cm in diameter.

IDENTIFICATION

A. The whole drug consists of the rhizome, often ramified, thick, short, fusiform or cylindrical and the adventitious roots whose surface is reddish-brown or blackish-brown, with longitudinal striations, sometimes with transverse fissures, and showing rootlet scars.

It may also be found as more or less cylindrical fragments up to 2 cm long or elliptical or irregular discs. The fracture is light-coloured and very fibrous.

B. Reduce to a powder (355) *(2.9.12)*. The powder is light yellowish-brown. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: numerous, whole or fragmented phloem fibres, usually isolated, narrow, sometimes more than 500 µm long and often rough-walled; calcium oxalate cluster crystals, free or inside parenchyma cells; a few reticulate lignified vessels; rare cork fragments. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R* . The powder shows rounded or ovoid starch granules, single or in groups of 2-4; the diameter of a component granule may reach 30 µm. Some starch granules are found in the parenchyma cells or in cells of the medullary rays.

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 2.0 g of the powdered drug (355) *(2.9.12)* add 50 ml of *water R* and boil under a reflux condenser for 30 min. Cool the solution and centrifuge for 10 min. Shake the supernatant with 2 quantities, each of 15 ml, of *di-isopropyl ether R* saturated with *hydrochloric acid R* . Combine the ether layers. Evaporate to dryness and dissolve the residue in 1.0 ml of *methanol R* . Filter through a polypropylene syringe filter (nominal pore size 0.45 µm).

Reference solution Dissolve 5 mg of *gallic acid R* and 20 mg of *resorcinol R* in 20 ml of *methanol R*.

Plate *TLC silica gel F $_{254}$ plate R* (5-40 µm) [or *TLC silica gel F $_{254}$ plate R* (2-10 µm)].

Mobile phase *anhydrous formic acid R*, *ethyl acetate R*, *toluene R* (10:30:60 *V/V/V*).

Application 10 µl [or 4 µl] as bands.

Development Over a path of 10 cm [or 6 cm].

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

Results A See below the sequence of quenching zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

TESTS

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C.

Total ash *(2.4.16)*

Maximum 10.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 2.0 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs *(2.8.14)* . Use 0.500 g of the powdered drug (180) *(2.9.12)*.

Ph Eur

Greater Celandine

General Notices

(Ph Eur monograph 1861)

Ph Eur

DEFINITION

Dried, whole or cut aerial parts of *Chelidonium majus* L. collected during flowering.

Content

Minimum 0.6 per cent of total alkaloids, expressed as chelidonine ($C_{20}H_{19}NO_5$; M_r 353.4) (dried drug).

IDENTIFICATION

A. The stems are rounded, ribbed, yellowish or greenish-brown, somewhat pubescent, about 3-7 mm in diameter, hollow and mostly collapsed. The leaves are thin, irregularly pinnate, the leaflets ovate to oblong with coarsely dentate margins, the terminal leaflet often three-lobed; the adaxial surface is bluish-green and glabrous, the abaxial surface paler and pubescent, especially on the veins. The flowers have 2 deeply concavo-convex sepals, readily removed, and 4 yellow, broadly ovate, spreading petals about 8-10 mm long; the stamens are numerous, yellow, and a short style arises from a superior ovary; long, capsular, immature fruits are rarely present.

B. Reduce to a powder (355) *(2.9.12)*. The powder is dark greyish-green or brownish-green. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: numerous fragments of leaves in surface view, the epidermal cells with sinuous walls; anomocytic stomata *(2.8.3)* occur on the abaxial surface only; covering trichomes long, uniseriate, with thin walls and usually fragmented; vascular tissue from the leaves and stems with groups of fibres, pitted and spirally thickened vessels and associated latex tubes with yellowish-brown contents; occasional fragments of the corolla with thin-walled, partly papillose cells containing numerous pale yellow droplets of oil; spherical pollen grains about 30-40 µm in diameter with 3 pores and a finely pitted exine.

C. Thin-layer chromatography *(2.2.27)* .

Test solution To 0.4 g of the powdered drug (710) *(2.9.12)* add 50 ml of *dilute acetic acid R* . Boil in a water-bath under a reflux condenser for 30 min. Cool and filter. To the filtrate add *concentrated ammonia R* until a strong alkaline reaction is produced. Shake with 30 ml of *methylene chloride R* . Dry the organic layer over *anhydrous sodium sulphate R* , filter and evaporate *in vacuo* to dryness. Dissolve the residue in 1.0 ml of *methanol R.*

Reference solution Dissolve 2 mg of *papaverine hydrochloride R* and 2 mg of *methyl red R* in 10 ml of *ethanol (96 per cent) R*.

Plate *TLC silica gel plate R.*

Mobile phase *anhydrous formic acid R, water R, propanol R* (1:9:90 *V/V/V*).

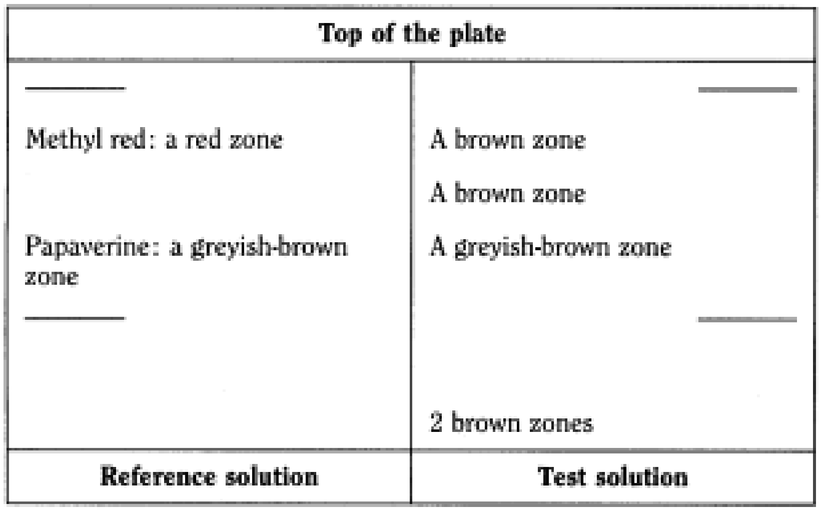
Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with *potassium iodobismuthate solution R* and dry in air; spray with *sodium nitrite solution R* and allow to dry in air; examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weaker zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
———	———
Methyl red: a red zone	A brown zone
	A brown zone
Papaverine: a greyish-brown zone	A greyish-brown zone

Reference solution	**Test solution**

TESTS

Foreign matter *(2.8.2)*

Maximum 10.0 per cent.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 13.0 per cent.

ASSAY

Test solution To 0.750 g of the powdered drug (710) *(2.9.12)*, add 200 ml of *dilute acetic acid R* and heat on a water-bath for 30 min, shaking frequently. Cool and dilute to 250.0 ml with *dilute acetic acid R*. Filter. Discard the first 20 ml of the filtrate. To 30.0 ml of the filtrate add 6.0 ml of *concentrated ammonia R* and 100.0 ml of *methylene chloride R*. Shake for 30 min. Separate the organic layer, place 50.0 ml in a 100 ml round-bottomed flask and evaporate to dryness *in vacuo* at a temperature not exceeding 40 °C. Dissolve the residue in about 2-3 ml of *ethanol (96 per cent) R*, warming slightly. Transfer the solution to a 25 ml volumetric flask by rinsing the round-bottomed flask with *dilute sulphuric acid R* and dilute to 25.0 ml with the same solvent. To 5.0 ml of the solution, add 5.0 ml of a 10 g/l solution of *chromotropic acid, sodium salt R* in *sulphuric acid R* in a 25 ml volumetric flask, stopper the flask and mix carefully. Dilute to 25.0 ml with *sulphuric acid R* and stopper the flask.

Compensation liquid Prepare at the same time and in the same manner as for the test solution: place in a 25 ml volumetric flask 5.0 ml of *dilute sulphuric acid R* and 5.0 ml of a 10 g/l solution of *chromotropic acid*, *sodium salt R in sulphuric acid R*, stopper the flask and mix carefully. Dilute to 25.0 ml with *sulphuric acid R* and stopper the flask.

Place both solutions on a water-bath for 10 min. Cool to about 20 °C and dilute if necessary to 25.0 ml with *sulphuric acid R*. Measure the absorbance *(2.2.25)* of the test solution at 570 nm by comparison with the compensation liquid.

Calculate the percentage content of total alkaloids, expressed as chelidonine, using the following expression:

$$\frac{A \times 2.23}{m}$$

i.e. taking the specific absorbance of chelidonine to be 933.

A = absorbance at 570 nm

m = mass of the substance to be examined, in grams

Ph Eur

Hamamelis Leaf

General Notices

(Ph Eur monograph 0909)

Ph Eur

DEFINITION

Whole or cut, dried leaf of *Hamamelis virginiana* L.

Content

Minimum 3 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1) (dried drug).

IDENTIFICATION

A. The leaf is green or greenish-brown, often broken, crumpled and compressed into more or less compact masses. The lamina is broadly ovate or obovate; the base is oblique and asymmetric and the apex is acute or, rarely, obtuse. The margins of the lamina are roughly crenate or dentate. The venation is pinnate and prominent on the abaxial surface. Usually, 4-6 pairs of secondary veins are attached to the main vein, emerging at an acute angle and curving gently to the marginal points where there are fine veins often at right angles to the secondary veins.

B. Reduce to a powder (355) (*2.9.12*). The powder is brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of adaxial epidermis with wavy anticlinal walls; abaxial epidermis with stomata mainly paracytic (*2.8.3*); star-shaped covering trichomes, either entire or broken, composed of 4-12 unicellular branches that are united by their bases, elongated, conical and curved, usually up to 250 µm long, thick-walled and with a clearly visible lumen whose contents are often brown; fibres are lignified and thick-walled, isolated or in groups, and accompanied by a sheath of prismatic calcium oxalate crystals; small, cylindrical parenchymatous cells of palisade; irregular-shaped cells of spongy mesophyll; sclereids, frequently enlarged at 1 or both ends, 150-180 µm long, whole or fragmented; fragments of annular or spiral vessels; isolated prisms of calcium oxalate.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *ethanol (60 per cent V/V) R*, shake for 15 min and filter.

Reference solution (a) Dissolve 30 mg of *tannic acid R* in 5 ml of *ethanol (60 per cent V/V) R.*

Reference solution (b) Dissolve 5 mg of *gallic acid R* in 5 ml of *ethanol (60 per cent V/V) R.*

Plate TLC silica gel G plate R.

Mobile phase anhydrous formic acid R, *water R, ethyl formate R* (10:10:80 *V/V/V*).

Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying At 100-105 °C for 10 min, then allow to cool.

Detection Spray with *ferric chloride solution R2* until bluish-grey zones (phenolic compounds) appear.

Results The chromatogram obtained with the test solution shows in its lower third a principal zone similar in position to the principal zone in the chromatogram obtained with reference solution (a) and, in its upper part, a narrow zone similar in position to the principal zone in the chromatogram obtained with reference solution (b). The chromatogram obtained with the test solution shows, in addition, several slightly coloured zones in the central part.

Figure 0909.-1. – *Illustration of powdered herbal drug of hamamelis leaf (see Identification B)*

TESTS

Foreign matter (*2.8.2*)

Maximum 7 per cent of stems and maximum 2 per cent of other foreign matter, determined on 50 g.

Loss on drying (*2.2.32*)

Maximum 10.0 per cent, determined on 2.000 g of powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 4 h.

Total ash (*2.4.16*)

Maximum 7.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*)

Maximum 2.0 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs (*2.8.14*). Use 0.750 g of the powdered drug (180) (*2.9.12*).

Ph Eur

Hawthorn Berries

General Notices

(Ph Eur monograph 1220)

Ph Eur

DEFINITION

Dried false fruits of *Crataegus monogyna* Jacq. (Lindm.), or *Crataegus laevigata* (Poir.) D.C. (synonym: *Crataegus oxyacantha* L.) or their hybrids or a mixture of these false fruits.

Content

Minimum 1.0 per cent of procyanidins, expressed as cyanidin chloride ($C_{15}H_{11}ClO_6$; M_r 322.7) (dried drug).

CHARACTERS

Sweet mucilaginous taste.

IDENTIFICATION

A. The false fruit of *Crataegus monogyna* is obovate or globular, generally 6-10 mm long and 4-8 mm wide, reddish-brown or dark red. The surface is pitted or, more rarely, reticulated. The upper end of the fruit is crowned by the remains of 5 reflexed sepals surrounding a small sunken disc with a shallow, raised rim. The remains of the style occur in the centre of the disc with tufts of stiff, colourless hairs at the base. At the lower end of the fruit is a short length of pedicel or, more frequently, a small pale circular scar where the pedicel was attached. The receptacle is fleshy and encloses a yellowish-brown, ovoid fruit with a hard, thick wall containing a single, elongated, pale brown, smooth and shiny seed.

The false fruit of *Crataegus laevigata* is up to 13 mm long. It contains 2-3 stony fruits, ventrally flattened, with short hairs at the top. Frequently, in the centre of the disc of the false fruit occur the remains of the 2 styles.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greyish-red. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: covering trichomes from inside the disc which are long, unicellular, frequently bent, tapering to a point, with smooth, much thickened and lignified walls; parenchymatous receptacle fragments, the outer layer with red colouring matter, some cells of the inner layers containing small cluster crystals of calcium oxalate; occasional fragments including groups of sclereids and vascular strands with associated files of cells containing prisms of calcium oxalate; pericarp fragments consisting of large thick-walled sclereids with numerous pits, some of which are conspicuously branched; a few fragments of the testa having an epidermal layer composed of hexagonal, mucilaginous cells beneath which is a yellowish-brown pigment layer containing numerous elongated prisms of calcium oxalate; thin-walled parenchyma of the endosperm and cotyledons containing aleurone grains and globules of fixed oil.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 10 ml of *methanol R* and heat in a water bath at 65 °C for 5 min, shaking frequently. Allow to cool to room temperature and filter. Dilute the filtrate to 10 ml with *methanol R*.

Reference solution Dissolve 2 mg of *chlorogenic acid R*, 2 mg of *caffeic acid R*, 5 mg of *hyperoside R* and 5 mg of *rutin R* in 20 ml of *methanol R*.

Plate *TLC silica gel plate R*.

Mobile phase *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 *V/V/V/V*).

Application 30 µl of the test solution and 10 µl of the reference solution, as bands.

Development Over a path of 15 cm.

Drying At 100-105 °C.

Detection Spray whilst hot with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*; allow to dry in air for 30 min and examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the reference solution shows in the lower half, in order of increasing R_F values, a yellowish-brown fluorescent zone (rutin), a light blue fluorescent zone (chlorogenic acid) and a yellowish-brown fluorescent zone (hyperoside); in the upper third appears a light blue fluorescent zone (caffeic acid). The chromatogram obtained with the test solution shows 3 zones similar in position and fluorescence to the zones due to chlorogenic acid, hyperoside and caffeic acid in the chromatogram obtained with the reference solution, and 3 weak reddish fluorescent zones, one corresponding to the zone due to rutin in the chromatogram obtained with the reference solution and both of the others located above the zone due to hyperoside. Below and above the zone due to caffeic acid some light blue zones appear.

TESTS

Foreign matter *(2.8.2)*

Maximum 5 per cent of deteriorated false fruit and maximum 2 per cent of other foreign matter. It does not contain fruits of other *Crataegus species* (*C. nigra* Waldst. et Kit., *C. pentagyna* Waldst. et Kit. ex Willd. and C. *azarolus* L.) which are characterised by the presence of more than 3 hard stones.

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 5.0 per cent.

ASSAY

To 2.50 g of the powdered drug (355) *(2.9.12)* add 30 ml of *ethanol (70 per cent V/V) R*. Heat under a reflux condenser for 30 min and filter. Wash the residue with 10.0 ml of *ethanol (70 per cent V/V) R*. Add to the filtrate 15.0 ml of *hydrochloric acid R1* and 10.0 ml of *water R*.

Heat under a reflux condenser for 80 min. Allow to cool, filter and wash the residue with *ethanol (70 per cent V/V) R* until the filtrate is colourless. Dilute the filtrate to 250.0 ml with *ethanol (70 per cent V/V) R*. Evaporate 50.0 ml of this solution in a round-bottomed flask to about 3 ml and transfer to a separating funnel. Rinse the round-bottomed flask sequentially with 10 ml and 5 ml of *water R* and transfer to the separating funnel. Shake the combined solution with 3 quantities, each of 15 ml, of *butanol R*. Combine the organic layers and dilute to 100.0 ml with *butanol R*.

Measure the absorbance *(2.2.25)* of the solution at 545 nm.

Calculate the percentage content of procyanidins, expressed as cyanidin chloride, using the following expression:

$$\frac{A \times 500}{75 \times m}$$

i.e. taking the specific absorbance of cyanidin chloride to be 75.

A = absorbance at 545 nm,

m = mass of the substance to be examined, in grams.

Ph Eur

Hawthorn Leaf and Flower Dry Extract

General Notices

(Ph Eur monograph 1865)

Ph Eur

DEFINITION

Dry extract produced from *Hawthorn leaf and flower (1432)*.

Content:

— for aqueous extracts: minimum 2.5 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried extract);

— for hydroalcoholic extracts: minimum 6.0 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried extract).

PRODUCTION

The extract is produced from the drug by a suitable procedure using either water or a hydroalcoholic solvent equivalent in strength to a minimum of 45 per cent *V/V* ethanol.

CHARACTERS

Appearance

Light brown or greenish-brown powder.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)*.

Test solution Suspend 0.2 g of the extract to be examined in 20 ml of *alcohol (70 per cent V/V) R* and filter.

Reference solution Dissolve 1 mg of *chlorogenic acid R*, 2.5 mg of *hyperoside R* and 2.5 mg of *rutin R* in 10 ml of *methanol R*.

Plate TLC silica gel plate R.

Mobile phase anhydrous formic acid R, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 *V/V/V/V*).

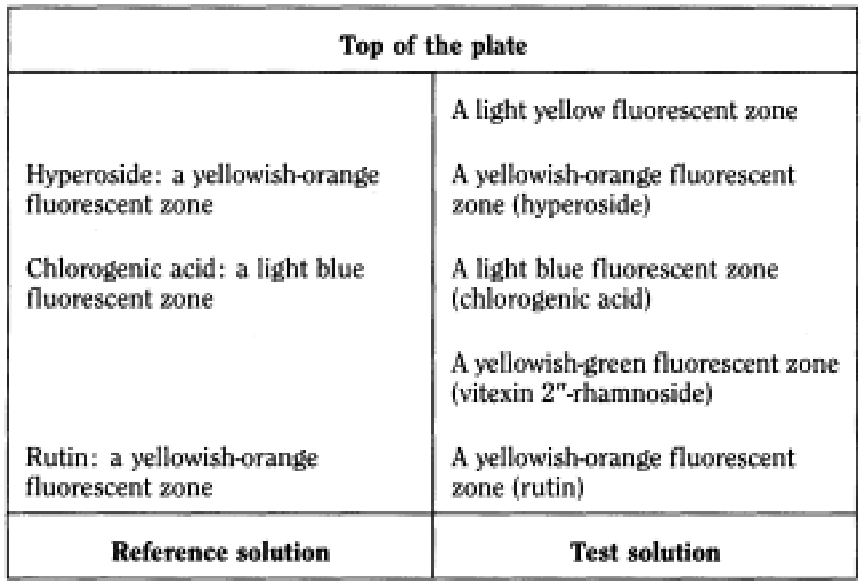
Application 20 µl of the test solution and 10 µl of the reference solution, as bands.

Development Over a path of 15 cm.

Drying At 100-105 °C.

Detection Spray the plate whilst hot with a 10 g/l solution of *diphenylboric acid aminoethyl* *ester R* in *methanol R*; subsequently spray the plate with a 50 g/l solution of *macrogol 400 R* in *methanol R*; allow the plate to dry in air for 30 min and examine in ultraviolet light at 365 nm.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A light yellow fluorescent zone
Hyperoside: a yellowish-orange fluorescent zone	A yellowish-orange fluorescent zone (hyperoside)
Chlorogenic acid: a light blue fluorescent zone	A light blue fluorescent zone (chlorogenic acid)
	A yellowish-green fluorescent zone (vitexin 2″-rhamnoside)
Rutin: a yellowish-orange fluorescent zone	A yellowish-orange fluorescent zone (rutin)
Reference solution	**Test solution**

TESTS

Methanol *(2.9.11)*

Maximum 0.05 per cent *V/V*.

Loss on drying *(2.2.32)*

Maximum 6.0 per cent, determined on 0.500 g of the extract to be examined by drying in an oven at 105 °C for 2 h.

ASSAY

Stock solution Dissolve 0.100 g of the extract to be examined in *alcohol (60 per cent V/V) R* and dilute to 100.0 ml with the same solvent.

Test solution Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Dissolve the residue in 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the 25 ml volumetric flask. Add 10.0 ml of a solution containing 25.0 g/l of *boric acid R* and 20.0 g/l of *oxalic acid R* in *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

Compensation liquid Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Dissolve the residue in 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the 25 ml volumetric flask. Add 10.0 ml of *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

After 30 min measure the absorbance *(2.2.25)* of the test solution at 410 nm by comparison with the compensation liquid.

Calculate the percentage content of total flavonoids, calculated as hyperoside, from the expression:

$$\frac{A \times 1.235}{m}$$

i.e. taking the specific absorbance to be 405.

A = absorbance at 410 nm,

m = mass of the extract to be examined, in grams.

Ph Eur

Hawthorn Leaf and Flower

General Notices

(Ph Eur monograph 1432)

Preparation

Hawthorn Leaf and Flower Dry Extract

Ph Eur

DEFINITION

Whole or cut, dried flower-bearing branches of *Crataegus monogyna* Jacq. (Lindm.), *C. laevigata* (Poiret) D.C. (*C. oxyacanthoides* Thuill.) or their hybrids or, more rarely, other European *Crataegus* species including *C. pentagyna* Waldst. et Kit. ex Willd., *C. nigra* Waldst. et Kit., *C. azarolus* L.

Content

Minimum 1.5 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried drug).

IDENTIFICATION

A. The stems are dark brown, woody, 1-2.5 mm in diameter, bearing alternate, petiolate leaves with small, often deciduous stipules and corymbs of numerous small white flowers. The leaves are more or less deeply lobed with slightly serrate or almost entire margins; those of *C. laevigata* are pinnately lobed or pinnatifid with 3, 5 or 7 obtuse lobes, those of *C. monogyna* pinnatisect with 3 or 5 acute lobes; the adaxial surface is dark green or brownish-green, the abaxial surface is lighter greyish-green and shows a prominent, dense, reticulate venation. The leaves of *C. laevigata*, *C. monogyna* and *C. pentagyna* are glabrous or bear only isolated trichomes, those of *C. azarolus* and *C. nigra* are densely pubescent. The flowers have a brownish-green tubular calyx composed of 5 free, reflexed sepals, a corolla composed of 5 free, yellowish-white or brownish, rounded or broadly ovate and shortly unguiculate petals and numerous stamens. The ovary is fused to the calyx and consists of 1-5 carpels, each with a long style and containing a single ovule; in *C. monogyna* there is 1 carpel, in *C. laevigata* 2 or 3, in *C. azarolus* 2 or 3, or sometimes only 1, in *C. pentagyna* 5 or, rarely, 4.

B. Reduce to a powder (355) *(2.9.12)*. The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: unicellular covering trichomes, usually with a thick wall and wide lumen, almost straight or slightly curved, pitted at the base; fragments of leaf epidermis with cells which have sinuous or polygonal anticlinal walls and with large anomocytic stomata *(2.8.3)* surrounded by 4-7 subsidiary cells; parenchymatous cells of the mesophyll containing calcium oxalate clusters, usually measuring 10-20 µm, those associated with the veins containing groups of small prism crystals; fragments of petals showing rounded polygonal epidermal cells, strongly papillose, with thick walls, the cuticle of which clearly shows wavy striations; fragments of anthers showing endothecium with an arched and regularly thickened margin; fragments of stems containing collenchymatous cells, bordered pitted vessels and groups of lignified sclerenchymatous fibres with narrow lumina; numerous spherical to elliptical or triangular pollen grains up to 45 µm in diameter, with 3 germinal pores and a faintly granular exine.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 10 ml of *methanol R* and heat in a water-bath at 65 °C under a reflux condenser for 5 min. Cool and filter.

Reference solution Dissolve 1.0 mg of *chlorogenic acid R* and 2.5 mg of *hyperoside R* in 10 ml of *methanol R*.

Plate *TLC silica gel plate R*.

Mobile phase *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 *V/V/V/V*).

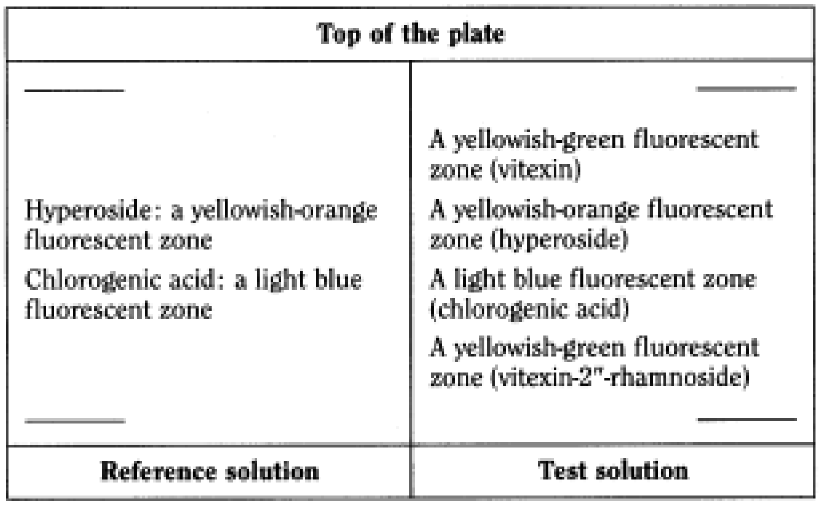
Application 20 µl, as bands.

Development Over a path of 15 cm.

Drying At 100-105 °C.

Detection Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*; allow to dry in air for about 30 min and examine in ultraviolet light at 365 nm.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A yellowish-green fluorescent zone (vitexin)
Hyperoside: a yellowish-orange fluorescent zone	A yellowish-orange fluorescent zone (hyperoside)
Chlorogenic acid: a light blue fluorescent zone	A light blue fluorescent zone (chlorogenic acid)
	A yellowish-green fluorescent zone (vitexin-2″-rhamnoside)

TESTS

Foreign matter *(2.8.2)*

Maximum 8 per cent of lignified branches with a diameter greater than 2.5 mm and maximum 2 per cent of other foreign matter.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash ***(2.4.16)***

Maximum 10.0 per cent.

ASSAY

Stock solution Into a 200 ml flask introduce 0.400 g of the powdered drug (250) *(2.9.12)* and 40 ml of *ethanol (60 per cent V/V) R*. Heat in a water-bath at 60 °C for 10 min, shaking frequently. Allow to cool and filter through a plug of absorbent cotton into a 100 ml volumetric flask. Transfer the absorbent cotton with the drug residue back into the 200 ml flask, add 40 ml of *ethanol (60 per cent V/V) R* and heat again in a water-bath at 60 °C for 10 min, shaking frequently. Allow to cool and filter into the same 100 ml volumetric flask. Rinse the 200 ml flask with a further quantity of *ethanol (60 per cent V/V) R*, filter and transfer to the same 100 ml volumetric flask. Dilute to 100.0 ml with *ethanol (60 per cent V/V) R* and filter.

Test solution Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the same 25 ml volumetric flask. Add 10.0 ml of a solution containing 25.0 g/l of *boric acid R* and 20.0 g/l of *oxalic acid R* in *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R.*

Compensation liquid Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the same 25 ml volumetric flask. Add 10.0 ml of *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

Measure the absorbance *(2.2.25)* of the test solution after 30 min at 410 nm, by comparison with the compensation liquid.

Calculate the percentage content of total flavonoids, expressed as hyperoside, using the following expression:

$$\frac{A \times 1.235}{m}$$

i.e. taking the value of the specific absorbance of hyperoside to be 405.

A = absorbance at 410 nm,

m = mass of the drug to be examined, in grams.

Ph Eur

Herbal Drug Preparations

General Notices

(Ph Eur monograph 1434)

Herbal Drug Preparations comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

DEFINITION

Herbal drug preparations are obtained by subjecting herbal drugs to treatments such as extraction, distillation, expression, fractionation, purification, concentration or fermentation. These include comminuted or powdered herbal drugs, tinctures, extracts, essential oils, expressed juices and processed exudates.

Herbal teas comply with the monograph on *Herbal teas (1435)* .

Instant herbal teas consist of powder or granules of one or more herbal drug preparation(s) intended for the preparation of an oral solution immediately before use.

Ph Eur

Herbal Drugs

General Notices

(Ph Eur monograph 1433)

Ph Eur

DEFINITION

Herbal drugs are mainly whole, fragmented, or cut plants, parts of plants, algae, fungi or lichen, in an unprocessed state, usually in dried form but sometimes fresh. Certain exudates that have not been subjected to a specific treatment are also considered to be herbal drugs. Herbal drugs are precisely defined by the botanical scientific name according to the binominal system (genus, species, variety and author).

PRODUCTION

Herbal drugs are obtained from cultivated or wild plants. Suitable collection, cultivation, harvesting, drying, fragmentation and storage conditions are essential to guarantee the quality of herbal drugs.

Herbal drugs are, as far as possible, free from impurities such as soil, dust, dirt and other contaminants such as fungal, insect and other animal contaminations. They are not rotten.

If a decontaminating treatment has been used, it is necessary to demonstrate that the constituents of the plant are not affected and that no harmful residues remain. The use of ethylene oxide is prohibited for the decontamination of herbal drugs.

IDENTIFICATION

Herbal drugs are identified using their macroscopic and microscopic descriptions and any further tests that may be required (for example, thin-layer chromatography).

TESTS

Foreign matter *(2.8.2)*

Carry out a test for foreign matter, unless otherwise prescribed or justified and authorised. The content of foreign matter is not more than 2 per cent *m/m*, unless otherwise prescribed or justified and authorised. A specific appropriate test may apply to herbal drugs liable to be adulterated.

Loss on drying *(2.2.32)*

Carry out a test for loss on drying, unless otherwise prescribed or justified and authorised.

Water *(2.2.13)*

A determination of water may be carried out instead of a test for loss on drying for herbal drugs with a high essential-oil content.

Pesticides ***(2.8.13)***

Herbal drugs comply with the requirements for pesticide residues. The requirements take into account the nature of the plant, where necessary the preparation in which the plant might be used, and where available the knowledge of the complete record of treatment of the batch of the plant.

Microbial contamination

Recommendations on the microbiological quality of herbal medicinal products consisting solely of one or more herbal drugs are given in the text *5.1.4*. *Microbiological quality of pharmaceutical preparations.*

Where necessary, herbal drugs comply with other tests, such as the following, for example.

Total ash ***(2.4.16)***

Ash insoluble in hydrochloric acid ***(2.8.1)***

Extractable matter

Swelling index ***(2.8.4)***

Bitterness value ***(2.8.15)***

Heavy metals

The risk of contamination of herbal drugs by heavy metals must be considered. If an individual monograph does not prescribe a test for heavy metals or specific elements, such a test or tests may be required if justified.

Aflatoxins ***(2.8.18)***

Where necessary, limits for aflatoxins may be required.

Radioactive contamination

In some specific circumstances, the risk of radioactive contamination is to be considered.

ASSAY

Unless otherwise prescribed or justified and authorised, herbal drugs are assayed by an appropriate method.

STORAGE

Protected from light.

Ph Eur

Herbal Teas

General Notices

(Ph Eur monograph 1435)

Herbal Teas comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

DEFINITION

Herbal teas consist exclusively of one or more herbal drugs intended for oral aqueous preparations by means of decoction, infusion or maceration. The preparation is prepared immediately before use.

Herbal teas are usually supplied in bulk form or in sachets.

The herbal drugs used comply with the appropriate individual European Pharmacopoeia monographs or in their absence to the general monograph on *Herbal drugs (1433)* .

Recommendations on the microbiological quality of herbal teas *(5.1.4. – Category 4)* take into account the prescribed preparation method (use of boiling or non-boiling water).

IDENTIFICATION

The identity of herbal drugs present in herbal teas is checked by botanical examinations.

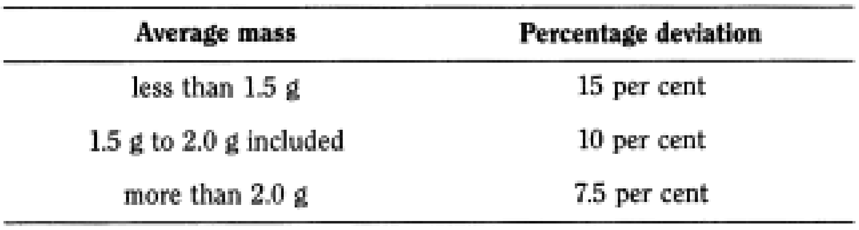
TESTS

The proportion of herbal drugs present in herbal teas is checked by appropriate methods.

Herbal teas in sachets comply with the following test:

Uniformity of mass

Determine the average mass of twenty randomly chosen units as follows: weigh a single full sachet of herbal tea, open it without losing any fragments. Empty it completely using a brush. Weigh the empty sachet and calculate the mass of the contents by subtraction. Repeat the operation on the nineteen remaining sachets. Unless otherwise justified not more than two of the twenty individual masses of the contents deviate from the average mass of the contents by more than the percentage deviation shown in the table below and none deviates by more than twice that percentage.



Average mass	Percentage deviation
less than 1.5 g	15 per cent
1.5 g to 2.0 g included	10 per cent
more than 2.0 g	7.5 per cent

STORAGE

Store protected from light.

Ph Eur

Hop Strobile

General Notices

(Ph Eur monograph 1222)

Ph Eur

DEFINITION

Dried, generally whole, female inflorescence of *Humulus lupulus* L.

CHARACTERS

Characteristic, aromatic odour.

IDENTIFICATION

A. Hop strobiles are generally isolated and 2-5 cm long, petiolate, ovoid, made up of many oval, greenish-yellow, sessile, membranous, overlapping bracts. The external bracts are flattened and symmetrical. The internal bracts are longer and asymmetrical at the base because of a fold generally encircling an induviate fruit (achene). The ovary or rarely the fruit, the base of the bracts and especially the induvial fold, are covered with small orange-yellow glands.

B. Reduce to a powder (355) (*2.9.12*). The powder is greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of bracts and bracteoles covered by polygonal, irregular epidermal cells with wavy walls; unicellular, conical, straight or curved covering trichomes with thin, smooth walls; rare anomocytic stomata (*2.8.3*); glandular trichomes, usually free, with bicellular biseriate stalks and heads consisting of 8 small cells; fragments of mesophyll containing small calcium oxalate cluster crystals; many characteristic orange-yellow glandular trichomes with short, bicellular biseriate stalks, bearing a part widening into a cup, 150-250 µm in diameter, made up of a hemispherical layer of secretory cells with a cuticle that has been detached and distended by the accumulation of oleoresinous secretions; fragments of elongated sclerenchymatous cells of the testa with thick walls showing striations and numerous pits.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 1.0 g of the freshly powdered drug (355) (*2.9.12*) add 10 ml of a mixture of 3 volumes of *water R* and 7 volumes of *methanol R*; shake for 15 min and filter.

Reference solution Dissolve 1.0 mg of *Sudan orange R*, 2.0 mg of *curcumin R* and 2.0 mg of *dimethylaminobenzaldehyde R* in 20 ml of *methanol R*.

Plate *TLC silica gel F_{254} plate R.*

Mobile phase *anhydrous acetic acid R*, *ethyl acetate R*, *cyclohexane R* (2:38:60 *V/V/V*).

Application 20 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

Results A The chromatogram obtained with the reference solution shows 3 quenching zones; in the lower quarter is the faint zone due to curcumin, somewhat below the middle is the zone due to dimethylaminobenzaldehyde and above the zone due to Sudan orange. The chromatogram obtained with the test solution shows a number of quenching zones similar in position to the zones in the chromatogram obtained with the reference solution: at about the level of the zone due to curcumin is a faint zone due to xanthohumol, near the level of the zone due to dimethylaminobenzaldehyde are zones due to humulones, and near the level of the zone due to Sudan orange are zones due to lupulones.

Detection B Examine in ultraviolet light at 365 nm.

Results B In the chromatogram obtained with the test solution the zones due to lupulones show blue fluorescence, the zones due to humulones show brown fluorescence and the zone due to xanthohumol shows dark brown fluorescence.

Detection C Spray with *dilute phosphomolybdotungstic reagent R*; expose to ammonia vapour and examine in daylight.

Results C In the chromatogram obtained with the test solution, the zones due to humulones and to lupulones are bluish-grey and the zone due to xanthohumol is greenish-grey. In the chromatogram obtained with the reference solution, the zones are bluish-grey or brownish-grey.

Figure 1222.-1. – *Illustration of powdered herbal drug of hop strobile (see Identification B)*

TESTS

Matter extractable by ethanol (70 per cent *V/V*)

Minimum 25.0 per cent.

To 10.0 g of the powdered drug (355) (*2.9.12*) add 300 ml of *ethanol (70 per cent V/V) R* and heat for 10 min on a water bath under a reflux condenser. Allow to cool, filter and discard the first 10 ml of the filtrate. Evaporate 30.0 ml of the filtrate to dryness on a water-bath and dry in an oven at 100-105 °C for 2 h. The residue weighs a minimum of 0.250 g.

Loss on drying (*2.2.32*)

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 12.0 per cent.

Ph Eur

Horsetail

General Notices

(Equisetum Stem, Ph Eur monograph 1825)

Ph Eur

DEFINITION

Whole or cut, dried sterile aerial parts of *Equisetum arvense* L.

Content

Minimum 0.3 per cent of total flavonoids expressed as isoquercitroside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried drug).

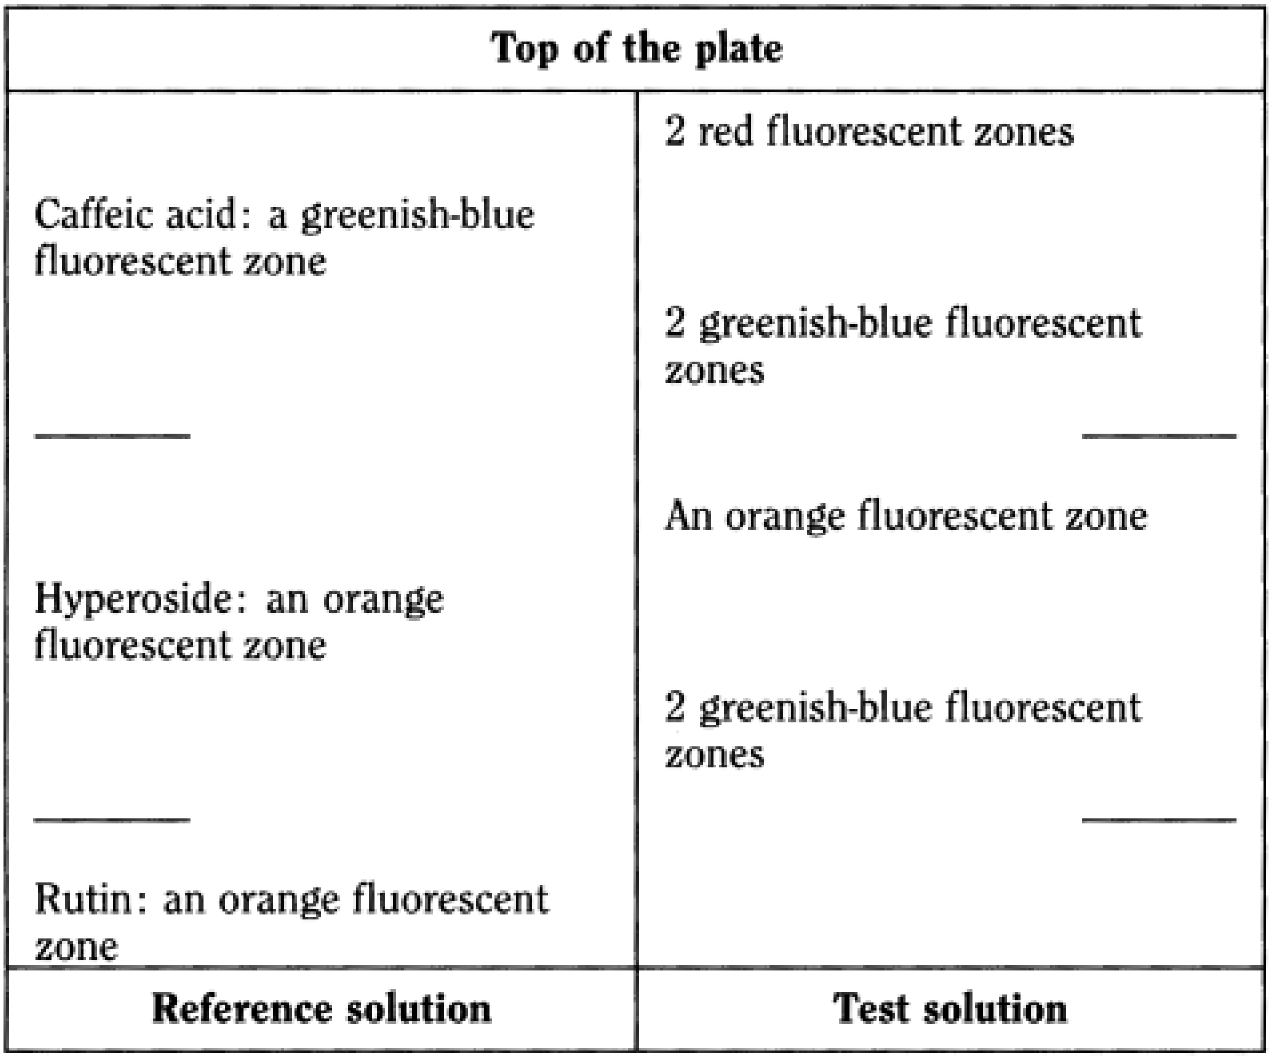
IDENTIFICATION

A. It consists of fragments of grooved stems and linear leaves, light green to greenish-grey. They are rough to the touch, brittle and crunchy when crushed. The main stems are about 0.8 mm to 4.5 mm in diameter, hollow, jointed at the nodes which occur at intervals of about 1.5 cm to 4.5 cm; distinct vertical grooves are present on the internodes, ranging in number from 4 to 14 or more. Verticils of widely spaced and erect branches, usually simple, each about 1 mm thick with 2 to 4 longitudinal grooves, occur at the nodes. The leaves are small, linear, verticillate at each node, concrescent at the base, they form a toothed sheath around the stem; with the number of teeth corresponding to the number of grooves on the stem. Each tooth, often brown, is lanceolate-triangular. The lowest internode of each branch is longer than the sheath of the stem it belongs to.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greenish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the epidermis in surface view, composed of rectangular cells with wavy walls and paracytic stomata *(2.8.3)* with the 2 subsidiary cells covering the guard cells and having conspicuous radial ridges; in transverse sectional view the epidermis is crenate, with the protuberances formed from the contiguous walls of 2 adjacent, U-shaped cells. Fragments of large-celled parenchyma and groups of long, non-lignified fibres with narrow lumens; scattered small, lignified vessels with spiral or annular thickening.

C. Examine the chromatograms obtained in the test for other *Equisetum* species and hybrids.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	2 red fluorescent zones
Caffeic acid: a greenish-blue fluorescent zone	
	2 greenish-blue fluorescent zones
———	———
	An orange fluorescent zone
Hyperoside: an orange fluorescent zone	
	2 greenish-blue fluorescent zones
———	———
Rutin: an orange fluorescent zone	
Reference solution	**Test solution**

TESTS

Foreign matter *(2.8.2)*

Maximum 5 per cent of stems from other *Equisetum* species and hybrids and maximum 2 per cent of other foreign matter.

Other *Equisetum* species and hybrids

Thin-layer chromatography *(2.2.27)*.

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 10 ml of *methanol R*. Heat in a water-bath at 60 °C for 10 min with occasional shaking. Allow to cool. Filter.

Reference solution Dissolve 1.0 mg of *caffeic acid R*, 2.5 mg of *hyperoside R* and 2.5 mg of *rutin R* in 10 ml of *methanol R*.

Plate TLC silica gel plate R.

Mobile phase anhydrous formic acid R, *glacial acetic acid R*, *water R*, *ethyl acetate R* (7.5:7.5:18:67 *V/V/V/V*).

Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying At 100-105 °C.

Detection Spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Then spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for 30 min. Examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the test solution shows no yellow or greenish-yellow fluorescent zone shortly above the starting line.

Loss on drying *(2.2.32)*

Maximum 10 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Ash insoluble in hydrochloric acid *(2.8.1)*

Minimum 3.0 per cent and maximum 15.0 per cent.

Total ash *(2.4.16)*

Minimum 12.0 per cent and maximum 27.0 per cent.

ASSAY

Stock solution In a 100 ml round-bottomed flask, introduce 0.800 g of the powdered drug (355) *(2.9.12)*, add 1 ml of a 5 g/l solution of *hexamethylenetetramine R*, 20 ml of *acetone R* and 2 ml of *hydrochloric acid R1*. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a plug of absorbent cotton into a flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 ml, of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool and filter each extract through a plug of absorbent cotton into the flask. After cooling, filter the combined acetone extracts through a filter paper into a volumetric flask and dilute to 100.0 ml with *acetone R* by rinsing the flask and the filter paper. Introduce 20.0 ml of the solution into a separating funnel, add 20 ml of *water R* and shake the mixture with 1 quantity of 15 ml and then 3 quantities, each of 10 ml, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, wash with 2 quantities, each of 50 ml, of *water R*, and filter the extracts over 10 g of *anhydrous sodium sulphate R* into a volumetric flask. Dilute to 50.0 ml with *ethyl acetate R*.

Test solution To 10.0 ml of the stock solution add 1 ml of *aluminium chloride reagent R* and dilute to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Compensation solution Dilute 10.0 ml of the stock solution to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Measure the absorbance *(2.2.25)* of the test solution after 30 min, by comparison with the compensation solution at 425 nm. Calculate the percentage content of flavonoids, calculated as isoquercitroside, from the expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of isoquercitroside to be 500,

A = absorbance at 425 nm,

m = mass of the substance to be examined, in grams.

Ph Eur

Iceland Moss

General Notices

(Ph Eur monograph 1439)

Ph Eur

DEFINITION

Whole or cut, dried thallus of *Cetraria islandica* (L.) Acharius s.l.

IDENTIFICATION

A. The thallus, up to 15 cm long, is irregularly dichotomous and consists of glabrous, groove-shaped or almost flat, stiff, brittle bands, 0.3-1.5 cm wide and about 0.5 mm thick, sometimes serrated with the margin appearing ciliated (pycnidia). The upper surface is greenish or greenish-brown, the lower surface is greyish-white or light brownish and shows whitish, depressed spots (so-called respiratory cavities). On the apices of the terminal lobes, very rarely, there are brown, discoid apothecia.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greyish-brown. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: numerous fragments of the pseudoparenchyma consisting of narrow-lumened, thick-walled hyphae from the marginal layer and wide-lumened hyphae from the adjacent layer consisting of loosely entwined hyphae, in which, in the medullary zone, greenish or brownish algae cells up to 15 µm in diameter, are embedded; occasionally marginal fragments of the thallus with tube-like or cylindrical spermogonia, up to about 160 µm wide and up to about 400 µm long.

C. To 1.0 g of the powdered drug (355) *(2.9.12)* add 10 ml of *water R* and boil for 2-3 min. The greyish-brown solution forms a gel after cooling which gives a blue colour with *iodine solution R.*

D. Thin-layer chromatography *(2.2.27)*.

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 5 ml of *acetone R* and heat in a water-bath under a reflux condenser for 2-3 min. Cool and filter.

Reference solution Dissolve 5 mg of *anethole R* and 5 mg of *caffeic acid R* in 2 ml of *acetone R.*

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *acetone R*, *methanol R*, *anhydrous formic acid R*, *toluene R* (5:5:10:80 *V/V/V/V*).

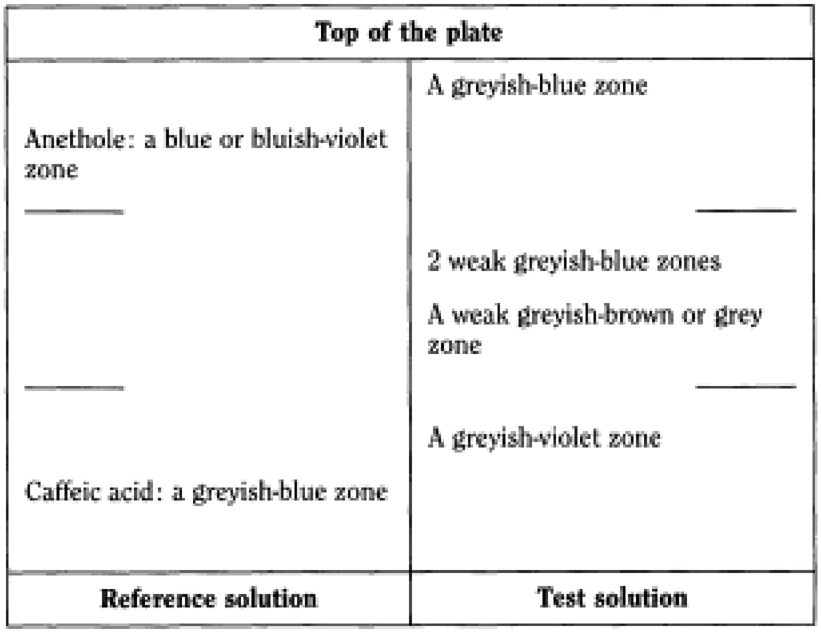
Application 20 µl [or 4 µl] of the test solution and 10 µl [or 2 µl] of the reference solution, as bands.

Development Over a path of 10 cm [or 6 cm].

Drying In air.

Detection Spray with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min and examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A greyish-blue zone
Anethole: a blue or bluish-violet zone	
———	———
	2 weak greyish-blue zones
	A weak greyish-brown or grey zone
———	———
	A greyish-violet zone
Caffeic acid: a greyish-blue zone	
Reference solution	**Test solution**

TESTS

Foreign matter *(2.8.2)*

Maximum 5 per cent.

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 3.0 per cent.

Swelling value *(2.8.4)*

Minimum 4.5, determined on the powdered drug (355) *(2.9.12)*.

Ph Eur

Indian Frankincense

General Notices

(Ph Eur monograph 2310)

Ph Eur

DEFINITION

Air-dried gum-resin exudate, obtained by incision in the stem or branches of *Boswellia serrata* Roxb. ex Colebr.

Content

- *11-keto-β-boswellic acid* ($C_{30}H_{46}O_4$; M_r 470.7): minimum 1.0 per cent (dried drug);
- *acetyl-11-keto-β-boswellic acid* ($C_{32}H_{48}O_5$; M_r 512.7): minimum 1.0 per cent (dried drug).

IDENTIFICATION

A. Indian frankincense consists of translucent, roundish or irregularly shaped, variable size pieces of up to 3 cm. They are yellowish or reddish-brown. Their surface is covered with grey dust. The fracture is dull or slightly glossy.

B. Thin-layer chromatography *(2.2.27)*.

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 90 ml of *methanol R* and sonicate for 10 min. Shake the mixture vigorously 3 or 4 times during this procedure. Dilute to 100 ml with *methanol R*. Centrifuge and use the clear supernatant solution.

Reference solution Dissolve 2 mg of *11-keto-β-boswellic acid R* and 2 mg of *acetyl-11-keto-β-boswellic acid R* in 20 ml of *methanol R*.

Plate *TLC silica gel F_{254} plate R* (5-40 µm) [or *TLC silica gel F_{254} plate R* (2-10 µm)].

Mobile phase *anhydrous formic acid R*, *heptane R*, *ethyl acetate R*, *toluene R* (3:10:20:80 *V/V/V/V*).

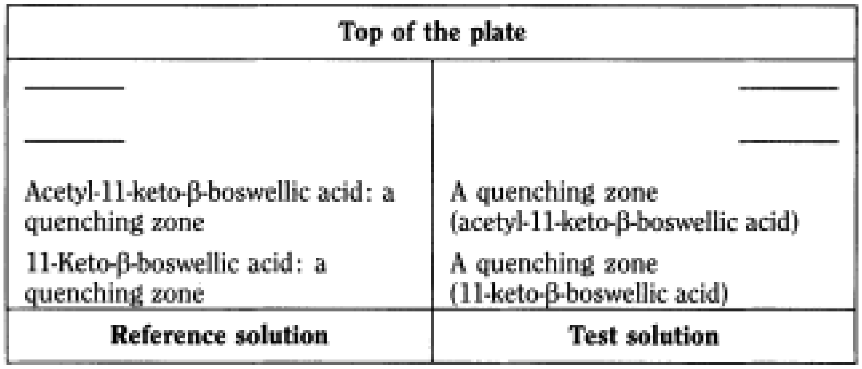
Application 10 µl [or 3 µl] as bands.

Development Over a path of 8 cm [or 5 cm].

Drying In air.

Detection Examine in ultraviolet light at 254 nm.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. The zones due to 11-keto-β-boswellic acid and acetyl-11-keto-β-boswellic acid in the test solution are of approximately equivalent intensity. Furthermore, other weak quenching zones may be present in the chromatogram obtained with the test solution.



Top of the plate

TESTS

Loss on drying *(2.2.32)*

Maximum 8.0 per cent, determined on 1.000 g of powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 3 h.

Total ash *(2.4.16)*

Maximum 10.0 per cent.

ASSAY

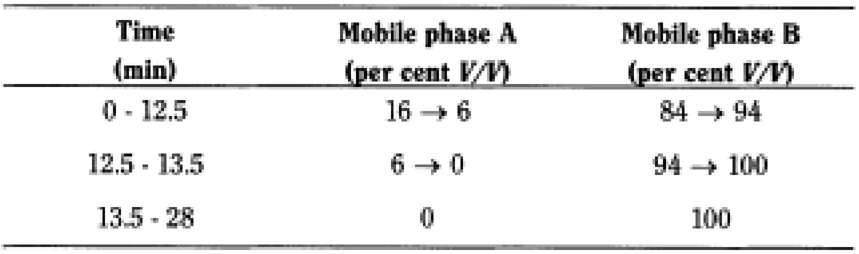
Liquid chromatography *(2.2.29)*.

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 90 ml of *methanol R* and sonicate for 10 min. Shake the mixture vigorously 3 or 4 times during this procedure. Dilute to 100.0 ml with *methanol R*. Centrifuge for 5 min. Dilute 1.0 ml of the clear solution to 10.0 ml with a mixture of 16 volumes of mobile phase A and 84 volumes of mobile phase B.

Reference solution Dissolve 1.0 mg of *11-keto-β-boswellic acid R* and 1.0 mg of *acetyl-11-keto-β-boswellic acid R* in 20.0 ml of *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with mobile phase A.

Column:
- *size: l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:
- *mobile phase A*: *phosphoric acid R*, *water R* (0.1:99.9 *V/V*);
- *phase mobile B*: *phosphoric acid R*, *acetonitrile R* (0.1:99.9 *V/V*);



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 12.5	16 → 6	84 → 94
12.5 - 13.5	6 → 0	94 → 100
13.5 - 28	0	100

Flow rate 1.0 ml/min.

Detection Spectrophotometer at 250 nm.

Injection 20 µl.

Retention time 11-keto-β-boswellic acid = about 8 min; acetyl-11-keto-β-boswellic acid = about 12 min.

System suitability Reference solution:

— *resolution*: minimum 6.0 between the peaks due to 11-keto-β-boswellic acid and acetyl-11-keto-β-boswellic acid.

Calculate the percentage content of 11-keto-β-boswellic acid using the following expression:

$$\frac{A_1 \times m_1 \times 5 \times p_1}{A_2 \times m}$$

A_1 = area of the peak due to 11-keto-β-boswellic acid in the chromatogram obtained with the test solution,

A_2 = = area of the peak due to 11-keto-β-boswellic acid in the chromatogram obtained with the reference solution,

m = mass of the substance to be examined, in grams,

m_1 = mass of *11-keto-β-boswellic acid R* in the reference solution, in grams,

p_1 = percentage content of 11-keto-β-boswellic acid in *11-keto-β-boswellic acid R*.

Calculate the percentage content of acetyl-11-keto-β-boswellic acid using the following expression:

$$\frac{A_3 \times m_2 \times 5 \times p_2}{A_4 \times m}$$

A_3 = area of the peak due to acetyl-11-keto-β-boswellic acid in the chromatogram obtained with the test solution,

A_4 = area of the peak due to acetyl-11-keto-β-boswellic acid in the chromatogram obtained with the reference solution

m = mass of the substance to be examined, in grams

m_2 = mass of *acetyl-11-keto-β-boswellic acid R* in the reference solution, in grams

p_2 = percentage content of acetyl-11-keto-β-boswellic acid in *acetyl-11-keto-β-boswellic acid R.*

Indian Squill

General Notices

Preparation

Squill Oxymel

When Powdered Indian Squill is prescribed or demanded, material complying with the appropriate requirements below shall be dispensed or supplied.

DEFINITION

Indian Squill consists of the bulb of *Drimia indica* (Roxb.) J P Jessop, collected soon after the plant has flowered, divested of dry, outer membranous coats and usually cut longitudinally into slices and dried.

CHARACTERISTICS

Odourless or almost odourless.

Macroscopical

Curved or irregularly shaped strips, about 10 to 50 mm long, 3 to 10 mm wide and 1 to 3 mm thick, frequently tapering towards the ends, occasionally grouped three or four together and attached to a portion of the axis; ridged in the direction of their length and varying in colour from pale yellowish brown to buff; brittle when dry, but tough and flexible when exposed to air.

Microscopical

Epidermis: cells tetrahedral to hexahedral, thin-walled, three to five times longer than wide, having a thick, striated cuticle; stomata rare, *anomocytic*, Appendix XI H, circular in outline, 40 to 42 µm in diameter; mesophyll of thin-walled polygonal cells containing mucilage, some cells also containing bundles of acicular crystals of calcium oxalate, 20 to 900 µm in length; vascular bundles collateral, scattered throughout the mesophyll; xylem vessels with spiral and annular wall thickening; trichomes and starch absent.

IDENTIFICATION

The mucilage contained in the cells of the mesophyll is stained red with *alkaline corallin solution* and reddish purple with 0.01M *iodine*.

TESTS

Ash

Not more than 6.0%, Appendix XI J.

STORAGE

Indian Squill should be stored in a dry place.

Ipecacuanha Liquid Extract

General Notices

DEFINITION

Ipecacuanha Liquid Extract is prepared from Ipecacuanha by a method stated under the general monograph for Extracts. It contains not less than 1.90% and not more than 2.10% of total alkaloids, calculated as emetine, $C_{29}H_{40}N_2O_4$.

EXTEMPORANEOUS PREPARATION

Prepare by extracting Ipecacuanha with Ethanol (80 per cent) according to the following formula and directions.

Ipecacuanha in *fine powder*	1000 g
Ethanol (80 per cent)	A sufficient quantity

Exhaust the Ipecacuanha by *percolation*, Appendix XI F, with Ethanol (80 per cent), reserving the first 750 ml of the percolate. Remove the ethanol from the remainder of the percolate by evaporation under reduced pressure at a temperature not exceeding 60° and dissolve the residual extract in the reserved portion. Determine the proportion of alkaloids in the liquid thus obtained by the Assay described below. To the remainder of the liquid add sufficient Ethanol (80%) to produce an Ipecacuanha Liquid Extract containing 2% w/v of total alkaloids calculated as emetine. Allow to stand for not less than 24 hours; filter.

The extract complies with the requirements stated under Extracts and with the following requirements.

TESTS

Ethanol content

63 to 69% v/v, Appendix VIII F, Method III.

Relative density

0.910 to 0.960, Appendix V G.

Dry residue

The requirement for Dry residue does not apply to Ipecacuanha Liquid Extract.

ASSAY

To 5 ml in a separating funnel add 20 ml of *water*, 5 ml of 1M *sulphuric acid* and 10 ml of *chloroform* and shake well. Transfer the chloroform extract to a second separating funnel containing a mixture of 4 ml of *ethanol (96%)* and 20 ml of 0.05M *sulphuric acid*, shake, allow to separate and discard the chloroform layer. Continue the extraction of the liquid in the first separating funnel with two further 10 ml quantities of *chloroform*, transferring the chloroform solution each time to the second separating funnel and washing as before. Transfer the acidic liquid from the second separating funnel to the first separating funnel, make distinctly alkaline with 5M *ammonia* and shake with successive quantities of *chloroform* until *complete extraction* of the alkaloids is effected, Appendix XI G, washing each chloroform solution with the same 10 ml of *water* contained in a third separating funnel. Remove the chloroform, add to the residue 2 ml of *ethanol (96%)*, evaporate to dryness and dry for 5 minutes at 80° in a current of air. Dissolve the residue in 2 ml of *ethanol (96%)*, previously neutralised to *methyl red solution*, add 10 ml of 0.05M *sulphuric acid VS* and titrate with 0.1M *sodium hydroxide VS* using *methyl red mixed solution* as indicator. Each ml of 0.05M *sulphuric acid VS* is equivalent to 24.03 mg of total alkaloids, calculated as emetine, $C_{29}H_{40}N_2O_4$.

Ipecacuanha

General Notices

(Ipecacuanha Root, Ph Eur monograph 0094)

Preparations

Prepared Ipecacuanha

Ipecacuanha Liquid Extract

Ph Eur

DEFINITION

Fragmented and dried underground organs of *Cephaelis ipecacuanha* (Brot.) A. Rich., known as Matto Grosso ipecacuanha, or of *Cephaelis acuminata* Karsten, known as Costa Rica ipecacuanha, or of a mixture of both species. The principal alkaloids are emetine and cephaeline.

Content

Minimum 2.0 per cent of total alkaloids, expressed as emetine ($C_{29}H_{40}N_2O_4$; M_r 480.7) (dried drug).

CHARACTERS

Slight odour.

IDENTIFICATION

A. *C. ipecacuanha*. The root occurs as somewhat tortuous pieces, dark reddish-brown or very dark brown, seldom more than 15 cm long or 6 mm thick, closely annulated externally, having rounded ridges completely encircling the root; the fracture is short in the bark and splintery in the wood. The transversely cut surface shows a wide greyish bark and a small uniformly dense wood. The rhizome occurs as short lengths usually attached to roots, cylindrical, up to 2 mm in diameter, finely wrinkled longitudinally and with pith occupying approximately one-sixth of the whole diameter.

C. acuminata. The root in general resembles the root of *C. ipecacuanha*, but differs in the following particulars: it is often up to 9 mm thick; the external surface is greyish-brown or reddish-brown with transverse ridges at intervals of usually 1-3 mm, the ridges being about 0.5-1 mm wide, extending about half-way round the circumference and fading at the extremities into the general surface level.

B. Reduce to a powder (355) *(2.9.12)*. The powder is light grey or yellowish-brown. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: parenchymatous cells, raphides of calcium oxalate up to 80 µm in length either in bundles or scattered throughout the powder; fragments of tracheids and vessels usually 10-20 µm in diameter, with bordered pits; larger vessels and sclereids from the rhizome. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows simple or two- to eight-compound starch granules contained in parenchymatous cells, the simple granules being up to 15 µm in diameter in *C. ipecacuanha* and up to 22 µm in diameter in *C. acuminata*.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 0.1 g of the powdered drug (180) *(2.9.12)* in a test-tube add 0.05 ml of *concentrated ammonia R* and 5 ml of *ether R* and stir the mixture vigorously with a glass rod. Allow to stand for 30 min and filter.

Reference solution Dissolve 2.5 mg of *emetine hydrochloride CRS* and 3 mg of *cephaeline hydrochloride CRS* in *methanol R* and dilute to 20 ml with the same solvent.

Plate *TLC silica gel plate R*.

Mobile phase *concentrated ammonia R, methanol R, ethyl acetate R, toluene R* (2:15:18:65 *V/V/V/V*).

Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection A Spray with a 5 g/l solution of *iodine R* in *ethanol (96 per cent) R* and heat at 60 °C for 10 min. Examine in daylight.

Results A The chromatograms obtained with the test solution and with the reference solution show in the lower part a yellow zone due to emetine and below a light brown zone due to cephaeline.

Detection B Examine in ultraviolet light at 365 nm.

Results B The zone due to emetine shows an intense yellow fluorescence and that due to cephaeline a light blue fluorescence. The chromatogram obtained with the test solution shows also faint fluorescent zones.

With *C acuminata* the principal zones in the chromatogram obtained with the test solution are similar in position, fluorescence and size to the zones in the chromatogram obtained with the reference solution.

With *C ipecacuanha* the only difference is that the zone due to cephaeline in the chromatogram obtained with the test solution is much smaller than the corresponding zone in the chromatogram obtained with the reference solution.

TESTS

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of powdered drug (180) *(2.9.12)* by drying in an oven at 105 °C.

Total ash *(2.4.16)*

Maximum 5.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 3.0 per cent.

ASSAY

To 7.5 g of the powdered drug (180) *(2.9.12)* in a dry flask, add 100 ml of *ether R* and shake for 5 min. Add 5 ml of *dilute ammonia R1*, shake for 1 h. Add 5 ml of *water R* and shake vigorously. Decant the ether layer into a flask through a plug of cotton. Wash the residue in the flask with 2 quantities, each of 25 ml, of *ether R*, decanting each portion through the same plug of cotton. Combine the ether solutions and eliminate the ether by distillation. Dissolve the residue in 2 ml of *ethanol (90 per cent V/V) R*, evaporate to dryness and heat at 100 °C for 5 min. Dissolve the residue in 5 ml of previously neutralised *ethanol (90 per cent V/V) R*, warming on a water-bath. Add 15.0 ml of *0.1 M hydrochloric acid* and titrate the excess acid with *0.1 M sodium hydroxide* using 0.5 ml of *methyl red mixed solution R* as indicator.

1 ml of *0.1 M hydrochloric acid* is equivalent to 24.03 mg of total alkaloids, expressed as emetine.

STORAGE

Protected from moisture.

Ph Eur

Ispaghula Husk

General Notices

(Ph Eur monograph 1334)

Preparations

Ispaghula Husk Oral Powder

Ispaghula Husk Granules

Ispaghula Husk Effervescent Granules

Ph Eur

DEFINITION

Episperm and collapsed adjacent layers removed from the seeds of *Plantago ovata* Forssk. (*P. ispaghula* Roxb.).

IDENTIFICATION

A. The husk consists of pinkish-beige fragments or flakes up to about 2 mm long and 1 mm wide, some showing a light brown spot corresponding to the location of the embryo before it was removed from the seed.

B. Reduce to a powder (355) *(2.9.12)*. The powder is pale yellow. Examine under a microscope using *lactic reagent R*. The powder shows the following diagnostic characters: mainly fragments of the episperm with polygonal cells filled with mucilage; fragments of the inner layers of the testa with brownish thin-walled cells often associated with the outer layers of the endosperm. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows occasional starch granules, single or in groups of 2-4, measuring 3-25 µm in diameter.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 10 mg of the powdered drug (355) *(2.9.12)* in a thick-walled centrifuge tube, add 2 ml of a 230 g/l solution of *trifluoroacetic acid R* and shake vigorously. Stopper the test tube and heat at 120 °C for 1 h. Centrifuge the hydrolysate, transfer the clear supernatant liquid into a 50 ml flask, add 10 ml of *water R* and evaporate to dryness under reduced pressure. Take up the residue in 10 ml of *water R* and evaporate again to dryness under reduced pressure. Take up the residue with 2 ml of *methanol R*.

Reference solution (a) Dissolve 10 mg of *arabinose R* in a small quantity of *water R* and dilute to 10 ml with *methanol R*.

Reference solution (b) Dissolve 10 mg of *xylose R* in a small quantity of *water R* and dilute to 10 ml with *methanol R.*

Reference solution (c) Dissolve 10 mg of *galactose R* in a small quantity of *water R* and dilute to 10 ml with *methanol R*.

Plate *TLC silica gel plate R*.

Mobile phase *water R, acetonitrile R* (15:85 *V/V*).

Application 10 µl, as bands.

Development Over a path of 15 cm.

Detection Spray with *aminohippuric acid reagent R* and heat at 120 °C for 5 min; examine in daylight.

Results The chromatogram obtained with the test solution shows 2 orange-pink zones (arabinose and xylose) and a yellow zone (galactose) similar in position and colour to the zones in the chromatograms obtained with the reference solutions.

TESTS

Foreign matter *(2.8.2)*

Carry out the determination using 5.0 g.

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 4.0 per cent.

Swelling index (*2.8.4)*

Minimum 40, determined on 0.1 g of the powdered drug (355) *(2.9.12)*.

Ph Eur

Ispaghula Seed

General Notices

(Ph Eur monograph 1333)

Ph Eur

DEFINITION

Dried ripe seeds of *Plantago ovata* Forssk. (*P. ispaghula* Roxb.).

IDENTIFICATION

A. Ispaghula seed is pinkish-beige, smooth, boat-shaped and curved. It is 1.5 mm to 3.5 mm long, 1.5 mm to 2 mm wide and 1 mm to 1.5 mm thick. The concave surface shows in the centre a light coloured spot corresponding to the hilum. The convex surface shows a light brown spot corresponding to the location of the embryo and takes up about one quarter of the length of the seed.

B. Reduce to a powder (355) *(2.9.12)*. The powder is pale brown. Examine under a microscope using *lactic reagent R*. The powder shows mainly fragments of the episperm with polygonal cells filled with mucilage; fragments of the inner layers of the testa with brownish thin-walled cells often associated with the outer layers of the endosperm; fragments of the endosperm with cells with thick cellulose walls containing aleurone grains and oil droplets; a few fragments of embryo with thin-walled cells. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows starch granules, single or in groups of 2 to 4 and measuring 3 µm to 25 µm in diameter.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 50 mg of the powdered drug (355) *(2.9.12)* in a thick-walled centrifuge tube add 2 ml of a 230 g/l solution of *trifluoroacetic acid R,* and shake vigorously. Stopper the test tube and heat the mixture at 120 °C for 1 h. Centrifuge the hydrolysate, transfer the clear supernatant liquid into a 50 ml flask, add 10 ml of *water R* and evaporate the solution to dryness under reduced pressure. Take up the residue in 10 ml of *water R* and evaporate again to dryness under reduced pressure. Take up the residue in 2 ml of *methanol R*.

Reference solution (a) Dissolve 10 mg of *arabinose R* in a small quantity of *water R* and dilute to 10 ml with *methanol R*.

Reference solution (b) Dissolve 10 mg of *xylose R* in a small quantity of *water R* and dilute to 10 ml with *methanol R*.

Reference solution (c) Dissolve 10 mg of *galactose R* in a small quantity of *water R* and dilute to 10 ml with *methanol R.*

Ph Eur

Ivy Leaf

General Notices

(Ph Eur monograph 2148)

Ph Eur

DEFINITION

Whole or cut, dried leaves of *Hedera helix L*., collected in spring.

Content

Minimum 3.0 per cent of hederacoside C ($C_{59}H_{96}O_{26}$; M_r 1221) (dried drug).

IDENTIFICATION

A. Whole leaves are coriaceous, 4-10 cm in length and width, cordate at the base. The lamina is palmately 3-5 lobed, the lobes more or less triangular with entire margins. The upper surface is dark green with a paler, radiate venation, the lower surface more greyish-green and the venation is distinctly raised. The petioles are long, cylindrical, about 2 mm in diameter and grooved longitudinally. Scattered white hairs occur on the petioles and on the surfaces of younger leaves, the older leaves are glabrous. Occasional entire, ovate-rhombic to lanceolate leaves 3-8 cm long from the flowering stems may be present.

B. Reduce to a powder (355) *(2.9.12)*. The powder is green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the lamina in surface view showing the cells of both the upper and lower epidermises with thickened, sinuous to wavy anticlinal walls and a thick cuticle; numerous stomata occur in the lower epidermis only, they are mostly anomocytic but occasionally anisocytic *(2.8.3)* and some of the surrounding cells may show faint cuticular striations; scattered stellate covering trichomes may be present, composed of 4-8 unicellular branches joined at the base; fragments in sectional view show 1-3 (usually 2) layers of palisade cells and a very porous spongy mesophyll containing occasional large mucilage cells; cluster crystals of calcium oxalate, about 40 µm in diameter, occur throughout the mesophyll; groups of lignified fibro-vascular tissue from the veins.

C. Thin-layer chromatography *(2.2.27)*.

Test solution Extract 0.50 g of the powdered drug (355) *(2.9.12)* under a reflux condenser in a water bath at 60 °C with 5 ml of *methanol R* for 30 min. Cool and filter.

Reference solution Dissolve 1.0 mg of *hederacoside C R* and 1.0 mg of α-*hederin R* in 1.0 ml of *methanol R*.

Plate *TLC silica gel plate R.*

Mobile phase *anhydrous formic acid R, methanol R, acetone R, ethyl acetate R* (4:20:20:30 *V/V/V/V*).

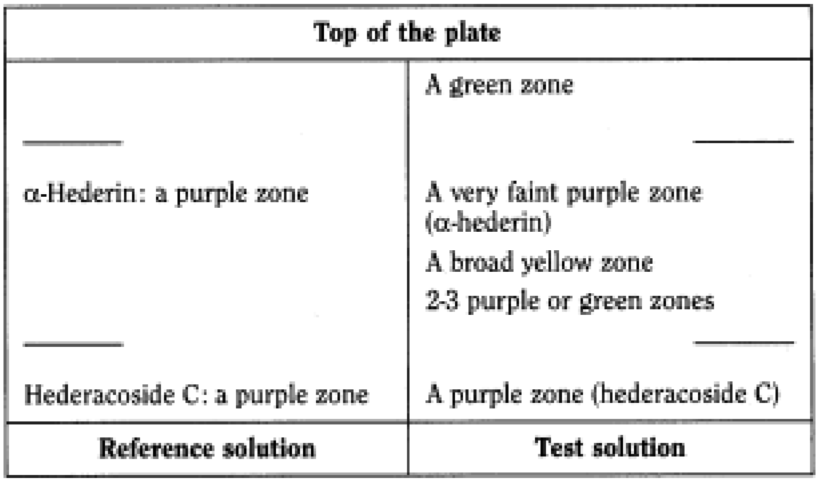
Application 20 µl, as bands of 15 mm.

Development Over a path of 12 cm.

Drying At 100-105 °C.

Detection Spray with *alcoholic solution of sulphuric acid R*. Heat at 110 °C for 10 min. Examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A green zone
———	———
α-Hederin: a purple zone	A very faint purple zone (α-hederin)
	A broad yellow zone
	2-3 purple or green zones

Reference solution	**Test solution**

TESTS

Foreign matter *(2.8.2)*

Maximum 10 per cent of discoloured matter, maximum 10 per cent of stems, and maximum 2 per cent other foreign matter.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 10.0 per cent.

ASSAY

Liquid chromatography *(2.2.29)*.

Test solution To 1.00 g of the powdered drug (355) *(2.9.12)* in a 250 ml round bottomed flask add 50 ml of a mixture of 20 volumes of *water R* and 80 volumes of *methanol R*. Heat under a reflux condenser in a water-bath at 80 °C for 1 h. Cool and filter through cotton into a 100 ml volumetric flask. The cotton together with the residue is again extracted with 30 ml of a mixture of 20 volumes of *water R* and 80 volumes of *methanol R* under reflux for 30 min. Filter and combine the filtrates. Rinse the round bottomed flask and the cotton with a mixture of 20 volumes of *water R* and 80 volumes of *methanol R* and use this mixture of solvents to dilute the contents of the volumetric flask to exactly 100.0 ml. Filter through a suitable membrane before use.

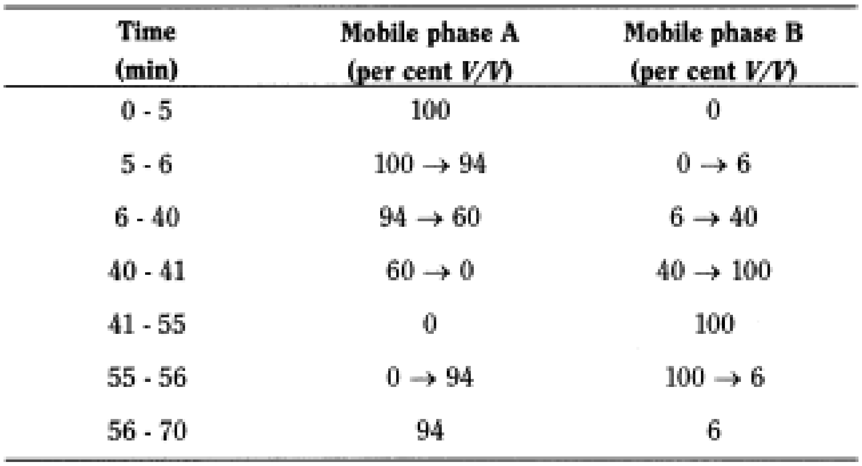
Reference solution Dissolve an amount of *ivy leaf standardised tincture CRS* corresponding to 3.0 mg of hederacoside C in *methanol R* and dilute to 5.0 ml with the same solvent.

Column:
— *size*: *l* = 0.125 m, Ø = 4 mm;

— *stationary phase: suitable octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:
— *mobile phase A*: mix 140 volumes of *acetonitrile R* and 880 volumes of *water R* and adjust to pH 2.0 with *phosphoric acid R*;

— *mobile phase B*: *phosphoric acid R, acetonitrile R* (2:998 *V/V*);



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 5	100	0
5 - 6	100 → 94	0 → 6
6 - 40	94 → 60	6 → 40
40 - 41	60 → 0	40 → 100
41 - 55	0	100
55 - 56	0 → 94	100 → 6
56 - 70	94	6

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 205 nm.

Injection 20 µl.

System suitability Reference solution:

— *retention time*: hederacoside C = about 20 min.

If necessary, adjust the time intervals of the gradient.

Calculate the percentage content of hederacoside C with reference to the dried drug using the following expression:

$$\frac{F_1 \times m_2 \times 400}{F_2 \times m_1 \times (100 - d)}$$

F_1 = area of the peak due to hederacoside C in the chromatogram obtained with the test solution

F_2 = area of the peak due to hederacoside C in the chromatogram obtained with the reference solution

d = loss on drying, in per cent;

m_1 = mass of drug, in grams

m_2 = mass of hederacoside C in the reference solution, in grams

Java Tea

General Notices

(Ph Eur monograph 1229)

Ph Eur

DEFINITION

Fragmented, dried leaves and tops of stems of *Orthosiphon stamineus* Benth. (*O. aristatus* Miq.; *O. spicatus* Bak.).

Content

Minimum 0.05 per cent of sinensetin ($C_{20}H_{20}O_7$; M_r 372.4) (dried drug).

IDENTIFICATION

A. The leaves are friable, up to 7.5 cm in length and 2.5 cm in width. The petiole is short. The lamina is oval to lanceolate, the apex acuminate and the base cuneate. The abaxial surface of the leaves is light greyish-green and the adaxial surface is dark green to brownish-green. The venation is pinnate with few secondary veins. Examined under a lens (× 10), the secondary veins, after running parallel to the midrib, diverge at an acute angle. The margin is irregularly and roughly dentate, sometimes crenate and the abaxial surface is slightly curved. The petioles are thin, quadrangular, 4 mm to 8 mm long and, like the primary venation, usually violet-coloured. Occasionally, inflorescences in clusters of bluish-white to violet flowers, not yet opened, are found.

B. Reduce to a powder (355) *(2.9.12)*. The powder is dark green. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of epidermis, with cells with sinuous outlines bearing unicellular or bicellular conical covering trichomes and articulated uniseriate trichomes up to 450 µm long, consisting of 3 to 8 cells with thick pitted walls; capitate trichomes with unicellular or bicellular heads; secretory trichomes with unicellular stalks and usually tetracellular heads; diacytic stomata *(2.8.3)*, which are more numerous on the lower epidermis.

C. Thin-layer chromatography *(2.2.27)*.

Test solution Shake 1 g of the powdered drug (710) *(2.9.12)* for 5 min with 10 ml of *methanol R* in a water-bath at 60 °C and filter the cooled solution.

Reference solution Dissolve 1 mg of *sinensetin R* in *methanol R* and dilute to 20 ml with the same solvent.

Plate *TLC silica gel plate R*.

Mobile phase *methanol R*, *ethyl acetate R*, *toluene R* (5:40:55 *V/V/V*).

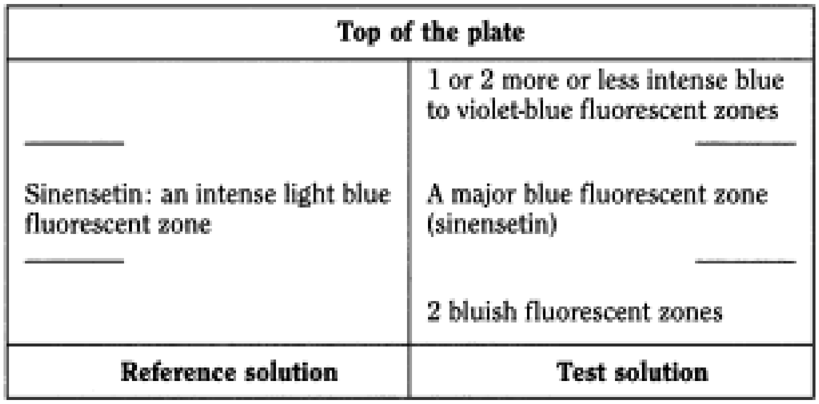
Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Examine in ultraviolet light at 365 nm.

Results See below the sequence of the zones present in the chromatogram obtained with the reference solution and the test solution. Furthermore, red fluorescent zones are present in the lower third and near the solvent front of the chromatogram obtained with the test solution.



Top of the plate	
	1 or 2 more or less intense blue to violet-blue fluorescent zones
Sinensetin: an intense light blue fluorescent zone	A major blue fluorescent zone (sinensetin)
	2 bluish fluorescent zones
Reference solution	**Test solution**

TESTS

Foreign matter *(2.8.2)*

Maximum 5 per cent of stems with a diameter greater than 1 mm; maximum 2 per cent of other foreign matter.

Loss on drying *(2.2.32)*

Maximum 11.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 12.5 per cent.

ASSAY

Liquid chromatography *(2.2.29)*.

Test solution Heat 2.5 g of the powdered drug (355) *(2.9.12)* and 100 ml of *methylene chloride R* on a water-bath for 30 min with stirring. Filter. Collect the filtrate and repeat the operation twice, in the same manner, on the filtration residue. Combine the filtrates. Evaporate the solvent under reduced pressure. Dissolve the residue in 25.0 ml of the mobile phase, using an ultrasonic bath if necessary. Filter the solution through a nitrocellulose filter with a pore size of 0.45 µm.

Reference solution Dissolve 5 mg (m_2) of *sinensetin R* in 80 ml of the mobile phase using an ultrasonic bath if necessary and dilute to 100.0 ml with the mobile phase.

Column:

— *size*: l = 0.25 m, Ø = 4.6 mm;

— *stationary phase: octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase *tetrahydrofuran R, acetic acid R, water R, methanol R* (5:8:42:45 *V/V/V/V*).

Flow rate 0.5 ml/min.

Detection Spectrophotometer at 258 nm.

Injection 20 µl.

Calculate the percentage content of sinensetin from the expression:

$$\frac{m_2 \times F_1 \times 25}{m_1 \times F_2}$$

F_1 = area of the peak corresponding to sinensetin in the chromatogram obtained with the test solution;

F_2 = area of the peak corresponding to sinensetin in the chromatogram obtained with the reference solution;

m_1 = mass of the drug to be examined, in grams;

m_2 = mass of sinensetin in the reference solution, in grams.

Javanese Turmeric

General Notices

(Ph Eur monograph 1441)

Ph Eur

DEFINITION

Dried rhizome, cut in slices, of *Curcuma xanthorrhiza* Roxb. (*C. xanthorrhiza* D. Dietrich).

Content:

— *essential oil*: minimum 50 ml/kg (anhydrous drug);

— *dicinnamoyl methane derivatives, expressed as curcumin* ($C_{21}H_{20}O_6$; M_r 368.4): minimum 1.0 per cent (anhydrous drug).

CHARACTERS

Aromatic odour.

IDENTIFICATION

A. Orange-yellow or yellowish-brown or greyish-brown slices, mostly peeled 1.5-6 mm thick and 15-50 mm, more rarely up to 70 mm, in diameter. Fragments of the brownish-grey cork are sporadically present. The transverse surface is yellow with dark spots in the paler centre. The fracture is short and finely grained.

B. Reduce to a powder (355) *(2.9.12)*. The powder is reddish-brown. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of colourless parenchyma with orange-yellow or yellowish-brown secretory cells; fragments of reticulate and other vessels; rare fragments of cork and epidermis and fragments of thick-walled unicellular acute trichomes. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous stratified, ovoid or irregular starch granules, about 30-50 µm long and about 10-30 µm wide, with an eccentric hilum and marked, concentric striations.

C. Thin-layer chromatography *(2.2.27)* as described in the test for *Curcuma domestica* with the following modifications.

Detection spray with a freshly prepared 0.4 g/l solution of *dichloroquinonechlorimide R* in 2-*propanol R*. Expose to ammonia vapour until the zone due to thymol becomes bluish-violet.

Results The chromatogram obtained with the reference solution shows almost in the middle a bluish-violet zone (thymol) and in the lower part a yellow zone (fluorescein). The chromatogram obtained with the test solution shows a blue zone (xanthorrhizol) slightly above the zone due to thymol in the chromatogram obtained with the reference solution and 2 yellowish-brown or brown zones (curcumin and demethoxycurcumin) between the zones due to thymol and fluorescein in the chromatogram obtained with the reference solution.

TESTS

Curcuma domestica

Thin-layer chromatography (*2.2.27*).

Test solution Shake 0.5 g of the freshly powdered drug (500) (*2.9.12*) with 5 ml of *methanol R* for 30 min and filter.

Reference solution Dissolve 5 mg of *fluorescein R* and 10 mg of *thymol R* in 10 ml of *methanol R*.

Plate *TLC silica gel plate R*.

Mobile phase *glacial acetic acid R, toluene R* (20:80 *V/V*).

Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with a mixture of 1 volume of *sulphuric acid R* and 9 volumes of *acetic anhydride R*. Examine in ultraviolet light at 365 nm.

Results In the chromatogram obtained with the test solution, no yellowish-red fluorescent zone (bisdemethoxycurcumin) appears slightly above the greenish-blue fluorescent zone due to fluorescein in the chromatogram obtained with the reference solution.

Water *(2.2.13)*

Maximum 120 ml/kg, determined on 20.0 g of the powdered drug (500) *(2.9.12)*.

Total ash *(2.4.16)*

Maximum 8.0 per cent.

ASSAY

Essential oil

Carry out the determination of essential oils in herbal drugs *(2.8.12)*. Use a 500 ml round-bottomed flask, 200 ml of *water R* as the distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Reduce the drug to a powder (500) *(2.9.12)* and immediately use 5.0 g for the determination. Distil at a rate of 3-4 ml/min for 3 h.

Dicinnamoyl methane derivatives

To 0.100 g of the powdered drug (180) *(2.9.12)* add 60 ml of *glacial acetic acid R* and heat in a water-bath at 90 °C for 60 min. Add 2.0 g of *boric acid R* and 2.0 g of *oxalic acid R* and heat in a water-bath at 90 °C for 10 min. Allow to cool, dilute to 100.0 ml with *glacial acetic acid R* and shake. Dilute 5.0 ml of the clear supernatant to 50.0 ml with *glacial acetic acid R*. Measure the absorbance *(2.2.25)* at 530 nm, using *glacial acetic acid R* as the compensation liquid.

Calculate the percentage content of dicinnamoyl methane derivatives, expressed as curcumin, using the following expression:

$$\frac{A \times 0.426}{m}$$

i.e. taking the specific absorbance of curcumin to be 2350.

A = absorbance at 530 nm

m = mass of the drug to be examined, in grams

Ph Eur

Juniper

General Notices

(Ph Eur monograph 1532)

Ph Eur

DEFINITION

Dried ripe cone berry of *Juniperus communis* L.

Content

Minimum 10 ml/kg of essential oil (anhydrous drug).

CHARACTERS

Strongly aromatic odour, especially if crushed.

IDENTIFICATION

A. The berry-shaped cone is globular, up to 10 mm in diameter, and violet-brown or blackish-brown, frequently with a bluish bloom. It consists of 3 fleshy scales. The apex has a three-rayed closed cleft and 3 not very clearly defined projections. A remnant of peduncle is frequently attached at the base. The fleshy part is crumbly and brownish. It contains 3 or, more rarely, 2 small, elongated, extremely hard seeds that have 3 sharp edges and are slightly rounded at the back, acuminate at the apex. The seeds are fused with the fleshy part of the cone berry in the lower part on the outside of their bases. Very large, oval oil glands containing sticky resin lie at the outer surface of the seeds.

B. Reduce to a powder (355) *(2.9.12)*. The powder is brown. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of epidermis of the cone berry wall containing cells with thick, pitted, colourless walls and brown glandular content, occasionnally with anomocytic stomata *(2.8.3)*; fragments of the three-rayed apical cleft of the cone berry with spaces and epidermal cells interlocked by papillous outgrowths; fragments of the hypodermis with collenchymatous thickened cells; fragments of the mesocarp consisting of large thin-walled parenchymatous cells, usually rounded, with large intercellular spaces and irregular, large, usually scarcely pitted, yellow idioblasts (barrel cells); fragments of schizogenous oil cells; fragments of the testa with thick-walled, pitted, colourless sclereids containing one or several prism crystals of calcium oxalate; fragments of the endosperm and embryonic tissue with thin-walled cells containing fatty oil and aleurone grains.

C. Thin-layer chromatography *(2.2.27)*.

Test solution Dilute the oil-xylene mixture obtained in the assay to 5.0 ml with *hexane R*.

Reference solution Dissolve 4.0 mg of *guaiazulene R* and 50 µl of *cineole R* in 10 ml of *hexane R*.

Plate *TLC silica gel plate R*.

Mobile phase *ethyl acetate R, toluene R* (5:95 *V/V*).

Application 20 µl of the test solution and 10 µl of the reference solution, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray the plate with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min and examine in daylight.

Results The chromatogram obtained with the reference solution shows a red zone (guaiazulene) in the upper half and a brownish-violet or greyish-violet zone (cineole) in the lower half. The chromatogram obtained with the test solution shows a strong violet zone (mono- and sesquiterpenes) similar in position to the zone due to guaiazulene in the chromatogram obtained with the reference solution, a reddish-violet zone a little above the zone due to cineole in the chromatogram obtained with the reference solution, a greyish-violet zone (terpinen-4-ol) a little below the zone due to cineole in the chromatogram obtained with the reference solution, and just below that a blue zone. A faint violet zone may be present in a similar position to the zone due to cineole. Further zones are present.

TESTS

Foreign matter *(2.8.2)*

Maximum 5 per cent of unripe or discoloured cone berries and maximum 2 per cent of other foreign matter.

Water (*2.2.13)*

Maximum 120 ml/kg, determined on 20.0 g of the crushed drug.

Total ash *(2.4.16)*

Maximum 4.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs *(2.8.12)*. Use 20.0 g of drug crushed immediately before the assay, a 500 ml round-bottomed flask, 200 ml of *water R* as the distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Distil at a rate of 3-4 ml/min for 90 min.

Ph Eur

Kelp

General Notices

Bladderwrack; Fucus

(Ph Eur monograph 1426)

Ph Eur

DEFINITION

Fragmented dried thallus of *Fucus vesiculosus* L. or *F. serratus* L. or *Ascophyllum nodosum* Le Jolis.

Content

Minimum 0.03 per cent and maximum 0.2 per cent of total iodine (A_r 126.9) (dried drug).

CHARACTERS

Salty and mucilaginous taste.

Unpleasant marine odour.

IDENTIFICATION

A. The drug consists of fragments with a corneous consistency, blackish-brown to greenish-brown, sometimes covered with whitish efflorescence. The thallus consists of a ribbon-like blade, branching dichotomously with prominent central ribs (pseudoveins). *F. vesiculosus* typically shows a foliose blade with smooth edges and bears occasional ovoid, single or paired, air vesicles. The ends of certain branches are of ovoid shape and a little widened. They bear numerous reproductive organs (conceptacles). *F. serratus* has a foliose blade with a serrate margin and no vesicles, the branches bearing conceptacles are less swollen. The thallus of *A. nodosum* is irregularly branched, without pseudo-midrib. It shows single ovoid air vesicles; the falciform conceptacles are located at the end of small branches.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greenish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of surface tissue with regular isodiametric cells with brown contents, and fragments of deep tissue with colourless, elongated cells arranged in long filaments with large mucilaginous spaces between them. Thick-walled cells in files and in closely packed groups, from the pseudovein, are sometimes visible.

C. To 1 g of the powdered drug (355) *(2.9.12)* add 20 ml of a 2 per cent *V/V* solution of *hydrochloric acid R*. Shake vigorously and filter. Wash the residue with 10 ml of *water R* and filter. To the residue add 10 ml of a 200 g/l solution of *sodium carbonate R*. Shake and centrifuge. Collect the supernatant liquid. Adjust to pH 1.5 using *sulphuric acid R*. A white, flocculent precipitate is slowly formed.

TESTS

Arsenic *(2.4.27)*

Maximum 90 ppm.

Cadmium *(2.4.27)*

Maximum 4 ppm.

Lead *(2.4.27)*

Maximum 5 ppm.

Mercury *(2.4.27)*

Maximum 0.1 ppm.

Swelling index *(2.8.4)*

Minimum 6.

Loss on drying *(2.2.32)*

Maximum 15.0 per cent, determined on 1.000 g by drying in an oven at 105 °C, for 2 h.

Total ash *(2.4.16)*

Maximum 24 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 3.0 per cent.

ASSAY

Total iodine

To 1.000 g of the powdered drug, in a tall silica crucible, add 5 ml of *water R* and 5 g of *potassium hydroxide R*. Stir with a magnesium rod. Heat on a water bath. Add 1 g of *potassium carbonate R*. Mix, add the tip of the magnesium rod with the residues of the drug and dry, first on a water-bath then over an open flame. Incinerate raising the temperature progressively to not more than 600 °C. Allow to cool. Add 20 ml of *water R* and heat gently to boiling, stirring with a glass rod. Filter the hot mixture through an unpleated filter, into a conical flask. Rinse the residue with 4 quantities, each of 20 ml, of hot *water R*. Rinse the filter and the crucible with 50 ml of hot *water R*. Combine the solutions. Allow to cool. Neutralise with *dilute sulphuric acid R* in the presence of *methyl orange solution R*. Add 3 ml of *dilute sulphuric acid R* and 1 ml of *bromine water R*. The solution is yellow. After 5 min add 0.6 ml of a 50 g/l solution of *phenol R*. The solution is clear. Acidify with 5 ml of *phosphoric acid R* and add 0.2 g of *potassium iodide R.* Allow to stand for 5 min protected from light. Add 1 ml of *starch solution R* and titrate with *0.01 M sodium thiosulphate*.

1 ml of *0.01 M sodium thiosulphate* is equivalent to 0.2115 mg of iodine.

LABELLING

The label states the species of kelp present.

Ph Eur

Knotgrass

General Notices

(Ph Eur monograph 1885)

Ph Eur

DEFINITION

Whole or cut dried flowering aerial parts of *Polygonum aviculare* L. *s.l.*

Content

Minimum 0.30 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried drug).

IDENTIFICATION

A. The stem is 0.5 mm to 2 mm thick, branched, with nodes, cylindrical or slightly angular and longitudinally striated. It bears sessile or shortly petiolate, glabrous entire leaves, which differ widely in shape and size. The sheath-like stipules (ochrea) are lacerate and silvery. The small axillary flowers have 5 greenish-white perianth segments, the tips of which are often coloured red. The fruits are 2 mm to 4 mm, brown to black triangular nuts, usually punctate or striate.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greenish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the leaf epidermis with polygonal to sinuous cell walls and numerous anisocytic stomata *(2.8.3)*, with a striated cuticle; fragments of leaves and stems containing numerous calcium oxalate clusters, some of them very large; groups of thick-walled fibres from the hypodermis of the stem; globular pollen grains with smooth exine and 3 germinal pores; occasional brown fragments of the exocarp composed of cells with thick sinuous walls. Examine under a microscope using a 675 g/l solution of *potassium hydroxide R*. Heat gently. The epidermis of the leaves and a few cells of the mesophyll stain red to reddish-violet. Examine under a microscope using a 0.1 g/l solution of *ferric chloride R*. Leaf fragments are stained almost black.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 10 ml of *methanol R*. Heat the mixture under a reflux condenser, in a water-bath for 10 min. Cool and filter.

Reference solution Dissolve 1 mg of *caffeic acid R*, 2.5 mg of *hyperoside R* and 1 mg of *chlorogenic acid R* in 10 ml of *methanol R.*

Plate *TLC silica gel plate R*.

Mobile phase *anhydrous formic acid R, glacial acetic acid R, water R, ethyl acetate R* (7:7:14:72 *V/V/V/V*).

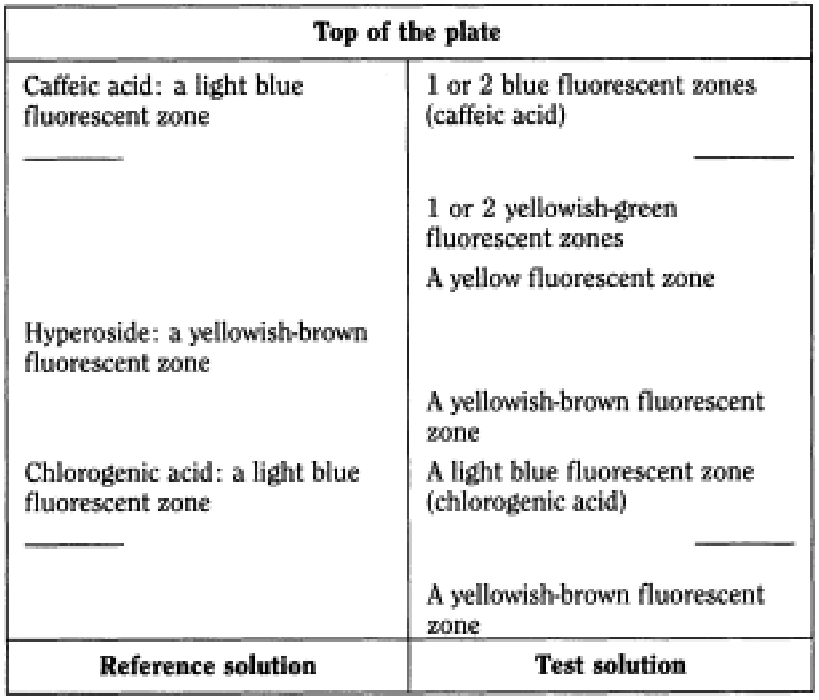
Application 20 µl, as bands.

Development Over a path of 10 cm.

Drying At 100-105 °C.

Detection Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for about 30 min. Examine in ultraviolet light at 365 nm.

Results See below the sequence of the fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones are present in the chromatogram obtained with the test solution.



Top of the plate	
Caffeic acid: a light blue fluorescent zone	1 or 2 blue fluorescent zones (caffeic acid)
———	———
	1 or 2 yellowish-green fluorescent zones
	A yellow fluorescent zone
Hyperoside: a yellowish-brown fluorescent zone	
	A yellowish-brown fluorescent zone
Chlorogenic acid: a light blue fluorescent zone	A light blue fluorescent zone (chlorogenic acid)
———	———
	A yellowish-brown fluorescent zone
Reference solution	**Test solution**

TESTS

Foreign matter *(2.8.2)*

Maximum 2 per cent of roots and maximum 2 per cent of other foreign matter.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of powdered drug (710) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 10.0 per cent.

ASSAY

Stock solution In a 100 ml round-bottomed flask, place 0.800 g of the powdered drug (355) *(2.9.12)*, add 1 ml of a 5 g/l solution of *hexamethylenetetramine R*, 20 ml of *acetone R* and 2 ml of *hydrochloric acid R1*. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a plug of absorbent cotton into a flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 ml, of *acetone R,* each time boiling under a reflux condenser for 10 min. Allow to cool, filter each extract through the plug of absorbent cotton into the flask. Filter the combined acetone extracts through a filter paper into a volumetric flask, dilute to 100.0 ml with *acetone R* rinsing the flask and the filter paper. Introduce 20.0 ml of the solution into a separating funnel, add 20 ml of *water R* and shake the mixture with 1 quantity of 15 ml and then 3 quantities, each of 10 ml of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel and wash with 2 quantities, each of 50 ml, of *water R*. Filter the extracts over 10 g of *anhydrous sodium sulphate R* into a 50 ml volume tric flask and dilute to volume with *ethyl acetate R*.

Test solution To 10.0 ml of the stock solution add 1 ml of *aluminium chloride reagent R* and dilute to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Compensation liquid Dilute 10.0 ml of the stock solution to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Measure the absorbance *(2.2.25)* of the test solution after 30 min by comparison with the compensation liquid at 425 nm. Calculate the percentage content of flavonoids, calculated as hyperoside, from the expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of hyperoside to be 500.

A = absorbance at 425 nm

m = mass of the drug to be examined, in grams

Ph Eur

Lavender Flower

General Notices

(Ph Eur monograph 1534)

Ph Eur

DEFINITION

Dried flower *of Lavandula angustifolia* P. Mill. (*L. officinalis* Chaix).

Content

Minimum 13 ml/kg of essential oil (anhydrous drug).

CHARACTERS

Strongly aromatic odour.

IDENTIFICATION

First identification A, B, D.

Second identification A, B, C.

A. The flower has a short peduncle and consists of a bluish-grey tubular calyx divided distally into 4 very short teeth and a small rounded lobe, a blue bilabial corolla with the upper lip bifid and the lower lip trilobate and 4 didynamous stamens with ovoid anthers.

B. Reduce to a powder (355) (*2.9.12*). The powder is bluish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: covering trichomes bifurcating at one or more levels; secretory trichomes with short stalks and eight-celled heads of the *Labiatae* type; secretory trichomes with unicellular or multicellular stalks and unicellular heads; secretory trichomes with long uneven stalks and unicellular heads, separated from the peduncle by an intermediary cell with a smooth cuticle; certain such trichomes show a crown of small spheroid cells just below the insertion point of the intermediary cell on the peduncle; fragments of warty epidermis from the inner surface of the petals; fragments of calyx epidermis with sinuous-walled cells and containing prismatic crystals of calcium oxalate; spherical pollen grains which have a diameter of about 45 µm and an exine with 6 slit-like germinal pores and 6 ribbon-like groins radiating from the poles.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 0.5 g of the powdered drug (355) (*2.9.12*) add 5 ml of *hexane R*, shake for 5 min and filter.

Reference solution Dissolve 10 µl of *linalol R* and 10 µl of *linalyl acetate R* in 5 ml of *hexane R*.

Plate TLC silica gel plate R.

Mobile phase *ethyl acetate R*, *toluene R* (5:95 *V/V*).

Application 10 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min and examine in daylight.

Results The chromatogram obtained with the reference solution shows in the lower third a greyish-blue zone (linalol) and in the middle third a greyish-blue zone (linalyl acetate). The chromatogram obtained with the test solution shows the zones due to linalol and linalyl acetate and in the middle, between these zones, a redish-violet zone (epoxydihydrocaryophyllene). Further zones are also present.

D. Examine the chromatograms obtained in the test for other species and varieties of lavender.

Results The 5 principal peaks in the chromatogram obtained with the reference solution are similar in retention time to peaks in the chromatogram obtained with the test solution. Among them are mainly linalol and linalyl acetate peaks.

TESTS

Foreign matter (*2.8.2*)

Maximum 3 per cent of stems and maximum 2 per cent of other foreign matter.

Other species and varieties of lavender

Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution Dilute 0.2 ml of the essential oil-xylene mixture obtained in the assay to 5 ml with *hexane R*, add 1 g of *anhydrous sodium sulphate R*, shake and use the supernatant liquid.

Reference solution Dissolve 0.1 g of *limonene R*, 0.2 g of *cineole R*, 0.05 g of *camphor R*, 0.4 g of *linalol R*, 0.6 g of *linalyl acetate R* and 0.2 g of α-*terpineol R* in 100 ml of *hexane R*.

Column:

— *material*: fused silica;

— *size*: *l* = 60 m, Ø = 0.25 mm;

— *stationary phase*: *macrogol 20 000 R*.

Carrier gas *helium for chromatography R*.

Flow rate 1.5 ml/min.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 15	70
	15 - 70	70 → 180
Injection port		220
Detector		220

Detection Flame ionisation.

Injection The same volume of each solution.

Elution order Order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability Reference solution:

— *resolution*: minimum 1.5 between the peaks due to limonene and cineol;

— *number of theoretical plates*: minimum 30 000, calculated for the peak due to limonene at 110 °C.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the 6 components of the reference solution in the chromatogram obtained with the test solution. Disregard the peaks due to hexane and xylene.

Limit:
— *camphor* : maximum 1 per cent.

Water (*2.2.13*)

Maximum 100 ml/kg, determined on 20.0 g.

Total ash (*2.4.16*)

Maximum 9.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs (*2.8.12*). Use 20.0 g of drug, a 1000 ml round-bottomed flask, 500 ml of *water R* as the distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

Lavender Oil

General Notices

(Ph Eur monograph 1338)

Ph Eur

DEFINITION

Essential oil obtained by steam distillation from the flowering tops of *Lavandula angustifolia* Miller (*Lavandula officinalis* Chaix).

CHARACTERS

Appearance

Colourless or pale yellow, clear liquid.

It has a characteristic odour.

IDENTIFICATION

First identification B.

Second identification A.

A. Thin-layer chromatography (*2.2.27*).

Test solution Dissolve 20 µl of the substance to be examined in 1 ml of *toluene R*.

Reference solution Dissolve 10 µl of *linalol R* and 10 µl of *linalyl acetate R* in 1 ml of *toluene R*.

Plate TLC silica gel plate R.

Mobile phase ethyl acetate R, *toluene R* (5:95 *V/V*).

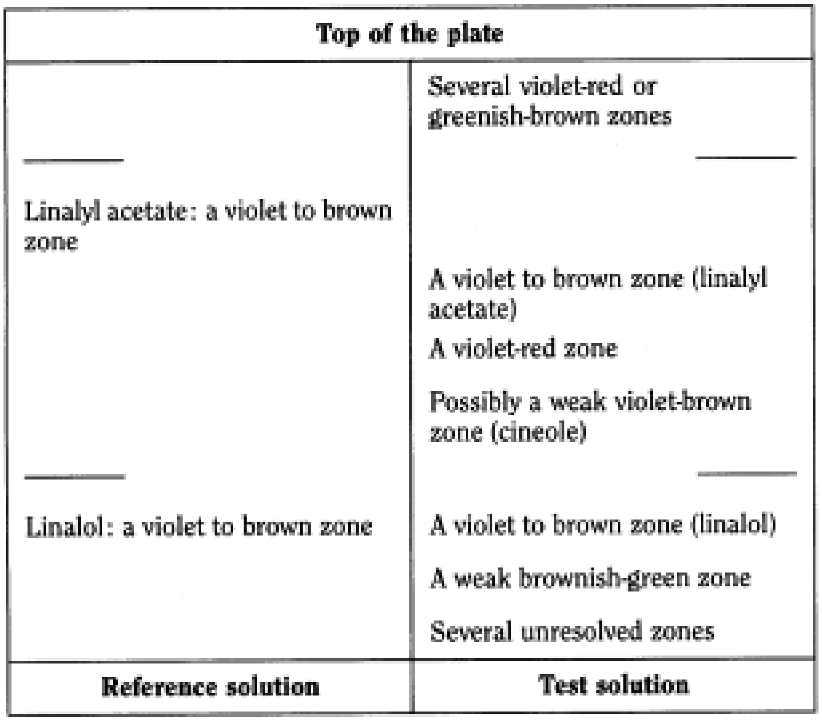
Application 10 µl as bands.

Development Twice, 5 min apart, over a path of 10 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min. Examine immediately in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other violet-red or greenish-brown zones are present in the chromatogram obtained with the test solution above the zone of linalyl acetate up to the solvent front.



Top of the plate	
	Several violet-red or greenish-brown zones
———	———
Linalyl acetate: a violet to brown zone	
	A violet to brown zone (linalyl acetate)
	A violet-red zone
	Possibly a weak violet-brown zone (cineole)
———	———
Linalol: a violet to brown zone	A violet to brown zone (linalol)
	A weak brownish-green zone
	Several unresolved zones
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a).

TESTS

Relative density (*2.2.5*)

0.878 to 0.892.

Refractive index (*2.2.6*)

1.455 to 1.466.

Optical rotation (*2.2.7*)

- 12.5 ° to - 7.0 °.

Acid value (*2.5.1*)

Maximum 1.0, determined on 5.0 g of the substance to be examined dissolved in 50 ml of the prescribed mixture of solvents.

Chromatographic profile

Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution The substance to be examined.

Reference solution (a) Dissolve 0.1 g of *limonene R*, 0.2 g of *cineole R*, 0.2 g of *3-octanone R*, 0.05 g of *camphor R*, 0.4 g of *linalol R*, 0.6 g of *linalyl acetate R*, 0.2 g of *terpinen-4-ol R*, 0.1 g of *lavandulyl acetate R*, 0.2 g of *lavandulol R* and 0.2 g of α-*terpineol R* in 5 ml of *hexane R*.

Reference solution (b) Dissolve 5 mg of *3-octanone R* in *hexane R* and dilute to 10 ml with the same solvent.

Column:

- — *material*: fused silica;
- — *size: l* = 60 m , Ø = 0.25 mm;
- — *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas *helium for chromatography R*.

Flow rate 1.5 ml/min.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 15	70
	15 - 70	70 → 180
Injection port		220
Detector		220

Detection Flame ionisation.

Injection 0.2 µl.

Elution order Order indicated in the composition of reference solution (a). Record the retention times of these substances.

System suitability Reference solution (a):

- — *resolution*: minimum 1.4 between the peaks due to terpinen-4-ol and lavandulyl acetate.

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

Determine the percentage content of each of these components. The percentages are within the following ranges:

- — *limonene*: less than 1.0 per cent;
- — *cineole*: less than 2.5 per cent;
- — *3-octanone*: 0.1 per cent to 2.5 per cent;
- — *camphor* : less than 1.2 per cent;
- — *linalol* : 20.0 per cent to 45.0 per cent;
- — *linalyl acetate*: 25.0 per cent to 46.0 per cent;
- — *terpinen-4-ol* : 0.1 per cent to 6.0 per cent;
- — *lavandulyl acetate*: more than 0.2 per cent;

— *lavandulol*: more than 0.1 per cent;

— α-*terpineol*: less than 2.0 per cent.

— *disregard limit*: area of the peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Chiral purity

Gas chromatography (*2.2.28*).

Test solution Dissolve 0.02 g of the substance to be examined in *pentane R* and dilute to 10 ml with the same solvent.

Reference solution Dissolve 10 µl of *linalol R*, add 10 µl of *linalyl acetate R* and 5 mg of *borneol R* in *pentane R* and dilute to 10 ml with the same solvent.

Column:

— *material*: fused silica;

— *size: l* = 25 m, Ø = 0.25 mm;

— *stationary phase*: *modified* β*-cyclodextrin for chiral chromatography R* (film thickness 0.25 µm).

Carrier gas *helium for chromatography R*.

Flow rate 1.3 ml/min.

Split ratio 1:30.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 65	50 → 180
Injection port		230
Detector		230

Detection Flame ionisation.

Injection 1 µl.

System suitability Reference solution:

— *resolution*: minimum 5.5 between the peaks due to (*R*)-linalol (1st peak) and (*S*)-linalol (2nd peak), minimum 2.9 between the peaks due to (*S*)-linalol and borneol (3rd peak) and minimum 2.7 between the peaks due to (*R*)-linalyl acetate (4th peak) and (*S*)-linalyl acetate (5th peak).

Calculate the percentage content of the specified (*S*)-enantiomers from the following expression:

$$\frac{A_S}{A_S + A_R} \times 100$$

A_S = area of the peak due to the corresponding (*S*)-enantiomer,

A_R = area of the peak due to the corresponding (*R*)-enantiomer.

Limits:

- *(S)-linalol*: maximum 12 per cent;
- *(S)-linalyl acetate*: maximum 1 per cent.

STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

Ph Eur

Lemon Balm

General Notices

(Melissa Leaf, Ph Eur monograph 1447)

Ph Eur

DEFINITION

Dried leaf of *Melissa officinalis* L.

Content

Minimum 4.0 per cent of total hydroxycinnamic derivatives, expressed as rosmarinic acid ($C_{18}H_{16}O_8$; M_r 360.3) (dried drug).

CHARACTERS

Odour reminiscent of lemon.

IDENTIFICATION

A. Melissa leaf has a petiole of varying length and is oval, cordate and up to about 8 cm long and 5 cm wide. The lamina is thin and the under surface has a conspicuous, raised, reticulate venation; the margins are roughly dentate or crenate. The upper surface is bright green and the lower surface is lighter in colour.

B. Reduce to a powder (355) (*2.9.12*). The powder is greenish. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the leaf epidermis with sinuous walls; short, straight, unicellular, conical covering trichomes with a finely striated cuticle; multicellular, uniseriate covering trichomes with pointed ends and thick, warty cuticles; eight-celled secretory trichomes of lamiaceous type; secretory trichomes with unicellular to tricellular stalks and unicellular or, more rarely bicellular, heads; diacytic stomata (*2.8.3*), on the lower surface only.

C. Thin-layer chromatography (*2.2.27*).

Test solution Place 2.0 g of the powdered drug (355) (*2.9.12*) in a 250 ml round-bottomed flask and add 100 ml of *water R*. Distil for 1 h using the apparatus for the determination of essential oils in herbal drugs *(2.8.12)* and 0.5 ml of *xylene R* in the graduated tube. After distillation transfer the organic phase to a 1 ml volumetric flask rinsing the graduated tube of the apparatus with the aid of a small portion of *xylene R* and dilute to 1.0 ml with the same solvent.

Reference solution Dissolve 1.0 µl of *citronellal R* and 10.0 µl of *citral R* in 25 ml of *xylene R*.

Plate *TLC silica gel plate R*.

Mobile phase *ethyl acetate R*, *hexane R* (10:90 *V/V*).

Application 10 µl of the reference solution and 20 µl of the test solution, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R*. Examine in daylight while heating at 100-105 °C for 10-15 min.

Results The chromatogram obtained with the reference solution shows in the lower third a greyish-violet or bluish-violet double zone (citral) and above it a grey or greyish-violet zone (citronellal). The chromatogram obtained with the test solution shows zones similar in position and colour to the zones in the chromatogram obtained with the reference solution and between these zones a reddish-violet zone (epoxycaryophyllene). Further zones may be present.

TESTS

Foreign matter *(2.8.2)*

Maximum 10 per cent of stems with a diameter greater than 1 mm and maximum 2 per cent of other foreign matter, determined on 20 g.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 12.0 per cent.

ASSAY

Stock solution To 0.200 g of the powdered drug (355) (*2.9.12*) add 190 ml of *ethanol (50 per cent V/V) R*. Boil in a water-bath under a reflux condenser for 30 min. Allow to cool and filter. Rinse the filter with 10 ml of *ethanol (50 per cent V/V) R.* Combine the filtrate and the rinsings in a volumetric flask and dilute to 200.0 ml with *ethanol (50 per cent V/V) R*.

Test solution To 1.0 ml of the stock solution in a test-tube add 2 ml of *0.5 M hydrochloric acid*, 2 ml of a solution prepared by dissolving 10 g of *sodium nitrite R* and 10 g of *sodium molybdate R* in 100 ml of *water R* and then add 2 ml of *dilute sodium hydroxide solution R* and dilute to 10.0 ml with *water R*; mix.

Compensation liquid In another test-tube place 1.0 ml of the stock solution, 2 ml of *0.5 M hydrochloric acid*, 2 ml of *dilute sodium hydroxide solution R* and dilute to 10.0 ml with *water R*.

Immediately measure the absorbance (*2.2.25*) of the test solution at 505 nm by comparison with the compensation liquid.

Calculate the percentage content of total hydroxycinnamic derivatives, expressed as rosmarinic acid, using the following expression:

$$\frac{A \times 5}{m}$$

i.e. taking the specific absorbance of rosmarinic acid to be 400.

A = absorbance at 505 nm,

m = mass of the substance to be examined, in grams.

Ph Eur

Lemon Oil

General Notices

(Ph Eur monograph 0620)

Ph Eur

DEFINITION

Essential oil obtained by suitable mechanical means, without the aid of heat, from the fresh peel of *Citrus limon* (L.) Burman fil.

CHARACTERS

Appearance: clear, mobile, pale yellow to greenish-yellow liquid with a characteristic odour. It may become cloudy at low temperatures.

IDENTIFICATION

First identification B.

Second identification A.

A. Thin-layer chromatography (*2.2.27*).

Test solution Mix 1 ml of the substance to be examined in 1 ml of *toluene R*.

Reference solution Dissolve 10 mg of *citropten R* and 50 µl of *citral R* in *toluene R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel GF$_{254}$ plate R*.

Mobile phase *ethyl acetate R*, *toluene R* (15:85 *V/V*).

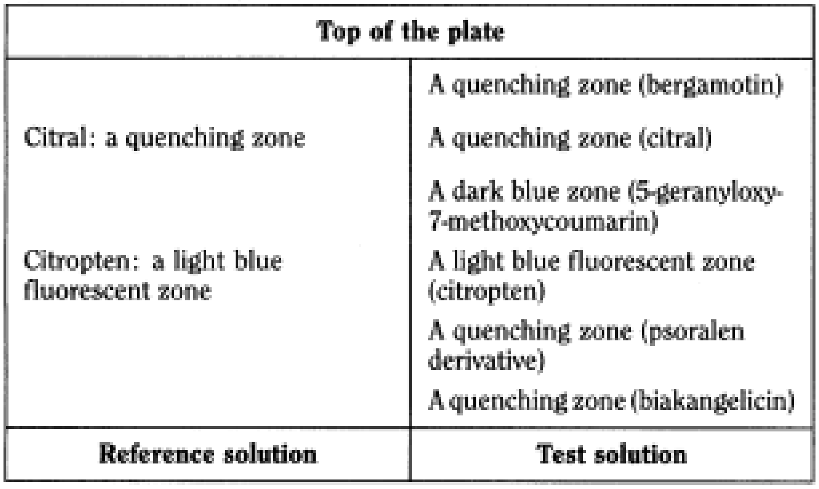
Application 10 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

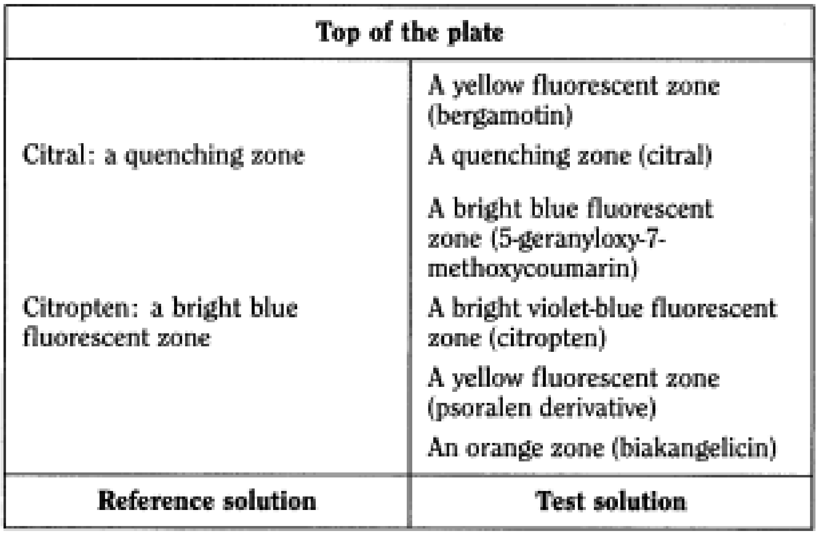
Results A See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
	A quenching zone (bergamotin)
Citral: a quenching zone	A quenching zone (citral)
	A dark blue zone (5-geranyloxy-7-methoxycoumarin)
Citropten: a light blue fluorescent zone	A light blue fluorescent zone (citropten)
	A quenching zone (psoralen derivative)
	A quenching zone (biakangelicin)
Reference solution	**Test solution**

Detection B Examine in ultraviolet light at 365 nm.

Results B See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
	A yellow fluorescent zone (bergamotin)
Citral: a quenching zone	A quenching zone (citral)
	A bright blue fluorescent zone (5-geranyloxy-7-methoxycoumarin)
Citropten: a bright blue fluorescent zone	A bright violet-blue fluorescent zone (citropten)
	A yellow fluorescent zone (psoralen derivative)
	An orange zone (biakangelicin)
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (*2.2.5*)

0.850 to 0.858.

Refractive index (*2.2.6*)

1.473 to 1.476.

Optical rotation (*2.2.7*)

+ 57 ° to + 70 °.

Absorbance (*2.2.25*)

Dissolve 0.250 g of the substance to be examined in *alcohol R*, mix and dilute to 100.0 ml with the same solvent. Measure the absorbance over the range 260 nm to 400 nm. If a manual instrument is used, measure the absorbance at 5 nm intervals from 260 nm to about 12 nm before the expected absorption maximum, then at 3 nm intervals for 3 readings and at 1 nm intervals to about 5 nm beyond the maximum and finally at 10 nm intervals to 400 nm. Plot a curve representing the absorption spectrum with the absorbances as ordinates and the wavelengths as abscissae. Draw as a baseline the tangent between *A* and *B* (Figure 0620.-1). The absorption maximum *C* is situated at 315 ± 3 nm. From C draw a line perpendicular to the axis of abscissae and intersecting *AB* at *D*. Deduct the absorbance corresponding to point *D* from that corresponding to point *C*. The value *C* - *D* is 0.20 to 0.96 and for Italian-type lemon oil it is not less than 0.45.

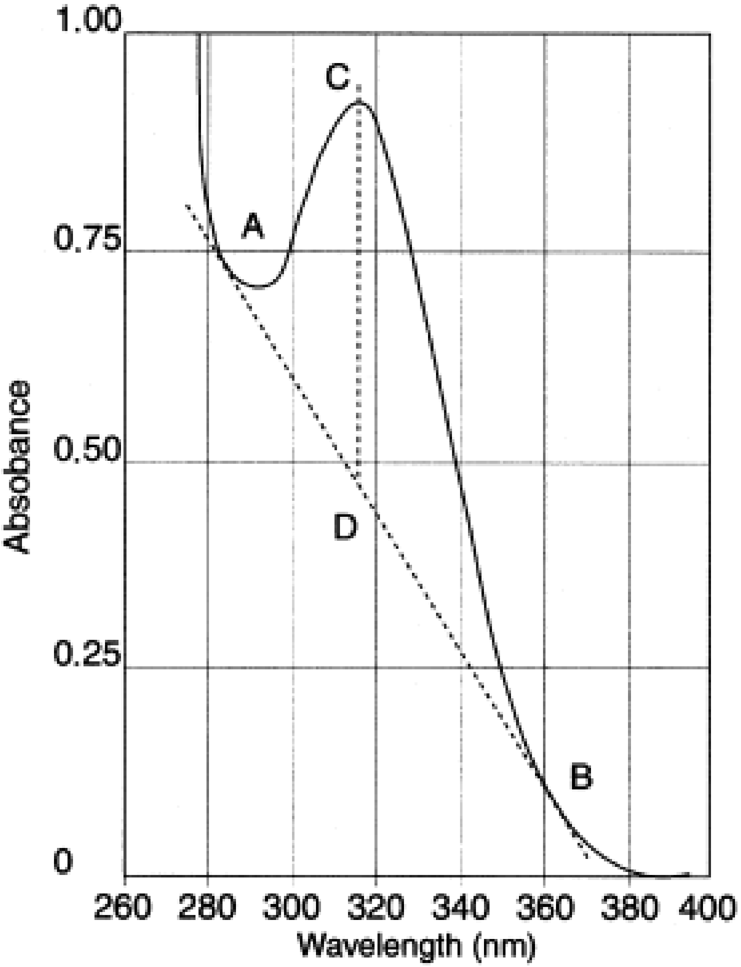


Figure 0620.-1. – *Typical spectrum of lemon oil for the test for absorbance*

Fatty oils and resinified essential oils (*2.8.7*)

It complies with the test for fatty oils and resinified essential oils.

Chromatographic profile

Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution The substance to be examined.

Reference solution Dissolve 20 µl of β*-pinene R*, 10 µl of *sabinene R*, 100 µl of *limonene R*, 10 µl of γ*-terpinene R*, 5 µl of β*-caryophyllene R*, 20 µl of *citral R*, 5 µl of α*-terpineol R*, 5 µl of *neryl acetate R* and 5 µl of *geranyl acetate R* in 1 ml of *acetone R*.

Column:

— *material*: fused silica;

— *size:* *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm;

— *stationary phase*: *macrogol 20 000 R*.

Carrier gas *helium for chromatography R*.

Flow rate 1.0 ml/min.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 6	45
	6 - 21	45 → 90
	21 - 39	90 → 180
	39 - 55	180
Injection port		220
Detector		220

Detection Flame ionisation.

Injection 0.5 µl of the reference solution and 0.2 µl of the test solution.

Elution order Order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability Reference solution:

— *resolution*: minimum 1.5 between the peaks due to β-pinene and sabinene and minimum 1.5 between the peaks due to geranial and geranyl acetate.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of these components. The percentages are within the following ranges:

— β*-pinene*: 7.0 per cent to 17.0 per cent;

— *sabinene*: 1.0 per cent to 3.0 per cent;

— *limonene*: 56.0 per cent to 78.0 per cent;

— γ-*terpinene*: 6.0 per cent to 12.0 per cent;

— β-*caryophyllene*: maximum 0.5 per cent;

— *neral*: 0.3 per cent to 1.5 per cent;

— α-*terpineol*: maximum 0.6 per cent;

— *neryl acetate*: 0.2 per cent to 0.9 per cent;

— *geranial*: 0.5 per cent to 2.3 per cent;

— *geranyl acetate*: 0.1 per cent to 0.8 per cent.

Residue on evaporation (*2.8.9*)

1.8 per cent to 3.6 per cent after heating on the water-bath for 4 h.

STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

LABELLING

The label states, where applicable, that the contents are Italian-type lemon oil.

Ph Eur

Lemon Verbena Leaf

General Notices

(Ph Eur monograph 1834)

Ph Eur

DEFINITION

Whole or fragmented, dried leaves of *Aloysia citriodora Palau* (syn. *Aloysia triphylla* (L'Hér.) Kuntze; *Verbena triphylla* L'Hér.; *Lippia citriodora* Kunth.).

Content:

— *acteoside* ($C_{29}H_{36}O_{15}$; M_r 625): minimum 2.5 per cent, expressed as ferulic acid (dried drug);

— *essential oil*: minimum 3.0 ml/kg for the whole drug and minimum 2.0 ml/kg for the fragmented drug (dried drug).

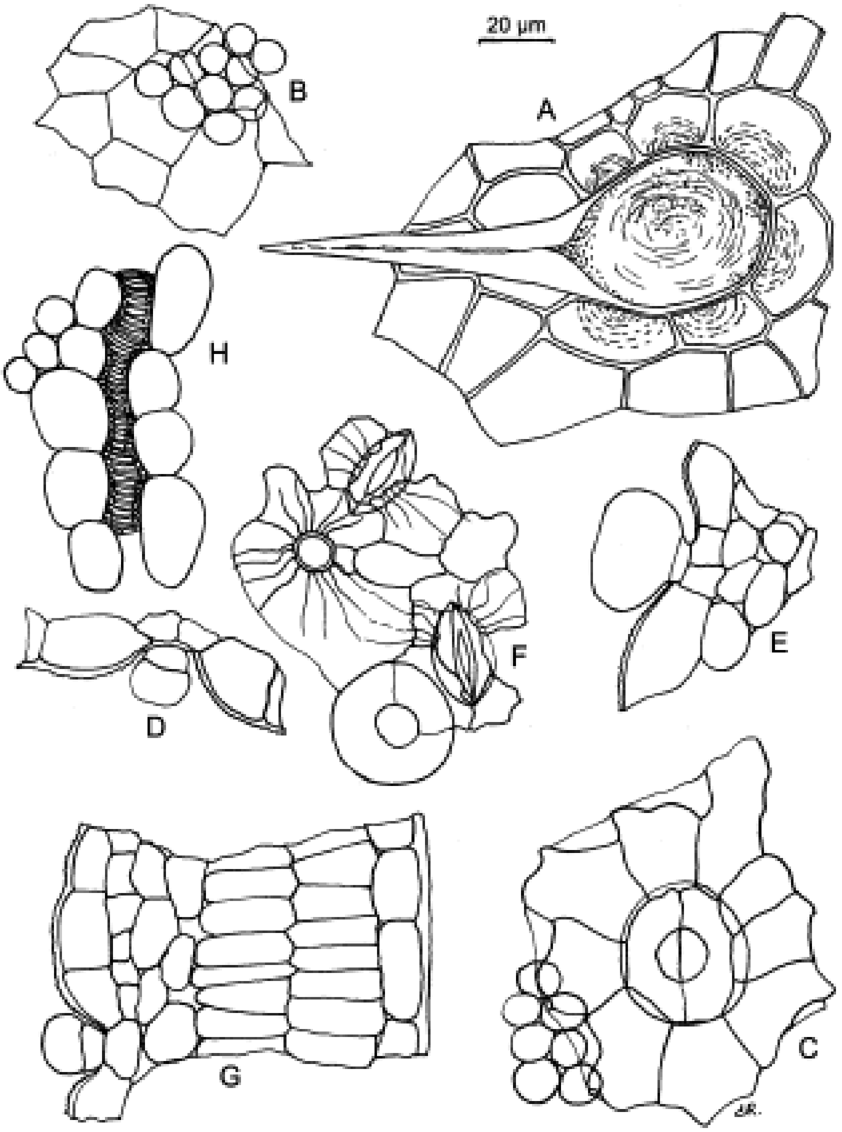
CHARACTERS

After grinding, it has a characteristic odour reminiscent of lemon.

IDENTIFICATION

A. The leaves are simple with short petioles. They are narrow, lanceolate, and about 4 times longer than they are wide. The entire, slightly undulating margins are curled towards the upper surface. The upper surface is dark green and rough to the touch; the lower surface is paler green and shows a prominent midrib with secondary veins running to the margins.

B. Reduce to a powder (355) (*2.9.12*). The powder is light green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the lamina in surface view, those of the upper epidermis being composed of polygonal cells with numerous short, unicellular, thick-walled cystolithic trichomes, each arising from a rosette of cells at the base, stomata are absent; the cells of the lower epidermis are more irregular and somewhat sinuous in outline and anomocytic stomata (*2.8.3*) are abundant, also present are numerous subsessile glandular trichomes with a globular head; fragments of parenchyma of the mesophyll and groups of lignified tissue from the veins.



A. Upper epidermis with cystolithic trichome, with subsidiary cells containing calcium concretons

B-C. Surface view of upper epidermis, with palisade parenchyma and glandular trichome (C)

D-E. Transverse section of glandular trichomes

F. Surface view of lower epidermis with striated cuticule, anomocytic stomata and glandular trichome

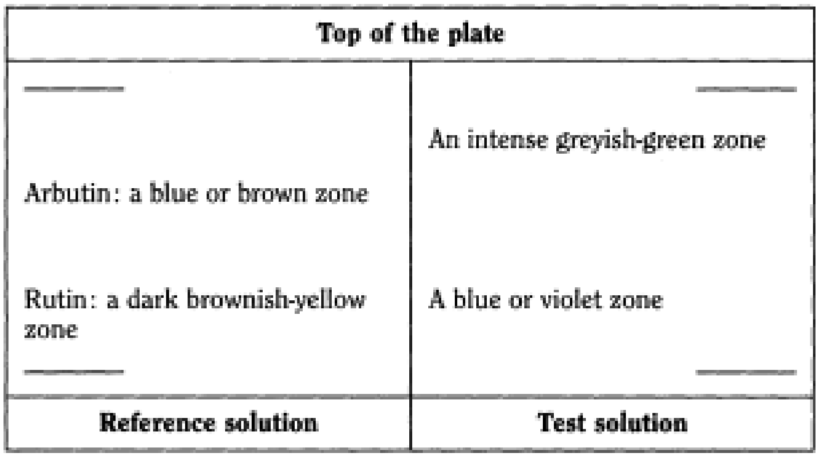
G. Transverse section of the lamina

H. Parenchyma of the mesophyll with a lignified vein

Figure 1834.-1. – *Illustration of powdered herbal drug of lemon verbena leaf (see Identification B)*

C. Examine the chromatograms obtained in the test for *Verbena officinalis*.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution. Zones may be present in the chromatogram obtained with the test solution below the zone due to rutin in the chromatogram obtained with the reference solution.



Top of the plate	
———	———
	An intense greyish-green zone
Arbutin: a blue or brown zone	
Rutin: a dark brownish-yellow zone	A blue or violet zone
———	———
Reference solution	**Test solution**

TESTS

Verbena officinalis

Thin-layer chromatography (*2.2.27*).

Test solution To 0.50 g of the powdered drug (710) (*2.9.12*) add 5 ml of *methanol R*. Heat in a water-bath at 60 °C for 10 min. Cool and filter.

Reference solution Dissolve 10 mg of *arbutin R* and 10 mg of *rutin R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate TLC silica gel plate R (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase anhydrous formic acid R, *glacial acetic acid R*, *water R*, *ethyl acetate R* (11:11:27:100 *V/V/V/V*).

Application 20 µl [or 5 µl], as bands.

Development Over a path of about 12 cm [or 6 cm].

Drying In air.

Detection Spray with *anisaldehyde solution R* and dry at 100-105 °C for about 10 min; examine in daylight.

Results The chromatogram obtained with the test solution shows no brownish-grey zone at a position between that of arbutin and rutin in the chromatogram obtained with the reference solution.

Loss on drying (*2.2.32*)

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 13.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*)

Maximum 3.5 per cent.

ASSAY

Acteoside

Liquid chromatography (*2.2.29*).

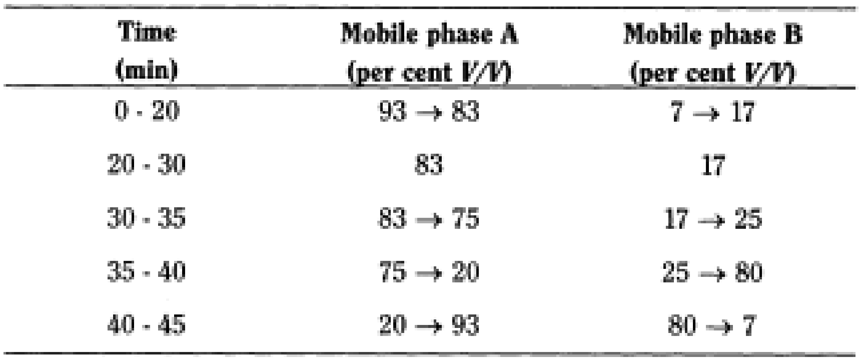
Test solution To 1.00 g of the powdered drug (710) (*2.9.12*) add 50.0 ml of the reference solution and stir for 2 h with a magnetic stirrer. Centrifuge for 15 min and pass the supernatant through a membrane filter (pore size 0.45 µm).

Reference solution Dissolve 10.0 mg of *ferulic acid CRS* in *ethanol (60 per cent V/V) R* and dilute to 100.0 ml with the same solvent.

Precolumn:
- *size:* *l* = 0.01 m, Ø = 4.0 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Column:
- *size:* *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 20 °C.

Mobile phase:
- *mobile phase A*: 0.3 per cent *V/V* solution of *phosphoric acid R*;
- *mobile phase B*: *acetonitrile R*;



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 20	93 → 83	7 → 17
20 - 30	83	17
30 - 35	83 → 75	17 → 25
35 - 40	75 → 20	25 → 80
40 - 45	20 → 93	80 → 7

Flow rate 1.0 ml/min.

Detection Spectrophotometer at 330 nm.

Injection 20 µl.

System suitability Test solution:
- *resolution*: minimum 3.5 between the peaks due to ferulic acid and acteoside.

Calculate the percentage content of acteoside, expressed as ferulic acid, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 5 \times 3.1}{A_2 \times m_1}$$

A_1 = area of the peak due to acteoside in the chromatogram obtained with the test solution;

A_2 = area of the peak due to ferulic acid in the chromatogram obtained with the reference solution;

m_1 = mass of the drug in the test solution, in grams;

m_2 = mass of *ferulic acid CRS* in the reference solution, in grams;

p = percentage content of ferulic acid in *ferulic acid CRS*;

3.1 = correlation factor between acteoside and ferulic acid.

***Essential oil* (*2.8.12*)**

Introduce 25.0 g of the freshly crushed drug into a 1000 ml flask and add 500 ml of a 10 g/l solution of *sodium chloride R* as the distillation liquid. Use 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 3.0-3.5 ml/min for 3 h.

Ph Eur

Lime Flower

General Notices

(Ph Eur monograph 0957)

Ph Eur

DEFINITION

Whole, dried inflorescence of *Tilia cordata* Miller, of *Tilia platyphyllos* Scop., of *Tilia × vulgaris* Heyne or a mixture of these.

CHARACTERS

Faint aromatic odour.

Faint, sweet and mucilaginous taste.

IDENTIFICATION

A. The inflorescence is yellowish-green. The main axis of the inflorescence bears a linguiform bract, membranous, yellowish-green, practically glabrous, the central vein of which is joined for up to about half of its length with the peduncle. The inflorescence usually consists of 2-7 flowers, occasionally up to 16. The sepals are detached easily from the perianth; they are up to 6 mm long, their abaxial surface is usually glabrous, their adaxial surface and their borders are strongly pubescent. The 5 spatulate, thin petals are yellowish-white, up to 8 mm long. They show fine venation and their borders only are sometimes covered with isolated trichomes. The numerous stamens are free and usually constitute 5 groups. The superior ovary has a pistil with a somewhat 5-lobate stigma.

B. Separate the inflorescence into its different parts. Examine under a microscope using *chloral hydrate solution R*. The adaxial epidermis of the bract shows cells with straight or slightly sinuous anticlinal walls; the abaxial epidermis shows cells with wavy-sinuous anticlinal walls and anomocytic stomata (*2.8.3*). Isolated cells in the mesophyll contain small calcium oxalate cluster crystals. The parenchyma of the sepals shows, particularly near the veins, numerous mucilaginous cells and cells containing small calcium oxalate clusters. The adaxial epidermis of sepals bears bent, thick-walled covering trichomes, unicellular or stellate with up to 5 cells. The epidermal cells of the petals show straight anticlinal walls with a striated cuticle without stomata. The parenchyma of the petals shows small calcium oxalate clusters and especially in its acuminate part mucilaginous cells. The pollen grains have a diameter of about 30-40 µm and are oval or slightly triangular with 3 germinal pores and a finely granulated exine. The ovary is glabrous or densely covered with trichomes, often very twisted, unicellular or stellate with 2-4 branches.

C. Thin-layer chromatography (*2.2.27*).

Test solution Shake 1.0 g of the powdered drug (355) (*2.9.12*) with 10 ml of *methanol R* in a water-bath at 65 °C for 5 min. Allow to cool and filter.

Reference solution Dissolve 2.0 mg of *caffeic acid R*, 5 mg of *hyperoside R* and 5 mg of *rutin*

R in 10 ml of *methanol R*.

Plate *TLC silica gel plate R.*

Mobile phase *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 *V/V/V/V*).

Application 10 µl, as bands.

Development Over a path of 15 cm.

Drying At 100-105 °C.

Detection Spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Then spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow to dry for about 30 min and examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the reference solution shows in order of increasing R_F value yellowish-orange or brownish-orange fluorescent zones due to rutin and hyperoside and a greenish-blue fluorescent zone due to caffeic acid. In the chromatogram obtained with the test solution, the main zone shows brownish-yellow or orange fluorescence. This zone is situated just above the zone due to hyperoside in the chromatogram obtained with the reference solution. In daylight, this zone stands out from the other zones as the main zone. At the R_F level of rutin there is also a brownish-yellow fluorescent zone. Below this zone, 2 yellow fluorescent zones may be present. Between the zones due to rutin and hyperoside, orange and yellow fluorescent zones are visible. Between the zones due to hyperoside and caffeic acid, up to 5 yellow or orange fluorescent zones are present. Immediately below the zone due to caffeic acid is a a blue fluorescent zone.

TESTS

Foreign matter (*2.8.2*)

Maximum 2 per cent, determined on 30 g. There are no inflorescences with a bract bearing at the abaxial face stellate, five- to eight-rayed trichomes and flowers having an apparent double corolla by transformation of five stamens into petal-like staminoids and having a pistil which is not lobular nor indented. Hexamerous flowers occur only occasionally (*Tilia americana* L., *Tilia tomentosa* Moench).

Loss on drying (*2.2.32*)

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 8.0 per cent.

Ph Eur

Linseed

General Notices

(Ph Eur monograph 0095)

When Powdered Linseed is prescribed or demanded, material complying with the appropriate requirements below shall be dispensed or supplied.

Ph Eur

DEFINITION

Dried, ripe seeds of *Linum usitatissimum* L.

IDENTIFICATION

A. The linseed has a flattened, elongated ovoid shape. The testa is dark reddish-brown or yellow, smooth and shiny. The seeds are 4-6 mm long, 2-3 mm wide and 1.5-2 mm thick; one end is rounded and the other end forms an oblique point near which the hilum appears as a slight depression. When viewed with a lens, the surface of the seed-coat is seen to be minutely pitted. Inside the testa a narrow, whitish endosperm and an embryo composed of 2 large, flattened, yellowish and oily cotyledons are present; the radicle points towards the hilum.

B. Reduce to a powder (355) (*2.9.12*). The powder is greasy to the touch. Examine under a microscope using *chloral hydrate solution R*. The powder consists of fragments of the outer epidermal cells of the testa filled with mucillage; collenchymatously thickened sub-epidermal layer seen in surface view as rounded cells with distinct triangular intercellular spaces often attached to the sclerenchymatous layer composed of elongated cells, some with strongly thickened and pitted walls; thin-walled pitted cells of the hyaline layer often remaining attached to the elongated sclereids and crossing them at approximately right angles; pigmented cells of the inner epidermis of the testa composed of moderately thickened polygonal cells filled with orange-brown pigment; parenchyma of the endosperm and cotyledons containing aleurone grains and fatty oil.

TESTS

Foreign matter (*2.8.2*)

Maximum 10 per cent of seeds with a dull coat and maximum 1.5 per cent of other foreign matter.

Swelling index (*2.8.4*)

Minimum 4.

Cadmium (*2.4.27*)

Maximum 0.5 ppm.

Loss on drying (*2.2.32*)

Maximum 8.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 5.0 per cent.

Ph Eur

Liquorice Dry Extract for Flavouring Purposes

General Notices

(Ph Eur monograph 2378)

Ph Eur

DEFINITION

Dry extract produced from *Liquorice root (0277).*

Content

5.0 per cent to 7.0 per cent of 18β-glycyrrhizic acid ($C_{42}H_{62}O_{16}$; M_r 823) (dried extract).

PRODUCTION

The extract is produced from the cut herbal drug by a suitable procedure using water.

CHARACTERS

Appearance

Yellowish-brown or brown powder.

Very sweet taste.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Solvent mixture *ethyl acetate R*, *methanol R* (50:50 *V/V*).

Test solution To 0.30 g of the extract to be examined add 30 ml of *hydrochloric acid R1* and boil on a water-bath under a reflux condenser for 60 min. After cooling, extract the mixture with 2 quantities, each of 20 ml, of *ethyl acetate R*. Combine the organic layers and filter through a filter covered with *anhydrous sodium sulphate R*. Evaporate the filtrate to dryness *in vacuo* and dissolve the residue in 2.0 ml of the solvent mixture.

Reference solution Dissolve 5.0 mg of *glycyrrhetic acid R* and 5.0 mg of *thymol R* in 5.0 ml of the solvent mixture.

Plate *TLC silica gel F_{254} plate R* (5-40 µm) [or *TLC silica gel F_{254} plate R* (2-10 µm)].

Mobile phase *concentrated ammonia R*, *water R*, *ethanol (96 per cent) R*, *ethyl acetate R* (1:9:25:65 *V/V/V/V*).

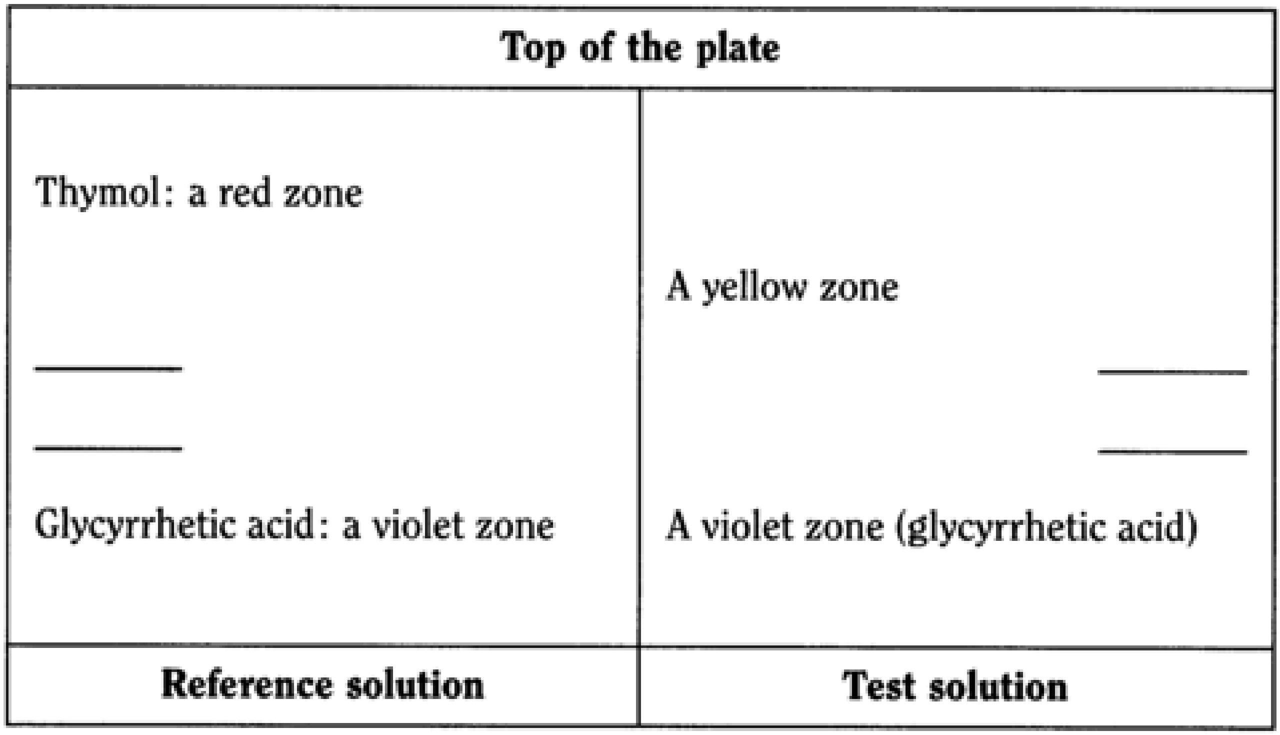
Application 20 µl [or 10 µl], as bands.

Development Over a path of 15 cm [or 7 cm].

Drying In air for 5 min.

Detection Spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
Thymol: a red zone	
	A yellow zone
———	———
———	———
Glycyrrhetic acid: a violet zone	A violet zone (glycyrrhetic acid)
Reference solution	**Test solution**

TESTS

Loss on drying ***(2.8.17)***

Maximum 7.0 per cent.

ASSAY

Liquid chromatography *(2.2.29)*.

Solvent mixture *water R*, *methanol R* (20:80 *V/V*).

Test solution Place 0.200 g of the extract to be examined in a 150 ml ground-glass conical flask. Add 100.0 ml of the solvent mixture and sonicate for 2 min. Filter through a membrane filter (nominal pore size 0.45 µm).

Reference solution Dissolve 50.0 mg of *monoammonium glycyrrhizate CRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 10.0 ml with the solvent mixture.

Column:

- *size:* *l* = 0.10 m, Ø = 4.0 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase *glacial acetic acid R*, *acetonitrile R*, *water R* (6:30:64 *V/V/V*).

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 254 nm.

Injection 10 µl.

Run time 3 times the retention time of 18β-glycyrrhizic acid.

Retention time 18β-glycyrrhizic acid = about 9 min.

Identification of peaks Use the chromatogram supplied with *monoammonium glycyrrhizate CRS* and the chromatogram obtained with the reference solution to identify the peaks due to 18β-glycyrrhizic acid and 18α-glycyrrhizic acid.

System suitability Reference solution:

— the chromatogram obtained with the reference solution is similar to the chromatogram supplied with *monoammonium glycyrrhizate CRS*;

— *resolution*: minimum 2.0 between the peaks due to 18β-glycyrrhizic acid and 18α-glycyrrhizic acid.

Calculate the percentage content of 18β-glycyrrhizic acid, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.979}{A_2 \times m_1 \times 5}$$

A_1 = area of the peak due to 18β-glycyrrhizic acid in the chromatogram obtained with the test solution

A_2 = area of the peak due to 18β-glycyrrhizic acid in the chromatogram obtained with the reference solution

m_1 = mass of the extract to be examined used to prepare the test solution, in grams

m_2 = mass of *monoammonium glycyrrhizate CRS* used to prepare the reference solution, in grams

p = percentage content of 18β-glycyrrhizic acid in *monoammonium glycyrrhizate CRS*

0.979 = peak correlation factor between glycyrrhizic acid and monoammonium glycyrrhizate.

Ph Eur

Liquorice Liquid Extract

General Notices

DEFINITION

Liquorice Liquid Extract is prepared by extracting Liquorice with Purified Water and adding sufficient Ethanol (90 per cent) to give an ethanol content of 18% v/v in the final extract.

Extemporaneous preparation

The following formula and directions apply.

Liquorice, unpeeled, in *coarse powder*	1000 g
Purified Water	A sufficient quantity
Ethanol (90 per cent)	A sufficient quantity

Exhaust the Liquorice with Purified Water by *percolation*, Appendix XI F. Boil the percolate for 5 minutes and set aside for not less than 12 hours. Decant the clear liquid, filter the remainder, mix the two liquids and evaporate until the *weight per ml* of the liquid is 1.198 g, Appendix V G. Add to this liquid, when cold, one quarter of its volume of Ethanol (90 per cent) . Allow to stand for not less than 4 weeks; filter.

The extract complies with the requirements stated under Extracts and with the following requirements.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using a suspension of *silica gel* GF_{254} in a 0.25% v/v solution of *orthophosphoric acid* to prepare the plate and a mixture of 5 volumes of *methanol* and 95 volumes of *chloroform* as the mobile phase. Apply separately to the plate 10 µl of solution (1) and 5 µl of solution (2). For solution (1) extract 5 ml of the liquid extract with 20 ml of *chloroform*. Heat 2.5 ml of the aqueous layer with 30 ml of 0.5M *sulphuric acid* under a reflux condenser for 1 hour, cool and extract with two 20 ml quantities of *chloroform*. Dry the combined chloroform extracts over *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness; dissolve the residue in 4 ml of a mixture of equal volumes of *chloroform* and *methanol*. For solution (2) dissolve 10 mg of *glycyrrhetinic acid* in 2 ml of a mixture of equal volumes of *chloroform* and *methanol*. After removal of the plate, examine it under *ultraviolet light (254 nm)*. The chromatogram obtained with solution (1) exhibits a dark spot corresponding to the principal spot in the chromatogram obtained with solution (2).

TESTS

Ethanol content

16 to 20% v/v, Appendix VIII F, Method III.

Ammonia

Place 5 ml in a distillation apparatus of about 500 ml capacity fitted with an efficient splash-head and a delivery tube that dips below the surface of a mixture of 10 ml of 0.05M *sulphuric acid VS* and 50 ml of *water* contained in the receiver. Add 200 ml of *water*, a little *pumice powder* and 30 ml of a solution prepared by dissolving 1.43 g of *potassium dihydrogen orthophosphate* and 9.1 g of *dipotassium hydrogen orthophosphate* in 100 ml of *water* and distil until about 175 ml of distillate has been collected. Titrate the excess of acid with 0.1M *sodium hydroxide VS* using *methyl red solution* as indicator. Not less than 5 ml of 0.1M *sodium hydroxide VS* is required.

Dry residue

40 to 45% w/v.

Relative density

1.125 to 1.140, Appendix V G.

Liquorice Root for use in THM

General Notices

Liquorice Root for use in use in Traditional Chinese Medicines

DEFINITION

Liquorice Root for use in THM is the dried unpeeled root and rhizome of *Glycyrrhiza uralensis* Fisch., *Glycyrrhiza inflata* Bat. or *Glycyrrhiza glabra* L.

It is collected in spring and autumn, separated from the rootlets and dried in the sun.

It contains not less than 2.0% of glycyrrhizic acid ($C_{42}H_{62}O_{16}$), calculated with reference to the dried material.

IDENTIFICATION

A. The root has few branches. Its bark is brownish-grey or brown with longitudinal striations and bears traces of lateral roots. The cylindrical stolons are 1-2 cm in diameter; their external appearance is similar to that of the root but there are occasional small buds. The fracture of the root and the stolon is granular and fibrous. The cork layer is thin; the secondary phloem region is thick and light yellow with radial striations. The yellow xylem cylinder is compact, with a radiate structure. The stolon has a central pith, which is absent from the root.

B. Reduce to a powder. The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution*. The powder shows abundant fibres occurring in groups, each group surrounded by a calcium oxalate prism crystal sheath, the individual fibres with very thick, partially lignified walls and few small pits; lignified bordered-pitted vessels, singly or in small groups and sometimes accompanied by lignified parenchymatous cells with moderately thickened and pitted walls, some of the individual vessels are very large, with pit apertures much elongated and the borders difficult to discern; prism crystals of calcium oxalate up to about 35 µm long occur scattered and in parenchymatous tissue; fragments of cork composed of thin-walled, slightly lignified polygonal cells. Examine under a microscope using 50% w/w glycerol in water. The powder shows abundant starch granules, mostly simple, spherical to ovoid, 3 µm to 20 µm in diameter.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 16 ml of water and 4 ml of *hydrochloric acid R1* to 0.5 g of the powdered drug, heat on a water-bath under reflux for 30 minutes, cool and filter. Dry the filter paper and residue in a flask at 105oC for 60 minutes, add 20 ml of ether, heat on a water-bath at 40ºC under reflux for 5 minutes, cool and filter. Evaporate the filtrate to dryness and dissolve the residue in 5 ml of ether.

(2) 0.1% w/v each of *glycyrrhetic acid* and *thymol* in ether.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating substance *silica gel* GF_{254} (Merck 10 x 20 cm plates are suitable).

(b) Mobile phase is a mixture of 1 volume of *concentrated ammonia*, 9 volumes of water, 25 volumes of *ethanol* (96%) and 65 volumes of *ethyl acetate*.

(c) Apply as a band, an application volume of 10 µl for each solution.

(d) Develop to 15 cm.

(e) Remove the plate and allow it to dry in air for 5 minutes. Examine under *ultraviolet light (254 nm)*. Spray the plate with *anisaldehyde solution* and heat at 100° to 105° for 10 minutes and examine in daylight.

SYSTEM SUITABILITY

Under ultra-violet light, the chromatogram obtained with solution (2) shows in the lower half a quenching zone due to glycyrrhetic acid. When sprayed, the chromatogram obtained with solution (2) shows in the lower half the violet zone of glycyrrhetic acid and in the upper third the red zone of thymol.

VALIDITY

The chromatogram obtained with solution (1) shows in the lower half a violet zone corresponding to the zone of glycyrrhetic acid in the chromatogram obtained with solution (2) and a yellow zone (isoliquiridigenine) in the upper third under the zone of thymol in the chromatogram obtained with solution (2). Further zones may be present.

TESTS

Total Ash

Not more than 7.0%, Appendix XI J, Method II.

Acid-insoluble ash

Not more than 2.0%, Appendix XI K, Method II.

Loss on drying

When dried for 2 hours at 100° to 105°, loses not more than 12.0%. Use 1 g.

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Mix 1 g of the powdered drug being examined with 100 ml of 0.8% w/v of *ammonia*, place in an ultrasonic bath for 30 minutes, centrifuge a part of the supernatant layer, dilute 1 ml to 5 ml with 0.8 % w/v of *ammonia* and filter through a 0.45-µm filter.

(2) 0.0065% w/v of *monoammonium glycyrrhizate EPCRS* in 0.8% w/v of *ammonia*.

(3) 0.013% w/v of *monoammonium glycyrrhizate EPCRS* in 0.8% w/v of *ammonia*.

(4) 0.0195% w/v of *monoammonium glycyrrhizate EPCRS* in 0.8% w/v of *ammonia*.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (12.5 cm × 4 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS SS is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1.5 ml per minute

(d) Ambient column temperature.

(e) Detection wavelength of 254 nm.

(f) Injection volume of 10 µl for each solution.

MOBILE PHASE

A mixture of 6 volumes of *glacial acetic acid*, 30 volumes of *acetonitrile* and 64 volumes of *water.*

SYSTEM SUITABILITY

The assay is not valid unless (a) the *column efficiency,* determined on the peak due to glycyrrhizic acid in the chromatogram obtained with solution (2), is at least 30,000 theoretical plates per metre and (b) the *symmetry factor* of the peak is not more than 1.3.

DETERMINATION OF CONTENT

Inject solution (4). Adjust the sensitivity of the system so that the height of the peaks are at least 50% of the full scale of the recorder. Inject solutions (2), (3) and (4) and determine the peak areas. Prepare a calibration curve with the concentration of the solutions (g per 100 ml) as the abscissa and the corresponding areas as the ordinate. Inject solution (1). Using the retention time and the peak area from the chromatograms obtained with solutions (2), (3) and (4), locate and integrate the peak due to glycyrrhizic acid in the chromatogram obtained with solution (1).

Calculate the percentage content of glycyrrhizic acid from the following expression:

$$A \times \frac{5}{m} \times B \times \frac{822}{840}$$

A = concentration of monoammonium glycyrrhizate in solution (1) determined from the calibration curve, in g per 100 ml,

B = declared percentage content of *monoammonium glycyrrhizate EPCRS*,

M = weight of the substance being examined in grams,

822 = molecular weight of glycyrrhizic acid,

840 = molecular weight of monoammonium glycyrrhizate (without any water of crystallisation).

STORAGE

Liquorice Root for use in THM should be protected from moisture.

Liquorice

General Notices

(Liquorice Root, Ph Eur monograph 0277)

Preparation

Liquorice Liquid Extract

When Powdered Liquorice is prescribed or demanded, material complying with the appropriate requirements below shall be dispensed or supplied.

Ph Eur

DEFINITION

Dried unpeeled or peeled, whole or cut root and stolons of *Glycyrrhiza glabra* L. and/or of *Glycyrrhiza inflata* Bat. and/or *Glycyrrhiza uralensis* Fisch.

Content

Minimum 4.0 per cent of glycyrrhizic acid ($C_{42}H_{62}O_{16}$; M_r 823) (dried drug).

IDENTIFICATION

A. The root has few branches. Its bark is brownish-grey or brown with longitudinal striations and bears traces of lateral roots. The cylindrical stolons are 1-2 cm in diameter; their external appearance is similar to that of the root but there are occasional small buds. The fracture of the root and the stolon is granular and fibrous. The cork layer is thin; the secondary phloem region is thick and light yellow with radial striations. The yellow xylem cylinder is compact, with a radiate structure. The stolon has a central pith, which is absent from the root. The external part of the bark is absent from the peeled root.

B. Reduce to a powder (355) (*2.9.12*). The powder is light yellow or faintly greyish. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of yellow thick-walled fibres, 700-1200 µm long and 10-20 µm wide with a punctiform lumen, often accompanied by crystal sheaths containing prisms of calcium oxalate 10-35 µm long and 2-5 µm wide. The walls of the large vessels are yellow, 5-10 µm thick, lignified and have numerous bordered pits with a slit-shaped aperture; fragments of cork consisting of thin-walled cells and isolated prisms of calcium oxalate occur as well as fragments of parenchymatous tissue. Fragments of cork are absent from the peeled root. Examine under a microscope using a mixture of equal volumes of *glycerol R* and *water R*. The powder shows the following diagnostic characters: simple, round or oval starch granules, 2-20 µm in diameter.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 0.50 g of the powdered drug (180) (*2.9.12*) in a 50 ml round-bottomed flask add 16.0 ml of *water R* and 4.0 ml of *hydrochloric acid R1* and heat on a water-bath under a reflux condenser for 30 min. Cool and filter. Dry the filter and the round-bottomed flask at 105

°C for 60 min. Place the filter in the round-bottomed flask, add 20.0 ml of *ether R* and heat in a water-bath at 40 °C under a reflux condenser for 5 min. Cool and filter. Evaporate the filtrate to dryness. Dissolve the residue in 5.0 ml of *ether R*.

Reference solution Dissolve 5.0 mg of *glycyrrhetic acid R* and 5.0 mg of *thymol R* in 5.0 ml of *ether R*.

Plate *TLC silica gel* F_{254} *plate R*.

Mobile phase *concentrated ammonia R*, *water R*, *ethanol (96 per cent) R*, *ethyl acetate R* (1:9:25:65 *V/V/V/V*).

Application 10 µl.

Development Over a path of 15 cm.

Drying In air for 5 min.

Detection A Examine in ultraviolet light at 254 nm.

Results A The chromatograms obtained with the test solution and with the reference solution show in the lower half a quenching zone due to glycyrrhetic acid.

Detection B Spray with *anisaldehyde solution R*, and heat at 100-105 °C for 5-10 min; examine in daylight.

Results B The chromatogram obtained with the reference solution shows in the lower half a violet zone due to glycyrrhetic acid and in the upper third a red zone due to thymol. The chromatogram obtained with the test solution shows in the lower half a violet zone corresponding to the zone of glycyrrhetic acid in the chromatogram obtained with the reference solution and a yellow zone (isoliquiridigenine) in the upper third under the zone of thymol in the chromatogram obtained with the reference solution. Further zones may be present.

TESTS

Loss on drying (*2.2.32*)

Maximum 10.0 per cent, determined on 1.000 g of powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 10.0 per cent for the unpeeled drug and maximum 6.0 per cent for the peeled drug.

Ash insoluble in hydrochloric acid (*2.8.1*)

Maximum 2.0 per cent for the unpeeled drug and maximum 0.5 per cent for the peeled drug.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution Place 1.000 g of the powdered drug (180) (*2.9.12*) in a 150 ml ground glass conical flask. Add 100.0 ml of an 8 g/l solution of *ammonia R* and treat in a ultrasonic bath for 30 min. Centrifuge a part of the solution and dilute 1.0 ml of the supernatant layer to 5.0 ml with an 8 g/l solution of *ammonia R*. Filter the solution through a filter (0.45 µm) and use the filtrate as the test solution.

Solution A Dissolve 0.130 g of *monoammonium glycyrrhizate CRS* in an 8 g/l solution of *ammonia R* and dilute to 100.0 ml with the same solvent.

Reference solution (a) Dilute 5.0 ml of solution A to 100.0 ml with an 8 g/l solution of *ammonia R*.

Reference solution (b) Dilute 10.0 ml of solution A to 100.0 ml with an 8 g/l solution of *ammonia R*.

Reference solution (c) Dilute 15.0 ml of solution A to 100.0 ml with an 8 g/l solution of *ammonia R*.

Column:

— *size:* l = 0.10 m, Ø = 4 mm;

— *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase *glacial acetic acid R*, *acetonitrile R*, *water R* (6:30:64 *V/V/V*).

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 254 nm.

Injection 10 µl.

Establish a calibration curve with the concentration of the reference solutions (g/100 ml) as the abscissa and the corresponding areas as the ordinate.

Using the retention time and the peak area determined from the chromatograms obtained with the reference solutions, locate and integrate the peak due to glycyrrhizic acid in the chromatogram obtained with the test solution.

Calculate the percentage content of glycyrrhizic acid from the following expression:

$$A \times \frac{5}{m} \times B \times \frac{822}{840}$$

A = concentration of monoammonium glycyrrhizate in the test solution determined from the calibration curve, in g/100 ml;

B = declared percentage content of *monoammonium glycyrrhizate CRS;*

m = mass of the drug, in grams;

822 = molecular weight of glycyrrhizic acid;

840 = molecular weight of the monoammonium glycyrrhizate (without any water of crystallisation).

LABELLING

The label states whether the drug is peeled or unpeeled.

Ph Eur

Loosestrife

General Notices

(Ph Eur monograph 1537)

Ph Eur

DEFINITION

Dried flowering tops, whole or cut, of *Lythrum salicaria* L.

Content

Minimum 5.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1) (dried drug).

IDENTIFICATION

A. The stems are rigid, four-angled, branching at the top, brownish-green, longitudinally wrinkled and pubescent. The leaves are opposite, decussate, rarely verticillate in threes and sometimes alternate at the inflorescence which forms a long terminal spike. The leaves are sessile, lanceolate and cordate at the base, 5-15 cm long and 1-2.5 cm wide, pubescent on the lower surface; the subsidiary veins form arcs that anastomose near the leaf margin. The flowers have a pubescent, tubular, persistent gamosepalous calyx, 4-8 mm long, consisting of 6 sepals bearing 6 small, triangular teeth alternating with 6 large acute teeth at least half as long as the tube; a polypetalous corolla consisting of 6 violet-pink petals, each expanded at the top with a wavy outline and narrowing at the base. The androecium consists of 2 verticils of 6 stamens (one verticil with short, barely emerging stamens, the other with long stamens extending well out of the corolla). The fruit, if formed, is a small capsule included in the persistent calyx.

B. Reduce to a powder (355) (*2.9.12*). The powder is greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: unicellular or bicellular, uniseriate, thick-walled, finely pitted covering trichomes from the lower epidermis of the stem and leaf; numerous uniseriate, unicellular or bicellular, thin-walled, finely pitted covering trichomes from the calyx; transparent violet-pink fragments from the petals; numerous cluster crystals of calcium oxalate; pollen grains with 3 pores and a thin and slightly granular exine; fragments of the upper epidermis with large polygonal cells and sinuous walls; fragments of the lower epidermis with smaller polygonal cells and anomocytic stomata (*2.8.3*).

C. Thin-layer chromatography (*2.2.27*).

Test solution To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *methanol R* and heat in a water-bath at 65 °C for 5 min with frequent shaking. Cool and filter. Dilute the filtrate to 10 ml with *methanol R*.

Reference solution Dissolve 0.5 mg of *chlorogenic acid R*, 1 mg of *hyperoside R*, 1 mg of *rutin R* and 1 mg of *vitexin R* in 10 ml of *methanol R*.

Plate *TLC silica gel plate R*.

Mobile phase *anhydrous acetic acid R*, *anhydrous formic acid R*, *water R*, *ethyl acetate R* (7.5:7.5:18:67 *V/V/V/V*).

Application 10 µl as bands.

Development Over a path of 15 cm.

Drying At 100-105 °C.

Detection Spray the plate while still warm with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow to dry in air for 30 min and examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the reference solution shows in the lower third a yellowish-brown fluorescent zone due to rutin and in the middle third a light blue fluorescent zone due to chlorogenic acid, above it a yellowish-brown fluorescent zone due to hyperoside and a green fluorescent zone due to vitexin. The chromatogram obtained with the test solution shows a bright green fluorescent zone slightly above the zone due to rutin in the chromatogram obtained with the reference solution, a yellow fluorescent zone similar in position to the zone due to chlorogenic acid in the chromatogram obtained with the reference solution, a yellow fluorescent zone similar in position to the zone due to hyperoside in the chromatogram obtained with the reference solution and a bright green fluorescent zone corresponding to the zone due to vitexin in the chromatogram obtained with the reference solution.

TESTS

Loss on drying (*2.2.32*)

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C.

Total ash (*2.4.16*)

Maximum 7.0 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs (*2.8.14*). Use 0.750 g of the powdered drug (180) (*2.9.12*).

Ph Eur

Lovage Root

General Notices

(Ph Eur monograph 1233)

Ph Eur

DEFINITION

Whole or cut, dried rhizome and root of *Levisticum officinale* Koch.

Content

Minimum 4.0 ml/kg of essential oil for the whole drug and minimum 3.0 ml/kg of essential oil for the cut drug (dried drug).

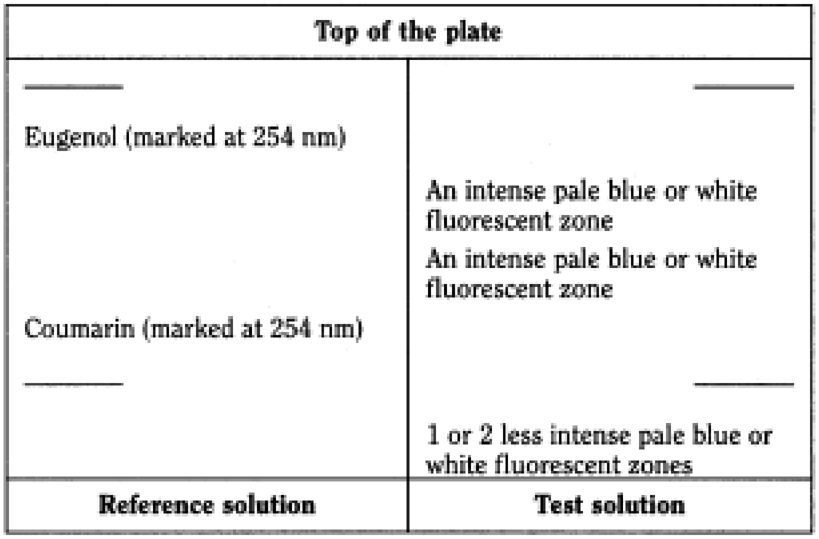
IDENTIFICATION

A. The rhizome and the large roots are often split longitudinally. The rhizome is short, up to 5 cm in diameter, light greyish-brown or yellowish-brown, simple or with several protuberances; the roots, showing little ramification, are the same colour as the rhizome; they are usually up to 1.5 cm thick and up to about 25 cm long; the fracture is usually smooth and shows a very wide yellowish-white bark and a narrow brownish-yellow wood.

B. Reduce to a powder (355) (*2.9.12*). The powder is brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: cork cells, polygonal or rounded in surface view, with brown contents; abundant parenchyma, mostly thin-walled and rounded but some with thicker walls; groups of small, reticulately thickened vessels embedded in small-celled, unlignified parenchyma; fragments of larger vessels with reticulate thickening, up to 125 µm in diameter; fragments of secretory canals up to 180 µm wide. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows starch granules, simple, rounded or ovoid, up to about 12 µm, and numerous larger, compound granules, many with several components.

C. Examine the chromatograms obtained in the test for angelica root.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
———	———
Eugenol (marked at 254 nm)	
	An intense pale blue or white fluorescent zone
	An intense pale blue or white fluorescent zone
Coumarin (marked at 254 nm)	
———	———
	1 or 2 less intense pale blue or white fluorescent zones
Reference solution	**Test solution**

TESTS

Angelica root

Thin-layer chromatography (*2.2.27*).

Test solution To 1.0 g of the freshly powdered drug (355) (*2.9.12*) add 5 ml of *methanol R* and boil for 30 s. Cool and filter.

Reference solution Dissolve 5 mg of *coumarin R* and 25 µl of *eugenol R* in 10 ml of *methanol R*.

Plate *TLC silica gel F_{254} plate R*.

Mobile phase *methylene chloride R*, *toluene R* (50:50 *V/V*).

Application 20 µl, as bands.

Development Twice over a path of 10 cm.

Drying In air.

Detection Examine in ultraviolet light at 254 nm. Mark the quenching zones due to coumarin and eugenol on the chromatogram obtained with the reference solution. Examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the test solution shows no blue or yellow fluorescent zones in the lower third.

Foreign matter (*2.8.2*)

Maximum 3 per cent, determined on 50 g.

Loss on drying (*2.2.32*)

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 8.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*)

Maximum 2.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs (*2.8.12*). Use a 2 litre flask, 10 drops of *liquid paraffin R*, 500 ml of *water R* as the distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Reduce the drug to a powder (500) (*2.9.12*) and immediately use 40.0 g for the determination. Distil at a rate of 2-3 ml/min for 4 h.

Ph Eur

Mallow Flower

General Notices

(Ph Eur monograph 1541)

Ph Eur

DEFINITION

Whole or fragmented dried flower of *Malva sylvestris* L. or its cultivated varieties.

IDENTIFICATION

A. The flower consists of an epicalyx with 3 oblong or elliptical-lanceolate parts that are shorter than those of the calyx and situated immediately below it; a calyx with 5 pubescent triangular lobes, gamosepalous at the base; a corolla 3-4 times longer than the calyx with 5 wedge-shaped, notched petals fused to the staminal tube at their base; numerous stamens, the filaments of which fuse into a staminal tube covered by small star-shaped trichomes and occasional simple trichomes visible using a lens; numerous wrinkled carpels, glabrous or sometimes pubescent, enclosed in the staminal tube and arranged into a circle around a central style ending with numerous filiform stigmas. In cultivated varieties, the epicalyx is 3-7 partite, the calyx 5-8 partite and the corolla 5-10 partite.

B. Reduce to a powder (355) (*2.9.12*). The powder is bluish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: unicellular, thick-walled, stiff trichomes, up to 2 mm in length; small unicellular covering trichomes, somewhat curved, either isolated or in small star-shaped groups of 2-6; capitate glandular trichomes with multicellular heads; mesophyll fragments with vessels accompanied by cluster crystals of calcium oxalate; spherical pollen grains, about 150 µm in diameter, with a roughly spiny exine.

When mounted with *ethanol (96 per cent) R*, numerous elongated cells containing mucilage are seen in the petal fragments.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 1 g of the powdered drug (355) (*2.9.12*) add 10 ml of *ethanol (60 per cent V/V) R*. Stir for 15 min and filter.

Reference solution A 0.5 g/l solution of *quinaldine red R* in *ethanol (96 per cent) R*.

Plate *TLC silica gel plate R.*

Mobile phase *acetic acid R*, *water R*, *butanol R* (15:30:60 *V/V/V*).

Application 10 µl of the test solution and 5 µl of the reference solution, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Examine in daylight.

Results The chromatogram obtained with the reference solution shows an orange-red zone in the upper part of the middle third. The chromatogram obtained with the test solution shows, below the zone in the chromatogram obtained with the reference solution, 2 violet zones in the middle third; the principal zone (6″-malonyl malvin) is situated just below the other violet zone (malvin).

TESTS

Loss on drying (*2.2.32*)

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug by drying in an oven at 105 °C.

Total ash (*2.4.16*)

Maximum 14.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*)

Maximum 2.0 per cent.

Swelling index (*2.8.4*)

Minimum 15, determined on 0.2 g of the powdered drug (710) (*2.9.12*) humidified with 0.5 ml of *anhydrous ethanol R*.

Ph Eur

Mandarin Oil

General Notices

(Ph Eur monograph 2355)

Ph Eur

DEFINITION

Essential oil obtained without heating, by suitable mechanical treatment, from the peel of the fresh fruit of *Citrus reticulata* Blanco.

CHARACTERS

Appearance

Greenish, or yellow to reddish orange liquid showing blue fluorescence.

It has a characteristic odour.

IDENTIFICATION

First identification B.

Second identification A.

A. Thin-layer chromatography (*2.2.27*).

Test solution Dilute 0.1 ml of the substance to be examined to 1 ml with *toluene R*.

Reference solution Dissolve 2 µl of *methyl N-methylanthranilate R*, 4 mg of *guaiazulene R* and 10 mg of α-*terpineol R* in 10 ml of *toluene R*.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *ethyl acetate* R, *toluene R* (15:85 *V/V*).

Application 10 µl [or 2 µl] as bands.

Development Over a path of 15 cm [or 6 cm].

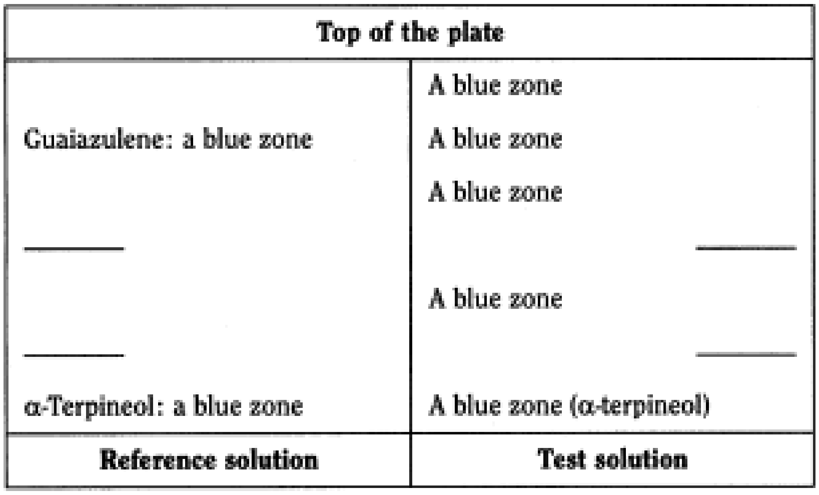
Drying In air.

Detection A Examine in ultraviolet light at 365 nm.

Results A The intense blue fluorescent zone in the chromatogram obtained with the test solution is similar in position and fluorescence to the zone due to methyl *N*-methylanthranilate in the chromatogram obtained with the reference solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Detection B Spray with a 200 g/l solution of *phosphomolybdic acid R* in *ethanol (96 per cent) R* and heat at 100 °C for 10 min; examine in daylight.

Results B See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate

_______	_______
α-Terpineol: a blue zone	A blue zone (α-terpineol)
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (*2.2.5*)

0.848 to 0.855.

Refractive index (*2.2.6*)

1.474 to 1.478.

Optical rotation (*2.2.7*)

+ 64 ° to + 75 °.

Fatty oils and resinified essential oils (*2.8.7*)

It complies with the test.

Chromatographic profile

Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution Dilute 0.20 g of the substance to be examined to 10.0 ml with *heptane R*.

Reference solution (a) Dilute 5 µl of α-*pinene R*, 5 µl of *sabinene R*, 5 µl of β-*pinene R*, 5 µl of β-*myrcene R*, 5 µl of *p-cymene R*, 70 µl of *limonene R*, 20 µl of γ-*terpinene R* and 5 µl of *methyl N-methylanthranilate R* to 5.0 ml with *heptane R*.

Reference solution (b) Dissolve 5 µl of *limonene R* in 50 ml of *heptane R*. Dilute 0.5 ml of this solution to 5.0 ml with *heptane R*.

Column:

- *material*: fused silica;
- *size:* l = 60 m, Ø = 0.25 mm;
- *stationary phase*: *poly(dimethyl)(diphenyl)siloxane R* (film thickness 0.25 µm).

Carrier gas *helium for chromatography R*.

Flow rate 1.4 ml/min.

Split ratio 1:70.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 90	50 → 230
Injection port		250
Detector		250

Detection Flame ionisation.

Injection 1 µl.

Elution order Order indicated in the composition of reference solution (a); record the retention times of these substances.

System suitability Reference solution (a):

- *resolution*: minimum 1.5 between the peaks due to sabinene and β-pinene and minimum 1.5 between the peaks due to *p*-cymene and limonene.

Identification of components Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution. Disregard the peak due to heptane.

Determine the percentage content of each of these components. The limits are within the following ranges:

- α-*pinene*: 1.6 per cent to 3.0 per cent;
- *sabinene*: less than 0.3 per cent;
- β-*pinene*: 1.2 per cent to 2.0 per cent;
- β-*myrcene*: 1.5 per cent to 2.0 per cent;
- *p-cymene*: less than 1.0 per cent;
- *limonene*: 65.0 per cent to 75.0 per cent;
- γ-*terpinene*: 16.0 per cent to 22.0 per cent;
- *methyl N-methylanthranilate*: 0.30 per cent to 0.60 per cent;
- *disregard limit*: area of the principal peak in the chromatogram obtained with reference solution (b).

Residue on evaporation (*2.8.9*)

1.6 per cent to 4.0 per cent, determined after heating on a water-bath for 4 h.

STORAGE

In a well-filled, airtight container , protected from light, at a temperature not exceeding 25 °C.

Ph Eur

Marshmallow Leaf

General Notices

(Ph Eur monograph 1856)

Ph Eur

DEFINITION

Whole or cut dried leaf of *Althaea officinalis* L.

IDENTIFICATION

A. The leaves have long petioles and are about 7-10 cm long; the lamina is cordate or ovate with 3-5 shallow lobes and crenate or dentate margins; the venation is palmate. The petioles and both surfaces of the lamina are greyish-green and densely pubescent. Rarely, fragments of the inflorescence or immature fruits may be present.

B. Reduce to a powder (355) (*2.9.12*). The powder is greyish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: numerous long, rigid, unicellular covering trichomes with thick walls, pointed at the apex, angular and pitted at the base where they are sometimes still united to form stellate structures with up to 8 components; few secretory trichomes with unicellular stalks and globular, multicellular heads; fragments of the leaf epidermis with anomocytic or paracytic stomata (*2.8.3*); cluster crystals of calcium oxalate, isolated or in the parenchyma of the mesophyll; fragments of veins with small, spiral or annular vessels. Examine under a microscope using *ruthenium red solution R*. The powder shows groups of parenchyma containing mucilage which stains orange-red.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 1 g of the powdered drug (355) (*2.9.12*) add 10 ml of *methanol R*. Heat in a water-bath under a reflux condenser for 5 min. Cool and filter. Distil the filtrate under reduced pressure until the total volume is about 2 ml.

Reference solution Dissolve 2.5 mg of *quercitrin R* and 2.5 mg of *chlorogenic acid R* in 10 ml of *methanol R*.

Plate TLC silica gel plate R.

Mobile phase anhydrous formic acid R, *glacial acetic acid R*, *water R, ethyl acetate R* (11:11:27:100 *V/V/V/V*).

Application 10 µl, as bands.

Development Over a path of 15 cm.

Drying At 100–105 °C.

Detection Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow to dry in air for 30 min.

Examine in ultraviolet light at 365 nm.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

TESTS

Foreign matter (*2.8.2*)

Maximum 4 per cent of leaves infected by *Puccinia malvacearum*, showing red spots and maximum 2 per cent of other foreign matter.

Loss on drying (*2.2.32*)

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 18.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*)

Maximum 2.0 per cent.

Swelling index (*2.8.4*)

Minimum 12, determined on 0.2 g of the powdered drug (355) (*2.9.12*).

Ph Eur

Marshmallow Root

General Notices

(Ph Eur monograph 1126)

Ph Eur

DEFINITION

Peeled or unpeeled, whole or cut, dried root of *Althaea officinalis* L.

IDENTIFICATION

A. The unpeeled, non-fragmented drug consists of cylindrical, slightly twisted roots, up to 2 cm thick, with deep longitudinal furrows. The outer surface is greyish-brown and bears numerous rootlet scars. The fracture is fibrous externally, rugged and granular internally. The section shows a more or less thick, whitish bark with brownish periderm, separated by the well-marked, brownish cambium from a white xylem. The stratified structure of the bark and the radiate structure of xylem become more distinct when moistened.

The peeled drug has a greyish-white, finely fibrous outer surface. Cork and external cortical parenchyma are absent.

B. Reduce to a powder (355) (*2.9.12*). The powder is brownish-grey (unpeeled root) or whitish (peeled root). Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of colourless, mainly unlignified, thick-walled fibres with pointed or split ends; fragments of bordered, pitted or scalariformly thickened vessels; cluster crystals of calcium oxalate about 20-35 µm, mostly 25-30 µm in size; parenchymatous cells containing mucilage; fragments of cork with thin-walled, tabular cells in the unpeeled root. Examine under a microscope using *water R*. The powder shows numerous starch granules about 3-25 µm in size occasionally with a longitudinal hilum. The starch grains are mostly simple, a few being 2-4 compound.

TESTS

Foreign matter (*2.8.2*)

Maximum 2 per cent of brown deteriorated drug.

Loss on drying (*2.2.32*)

Maximum 12.0 per cent, determined on 1.000 g of powdered drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 6.0 per cent for the peeled root and maximum 8.0 per cent for the unpeeled root.

Swelling index (*2.8.4*)

Minimum 10, determined on the powdered drug (710) (*2.9.12*).

Ph Eur

Mastic

General Notices

(Ph Eur monograph 1876)

Ph Eur

DEFINITION

Dried resinous exudate obtained from stems and branches of *Pistacia lentiscus* L. var. *latifolius* Coss.

Content

Minimum 10 ml/kg of essential oil (anhydrous drug).

IDENTIFICATION

A. Small light yellow to greenish-yellow, non-uniform, spherical or pyriform, clear or opaque, hard glassy fragments.

B. Thin-layer chromatography (*2.2.27*).

Test solution Dissolve 1 g of the substance to be examined in 10 ml of *methylene chloride R* and filter after 1-2 min.

Reference solution Dissolve 25 mg of *eugenol R* and 25 mg of *borneol R* in 3 ml of *methylene chloride R*.

Plate TLC silica gel plate R.

Mobile phase light petroleum R, *toluene R* (5:95 *V/V*).

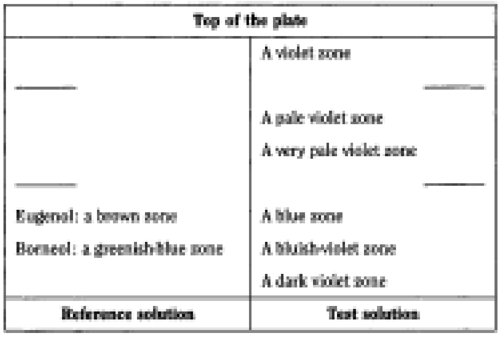
Application 1 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with *vanillin reagent R* and heat at 100-105 °C for 5 min.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones of various colours may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A violet zone
———	———
	A pale violet zone
	A very pale violet zone
———	———
Eugenol: a brown zone	A blue zone
Borneol: a greenish/blue zone	A bluish-violet zone
	A dark violet zone
Reference solution	**Test solution**

TESTS

Acid value (*2.5.1*)

50 to 70, determined on 1.0 g.

Water (*2.2.13*)

Maximum 10 ml/kg, determined on 25.0 g of the drug reduced to a coarse powder (1400) (*2.9.12*).

Total ash (*2.4.16*)

Maximum 0.5 per cent.

ASSAY

Essential oil (*2.8.12*)

Use a 500 ml round-bottomed flask and 200 ml of *water R* as the distillation liquid. Reduce the drug to a coarse powder (1400) (*2.9.12*) and immediately use 20.0 g for the determination. Introduce 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

STORAGE

Do not powder.

Ph Eur

Matricaria Flowers

General Notices

(Matricaria Flower, Ph Eur monograph 0404)

Ph Eur

DEFINITION

Dried capitula of *Matricaria recutita* L. (*Chamomilla recutita* (L.) Rauschert).

Content:

— *blue essential oil*: minimum 4 ml/kg (dried drug);

— *total apigenin 7-glucoside* ($C_{21}H_{20}O_{10}$): minimum 0.25 per cent (dried drug).

IDENTIFICATION

A. Capitula, when spread out, consisting of an involucre made up of many bracts arranged in 1-3 rows; an elongated-conical receptacle, occasionally hemispherical (young capitula); 12-20 marginal ligulate florets with a white ligule; several dozen yellow central tubular florets. The involucre bracts are ovate or lanceolate, with a brownish-grey scarious margin. The receptacle is hollow, without paleae. The corolla of the ligulate florets has a brownish-yellow tube at the base extending to form a white, elongated-oval ligule. The inferior ovary is dark brown, ovoid or spherical, and has a long style and bifid stigma. The tubular florets are yellow and have a five-toothed corolla tube, 5 syngenesious, epipetalous stamens and a gynoecium similar to that of the ligulate florets.

B. Separate the capitulum into its different parts. Examine under a microscope using *chloral hydrate solution R*. The bracts have a margin composed of thin-walled cells and a central region composed of elongated sclereids with occasional stomata (*2.8.3*). The inner epidermis of the corolla of the ligulate florets, in surface view, consisting of thin-walled, polygonal cells, slightly papillose, those of the outer epidermis markedly sinuous and strongly striated; corolla of the tubular florets with longitudinally elongated epidermal cells, and with small groups of papillae near the apex of the lobes. Glandular trichomes each consisting of a short stalk and a head of 2-3 tiers of 2 cells each occur on the outer surfaces of the bracts and on the corollas of both types of florets. The ovaries have a sclerous ring at the base and the wall is composed of vertical bands of thin-walled, longitudinally elongated cells with numerous glandular trichomes, alternating with fusiform groups of small, radially elongated cells containing mucilage. The cells at the apex of the stigmas are extended to form rounded papillae. Numerous small, cluster crystals of calcium oxalate occur in the inner tissues of the ovaries and the anther lobes. Pollen grains spherical to triangular, about 30 µm in diameter with 3 pores and a spiny exine.

C. Thin-layer chromatography (*2.2.27*).

Test solution Dilute 50 µl of essential oil obtained in the assay of essential oil in 1 ml of *xylene R*.

Reference solution Dissolve 2 µl of *chamazulene R*, 5 µl of *(−)-α-bisabolol R* and 10 mg of *bornyl acetate R* in 5 ml of *toluene R*.

Plate *TLC silica gel plate R.*

Mobile phase *ethyl acetate R*, *toluene R* (5:95 *V/V*).

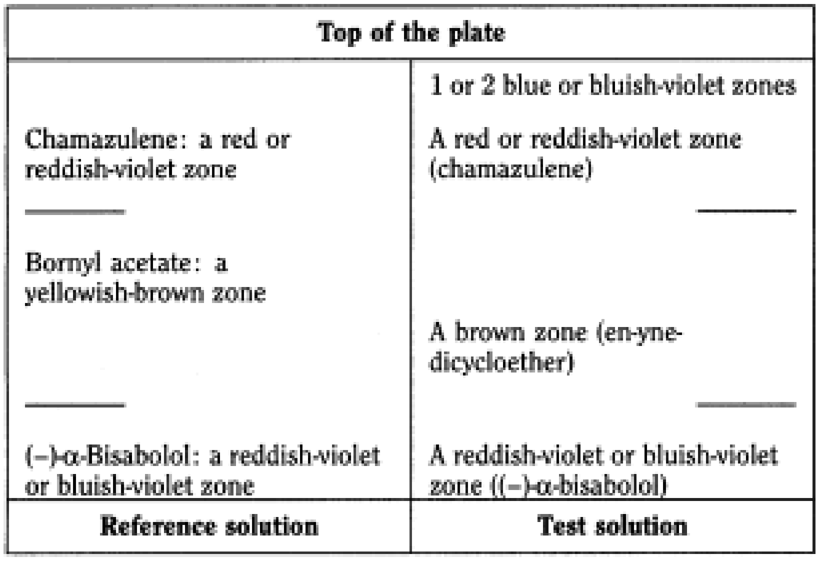
Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min. Examine immediately in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.



Top of the plate	
	1 or 2 blue or bluish-violet zones
Chamazulene: a red or reddish-violet zone	A red or reddish-violet zone (chamazulene)
Bornyl acetate: a yellowish-brown zone	
	A brown zone (en-yne-dicycloether)
(−)-α-Bisabolol: a reddish-violet or bluish-violet zone	A reddish-violet or bluish-violet zone ((−)-α-bisabolol)
Reference solution	**Test solution**

TESTS

Broken drug

Maximum 25 per cent, determined on 20.0 g, passes through a sieve (710) (*2.9.12*).

Loss on drying (*2.2.32*)

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 13.0 per cent.

ASSAY

Essential oil (*2.8.12*)

Use 30 g of whole drug, a 1000 ml flask, 300 ml of *water R* as distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 3-4 ml/min for 4 h. Towards the end of this period, stop the flow of water to the condenser assembly but continue distilling until the blue, steam-volatile components have reached the lower end of the condenser. Immediately re-start the flow of water to the condenser assembly to avoid warming the separation space. Stop the distillation after a further 10 min.

Total apigenin 7-glucoside

Liquid chromatography (*2.2.29*).

Test solution Reduce 40 g of the drug to a powder (500) (*2.9.12*). Place 2.00 g of the powdered drug in a 500 ml round-bottomed flask. Add 200 ml of *ethanol (96 per cent) R*. Heat the mixture under a reflux condenser on a water-bath for 15 min. Cool and filter. Rinse the filter and the residue with a few millilitres of *ethanol (96 per cent) R*. To the filtrate add 10 ml of freshly prepared *dilute sodium hydroxide solution R* and heat the mixture under a reflux condenser on a water-bath for about 1 h. Cool. Dilute to 250.0 ml with *ethanol (96 per cent) R*. To 50.0 ml of the solution add 0.5 g of *citric acid R*. Shake for 5 min and filter. Dilute 5.0 ml of this solution to 10.0 ml with the mobile phase (initial mixture).

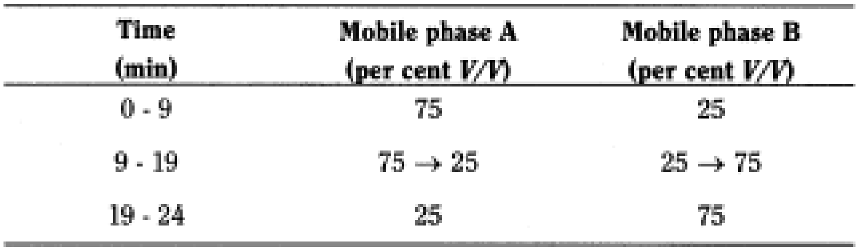
Reference solution (a) Dissolve 10.0 mg of *apigenin 7-glucoside R* in 100.0 ml of *methanol R*. Dilute 25.0 ml of this solution to 200.0 ml with the mobile phase (initial mixture).

Reference solution (b) Dissolve 10.0 mg of *5,7-dihydroxy-4-methylcoumarin R* in 100.0 ml of *methanol R*. Dilute 25.0 ml of this solution to 100.0 ml of the mobile phase (initial mixture). To 4.0 ml of this solution add 4.0 ml of reference solution (a) and dilute to 10.0 ml with the mobile phase (initial mixture).

Precolumn:
- *size: l* = 8 mm, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Column:
- *size: l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:
- *mobile phase A*: *phosphoric acid R*, *water R* (0.5:99.5 *V/V*);
- *mobile phase B*: *phosphoric acid R, acetonitrile R* (0.5:99.5 *V/V*).



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 9	75	25
9 - 19	75 → 25	25 → 75
19 - 24	25	75

Flow rate 1 ml/min.

Detection Spectrophotometer at 340 nm.

Injection 20 µl.

System suitability Reference solution (b):

— *resolution*: minimum 1.8 between the peaks due to apigenin 7-glucoside and 5,7-dihydroxy-4-methylcoumarin.

Calculate the percentage content of total apigenin 7-glucoside using the following expression:

$$\frac{A_1 \times m_2}{A_2 \times m_1} \times P \times 0.625$$

A_1 = area of the peak due to apigenin 7-glucoside in the chromatogram obtained with the test solution;

A_2 = area of the peak due to apigenin 7-glucoside in the chromatogram obtained with the reference solution;

m_1 = mass of the drug in the test solution, in grams;

m_2 = mass of *apigenin 7-glucoside R* in reference solution (a), in grams;

P = percentage content of apigenin 7-glucoside in the reagent.

Ph Eur

Matricaria Liquid Extract

General Notices

(Ph Eur monograph 1544)

Ph Eur

DEFINITION

Liquid extract produced from *Matricaria flower (0404)*.

Content

Minimum 0.30 per cent of blue residual oil.

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure for liquid extracts using a mixture of 2.5 volumes of a 10 per cent *m/m* solution of ammonia (NH_3), 47.5 volumes of water and 50 volumes of ethanol (96 per cent).

CHARACTERS

Appearance

Brownish, clear liquid.

Intense characteristic odour and characteristic bitter taste.

Solubility

Miscible with water and with ethanol (96 per cent) with development of turbidity, soluble in ethanol (50 per cent *V/V*).

IDENTIFICATION

A. Thin-layer chromatography *(2.2.27)*.

Test solution Place 10 ml of the extract to be examined in a separating funnel and shake with 2 quantities, each of 10 ml, of *pentane R*. Combine the pentane layers, dry over 2 g of *anhydrous sodium sulphate R* and filter. Evaporate the filtrate to dryness on a water-bath and dissolve the residue in 0.5 ml of *toluene R*.

Reference solution Dissolve 4 mg of *guaiazulene R*, 20 mg of *(-)-α-bisabolol R* and 20 mg of *bornyl acetate R* in 10 ml of *toluene R*.

Plate *TLC silica gel F_{254} plate R.*

Mobile phase *ethyl acetate R, toluene R* (5:95 *V/V*).

Application 10 µl as bands.

Development Over a path of 10 cm.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

Results A The chromatogram obtained with the test solution shows several quenching zones, of which 2 main zones are in the middle third (en-yne-dicycloether).

Detection B Examine in ultraviolet light at 365 nm.

Results B The chromatogram obtained with the test solution shows in the middle part an intense blue fluorescent zone (herniarin).

Detection C Spray with *anisaldehyde solution R* and examine in daylight while heating at 100-105 °C for 5-10 min.

Results C The chromatogram obtained with the reference solution shows in the lower third a reddish-violet or bluish-violet zone ((-)-α-bisabolol), in the middle third a yellowish-brown or greyish-green zone (bornyl acetate) and in the upper third a red or reddish-violet zone (guaiazulene). The chromatogram obtained with the test solution shows in the lower third yellowish-brown or greenish-yellow and violet zones and a reddish-violet or bluish-violet zone due to (-)-α-bisabolol in the chromatogram obtained with the reference solution; a brownish zone (en-yne-dicycloether) similar in position to the zone due to bornyl acetate in the chromatogram obtained with the reference solution; a red or reddish-violet zone (chamazulene) corresponding to guaiazulene in the chromatogram obtained with the reference solution and immediately above it 1 or 2 blue or bluish-violet zones; further weak zones may be present in the chromatogram obtained with the test solution.

B. Thin-layer chromatography *(2.2.27)*.

Test solution The extract to be examined.

Reference solution Dissolve 1.0 mg of *chlorogenic acid R*, 2.5 mg of *hyperoside R* and 2.5 mg of *rutin R* in 10 ml of *methanol R*.

Plate *TLC silica gel plate R.*

Mobile phase *anhydrous formic acid R*, *glacial acetic acid R*, *water R*, *ethyl acetate R* (7.5:7.5:18:67 *V/V/V/V*).

Application 10 µl as bands.

Development Over a path of 15 cm.

Drying At 100-105 °C.

Detection Spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*; subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*; allow to dry in air for about 30 min and examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the reference solution shows in the middle part a light blue fluorescent zone (chlorogenic acid), below it a yellowish-brown fluorescent zone (rutin) and above it a yellowish-brown fluorescent zone (hyperoside). The chromatogram obtained with the test solution shows a yellowish-brown fluorescent zone corresponding to the zone of rutin in the chromatogram obtained with the reference solution, a light blue fluorescent zone corresponding to the zone of chlorogenic acid in the chromatogram obtained with the reference solution, a yellowish-brown fluorescent zone similar in position to the zone of hyperoside in the chromatogram obtained with the reference solution; it also shows above the yellowish-brown fluorescent zone a green fluorescent zone, then several bluish or greenish fluorescent zones and near the solvent front a yellowish fluorescent zone.

TESTS

Ethanol *(2.9.10)*

38 per cent *V/V* to 53 per cent *V/V*.

Dry residue *(2.8.16)*

Minimum 12.0 per cent.

ASSAY

Place 20.0 g in a 1000 ml round-bottomed flask, add 300 ml of *water R* and distil until 200 ml has been collected in a flask. Transfer the distillate into a separating funnel. Dissolve 65 g of *sodium chloride R* in the distillate and shake with 3 quantities, each of 30 ml, of *pentane R* previously used to rinse the reflux condenser and the flask. Combine the pentane layers, dry over 2 g of *anhydrous sodium sulphate R* and filter into a tared 100 ml round-bottomed flask which has been dried in a desiccator for 3 h. Rinse the anhydrous sodium sulphate and the filter with 2 quantities, each of 20 ml, of *pentane R*. Evaporate the pentane in a water-bath at 45 °C. The residue of pentane is eliminated in a current of air for 3 min. Dry the flask in a desiccator for 3 h and weigh. The residual oil is blue (chamazulene).

Ph Eur

Matricaria Oil

General Notices

(Ph Eur monograph 1836)

Ph Eur

DEFINITION

Blue essential oil obtained by steam distillation from the fresh or dried flower-heads or flowering tops of *Matricaria recutita* L. (*Chamomilla recutita* L. Rauschert). There are 2 types of matricaria oil which are characterised as rich in bisabolol oxides, or rich in (-)-α-bisabolol.

CHARACTERS

Appearance

Clear, intensely blue, viscous liquid.

It has an intense characteristic odour.

IDENTIFICATION

First identification B.

Second identification A.

A. Thin-layer chromatography (*2.2.27*).

Test solution Dissolve 20 µl of the substance to be examined in 1.0 ml of *toluene R*.

Reference solution Dissolve 2 mg of *guaiazulene R*, 5 µl of *(-)-α-bisabolol R* and 10 mg of *bornyl acetate R* in 5.0 ml of *toluene R*.

Plate *TLC silica gel plate R*.

Mobile phase *ethyl acetate R*, *toluene R* (5:95 *V/V*).

Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection A Examine in daylight.

Results A See below for the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks due to (-)-α-bisabolol and chamazulene in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Chromatographic profile

Gas chromatography (*2.2.28*): use the normalisation procedure.

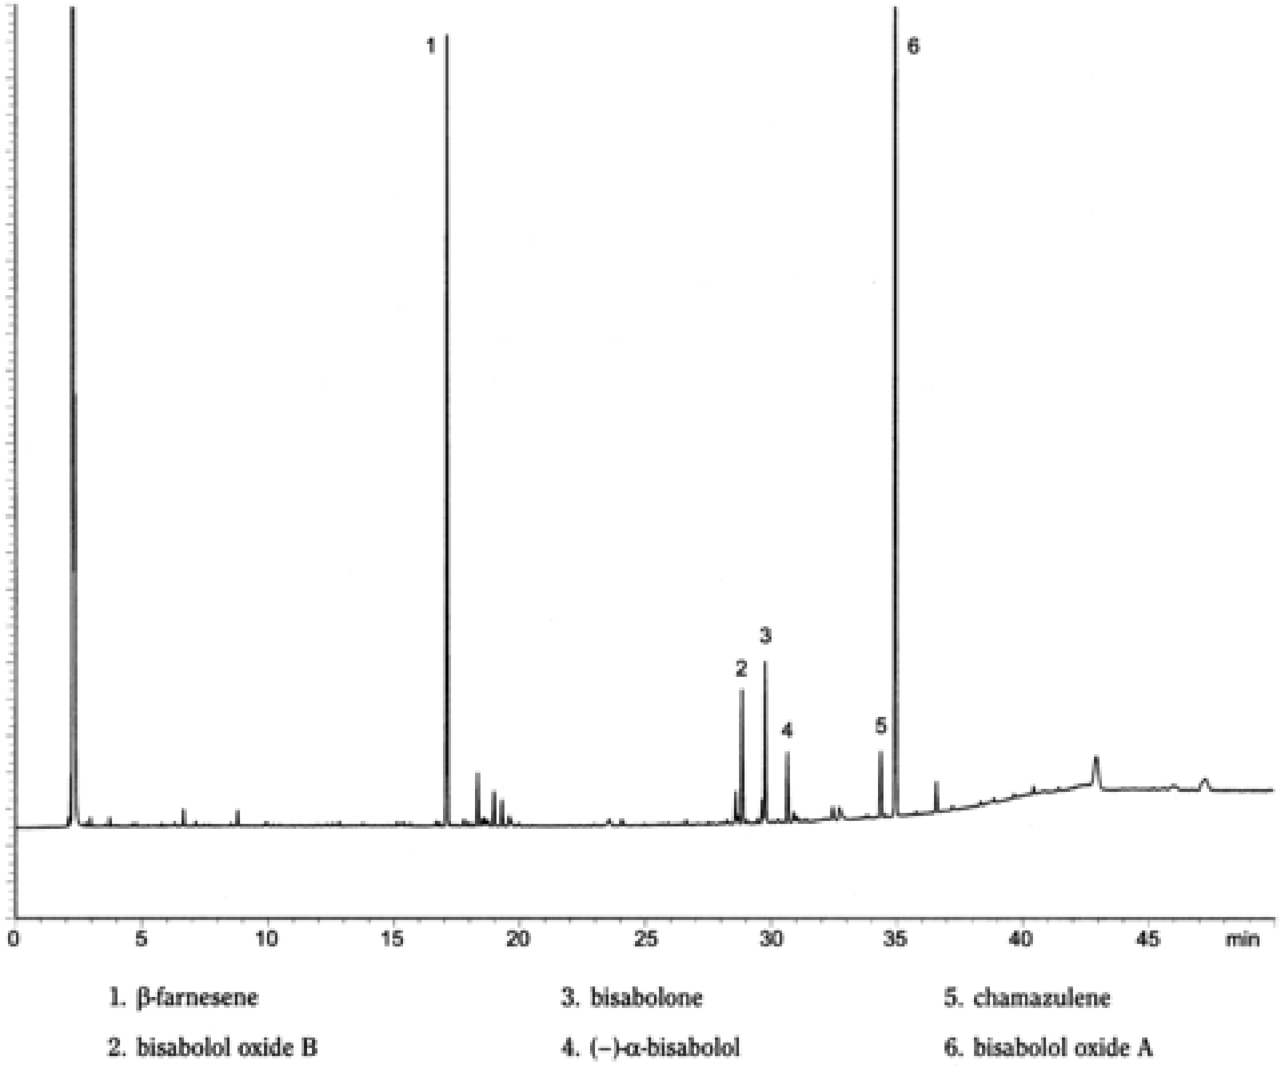

Figure 1836.-1. − *Chromatogram of matricaria oil rich in bisabolol oxides*

	Time (min)	Temperature (°C)
Column	0 - 40	70 → 230
	40 - 50	230
Injection port		250
Detector		250

Test solution Dissolve 20 µl of the oil to be examined in *cyclohexane R* and dilute to 5.0 ml with the same solvent.

Reference solution Dissolve 20 µl of *(-)-α-bisabolol R*, 5 mg of *chamazulene R* and 6 mg of *guaiazulene R* in *cyclohexane R* and dilute to 5.0 ml with the same solvent.

Column:
— *material*: fused silica;

— *size*: *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm, when using a column longer than 30 m, an adjustment of the temperature programme may be necessary;

— *stationary phase*: *macrogol 20 000 R*.

Carrier gas *helium for chromatography R*.

Flow rate 1-2 ml/min.

Split ratio 1:100.

Temperature:

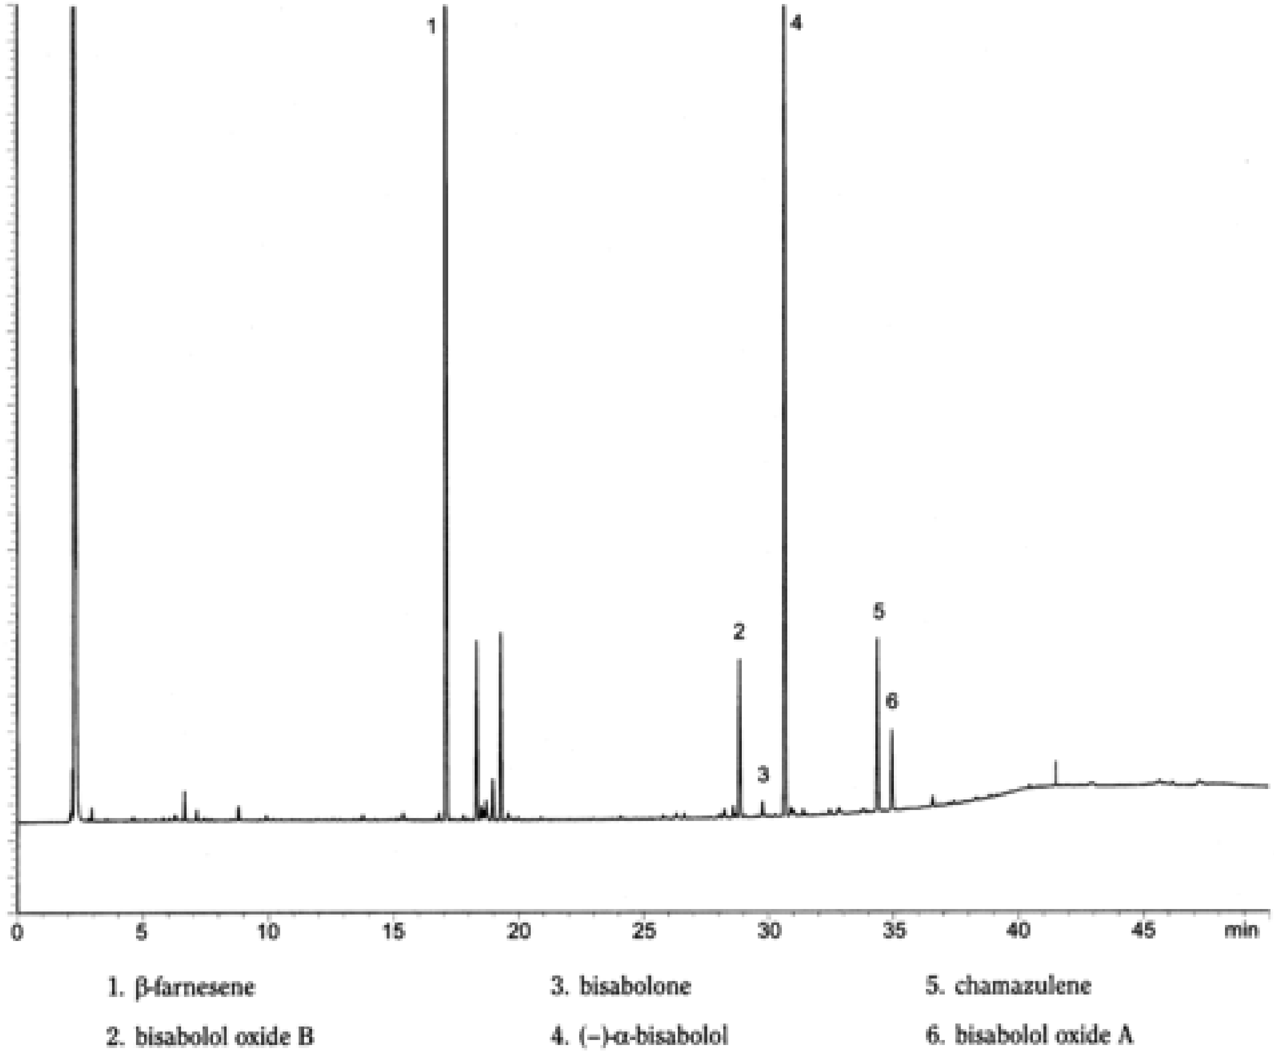

Figure 1836.-2. – *Chromatogram of matricaria oil rich in (−)-α-bisabolol*

Detection Flame ionisation.

Injection 1.0 µl.

Elution order Order indicated in the composition of the reference solution. Record the retention times of these substances.

Relative retention With reference to chamazulene (retention time = about 34.4 min): βfarnesene = about 0.5; bisabolol oxide B = about 0.8; bisabolone = about 0.87; (-)-α-bisabolol = about 0.9; bisabolol oxide A = about 1.02.

System suitability Reference solution:

— *resolution*: minimum 1.5 between the peaks due to chamazulene and guaiazulene.

Using the retention times determined from the chromatogram obtained with the reference solution, locate (-)-α-bisabolol and chamazulene in the chromatogram obtained with the test solution; locate bisabolol oxides (bisabolol oxide B, bisabolone and bisabolol oxide A) using Figures 1836.-1 and 1836.-2 (disregard the peak due to cyclohexane). The chromatogram obtained with the test solution does not show a peak with the retention time of guaiazulene.

Determine the percentage content of the components. The limits are within the following ranges.

	Matricaria oil rich in bisabolol oxides (per cent)	**Matricaria oil rich in (–)-α-bisabolol (per cent)**
Bisabolol oxides	29 - 81	
(–)-α-Bisabolol		10 - 65
Chamazulene	≥ 1.0	≥ 1.0
Total of bisabolol oxides and (–)-α-Bisabolol		≥ 20

STORAGE

In a well-filled, airtight container, protected from light at a temperature not exceeding 25 °C.

LABELLING

The label states the type of matricaria oil (rich in bisabolol oxides or rich in (-)-α-bisabolol.

Ph Eur

Meadowsweet

General Notices

(Ph Eur monograph 1868)

Ph Eur

DEFINITION

Whole or cut, dried flowering tops of *Filipendula ulmaria* (L.) Maxim. (= *Spiraea ulmaria* L.).

Content

Minimum 1 ml/kg of steam-volatile substances (dried drug).

CHARACTERS

Aromatic odour of methyl salicylate, after crushing.

IDENTIFICATION

A. The stem, up to 5 mm in diameter, is greenish-brown, stiff, angular, hollow except at the apex, and has regular, straight, longitudinal furrows. The petiolate leaf, compound imparipinnate, has 2 reddish-brown angular stipules. It consists of 3 to 9 pairs of leaflets, unevenly dentate, some of which are small and fan-shaped. The leaflets are dark green and glabrous on the upper surface, tomentose and lighter, sometimes silvery on the lower surface. The terminal leaflet, the largest, is divided into 3 segments. The veins are prominent and brown on the lower surface. The inflorescence is complex and composed of very numerous flowers arranged in irregular cymose panicles. The flowers are creamish-white and about 3 mm to 6 mm in diameter; the calyx consists of 5 dark green, reflexed and hairy sepals fused at the base to a concave receptacle; the 5 free petals, which are readily detached, are pale yellow, obovate and distinctly narrowed at the base; the stamens are numerous with rounded anthers and they extend beyond the petals; the gynoecium consists of about 4 to 6 carpels, each with a short style and a globular stigma; the carpels become twisted together spirally to form yellowish-brown fruits with a helicoidal twist. Unopened flower buds are frequently present. If the fruit is present, it has a helicoidal twist and contains brownish seeds.

B. Reduce to a powder (355) (*2.9.12*). The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows unicellular covering trichomes, some thin-walled, very long and flexuous, with pointed ends, others shorter, thick-walled, conical and thickened at the base; occasional clavate glandular trichomes with a 1- to 3-celled, uniseriate stalk and a multicellular head containing dense brown contents; fragments of the leaves and sepals with sinuous to wavy epidermal cells, anomocytic stomata (*2.8.3*) on the lower surface only and cluster crystals of calcium oxalate in the mesophyll; thin-walled epidermal cells of the petals, some showing rounded papillae; numerous spherical pollen grains with 3 pores and a faintly pitted exine; fragments of the fibrous layer of the anthers with stellate thickenings; groups of small-celled parenchyma from the ovaries containing prism crystals of calcium oxalate; fragments of vascular tissue with spiral and annular vessels from the leaves and stems.

C. Thin-layer chromatography (*2.2.27*).

Test solution Xylene solution obtained in the assay.

Reference solution Dissolve 0.1 ml of *methyl salicylate R* and 0.1 ml of *salicylaldehyde R* in *xylene R* and dilute to 5 ml with the same solvent.

Plate *TLC silica gel plate R*.

Mobile phase *hexane R*, *toluene R* (50:50 *V/V*).

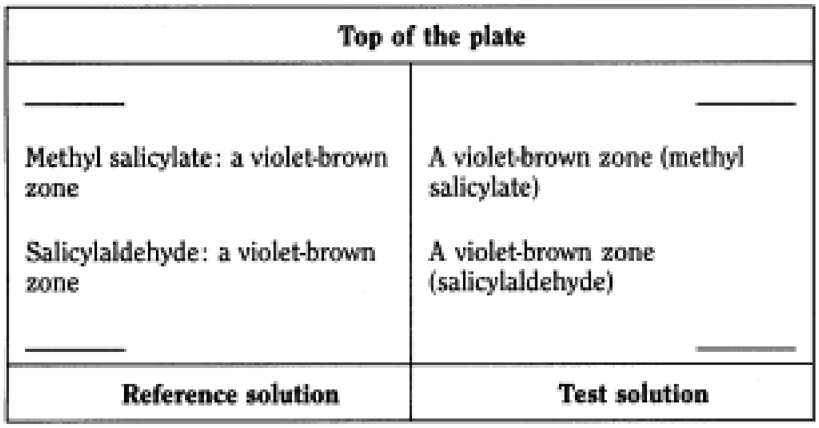
Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray the plate with 3 ml of *ferric chloride solution R3* and examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.



Top of the plate	
Methyl salicylate: a violet-brown zone	A violet-brown zone (methyl salicylate)
Salicylaldehyde: a violet-brown zone	A violet-brown zone (salicylaldehyde)
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*)

Maximum 5.0 per cent of stems with a diameter greater than 5 mm and maximum 2.0 per cent of foreign matter.

Loss on drying (*2.2.32*)

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 7.0 per cent.

ASSAY

Examine according to the method described for the determination of essential oils in herbal drugs (*2.8.12*). Use 50.0 g, a 1000 ml flask and 300 ml of *dilute hydrochloric acid R* as distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

Ph Eur

Melilot

General Notices

(Ph Eur monograph 2120)

Ph Eur

DEFINITION

Whole or cut, dried aerial parts of *Melilotus officinalis* (L.) Lam.

Content

Minimum 0.3 per cent of coumarin ($C_9H_6O_2$; M_r 146.1) (dried drug).

IDENTIFICATION

A. The stem is green, cylindrical, glabrous and finely ridged. The leaves are alternate, petiolate and trifoliate with 2 lanceolate stipules; the leaflets are up to about 3 cm long and 20 mm wide, elongated to ovate with a finely dentate margin, acute at the apex and base; the upper surface is dark green and glabrous, the lower surface paler green with short, fine hairs, especially at the base. The inflorescence is racemose with numerous pale yellow flowers, about 7 mm long, each having a hairy calyx with 5 deeply-divided, unequal teeth, and a papilionate corolla. The fruit is an indehiscent pod, often persistent within the calyx, yellowish-brown, short and tapering at the apex; the surface is glabrous and transversely wrinkled.

B. Reduce to a powder (355 *(2.9.12)*). The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the leaf lamina in surface view showing unevenly thickened, slightly sinuous epidermal cells and numerous stomata, mostly anomocytic with 3-6 sudsidiary cells; uniseriate covering trichomes with 2 short, smooth-walled based cells and a long terminal cell, bent at right angles, with a thick wall and a warty cuticle; occasional glandular trichomes with a short, 2-3 celled stalk and an ovoid, biseriate head with 4 indistinct cells; scattered fragments of the petals showing papillae; fragments of vascular tissue from the stems with associated unlignified septate fibres containing prism crystals of calcium oxalate; fibrous layer of the anther; spherical to ovoid pollen grains about 25 µm long with 3 pores and smooth exine.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 0.3 g of the powdered drug (355) *(2.9.12)* add 3 ml of *methanol R*. Heat on a water-bath at 60 °C for 1 min. Filter.

Reference solution Dissolve 50 mg of *coumarin CRS* and 20 mg of *o-coumaric acid R* in 50 ml of *methanol R*.

Plate *TLC silica gel plate R*.

Mobile phase Upper phase of the following mixture: *dilute acetic acid R*, *ether R*, *toluene R* (10:50:50 *V/V/V*).

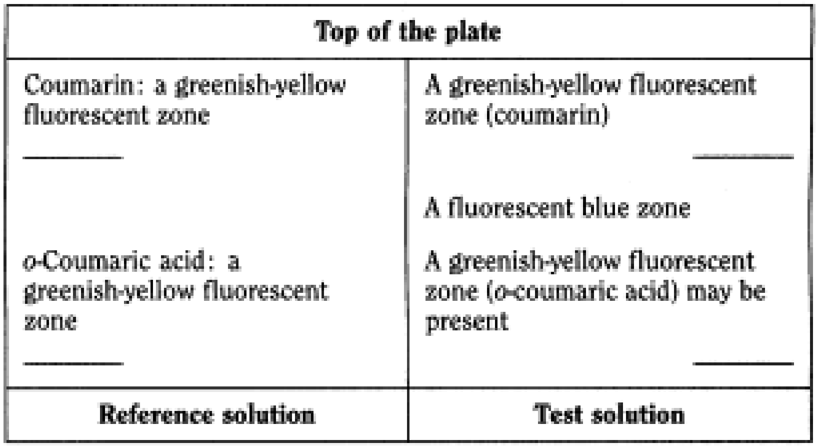
Application 25 µl as bands of 10 mm.

Development Over a path of 12 cm.

Drying In air.

Detection Spray with *2 M alcoholic potassium hydroxide R*. Examine in ultraviolet light at 365 nm.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones of various colours may be present in the chromatogram obtained with the test solution.



Top of the plate	
Coumarin: a greenish-yellow fluorescent zone	A greenish-yellow fluorescent zone (coumarin)
	A fluorescent blue zone
o-Coumaric acid: a greenish-yellow fluorescent zone	A greenish-yellow fluorescent zone (*o*-coumaric acid) may be present
Reference solution	**Test solution**

TESTS

Foreign matter *(2.8.2)*

Maximum 2 per cent of stems with a diameter greater than 3 mm and maximum 2 per cent of other foreign matter.

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 10.0 per cent.

ASSAY

Liquid chromatography *(2.2.29)*.

Test solution Completely reduce about 50 g to a powder (500) *(2.9.12)*. To 5.00 g of the powdered drug add 90 ml of *methanol R* and boil under a reflux condenser for 30 min. Allow to cool. Filter under vacuum through a fibre-glass filter. Take up the residue and the fragmented filter with 90 ml of *methanol R*. Treat in the same manner as before. Combine the filtrates and dilute to 250.0 ml with *methanol R*.

Reference solution Dissolve 25.0 mg of *coumarin CRS* in *methanol R* and dilute to 250.0 ml with the same solvent.

Column:

— *size:* l = 0.25 m, Ø = 4 mm;

— *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase *acetonitrile R*, 5 g/l solution of *phosphoric acid R* (22:78 *V/V*).

Flow rate 1.7 ml/min.

Detection Spectrophotometer at 275 nm.

Injection 20 µl.

System suitability:

— *retention time*: coumarin = about 7.8 min.

Calculate the percentage content of coumarin from the following expression:

$$\frac{A_1 \times m_2}{A_2 \times m_1}$$

A_1 = area of the peak due to coumarin in the chromatogram obtained with the test solution,

A_2 = area of the peak due to coumarin in the chromatogram obtained with reference solution,

m_1 = mass of the drug to be examined, in grams,

m_2 = mass of *coumarin CRS* in the reference solution, in grams.

Ph Eur

Milk-thistle Fruit

General Notices

(Ph Eur monograph 1860)

Ph Eur

DEFINITION

Mature fruit, devoid of the pappus, of *Silybum marianum* L. Gaertner.

Content

Minimum 1.5 per cent of silymarin, expressed as silibinin ($C_{25}H_{22}O_{10}$; M_r 482.4) (dried drug).

CHARACTERS

No rancid odour.

IDENTIFICATION

A. The achene is strongly compressed, elongate-obovate, about 6-8 mm long, 3 mm broad and 1.5 mm thick; the outer surface is smooth and shiny with a grey or pale brown ground colour variably streaked dark brown longitudinally to give an overall pale greyish or brown colour; the fruit is tapering at the base and crowned at the apex with a glistening, pale yellow extension forming a collar about 1 mm high surrounding the remains of the style. Cut transversely, the fruit shows a narrow, brown outer area and 2 large, dense, white oily cotyledons.

B. Reduce to a powder (355) (*2.9.12*). The powder is brownish-yellow with darker specks. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the epicarp composed of colourless cells, polygonal in surface view, the lumen appearing fairly large or as a small slit, depending on the orientation; groups of parenchymatous cells from the pigment layer, some of them containing colouring matter which appears bright red; very abundant groups of large sclereids from the testa with bright yellow pitted walls and a narrow lumen; occasionally fragments of small-celled parenchyma with pitted and beaded walls; abundant thin-walled parenchymatous cells from the cotyledons containing oil globules and scattered cluster crystals of calcium oxalate; a few larger, prismatic crystals of calcium oxalate.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 1.0 g of powdered drug (500) (*2.9.12*) add 10 ml of *methanol R*. Heat under reflux in a water-bath at 70 °C for 5 min. Cool and filter. Evaporate the filtrate to dryness and dissolve the residue in 1.0 ml of *methanol R*.

Reference solution Dissolve 2 mg of *silibinin R* and 5 mg of *taxifolin R* in 10 ml of *methanol R*.

Plate *TLC silica gel plate R.*

Mobile phase *anhydrous formic acid R*, *acetone R*, *methylene chloride R* (8.5:16.5:75 *V/V/V*) .

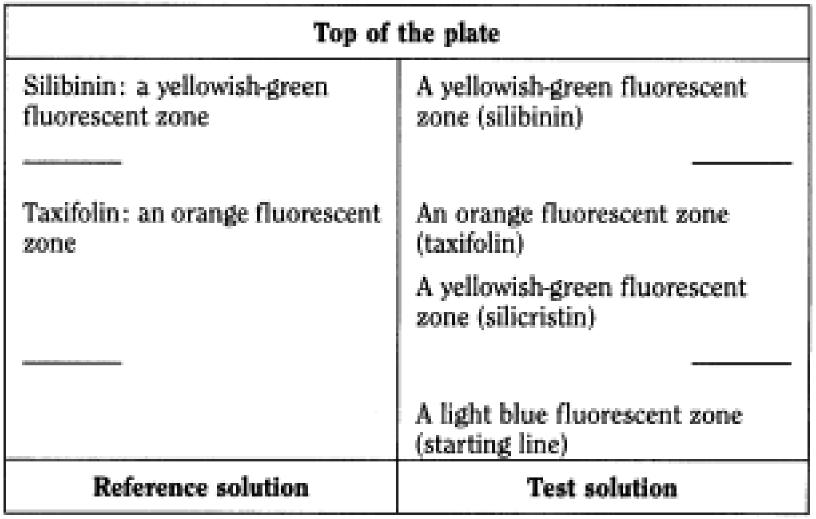
Application 30 µl of the test solution and 10 µl of the reference solution, as bands.

Development Over a path of 10 cm.

Drying At 100-105 °C.

Detection Spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow to dry for 30 min and examine in ultraviolet light at 365 nm.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other orange and yellowish-green fluorescent zones are present between the zones of silibinin and taxifolin in the chromatogram obtained with the test solution.



Top of the plate	
Silibinin: a yellowish-green fluorescent zone	A yellowish-green fluorescent zone (silibinin)

Taxifolin: an orange fluorescent zone	An orange fluorescent zone (taxifolin) A yellowish-green fluorescent zone (silicristin)
———	———
	A light blue fluorescent zone (starting line)
Reference solution	**Test solution**

TESTS

Loss on drying (*2.2.32*)

Maximum 8.0 per cent, determined on 1.000 g of the powdered drug (500) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 8.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution Place 5.00 g of the powdered drug (500) (*2.9.12*) in a continuous-extraction apparatus. Add 100 ml of *light petroleum R* and heat in a water-bath for 8 h. Allow the defatted drug to dry at room temperature. In a continuous-extraction apparatus, extract the latter with 100 ml of *methanol R* in a water-bath for 5 h. Evaporate the methanolic extract *in vacuo* to a volume of about 30 ml. Filter into a 50 ml volumetric flask, rinsing the extraction flask and the filter, and diluting to 50.0 ml with *methanol R*. Dilute 5.0 ml of this solution to

50.0 ml with *methanol R*.

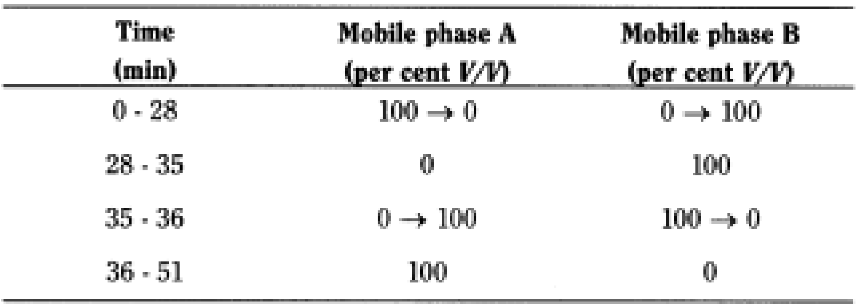
Reference solution Dissolve a quantity of *milk thistle standardised dry extract CRS* equivalent to 5.0 mg of silibinin (m_1 g) in *methanol R* and dilute to 50.0 ml with the same solvent.

Column:

- *size*: *l* = 0.125 m, Ø = 4 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

- *mobile phase A*: *phosphoric acid R*; *methanol R*, *water R* (0.5:35:65 *V/V/V*);
- *mobile phase B*: *phosphoric acid R*; *methanol R*, *water R* (0.5:50:50 *V/V/V*);



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 28	100 → 0	0 → 100
28 - 35	0	100
35 - 36	0 → 100	100 → 0
36 - 51	100	0

Flow rate 0.8 ml/min.

Detection Spectrophotometer at 288 nm.

Injection 10 µl.

Retention time Silibinin B = about 30 min. If necessary, adjust the time periods of the gradient.

System suitability Reference solution:

- *resolution*: minimum 1.8 between the peaks due to silibinin A and silibinin B;
- the chromatogram obtained is similar to the chromatogram supplied with *milk thistle standardised dry extract CRS*.

Locate silicristin, silidianin, silibinin A, silibinin B, isosilibinin A and isosilibinin B by comparison with the chromatogram supplied with *milk thistle standardised dry extract CRS*. In the chromatogram obtained with the test solution the peak due to silidianin may vary in size, be absent or be present as the principal peak. Determine the area of the peaks due to silicristin, silidianin, silibinin A, silibinin B, isosilibinin A and isosilibinin B.

Calculate the percentage content of silymarin, calculated as silibinin, using the following expression:

$$\frac{(A1 + A2 + A3 + A4 + A5 + A6) \times m_1 \times p \times 1000}{(A7 + A8) \times m_2 \times (100 - d)}$$

A1 area of the peak due to silicristin in the chromatogram obtained with the test solution,

A2 = area of the peak due to silidianin in the chromatogram obtained with the test solution,

A3 = area of the peak due to silibinin A in the chromatogram obtained with the test solution,

A4 = area of the peak due to silibinin B in the chromatogram obtained with the test solution,

A5 = area of the peak due to isosilibinin A in the chromatogram obtained with the test solution,

A6 = area of the peak due to isosilibinin B in the chromatogram obtained with the test solution,

A7 = area of the peak due to silibinin A in the chromatogram obtained with the reference solution,

A8 = area of the peak due to silibinin B in the chromatogram obtained with the reference solution,

m_1 = mass of *milk thistle standardised dry extract CRS* used to prepare the reference solution, in grams,

m_2 = mass of the drug to be examined, in grams,

p = combined percentage content of silibinin A and silibinin B in *milk thistle standardised dry extract CRS,*

d = percentage loss on drying of the drug.

Ph Eur

Motherwort

General Notices

(Ph Eur monograph 1833)

Ph Eur

DEFINITION

Whole or cut, dried flowering aerial parts of *Leonurus cardiaca* L.

Content

Minimum 0.2 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried drug).

IDENTIFICATION

A. The stem pieces are hairy, longitudinally striated, quadrangular, hollow, and up to about 10 mm wide; they bear opposite and decussate, petiolate leaves and, in the axils of the upper leaves, about 6 to 12 small flowers, arranged in sessile whorls forming a long leafy spike. The lower leaves are ovate-orbicular, palmately 3 to 5-lobed, rarely 7-lobed, the lobes irregularly dentate. The upper leaves are entire or slightly trifid, lanceolate with a serrate margin and cuneate at the base. The upper surface of the leaves is green with scattered hairs, the lower surface is paler green, densely pubescent and shows a prominent palmate and reticulate venation. The flowers have a funnel-shaped calyx, 3 mm to 5 mm long with 5 stiff, recurved teeth; the corolla is 2-lipped, the upper lip pink and pubescent on the outer surface, the lower lip white with purplish spots; stamens 4, densely pubescent.

B. Reduce to a powder (355) (*2.9.12*). The powder is green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the leaf lamina with a one-layered palisade mesophyll reaching almost to the centre and a loosely arranged spongy parenchyma; fragments of leaf epidermis; upper epidermal cells with straight anticlinal walls and a striated cuticle; lower epidermal cells with sinuous anticlinal walls; stomata of the diacytic type (*2.8.3*) more numerous on the lower surface; glandular trichomes with a short unicellular stalk and a globular head composed of 8, sometimes up to 16 cells or with a unicellular head; covering trichomes conical, uniseriate, up to about 300 µm long, occasionally up to 1500 µm, composed of from 2 to 8 cells with slight swellings at the junctions and a warty or striated cuticle; fragments of the calyx containing small, cluster crystals of calcium oxalate; spherical pollen grains, about 25 µm to 30 µm in diameter, with 3 pores and 3 furrows and a smooth exine; thick-walled, lignified fibres and spirally and annularly thickened vessels from the stem; occasional brown fragments of pericarp with single crystals of calcium oxalate.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 0.5 g of the powdered drug (355) (*2.9.12*) add 5 ml of *methanol R*. Heat in a water-bath at 65 °C for 5 min with shaking. Cool and filter.

Reference solution Dissolve 5 mg of *naphthol yellow S R* and 2.0 mg of *catalpol R* in 5.0 ml of *methanol R*.

Plate *TLC silica gel plate R*.

Mobile phase *glacial acetic acid R*, *water R*, *ethyl acetate R* (20:20:60 *V/V/V*).

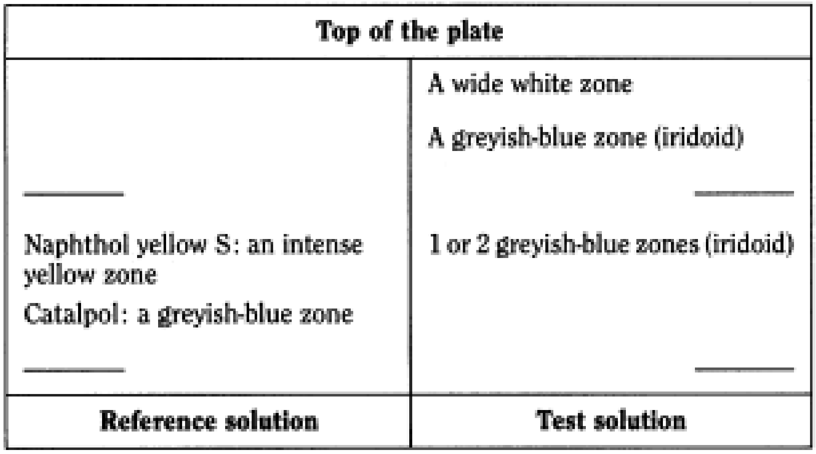
Application 20 µl as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with *dimethylaminobenzaldehyde solution R2*, using about 5 ml for a plate 200 mm square; heat at 100-105 °C for 10 min until the spots appear; examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, further weak greyish-blue zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A wide white zone A greyish-blue zone (iridoid)
———	———
Naphthol yellow S: an intense yellow zone Catalpol: a greyish-blue zone	1 or 2 greyish-blue zones (iridoid)
———	———
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*)

Maximum 2 per cent of brown or yellow leaves and maximum 2 per cent of other foreign matter.

Loss on drying (*2.2.32*)

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 12.0 per cent.

ASSAY

Stock solution In a 100 ml round-bottomed flask, place 1.00 g of the powdered drug (355) (*2.9.12*), add 1 ml of a 5 g/l solution of *hexamethylenetetramine R*, 20 ml of *acetone R* and 2 ml of *hydrochloric acid R1*. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a plug of absorbent cotton into a flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 ml, of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool, filter each extract through the plug of absorbent cotton into the flask. After cooling, filter the combined acetone extracts through a paper filter into a volumetric flask, dilute to 100.0 ml with *acetone R* by rinsing the flask and the paper filter. Introduce 20.0 ml of the solution into a separating funnel, add 20 ml of *water R* and shake the mixture with 1 quantity of 15 ml and then with 3 quantities, each of 10 ml, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, wash with 2 quantities, each of 50 ml, of *water R*, and filter the extracts over 10 g of *anhydrous sodium sulphate R* into a volumetric flask and dilute to 50.0 ml with *ethyl acetate R*.

Test solution To 10.0 ml of the stock solution add 1 ml of *aluminium chloride reagent R* and dilute to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Compensation liquid Dilute 10.0 ml of the stock solution to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Measure the absorbance (*2.2.25*) of the test solution after 30 min, by comparison with the compensation liquid at 425 nm. Calculate the percentage content of flavonoids, calculated as hyperoside, from the expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of hyperoside to be 500.

A = absorbance at 425 nm,

m = mass of the substance to be examined, in grams.

Ph Eur

Mullein Flower

General Notices

(Ph Eur monograph 1853)

Ph Eur

DEFINITION

Dried flower, reduced to the corolla and the androecium, of *Verbascum thapsus* L., V. *densiflorum Bertol*. (*V. thapsiforme* Schrad), and *V. phlomoides* L.

IDENTIFICATION

A. The corolla of *V. thapsus* is about 20 mm in diameter, pale yellow, yellow to brown, funnel-shaped with 5 slightly unequal and spreading lobes. The corolla lobes are densely hairy on the outer surface, glabrous on the inner surface, with a fine network of light brown veins. There are 5 stamens, alternating with the petal lobes, 2 of these are long, with glabrous filaments, the other 3 shorter, with densely tormentose filaments. The anthers are attached transversely. In *V. phlomoides* the corolla is up to about 30 mm in diameter, bright yellow to orange, and the anthers are obliquely attached to the filaments. The corolla of *V. densiflorum*, about 30 mm in diameter, is almost flat and deeply divided into 5 slightly unequal lobes, with rounded apices.

B. Reduce to a powder (355) (*2.9.12*). The powder is yellow or yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows many covering trichomes from the corolla, whole and fragmented; there are pluricellular, of the candelabra type with a central uniseriate axis from which whorls of branch cells arise at the position of the cross walls and at the apex. The covering trichomes from the stamen filaments are unicellular, long, thin-walled and tubular, sometimes with a club-shaped tip; they have a distinctly granular or striated surface. Numerous pollen grains, ovoid with a finely granular exine with 3 pores. Fragments of the fibrous layer of the anther with thickened walls giving a characteristic star-shaped appearance. Yellow fragments of the petals in the surface view, the epidermal cells polygonal and isodiametric; fragments of the mesophyll consisting of irregular parenchymatous cells and scattered spiral vessels.

C. Thin-layer chromatography (*2.2.27*).

Test solution Heat 1.0 g of the powdered drug (355) (*2.9.12*) in 10 ml of *methanol R* in a water-bath at 60 °C for 5 min, with stirring. Cool and filter.

Reference solution Dissolve 1 mg of *caffeic acid R*, 2.5 mg of *hyperoside R* and 2.5 mg of *rutin R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel plate R.*

Mobile phase *water R*, *anhydrous formic acid R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 *V/V/V/V*).

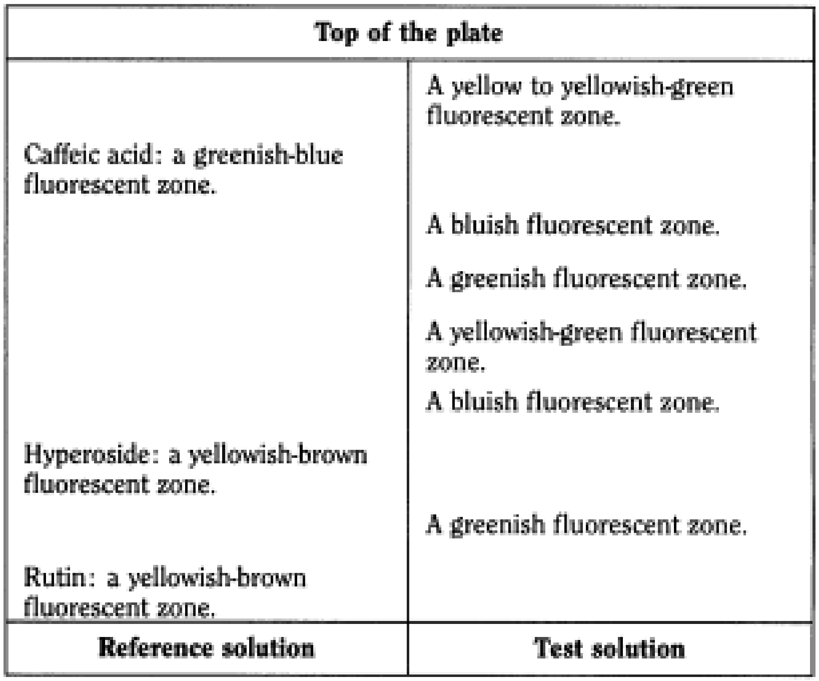
Application 10 µl of the reference solution and 30 µl of the test solution, as bands.

Development Over a path of 15 cm.

Drying At 100-105 °C.

Detection Spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for 30 min and examine in ultraviolet light at 365 nm.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A yellow to yellowish-green fluorescent zone.
Caffeic acid: a greenish-blue fluorescent zone.	
	A bluish fluorescent zone.
	A greenish fluorescent zone.
	A yellowish-green fluorescent zone.
	A bluish fluorescent zone.
Hyperoside: a yellowish-brown fluorescent zone.	
	A greenish fluorescent zone.
Rutin: a yellowish-brown fluorescent zone.	
Reference solution	**Test solution**

D. Boil 1.0 g of the powdered drug (355) (*2.9.12*) with 15 ml of *water R* for 1 min. Filter. Add 1 ml of *hydrochloric acid R* and boil for 1 min. A greenish-blue colour develops and, after a few minutes, cloudiness appears and then a blackish precipitate (iridoids).

TESTS

Foreign matter (*2.8.2*)

Maximum 5 per cent of brown petals and maximum 2 per cent of fragments of the calyx and other foreign matter, determined on 20 g.

Swelling index (*2.8.4*)

Minimum 9, determined on the powdered drug (710) (*2.9.12*), humidified with 2 ml of *alcohol R.*

Loss on drying (*2.2.32*)

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 6.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*)

Maximum 2.0 per cent.

STORAGE

In an airtight container .

Ph Eur

Myrrh Tincture

General Notices

(Ph Eur monograph 1877)

Ph Eur

DEFINITION

Tincture produced from *Myrrh (1349)*.

PRODUCTION

The tincture is produced from 1 part of the drug and 5 parts of ethanol (90 per cent *V/V*) by a suitable procedure.

CHARACTERS

Clear yellowish-brown or orange-brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution Dilute 5 ml of the tincture to be examined to 10 ml with *alcohol R*.

Reference solution Dissolve 10 mg of *thymol R* and 40 µl of *anethole R* in 10 ml of *ether R*.

Plate *TLC silica gel plate R.*

Mobile phase *ethyl acetate R*, *toluene R* (2:98 *V/V*).

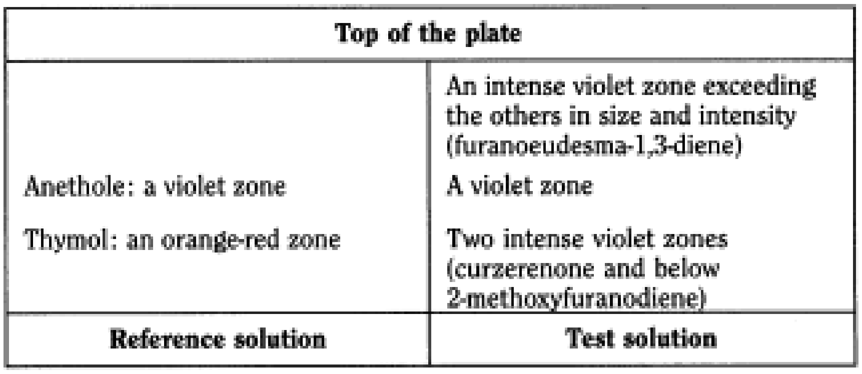
Application 10 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R* and examine in daylight whilst heating at 100-105 °C for 10 min.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones mostly violet, are present in the chromatogram obtained with the test solution.



Top of the plate	
	An intense violet zone exceeding the others in size and intensity (furanoeudesma-1,3-diene)
Anethole: a violet zone	A violet zone
Thymol: an orange-red zone	Two intense violet zones (curzerenone and below 2-methoxyfuranodiene)
Reference solution	**Test solution**

TESTS

Ethanol content *(2.9.10)*

82 per cent *V/V* to 88 per cent *V/V*.

Methanol and 2-propanol *(2.9.11)*

Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

Dry residue *(2.8.16)*

Minimum 4.0 per cent *m/m*.

STORAGE

Plastic containers are not recommended.

Ph Eur

Myrrh

General Notices

(Ph Eur monograph 1349)

Ph Eur

DEFINITION

Gum-resin, hardened in air, obtained by incision or produced by spontaneous exudation from the stem and branches of *Commiphora molmo* Engler and/or other species of *Commiphora*.

CHARACTERS

Bitter taste.

IDENTIFICATION

A. The light or dark orange-brown, irregular or roundish grains or pieces of different size show components of various colours. Their surface is mostly covered with grey or yellowish-brown dust.

B. Reduce to a powder (355) (*2.9.12*). The powder is brownish-yellow or reddish-brown. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: a few tissue fragments from the original plants including: reddish-brown cork fragments; single or grouped polyhedral or elongated stone cells with partly strongly thickened, pitted and lignified walls with a brownish content; fragments of thin-walled parenchyma and sclerenchymatous fibres; irregular prismatic or polyhedral crystals of calcium oxalate, about 10-25 µm in size.

C. Examine the chromatograms obtained in the test for *Commiphora mukul*.

Detection Spray with *anisaldehyde solution R*, and examine in daylight while heating at 100-105 °C for 10 min.

Results The chromatogram obtained with the reference solution shows in the lower third an orange-red zone (thymol) and in the middle third a violet zone (anethole). The chromatogram obtained with the test solution shows an intense violet zone (furanoeudesma-1,3-diene), exceeding the other zones in size and intensity, above the zone of anethole in the chromatogram obtained with the reference solution; a violet zone similar in position to the zone of anethole in the chromatogram obtained with the reference solution; 2 intense violet zones similar in position to the zone of thymol in the chromatogram obtained with the reference solution, the upper one due to curzerenone and the lower one to 2-methoxyfuranodiene. Further mostly violet zones are present in the chromatogram obtained with the test solution.

TESTS

Commiphora mukul

Thin-layer chromatography (*2.2.27*).

Test solution To 0.5 g of the powdered drug (355) (*2.9.12*) add 5.0 ml of *ethanol (96 per cent) R* and warm the mixture on a water-bath for 2-3 min. Cool and filter.

Reference solution Dissolve 10 mg of *thymol R* and 40 µl of *anethole R* in 10 ml of *ethanol (96 per cent) R*.

Plate *TLC silica gel plate R.*

Mobile phase *ethyl acetate R*, *toluene R* (2:98 *V/V*).

Application 10 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the test solution shows no blue or violet fluorescent zones in the lower third of the chromatogram.

Matter insoluble in ethanol

Maximum 70 per cent.

Place 1.00 g of the powdered drug (250) (*2.9.12*) in a flask. Add 30 ml of *ethanol (96 per cent) R* and shake vigorously for 10 min. Filter the supernatant through a tared sintered-glass filter (16) (*2.1.2*) avoiding the transfer of sediment from the flask. Repeat the extraction with 2 quantities, each of 20 ml, of *ethanol (96 per cent) R.* Quantitatively transfer the sediment to the filter by rinsing the flask with *ethanol (96 per cent) R*. Dry the filter and the residue in an oven at 100-105 °C and weigh.

Loss on drying (*2.2.32*)

Maximum 15.0 per cent, determined on 1.000 g of powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 7.0 per cent.

Ph Eur

Neroli Oil

General Notices

(Ph Eur monograph 1175)

Ph Eur

DEFINITION

Neroli oil is obtained by steam distillation from the fresh flowers of *Citrus aurantium* L. subsp. *aurantium* L. (*C. aurantium* L. subsp. *amara* Engl.).

CHARACTERS

Appearance

Clear, pale-yellow or dark-yellow liquid.

It has a characteristic odour.

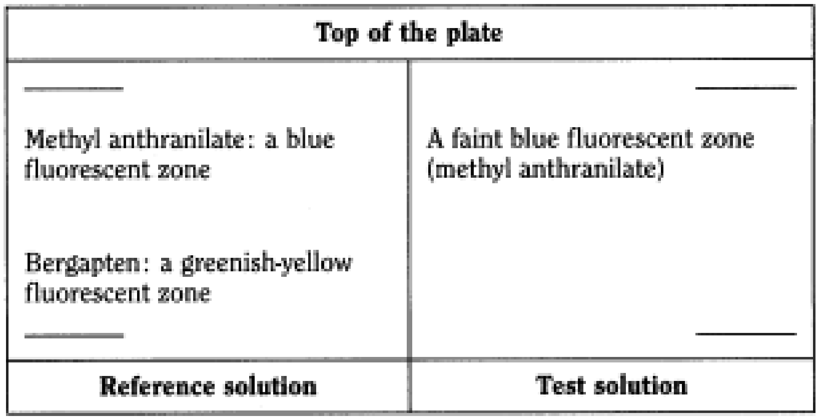
IDENTIFICATION

First identification B.

Second identification A.

A. Examine the chromatograms obtained in the test for bergapten.

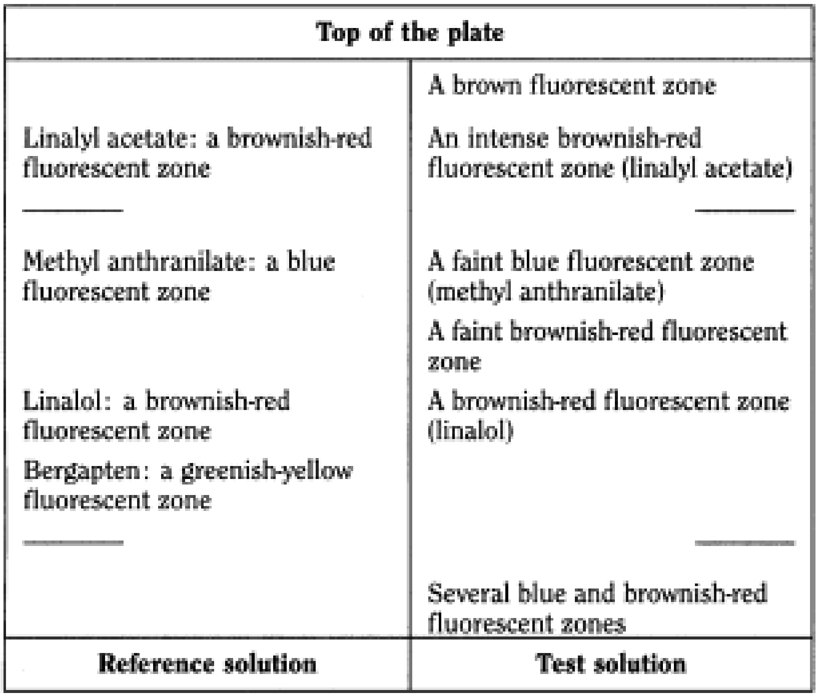
Results A See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore other zones may be present in the chromatograms obtained with the test solution.



Top of the plate	
_______	_______
Methyl anthranilate: a blue fluorescent zone	A faint blue fluorescent zone (methyl anthranilate)
Bergapten: a greenish-yellow fluorescent zone	
_______	_______
Reference solution	**Test solution**

Detection B Spray with *anisaldehyde solution R*; heat at 100-105 °C for 10 min; examine the chromatograms in ultraviolet light at 365 nm.

Results B See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. In the chromatogram obtained with the test solution the zone due to linalol is more intense than the zone due to linalyl acetate.



Top of the plate	
	A brown fluorescent zone
Linalyl acetate: a brownish-red fluorescent zone	An intense brownish-red fluorescent zone (linalyl acetate)
_______	_______
Methyl anthranilate: a blue fluorescent zone	A faint blue fluorescent zone (methyl anthranilate)
	A faint brownish-red fluorescent zone
Linalol: a brownish-red fluorescent zone	A brownish-red fluorescent zone (linalol)
Bergapten: a greenish-yellow fluorescent zone	
_______	_______
	Several blue and brownish-red fluorescent zones
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The principal peaks in the chromatogram obtained with the test solution are similar in retention time to the principal peaks in the chromatogram obtained with the reference solution.

TESTS

Relative density (*2.2.5*)

0.863 to 0.880.

Refractive index (*2.2.6*)

1.464 to 1.474.

Optical rotation (*2.2.7*)

+ 1.5° to + 11.5°.

Acid value (*2.5.1*)

Maximum 2.0.

Bergapten

Thin-layer chromatography (*2.2.27*).

Test solution Dissolve 0.1 g of the substance to be examined in *ethanol (96 per cent) R* and dilute to 5.0 ml with the same solvent.

Reference solution Dissolve 2 µl of *methyl anthranilate R*, 10 µl of *linalyl acetate R*, 20 µl of *linalol R* and 5 mg of *bergapten R* in *ethanol (96 per cent) R* and dilute to 10.0 ml with the same solvent.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *ethyl acetate R*, *toluene R* (15:85 *V/V*).

Application 10 µl [or 2 µl] as bands.

Development Over a path of 15 cm [or 8 cm].

Drying In air.

Detection Examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the test solution does not show a zone corresponding to the zone due to bergapten in the chromatogram obtained with the reference solution.

Chromatographic profile

Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution The substance to be examined.

Reference solution (a) Dissolve 20 µl of β-*pinene R*, 5 mg of *sabinene R*, 40 µl of *limonene R*, 40 µl of *linalol R*, 20 µl of *linalyl acetate R*, 5 mg of α-*terpineol R*, 5 µl of *neryl acetate R*, 5 µl of *geranyl acetate R*, 5 µl of *trans-nerolidol R*, 5 µl of *methyl anthranilate R* and 5 µl (*E,E)-farnesol R* in 2 ml of *heptane R*.

Reference solution (b) Dissolve 5 µl of *methyl anthranilate R* in *heptane R* and dilute to 10 ml with the same solvent.

Column:
- *material*: fused silica;
- *size: l* = 60 m, Ø = 0.25 mm;
- *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas *helium for chromatography R*.

Flow rate 1.5 ml/min.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 4	75
	4 - 42.8	75 → 230
	42.8 - 63	230
Injection port		270
Detector		270

Detection Flame ionisation.

Injection 0.2 µl.

Elution order Order indicated in the composition of reference solution (a). Record the retention times of these substances.

System suitability Reference solution (a):

- *resolution*: minimum 1.5 between the peaks due to β-pinene and sabinene.

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

Limits:

- β*-pinene*: 7.0 per cent to 17.0 per cent;
- *limonene*: 9.0 per cent to 18.0 per cent;
- *linalol*: 28.0 per cent to 44.0 per cent;
- *linalyl acetate*: 2.0 per cent to 15.0 per cent;
- α*-terpineol*: 2.0 per cent to 5.5 per cent;
- *neryl acetate*: maximum 2.5 per cent;
- *geranyl acetate*: 1.0 per cent to 5.0 per cent;
- *trans-nerolidol*: 1.0 per cent to 5.0 per cent;
- *methyl anthranilate*: 0.1 per cent to 1.0 per cent;
- *(E,E)-farnesol*: 0.8 per cent to 4.0 per cent;
- *disregard limit*: area of the peak in the chromatogram obtained with reference solution (b) .

Chiral purity

Gas chromatography (*2.2.28*).

Test solution Dissolve 20 mg of the substance to be examined in *pentane R* and dilute to 10.0 ml with the same solvent.

Reference solution To 10 µl of *linalol R* add 10 µl of *linalyl acetate R*. Dilute to 10.0 ml with *pentane R*.

Column:

- *material*: fused silica;
- *size: l* = 25 m, Ø = 0.25 mm;
- *stationary phase*: *modified* β*-cyclodextrin for chiral chromatography R* (film thickness 0.25 µm).

Carrier gas *helium for chromatography R*.

Flow rate 1.3 ml/min.

Split ratio 1:30.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 65	50 → 180
Injection port		230
Detector		230

Detection Flame ionisation.

Injection 1 µl.

System suitability Reference solution:

— *resolution*: minimum 5.5 between the peaks due to (*R*)(–)-linalol (1^{st} peak) and (*S*)(+)-linalol (2^{nd} peak); minimum 2.7 between the peaks due to (*R*)(–)-linalyl acetate (3^{rd} peak) and (*S*)(+)-linalyl acetate 4^{th} peak).

Calculate the percentage content of the specified (*S*)-enantiomers from the following expression:

$$\frac{A_1}{A_1 + A_2} \times 100$$

A_1 = area of the corresponding (*S*)-enantiomer,

A_2 = area of the corresponding (*R*)-enantiomer.

Limits:

— (*S*)(+)-linalol: maximum 30 per cent;

— (*S*)(+)-linalyl acetate: maximum 5 per cent.

STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

Ph Eur

Nettle Leaf

General Notices

(Ph Eur monograph 1897)

Ph Eur

DEFINITION

Whole or cut dried leaves of *Urtica dioica* L., *Urtica urens* L. or a mixture of the 2 species.

Content

Minimum 0.3 per cent for the sum of caffeoylmalic acid and chlorogenic acid expressed as chlorogenic acid ($C_{16}H_{18}O_9$; M_r 354.3) (dried drug).

IDENTIFICATION

A. The leaves are dark green, dark greyish-green or brownish-green on the upper surface, paler on the lower surface; scattered stinging hairs occur on both surfaces, also small covering trichomes which are more numerous along the margins and on the veins on the lower surface. The lamina is strongly shrunken, ovate to oblong, up to 100 mm long and 50 mm wide, with a coarsely serrate margin and a cordate to rounded base. The venation is reticulate and distinctly prominent on the lower surface. The petiole is green or brownish-green, rounded or flattened, about 1 mm wide, longitudinally furrowed and twisted; it bears stinging hairs and covering trichomes.

B. Reduce to a powder (355) (*2.9.12*). The powder is green to greyish-green. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: unicellular stinging hairs, up to 2 mm long, composed of an elongated tapering cell with a slightly swollen stinging tip which readily breaks off, arising from a raised, multicellular base; unicellular, straight or slightly curved covering trichomes, up to 700 µm long, enlarged at the base; small glandular trichomes (35-65 µm) with a stalk consisting of 1 or 2 cells and a head consisting of 2 or 4 cells; sporadic small fragments of leaves showing sinuous, wavy walled epidermal cells, anomocytic stomata (*2.8.3*) and abundant large cystoliths containing dense granular masses of calcium carbonate; small cluster crystals of calcium oxalate occur in the spongy mesophyll; occasional small groups of pitted vessels from the stem.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 1 g of the powdered drug (355) (*2.9.12*), add 10 ml of *methanol R*. Boil under a reflux condenser for 15 min. Cool and filter. Evaporate to dryness *in vacuo* at 40 °C. Dissolve the residue in 2 ml of *methanol R*.

Reference solution Dissolve 2 mg of *chlorogenic acid R* and 1 mg of *scopoletin R* in 20 ml of *methanol R*.

Plate TLC silica gel plate R.

Mobile phase anhydrous formic acid R, water R, *methanol R*, *ethyl acetate R* (2.5:4:4:50 *V/*

V/V/V).

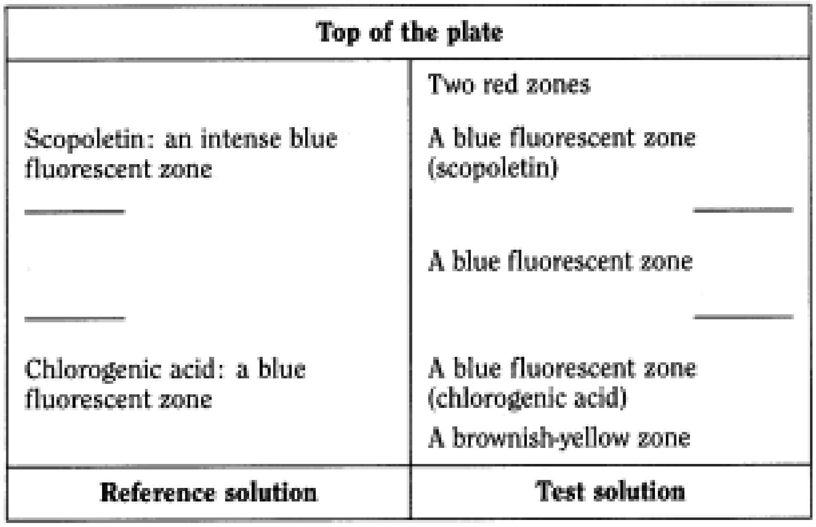
Application 10 µl, as bands.

Development Over a path of 8 cm.

Drying In air.

Detection Heat at 100 °C for 5 min. Spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Examine in ultraviolet light at 365 nm.

Results See below the sequence of the zones present in the chromatogram obtained with the reference solution and the test solution. Furthermore, faint blue or yellow fluorescent zones may be present in the lower half of the chromatogram obtained with the test solution.



Top of the plate	
	Two red zones
Scopoletin: an intense blue fluorescent zone	A blue fluorescent zone (scopoletin)
	A blue fluorescent zone
Chlorogenic acid: a blue fluorescent zone	A blue fluorescent zone (chlorogenic acid)
	A brownish-yellow zone
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*)

Maximum 5 per cent of stems and maximum 5 per cent of other foreign matter (including inflorescences).

Loss on drying (*2.2.32*)

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 20.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1)

Maximum 4.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

Internal standard solution Dissolve 20.0 mg of *p-coumaric acid R* in a 40 per cent *V/V* solution of *methanol R* and dilute to 200.0 ml with the same solution.

Test solution To 0.200 g of the powdered drug (355) (*2.9.12*) add 25.0 ml of the internal standard solution. Extract for 30 min in an ultrasonic bath at 40 °C and filter.

Reference solution Dissolve 10.0 mg of *chlorogenic acid CRS* in 100.0 ml of the internal standard solution.

Precolumn:

- *size*: *l* = 4 mm, Ø = 4 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

Column:

- *size*: *l* = 0.125 m, Ø = 4 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 25 °C.

Mobile phase:

- *mobile phase A*: a mixture of 15 volumes of *methanol R* and 85 volumes of *water R* adjusted to pH 2.0 with *dilute phosphoric acid R*;
- *mobile phase B*: *methanol R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 1	100	0
1 - 25	100 → 85	0 → 15
25 - 35	85	15
35 - 36	85 → 0	15 → 100
36 - 37	0 → 100	100 → 0
37 - 41	100	0

Flow rate 1 ml/min.

Detection Spectrophotometer at 330 nm.

Injection 20 µl of the reference solution and the test solution.

Relative retention With reference to *p*-coumaric acid (retention time = about 24 min): chlorogenic acid = about 0.53; caffeoylmalic acid = about 1.19.

Calculate the percentage content of chlorogenic acid (C_A) or of caffeoylmalic acid (C_B) from the following expression:

$$\frac{A_1 \times A_4 \times C_1 \times 2500}{A_2 \times A_3 \times m_1}$$

A_1 = area of the peak due to caffeoylmalic acid or to chlorogenic acid in the chromatogram obtained with the test solution,

A_2 = area of the peak due to chlorogenic acid in the chromatogram obtained with the reference solution,

A_3 = area of the peak due to *p*-coumaric acid in the chromatogram obtained with the test solution,

A_4 = area of the peak due to *p*-coumaric acid in the chromatogram obtained with the reference solution,

m_1 = mass of the drug to be examined, in milligrams,

C_1 = content of chlorogenic acid in the reference solution, in milligrams per millilitre.

Calculate the total percentage content $C_A + C_B$.

Ph Eur

Notoginseng Root

General Notices

(Ph Eur monograph 2383)

Ph Eur

DEFINITION

Whole or fragmented taproot, without secondary roots, of *Panax pseudoginseng* Wall. var. *notoginseng* (Burk.) Hoo et Tseng [*Panax notoginseng* (Burk.) F.H. Chen ex C.Y. Wu et K.M. Feng] treated with steam and dried.

Content

Minimum 3.8 per cent for the sum of ginsenosides Rg1 ($C_{42}H_{72}O_{14},2H_2O$; M_r 837) and Rb1 ($C_{54}H_{92}O_{23},3H_2O$; M_r 1163) (dried drug).

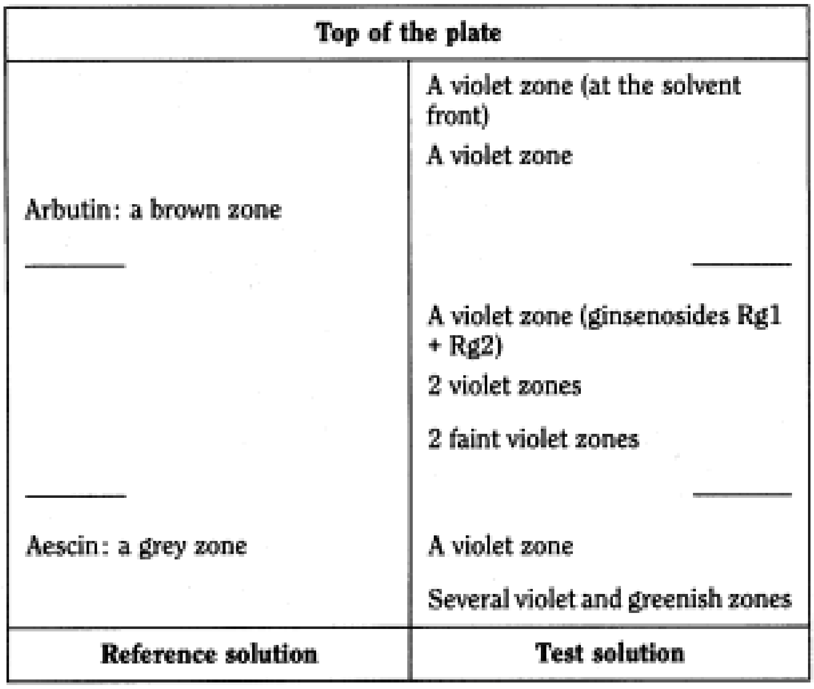
IDENTIFICATION

A. The primary root is conical, subconical or cylindrical, up to 6 cm long and 4 cm in diameter. The outer surface, showing shallow transverse striations and secondary root scars, is brownish-grey or yellowish-grey. The aerial stem scar is surrounded by warty protuberances at the crown. The texture of the root is compact. The fracture is smooth, shiny, brownish-grey and shows a yellowish-grey ring (cambial zone) and many radial striations.

B. Reduce to a powder (355) *(2.9.12)*. The powder is light yellowish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: abundant fragments of thin-walled parenchymatous cells; fragments of secretory canals containing yellowish-brown resin; rare lignified vessels about 30 µm in diameter, reticulate or pitted; rare cork fragments. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The starch granules, often deformed, are very abundant, single or in groups of 2-3, and 1-10 µm in diameter.

C. Examine the chromatogram obtained in the test for *Panax ginseng* or *Panax quinquefolium*.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A violet zone (at the solvent front)
	A violet zone
Arbutin: a brown zone	
_______	_______
	A violet zone (ginsenosides Rg1 + Rg2)
	2 violet zones
	2 faint violet zones
_______	_______
Aescin: a grey zone	A violet zone
	Several violet and greenish zones
Reference solution	**Test solution**

TESTS

Panax ginseng* or *Panax quinquefolium

Thin-layer chromatography *(2.2.27)*.

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 10 ml of a 70 per cent *V/V* solution of *methanol R* and boil under a reflux condenser for 15 min. Filter after cooling and dilute to 10.0 ml with *methanol R*.

Reference solution Dissolve 5.0 mg of *aescin R* and 5.0 mg of *arbutin R* in 1 ml of *methanol R*.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *ethyl acetate R, water R, butanol R* (25:50:100 *V/V/V*); allow to stand for 10 min and use the upper layer.

Application 20 µl, as bands of 15 mm [or 4 µl of the test solution and 2 µl of the reference solution, as bands of 8 mm].

Development In an unsaturated tank, over a path of 10 cm [or 5 cm].

Drying In air for 30 min.

Detection Spray with *anisaldehyde solution R* and heat at 105-110 °C for 5-10 min; examine in daylight.

Results In the chromatogram obtained with the test solution, the absence of a violet zone immediately above the zone due to arbutin in the chromatogram obtained with the reference solution suggests the presence of *Panax ginseng*; in the chromatogram obtained with the test solution, the presence of a brown zone immediately below the violet zone due to the ginsenosides Rg1 + Rg2 suggests the presence of *Panax quinquefolium*.

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash ***(2.4.16)***

Maximum 6.0 per cent.

Ash insoluble in hydrochloric acid ***(2.8.1)***

Maximum 1.0 per cent.

ASSAY

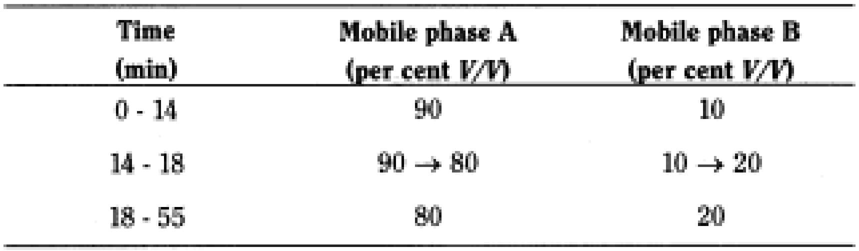
Liquid chromatography *(2.2.29)*.

Test solution Reduce about 50 g to a powder (355) *(2.9.12)*. Place 0.250 g of the powdered drug and 70 ml of a 50 per cent *V/V* solution of *methanol R* in a 250 ml round-bottomed flask. After adding a few grains of pumice, boil on a water-bath under a reflux condenser for 1 h. After cooling, centrifuge and collect the supernatant liquid. Treat the residue as described above. Mix the collected liquids and evaporate to dryness under reduced pressure at a temperature not exceeding 60 °C. Take up the residue with 10.0 ml of a buffer solution, adjusted to pH 4.5, containing 3.5 g of *sodium dihydrogen phosphate R* and 7.2 g of *potassium dihydrogen phosphate R* in 1000 ml of *water R* (solution A). Wash a cartridge containing about 0.36 g of *octadecylsilyl silica gel for chromatography R* with 5 ml of *methanol R* followed by 20 ml of *water for chromatography R*. Apply 5.0 ml of solution A to the cartridge. Elute with 20 ml of *water for chromatography R*, followed by 15 ml of a 30 per cent *V/V* solution of *methanol R*. Discard the eluates after confirming that no ginsenosides are present, otherwise repeat the assay with another type of cartridge. Elute the cartridge with 20 ml of *methanol R* and evaporate the eluate to dryness. Take up the residue with 5.0 ml of *methanol R*.

Reference solution Dissolve 3.0 mg of *ginsenoside Rb1 R*, 3.0 mg of *ginsenoside Rg1 R* and 3.0 mg of *ginsenoside Rf R* in *methanol R* and dilute to 5.0 ml with the same solvent.

Column:
- *size:* *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase: aminopropylsilyl silica gel for chromatography R* (3 µm).

Mobile phase:
- *mobile phase A*: *acetonitrile R*;
- *mobile phase B*: *water for chromatography R*;



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 14	90	10
14 - 18	90 → 80	10 → 20
18 - 55	80	20

Flow rate 2 ml/min.

Detection Spectrophotometer at 203 nm.

Injection   20 µl.

System suitability   Reference solution:

— *resolution*: minimum 3.0 between the peaks due to ginsenosides Rf and Rg1.

Calculate the sum of the percentage contents of ginsenosides Rb1 and Rg1 using the following expression:

$$\frac{A_1 \times m_2 \times 2 \times p_1}{m_1 \times A_3} + \frac{A_2 \times m_3 \times 2 \times p_2}{m_1 \times A_4}$$

A_1 = area of the peak due to ginsenoside Rb1 in the chromatogram obtained with the test solution;

A_2 = area of the peak due to ginsenoside Rg1 in the chromatogram obtained with the test solution;

A_3 = area of the peak due to ginsenoside Rb1 in the chromatogram obtained with the reference solution;

A_4 = area of the peak due to ginsenoside Rg1 in the chromatogram obtained with the reference solution;

m_1 = mass of the dried drug to be examined, in grams;

m_2 = mass of *ginsenoside Rb1 R* in the reference solution, in grams;

m_3 = mass of *ginsenoside Rg1 R* in the reference solution, in grams;

p_1 = percentage content of ginsenoside Rb1 in *ginsenoside Rb1 R*;

p_2 = percentage content of ginsenoside Rg1 in *ginsenoside Rg1 R*

Ph Eur

Nutmeg Oil

General Notices

(Ph Eur monograph 1552)

Ph Eur

DEFINITION

Essential oil obtained by steam distillation of the dried and crushed kernels of *Myristica fragrans* Houtt.

CHARACTERS

Appearance

Colourless or pale yellow liquid.

Spicy odour.

IDENTIFICATION

First identification B.

Second identification A.

A. Thin-layer chromatography *(2.2.27)*.

Test solution Dissolve 1 ml of the substance to be examined in *toluene R* and dilute to 10 ml with the same solvent.

Reference solution Dissolve 20 µl of *myristicine R* in 10 ml of *toluene R*.

Plate TLC silica gel plate R.

Mobile phase ethyl acetate R, toluene R (5:95 *V/V*).

Application 10 µl as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with *vanillin reagent R*, heat at 100-105 °C for 10 min and examine in daylight.

Results The chromatogram obtained with the reference solution shows in the upper third a pink or reddish-brown zone (myristicine); the chromatogram obtained with the test solution shows a series of zones of which 1 is similar in position and colour to the zone in the chromatogram obtained with the reference solution; above this zone a brownish zone (safrole) and a violet zone (hydrocarbons) are present; below the myristicine zone, 5 blue zones of variable intensity are present.

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The principal peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density *(2.2.5)*

0.885 to 0.905.

Refractive index *(2.2.6)*

1.475 to 1.485.

Optical rotation *(2.2.7)*

+ 8° to + 18°.

Chromatographic profile

Gas chromatography *(2.2.28)*: use the normalisation procedure.

Test solution The substance to be examined.

Reference solution Dissolve 15 µl of α-*pinene R*, 15 µl of β-*pinene R*, 15 µl of *sabinene R*, 5 µl of *car-3-ene R*, 5 µl of *limonene R*, 5 µl of γ-*terpinene R*, 5 µl of *terpinen-4-ol R*, 5 µl of *safrole R* and 10 µl of *myristicine R* in 1 ml of *hexane R*.

Column:

- *material*: fused silica;
- *size: l* = 25-60 m, Ø = about 0.3 mm;
- *stationary phase: bonded macrogol 20 000 R*.

Carrier gas *helium for chromatography R.*

Flow rate 1.5 ml/min.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	50
	10 - 75	50 → 180
	75 - 130	180
Injection port		200 - 220
Detector		240 - 250

Detection Flame ionisation.

Injection 0.2 µl.

Elution order Order indicated in the composition of the reference solution; record the retention times of these substances.

System suitability Reference solution:

— *resolution*: minimum 1.5 between the peaks due to β-pinene and sabinene.

Identification of components Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of each of these components. The percentages are within the following ranges:

— α-*pinene*: 15 per cent to 28 per cent;

— β-*pinene*: 13 per cent to 18 per cent;

— *sabinene*: 14 per cent to 29 per cent;

— *car-3-ene*: 0.5 per cent to 2.0 per cent;

— *limonene*: 2.0 per cent to 7.0 per cent;

— γ-*terpinene*: 2.0 per cent to 6.0 per cent;

— *terpinen-4-ol* : 2.0 per cent to 6.0 per cent;

— *safrole*: less than 2.5 per cent;

— *myristicine*: 5.0 per cent to 12.0 per cent.

STORAGE

Protected from heat.

Ph Eur

Oak Bark

General Notices

(Ph Eur monograph 1887)

Ph Eur

DEFINITION

Cut and dried bark from the fresh young branches of *Quercus robur* L., *Q. petraea* (Matt.) Liebl. and *Q. pubescens* Willd.

Content

Minimum 3.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1) (dried drug).

IDENTIFICATION

A. The bark occurs in channelled or quilled pieces, not more than 3 mm thick. The outer surface is light grey or greenish-grey, rather smooth, with occasional lenticels. The inner surface is dull brown or reddish-brown and has slightly raised longitudinal striations about 0.5-1 mm wide. The fracture is splintery and fibrous.

B. Reduce to a powder (355) (*2.9.12*). The powder is light brown or reddish-brown and fibrous. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: groups of thick-walled fibres surrounded by a moderately thickened parenchymatous sheath containing prism crystals of calcium oxalate; fragments of cork composed of thin-walled tabular cells filled with brownish or reddish contents; abundant sclereids, isolated and in groups, some large with thick, stratified walls and branching pits, others smaller and thinner-walled with simple pits, often with dense brown contents; fragments of parenchyma containing cluster crystals of calcium oxalate; occasional fragments of sieve tissue, thin-walled, some showing sieve areas on the oblique end-walls.

C. To 1 g of the powdered drug (710) (*2.9.12*) add 10 ml of *ethanol (30 per cent V/V) R* and heat the mixture under a reflux condenser on a water-bath for 30 min. Cool and filter. To 1 ml of this solution add 2 ml of a 10 g/l solution of *vanillin R* in *hydrochloric acid R*. A red colour develops.

TESTS

Loss on drying (*2.2.32*)

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 8.0 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs (*2.8.14*). Use 0.700 g of the powdered drug (710) (*2.9.12*).

Ph Eur

Olive Leaf

General Notices

(Ph Eur monograph 1878)

Ph Eur

DEFINITION

Dried leaf of *Olea europaea* L.

Content

Minimum 5.0 per cent of oleuropein ($C_{25}H_{32}O_{13}$; M_r 540.5) (dried drug).

IDENTIFICATION

A. The leaf is simple, thick and coriaceous, lanceolate to obovate, 30-50 mm long and 10-15 mm wide, with a mucronate apex and tapering at the base to a short petiole; the margins are entire and reflexed abaxially. The upper surface is greyish-green, smooth and shiny, the lower surface paler and pubescent, particularly along the midrib and main lateral veins.

B. Reduce to a powder (355) (*2.9.12*). The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the epidermis in surface view with small, thick-walled polygonal cells and, in the lower epidermis only, small anomocytic stomata (*2.8.3*); fragments of the lamina in sectional view showing a thick cuticle, a palisade composed of 3 layers of cells and a small-celled spongy parenchyma; numerous sclereids, very thick-walled and mostly fibre-like with blunt or, occasionally, forked ends, isolated or associated with the parenchyma of the mesophyll; abundant, very large peltate trichomes, with a central unicellular stalk from which radiate some 10 to 30 thin-walled cells which become free from the adjoining cells at the margin of the shield, given an uneven, jagged appearance.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *methanol R*. Boil under a reflux condenser for 15 min. Cool and filter.

Reference solution Dissolve 10 mg of *oleuropein R* and 1 mg of *rutin R* in 1 ml of *methanol R.*

Plate *TLC silica gel plate R*.

Mobile phase *water R*, *methanol R*, *methylene chloride R* (1.5:15:85 *V/V/V*).

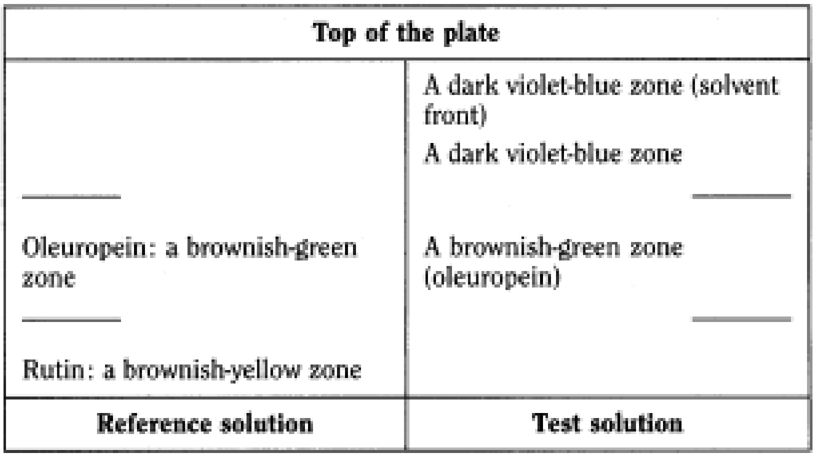
Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with *vanillin reagent R* and heat at 100-105 °C for 5 min; examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A dark violet-blue zone (solvent front) A dark violet-blue zone
———	———
Oleuropein: a brownish-green zone	A brownish-green zone (oleuropein)
———	———
Rutin: a brownish-yellow zone	
Reference solution	**Test solution**

TESTS

Loss on drying (*2.2.32*)

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 9.0 per cent.

ASSAY

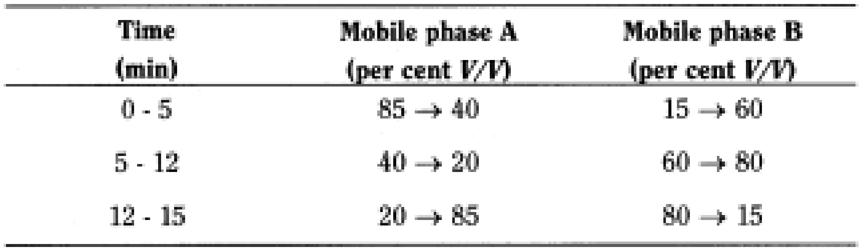
Liquid chromatography (*2.2.29*).

Test solution In a flask, place 1.000 g of the powdered drug (355) (*2.9.12*) and add 50 ml of *methanol R*. Heat in a water-bath at 60 °C for 30 min with shaking. Allow to cool and filter into a 100 ml volumetric flask. Rinse the flask and the filter with *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of this solution to 20.0 ml with *water R*.

Reference solution Dissolve 5.0 mg of *oleuropein CRS* in 5.0 ml of *methanol R*. Dilute 1.0 ml of this solution to 25.0 ml with *water R.*

Column:
— *size:* *l* = 0.15 m, Ø = 3.9 mm;
— *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
— *temperature*: 25 °C.

Mobile phase:
— *mobile phase A*: dilute 1.0 ml of *glacial acetic acid R* to 100 ml with *water R*;
— *mobile phase B*: *methanol R*;



Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	85 → 40	15 → 60
5 - 12	40 → 20	60 → 80
12 - 15	20 → 85	80 → 15

Flow rate 1 ml/min.

Detection Spectrophotometer at 254 nm.

Injection 20 µl.

Retention time Oleuropein = about 9 min.

Calculate the percentage content of oleuropein using the following expression:

$$\frac{A_1 \times m_2 \times p \times 8}{A_2 \times m_1}$$

A_1 = area of the peak due to oleuropein in the chromatogram obtained with the test solution,

A_2 = area of the peak due to oleuropein in the chromatogram obtained with the reference solution,

m_1 = mass of the drug to be examined, in grams,

m_2 = mass of *oleuropein CRS* in the reference solution, in grams,

p = percentage content of oleuropein in *oleuropein CRS*.

Ph Eur

Opium Tincture

General Notices

DEFINITION

Opium, sliced	200 g
Ethanol (90 per cent)	A sufficient quantity
Purified Water	A sufficient quantity

Extemporaneous preparation

The following directions apply.

Pour 500 ml of boiling Purified Water on to the Opium and allow to stand for 6 hours; add 500 ml of Ethanol (90 per cent), mix thoroughly and allow to stand in a covered vessel for 24 hours; strain, press the marc, mix the liquids and allow to stand for not less than 24 hours; filter.

Determine the concentration of morphine, calculated as anhydrous morphine, in the tincture so prepared by the Assay. To the remainder of the liquid add sufficient of a mixture of equal volumes of Ethanol (90 per cent) and Purified Water to produce an Opium Tincture containing 1% w/v of anhydrous morphine.

The tincture complies with the requirements for Tinctures stated under Extracts and with the following requirements.

Content of anhydrous morphine, $C_{17}H_{19}NO_3$

0.925 to 1.075% w/v.

TESTS

Ethanol content

41 to 46% v/v, Appendix VIII F, Method III.

Relative density

0.898 to 0.969, Appendix V G.

ASSAY

Dilute 5 ml to 100 ml with *ethanol* (*45%*). To 10 ml of the resulting solution add 5 ml of *water* and 1 ml of 5M *ammonia* and extract with 30 ml of a mixture of equal volumes of *ethanol* (*96%*) and *chloroform* and then with two 22.5 ml quantities of a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol* (*96%*), washing each extract with the same 20 ml of a mixture of equal volumes of *ethanol* (*96%*) and *water*. Evaporate the combined extracts just to dryness, extract the residue with two 5 ml quantities of *calcium hydroxide solution*, filter and wash the filter with 10 ml of *calcium hydroxide solution*. To the combined filtrate and washings add 0.1 g of *ammonium sulphate*, extract with two 10 ml quantities of *ethanol-free chloroform*, wash the combined extracts with 10 ml of *water* and discard the chloroform solution. To the combined alkaline liquid and aqueous washings add 10 ml of 1M *hydrochloric acid*, heat on a water bath to remove any chloroform, cool and dilute to 100 ml with *water*. To 10 ml of this solution add 10 ml of 0.1M *hydrochloric acid* and 8 ml of a freshly prepared 1.0% w/v solution of *sodium nitrite*, allow to stand for 15 minutes, add 12 ml of 5M *ammonia*, dilute to 50 ml with *water* and measure the *absorbance* of a 4-cm layer of the resulting solution at the maximum at 442 nm, Appendix II B, using in the reference cell a solution prepared at the same time and in the same manner but using 8 ml of *water* in place of the solution of sodium nitrite. Calculate the content of $C_{17}H_{19}NO_3$ taking 124 as the value of A(1%, 1 cm) at the maximum at 442 nm.

Opium

General Notices

(Raw Opium, Ph Eur monograph 0777)

Preparation

Opium Tincture

Ph Eur

DEFINITION

Raw opium is intended only as starting material for the manufacture of galenical preparations. It is not dispensed as such.

Air-dried latex obtained by incision from the unripe capsules of *Papaver somniferum* L.

Content:

— *morphine* ($C_{17}H_{19}NO_3$; M_r 285.3): minimum 10.0 per cent (dried drug);

— *codeine* ($C_{18}H_{21}NO_3$; M_r 299.4): minimum 2.0 per cent (dried drug).

CHARACTERS

Characteristic odour.

Appearance

Blackish-brown masses of various sizes, which tend to be soft and shiny and, after drying, become hard and brittle.

IDENTIFICATION

Strip off any covering, cut the substance to be examined into thin slices, dry at about 60 °C for 48 h, if necessary, and reduce to a powder (500) (2.9.12).

A. Examined under a microscope, a suspension of raw opium in a 20 g/l solution of *potassium hydroxide R* shows the following diagnostic characters: granules of latex agglomerated in irregular masses, and light-brown elongated filaments. Some fragments of vessels and rather elongated, refringent crystals are also visible, as well as a smaller number of round pollen grains and fragments of elongated fibres. Hairs of various lengths with sharp points and a few grains of starch introduced during the handling of the latex may be present. Fragments of epicarp consisting of polygonal cells with thick walls defining a stellate lumen may also be present.

B. Thin-layer chromatography (*2.2.27*).

Test solution Triturate 0.10 g of the powdered drug with 5 ml of *ethanol (70 per cent V/V) R*, add 3 ml of *ethanol (70 per cent V/V) R*, transfer to a 25 ml conical flask and heat in a water-bath at 50-60 °C with stirring for 30 min. Cool, filter, wash the filter with *ethanol (70 per cent*

V/V) R and dilute the filtrate to 10 ml with the same solvent.

Reference solution Dissolve 2.0 mg of *papaverine hydrochloride R*, 12.0 mg of *codeine phosphate R*, 12.0 mg of *noscapine hydrochloride R* and 25.0 mg of *morphine hydrochloride R* in *ethanol (70 per cent V/V) R* and dilute to 25.0 ml with the same solvent.

Plate *TLC silica gel G plate R.*

Mobile phase *concentrated ammonia R*, *ethanol (96 per cent) R*, *acetone R*, *toluene R* (2:6:40:40 *V/V/V/V*); use a freshly prepared mixture.

Application 20 µl, as bands of 20 mm by 3 mm.

Development Over a path of 15 cm.

Drying At 100-105 °C for 15 min, then allow to cool.

Detection Spray with *potassium iodobismuthate solution R2* and then with a 4 g/l solution of *sulphuric acid R*.

Results The chromatogram obtained with the reference solution shows in the lower part an orange-red or red zone (morphine) with a similarly coloured zone (codeine) above it, and in the upper part an orange-red or red zone (papaverine) with a similarly coloured zone (noscapine) above that; the chromatogram obtained with the test solution shows orange-red or red zones corresponding to those in the chromatogram obtained with the reference solution, and may also show a dark red zone (thebaine) situated between those due to codeine and papaverine.

C. To 1.0 g of the powdered drug add 5 ml of *water R*, shake for 5 min and filter. To the filtrate add 0.25 ml of *ferric chloride solution R2*. A red colour develops that does not disappear upon the addition of 0.5 ml of *dilute hydrochloric acid R*.

TESTS

Thebaine

Liquid chromatography (*2.2.29*).

Test solution Suspend 1.00 g of the substance to be examined, cut into thin slices, in 50 ml of *ethanol (50 per cent V/V) R*, mix with the aid of ultrasound for 1 h, allow to cool and dilute to 100.0 ml with the same solvent. Allow to stand. To 10.0 ml of the supernatant liquid add 5 ml of *ammonium chloride buffer solution pH 9.5 R*, dilute to 25.0 ml with *water R* and mix. Transfer 20.0 ml of this solution to a chromatography column about 0.15 m long and about 30 mm in internal diameter containing 15 g of *kieselguhr for chromatography R*. Allow to stand for 15 min. Elute with 2 quantities, each of 40 ml, of a mixture of 15 volumes of *2-propanol R* and 85 volumes of *methylene chloride R*. Evaporate the eluate to dryness *in vacuo* at 40 °C. Transfer the residue to a volumetric flask with the aid of the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution Dissolve 25.0 mg of *thebaine R* in the mobile phase and dilute to 25.0 ml with the mobile phase. Dilute 10.0 ml of this solution to 100.0 ml with the mobile phase.

Precolumn:

— *size:* *l* = 4 mm, Ø = 4.0 mm;

— *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Column:

— *size:* *l* = 0.25 m, Ø = 4.0 mm;

— *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase Dissolve 1.0 g of *sodium heptanesulphonate monohydrate R* in 420 ml of *water R,* adjust to pH 3.2 with phosphoric acid (4.9 g/l H_3PO_4) (about 5 ml) and add 180 ml of *acetonitrile R*.

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 280 nm.

Injection A suitable volume with a loop injector.

System suitability Reference solution:

— *number of theoretical plates*: minimum 3000;

— *mass distribution ratio*: minimum 3.0 for the peak due to thebaine.

Calculate the percentage content of the alkaloid using the following expression:

$$\frac{m_1 \times A_2 \times 625}{m_2 \times A_1 \times 5} \times \frac{100}{100 - h}$$

m_1 = mass of the alkaloid used to prepare the reference solution, in grams,

m_2 = mass of the substance to be examined used to prepare the test solution, in grams

A_1 = area of the peak due to the alkaloid in the chromatogram obtained with the reference solution,

A_2 = area of the peak due to the alkaloid in the chromatogram obtained with the test solution,

h = percentage loss on drying.

Limit:

— *thebaine*: maximum 3.0 per cent (dried drug).

Loss on drying (*2.2.32*)

Maximum 15.0 per cent, determined on 1.000 g of the substance to be examined cut into thin slices, by drying in an oven at 105 °C for 4 h.

Total ash (*2.4.16*)

Maximum 6.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for thebaine with the following modifications.

Reference solution Dissolve 0.100 g of *morphine hydrochloride R* and 25.0 mg of *codeine R* in the mobile phase and dilute to 25.0 ml with the mobile phase. Dilute 10.0 ml of this solution to 100.0 ml with the mobile phase.

System suitability Reference solution:

- *resolution*: minimum 2.5 between the peaks due to morphine and codeine; if necessary, adjust the volume of acetonitrile in the mobile phase;
- *repeatability*: maximum relative standard deviation of 1.0 per cent for the area of the peak due to morphine after 6 injections.

Calculate the percentage content of morphine and codeine from the expression given in the test for thebaine.

For the calculation, 1 mg of *morphine hydrochloride R* is equivalent to 0.759 mg of morphine, and 1 mg of *codeine R* is equivalent to 0.943 mg of codeine.

Ph Eur

Orange Oil

General Notices

DEFINITION

Orange Oil is obtained by mechanical means from the fresh peel of the sweet orange, *Citrus sinensis* (L.) Osbeck.

CHARACTERISTICS

A yellow to yellowish brown liquid, visibly free from water; odour, that of orange.

TESTS

Optical rotation

+94° to +99°, Appendix V F. On distillation, the first 10% of the distillate has an optical rotation the same as, or only slightly lower than, the original oil.

Refractive index

1.472 to 1.476, Appendix V E.

Residue on evaporation

1.0 to 5.0% when determined by the method for *residue on evaporation of volatile oils*, Appendix X M. Use 2 g and heat for 4 hours.

Solubility in ethanol

Soluble at 20°, in 7 parts of *ethanol (90%)*, Appendix X M. A bright solution is rarely obtained due to the presence of waxy non-volatile substances.

Weight per ml

0.842 to 0.848 g, Appendix V G.

Content of aldehydes

Not less than 1.0% w/w, calculated as decanal, $C_{10}H_{20}O$. Carry out the method for the *determination of aldehydes*, Appendix X K, using 10 g, omitting the *toluene* and using a volume, not less than 7 ml, of *alcoholic hydroxylamine solution* that exceeds by 1 to 2 ml the volume of 0.5M *potassium hydroxide in ethanol (60%) VS* required. Each ml of 0.5M *potassium hydroxide in ethanol (60%) VS* is equivalent to 78.76 mg of $C_{10}H_{20}O$.

STORAGE

Orange Oil should be kept in a well-filled container and protected from light.

Orange Peel Infusion

General Notices

DEFINITION

Concentrated Orange Peel Infusion	100 ml
Water	Sufficient to produce 1000 ml

The infusion complies with the requirements stated under Infusions.

CONCENTRATED ORANGE PEEL INFUSION

DEFINITION

Dried Bitter-Orange Peel, cut small	500 g
Ethanol (25 per cent)	1350 ml

Extemporaneous preparation

The following directions apply.

Macerate the Dried Bitter-Orange Peel in a covered vessel for 48 hours with 1000 ml of the Ethanol (25 per cent) and press out the liquid. To the pressed marc add 350 ml of the Ethanol (25 per cent), macerate for 24 hours, press and add the liquid to the product of the first pressing. Allow to stand for not less than 14 days and filter.

TESTS

Ethanol content

18 to 23% v/v, Appendix VIII F.

Total solids

10 to 15% w/v, Appendix XI A. Use 1 ml.

Weight per ml

1.01 to 1.04 g, Appendix V G.

Orange Tincture

General Notices

(Bitter-Orange Epicarp and Mesocarp Tincture, Ph Eur monograph 1604)

Ph Eur

DEFINITION

Tincture produced from *Bitter-orange epicarp and mesocarp (1603).*

PRODUCTION

The tincture is produced from 1 part of the freshly powdered drug (2000) (*2.9.12*) and 5 parts of *alcohol (70 per cent V/V/V)* by an appropriate procedure.

CHARACTERS

Liquid with a bitter taste.

IDENTIFICATION

Examine by thin-layer chromatography (*2.2.27*).

Test solution The tincture to be examined.

Reference solution Dissolve 1.0 mg of *naringin R* and 1.0 mg of *caffeic acid R* in 1 ml of *methanol R*.

Plate TLC silica gel plate R.

Mobile phase water R, *anhydrous formic acid R*, *ethyl acetate R* (10:15:75 *V/V/V*).

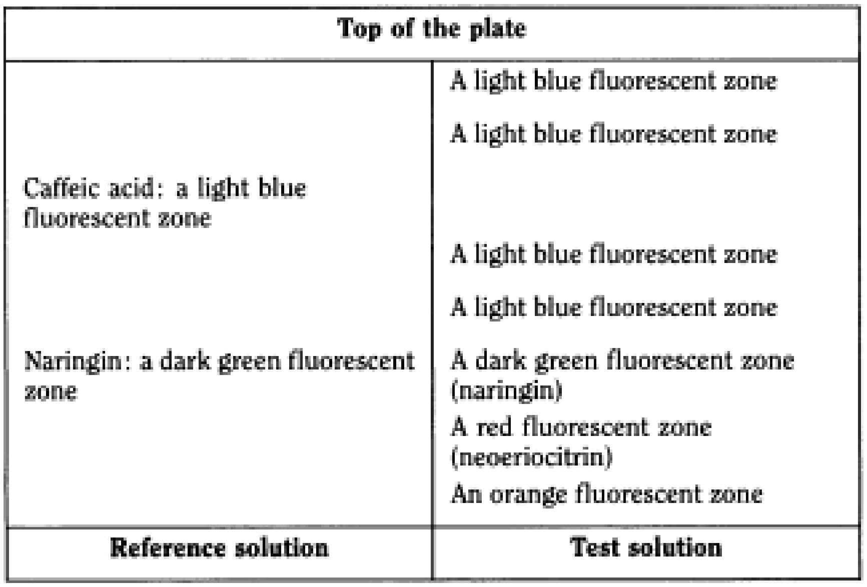
Application 20 µl, as bands.

Development Over a path of 10 cm.

Drying In air, and heat in an oven at 110-120 °C for 5 min.

Detection Spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. After 1 h, examine in ultraviolet light at 365 nm.

Results See below the sequence of the zones present in the chromatograms obtained with the reference and test solutions. Furthermore, other zones are present in the chromatogram obtained with the test solution.



Top of the plate	
	A light blue fluorescent zone
	A light blue fluorescent zone
Caffeic acid: a light blue fluorescent zone	
	A light blue fluorescent zone
	A light blue fluorescent zone
Naringin: a dark green fluorescent zone	A dark green fluorescent zone (naringin)
	A red fluorescent zone (neoeriocitrin)
	An orange fluorescent zone
Reference solution	**Test solution**

TESTS

Ethanol content (*2.9.10*)

63 per cent to 67 per cent *V/V*.

Methanol and 2-propanol (*2.9.11*)

Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

Dry residue: minimum 6.0 per cent *m/m*, determined on 2.00 g of tincture to be examined.

Ph Eur

Oregano

General Notices

(Ph Eur monograph 1880)

Ph Eur

DEFINITION

Dried leaves and flowers separated from the stems of *Origanum onites* L. or *Origanum vulgare* L. subsp. *hirtum* (Link) Ietsw., or a mixture of both species.

Content

— *essential oil*: minimum 25 ml/kg (anhydrous drug);

— *sum of the contents of carvacrol and thymol* (both $C_{10}H_{14}O$; M_r 150.2): minimum 60 per cent in the essential oil.

IDENTIFICATION

A. *O. onites*. The leaf is yellowish-green, usually 4-22 mm long and 3-14 mm wide. It has a long or short petiole or is sessile. The lamina is ovate, elliptic or ovate-lanceolate. Margins are entire or serrate, the apex is acute or obtuse. The veins are yellowish and conspicuous on the adaxial surface. Flowers are solitary or seen as broken parts of the corymb. The calyx is bract-like and inconspicuous. The corolla is white, on top of inflorescenses or single flowers, or inconspicuous. The bracts are imbricate and green like the leaves. The drug contains yellowish or yellowish-brown stem parts.

O. vulgare (subsp. *hirtum*). The leaf is green and usually 3-28 mm long and 2.5-19 mm wide. It is petiolate or sessile. The lamina is ovate or ovate-eliptic. The margins are entire or serrate, the apex is acute or obtuse. Flowers are rare, found as broken parts of the corymbs. Bracts are greenish-yellow and imbricate. The calyx is corolla-like and inconspicuous. The corolla is white, on top of inflorescenses, slightly conspicuous or inconspicuous.

B. Reduce to a powder (355) (*2.9.12*). The powder is green (*O. vulgare*) to yellowish-green (*O. onites*). Examine under a microscope using *chloral hydrate solution R*. The covering trichomes are of lamiaceous type or short, unicellular and rarely conical; conical trichomes shaped as pointed teeth are more abundant in *O. vulgare*. Covering trichomes are thick-walled in *O. vulgare*. Covering trichomes contain prismatic crystals in *O. onites*, minute needles in O. *vulgare*. The cuticle on covering trichomes is smooth; warty in *O. vulgare*. The epidermises of the leaves have cells with walls that are sinuous and the stomata are of diacytic type (*2.8.3*); in *O. vulgare* cells of the upper epidermis are beaded; secretory trichomes with 8-16 cells (12 in *O. vulgare*); glandular trichomes are numerous in *O. onites*, rare in *O. vulgare*. They have a unicellular head and unicellular, bicellular or tricellular (bicellular or tricellular in *O. vulgare*) stalk; pollen grains are smooth, spherical and more abundant in *O. onites*.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 1.0 g of the powdered drug (355) (*2.9.12*) add 5 ml of *methylene chloride R* and shake for 3 min, then filter through about 2 g of *anhydrous sodium sulphate R*.

Reference solution Dissolve 1 mg of *thymol R* and 10 µl of *carvacrol R* in 10 ml of *methylene chloride R*.

Plate *TLC silica gel plate R.*

Mobile phase *methylene chloride R.*

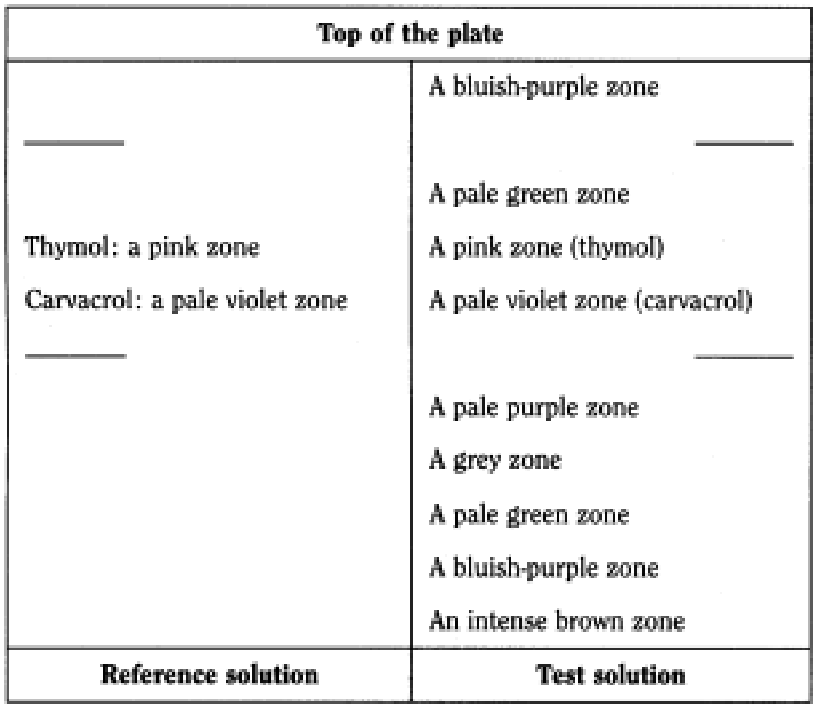
Application 20 µl as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R* using 10 ml for a plate 200 mm square and heat at 100-105 °C for 10 min.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the lower third and upper part of the chromatogram obtained with the test solution.



Top of the plate	
	A bluish-purple zone
———	———
	A pale green zone
Thymol: a pink zone	A pink zone (thymol)
Carvacrol: a pale violet zone	A pale violet zone (carvacrol)
———	———
	A pale purple zone
	A grey zone
	A pale green zone
	A bluish-purple zone
	An intense brown zone
Reference solution	**Test solution**

TESTS

Water (*2.2.13*)

Maximum 120 ml/kg, determined on 20.0 g of the powdered drug (355) (*2.9.12*).

Total ash (*2.4.16*)

Maximum 15.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*)

Maximum 4.0 per cent.

ASSAY

Essential oil (*2.8.12*)

Use 30.0 g of the drug to be examined, a 1000 ml round-bottomed flask and 400 ml of *water R* as the distillation liquid. Distil at a rate of 2-3 ml/min for 2 h without *xylene R* in the graduated tube.

Carvacrol and thymol

Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution Filter the essential oil obtained in the assay of essential oil over a small amount of *anhydrous sodium sulphate R* and dilute to 5.0 ml with *hexane R* by rinsing the apparatus and the anhydrous sodium sulphate.

Reference solution Dissolve 0.20 g of *thymol R* and 50 mg of *carvacrol R* in *hexane R* and dilute to 5.0 ml with the same solvent.

Column:
- — *material*: fused silica;
- — *size: l* = 60 m, Ø = 0.25 mm;
- — *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas *nitrogen for chromatography R* or *helium for chromatography R*.

Flow rate 1.5 ml/min.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 45	40 → 250
Injection port		190
Detector		210

Detection Flame ionisation.

Injection 0.2 µl.

Elution order Order indicated in the composition of the reference solution; record the retention times of these substances.

System suitability Reference solution:

- — *resolution*: minimum of 1.5 between the peaks due to thymol and carvacrol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of the sum of carvacrol and thymol.

Passion Flower Dry Extract

General Notices

(Ph Eur monograph 1882)

Ph Eur

DEFINITION

Dry extract produced from *Passion flower (1459).*

Content

Minimum 2.0 per cent of flavonoids, expressed as vitexin ($C_{21}H_{20}O_{10}$; M_r 432.4) (dried extract) .

PRODUCTION

The extract is produced from the herbal drug and ethanol (40 per cent *V/V* to 90 per cent *V/V*), methanol (60 per cent *V/V*) or acetone (40 per cent *V/V*) by an appropriate procedure.

CHARACTERS

Appearance: greenish-brown amorphous powder.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)*.

Test solution To 0.25 g of the extract to be examined add *methanol R*. Shake, filter and dilute to 5 ml with *methanol R.*

Reference solution Dissolve 2.0 mg of *hyperoside R* and 2.0 mg of *rutin R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 *V/V/V/V*).

Application 10 µl [or 5 µl] as bands.

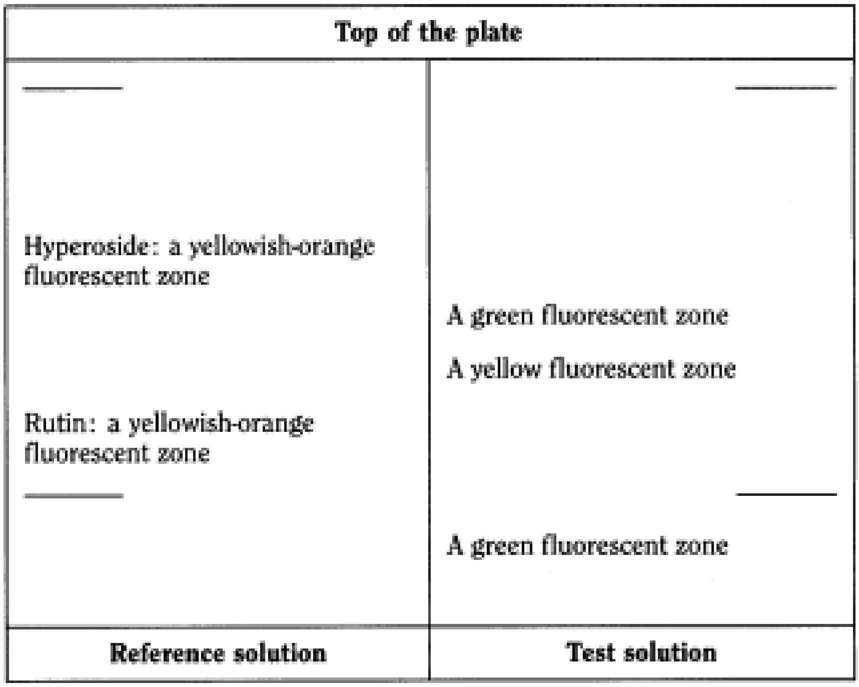
Development Over a path of 15 cm [or 5 cm].

Drying At 100-105 °C.

Detection Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for about 30 min. Examine in ultraviolet light at 365 nm.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Other fluorescent zones may be present in the

chromatogram obtained with the test solution.



Top of the plate	
———	———
Hyperoside: a yellowish-orange fluorescent zone	
	A green fluorescent zone
	A yellow fluorescent zone
Rutin: a yellowish-orange fluorescent zone	
———	———
	A green fluorescent zone
Reference solution	**Test solution**

TESTS

Loss on drying *(2.8.17)*

Maximum 5.0 per cent, determined on 0.500 g.

ASSAY

Stock solution To 50 mg of the extract to be examined add *ethanol (60 per cent V/V) R*. Shake, filter and dilute to 100.0 ml with *ethanol (60 per cent V/V) R*.

Test solution Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the 25 ml volumetric flask. Add 10.0 ml of a solution containing 25.0 g/l of *boric acid R* and 20.0 g/l of *oxalic acid R* in *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

Compensation liquid Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the 25 ml volumetric flask. Add 10.0 ml of *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

After 30 min, measure the absorbance (*2.2.25*) of the test solution at 401 nm.

Calculate the percentage content of total flavonoids, expressed as vitexin, from the following expression:

$$\frac{A \times 0.8}{m}$$

i.e. taking the specific absorbance of vitexin to be 628.

A = absorbance at 401 nm,

m = mass of the extract to be examined, in grams.

Ph Eur

Passion Flower

General Notices

Passiflora

(Ph Eur monograph 1459)

Ph Eur

DEFINITION

Fragmented or cut, dried aerial parts of *Passiflora incarnata L*. It may also contain flowers and/or fruits.

Content

Minimum 1.5 per cent of total flavonoids, expressed as vitexin ($C_{21}H_{20}O_{10}$; M_r 432.4) (dried drug).

IDENTIFICATION

A. The green or greenish-grey or brownish stem is ligneous, hollow, longitudinally striated, glabrous or very slightly pubescent, with a diameter that is generally less than 8 mm. The green or greenish-brown leaves are alternate, finely dentate and pubescent, deeply divided into 3 acute lobes of which the central lobe is the largest. The midrib is much more prominent on the lower surface. The petiole is pubescent and bears 2 dark nectaries near the lamina. The tendrils are very numerous and grow from the axils of the leaves; they are fine, smooth, round and terminated in cylindrical spirals. The radiate flowers, if present, have 3 small bracts and a corolla consisting of 5 white, elongated petals with several rows of filiform, petaloid appendices. If present, the greenish or brownish fruit is flattened and oval; it contains several flattened, brownish-yellow, pitted seeds.

B. Reduce to a powder (355) (*2.9.12*). The powder is light green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the leaf epidermis with sinuous walls and anomocytic stomata (*2.8.3*); numerous cluster crystals of calcium oxalate isolated or aligned along the veins; many isolated or grouped fibres from the stems associated with pitted vessels and tracheids; uniseriate trichomes with 1-3 thin-walled cells, straight or slightly curved, ending in a point or sometimes a hook. In addition, the powder shows, if flowers are present, papillose epidermises of the petals and appendages and pollen grains with a reticulate exine; and if mature fruits are present, scattered brown tannin cells and brownish-yellow, pitted fragments of the testa.

C. Examine the chromatograms obtained in the test for other species of *Passiflora*.

Results The chromatogram obtained with the test solution shows below the zone due to rutin in the chromatogram obtained with the reference solution a zone of intense yellow fluorescence, above it a zone of green fluorescence (diglycosylflavone), below the zone due to hyperoside in the chromatogram obtained with the reference solution a zone of yellow fluorescence (iso-orientin) and above a zone of green fluorescence (isovitexin), above the zone due to hyperoside in the chromatogram obtained with the reference solution a zone of brownish-yellow fluorescence (orientin) and above it a zone of green fluorescence (vitexin). These latter 2 zones may be absent. Further zones may be present.

TESTS

Other species of *Passiflora*

Thin-layer chromatography (*2.2.27*).

Test solution To 1.0 g of the powdered drug (355) (*2.9.12*) add 5 ml of *methanol R*. Heat to boiling under a reflux condenser for 10 min. Cool and filter.

Reference solution Dissolve with heating 2.0 mg of *rutin R* and 2.0 mg of *hyperoside R* in 10 ml of *methanol R*.

Plate *TLC silica gel plate R.*

Mobile phase *Anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 *V/V/V/V*).

Application 10 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow to dry in air for 30 min. Examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the reference solution shows in the lower third a zone of yellowish-brown fluorescence due to rutin and in the middle third a zone of yellowish-brown fluorescence due to hyperoside. The chromatogram obtained with the test solution shows no intense zones of greenish-yellow or orange-yellow fluorescence between the zone due to diglycosylflavones and that due to iso-orientin (P. *coerulea* and P. *edulis*).

Total ash (*2.4.16*)

Maximum 13.0 per cent.

Loss on drying (*2.2.32*)

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

ASSAY

Stock solution In a 100 ml round-bottomed flask, introduce 0.200 g of the powdered drug (250) (*2.9.12*) and add 40 ml of *ethanol (60 per cent V/V) R*. Heat in a water-bath at 60 °C under a reflux condenser for 30 min while shaking frequently. Allow to cool and filter the mixture through a plug of absorbent cotton in a 100 ml flask. Transfer the absorbent cotton with the drug residue into the round-bottomed flask. Add 40 ml of *ethanol (60 per cent V/V) R* and heat again in a water-bath at 60 °C under reflux for 10 min. Allow to cool and filter the mixture and the first filtrate from the 100 ml flask through a filter paper into the 100 ml volumetric flask. Dilute to 100 ml with the same solvent, while rinsing the flask, round-bottomed flask and filter.

Test solution

Introduce 5.0 ml of stock solution into a flask. Evaporate to dryness under reduced pressure and take up the residue with 10 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R*. Add 10 ml of a solution consisting of 25 g/l of *boric acid R* and 20 g/l of oxalic acid in *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

Compensation liquid

Introduce 5.0 ml of the stock solution into a second flask. Evaporate to dryness under reduced pressure and take up the residue with 10 ml of a mixture of 10 volumes of *methano R* and 100 volumes of *glacial acetic acid R*. Add 10 ml of *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

After 30 min, measure the absorbance (*2.2.25*) of the test solution at 401 nm, by comparison with the compensation liquid.

Calculate the percentage content of total flavonoids, expressed as vitexin, using the following expression:

i.e. taking the specific absorbance of vitexin to be 628.

$$\frac{A \times 0.8}{m}$$

A = absorbance at 401 nm

M = mass of the drug to be examined, in grams.

Ph Eur

Pelargonium Root

General Notices

(Ph Eur monograph 2264)

Ph Eur

DEFINITION

Dried, usually fragmented, underground organs of *Pelargonium sidoides* DC and/or *Pelargonium reniforme* Curt.

Content

Minimum 2.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1) (dried drug).

IDENTIFICATION

A. The root is covered with dark, partly reddish-brown, longitudinally fissured bark. The transverse section shows, underneath the cork layer, yellow or white wood, which clearly shows partly brownish medullary rays.

B. Reduce to a powder (355 (*2.9.12*)). The powder is brownish-red. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: multilayer cork cells consisting of almost uniform, rectangular cells; fragments of parenchyma underneath the cork containing sclereids with a wide lumen; numerous calcium oxalate cluster crystals. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows simple starch granules without striations or cracks.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 0.5 g of the powdered drug (355) (*2.9.12*) add 10 ml of *methanol R*, shake for 15 min and filter.

Reference solution Dissolve 1 mg of *scopoletin R* and 2 mg of *esculin R* in 20 ml of *methanol R*.

Plate *TLC silica gel F_{254} plate R* (5-40 µm) [or *TLC silica gel F254 plate* R (2-10 µm)].

Mobile phase *water R*, *methanol R*, *ethyl acetate R* (10:14:76 *V/V/V*).

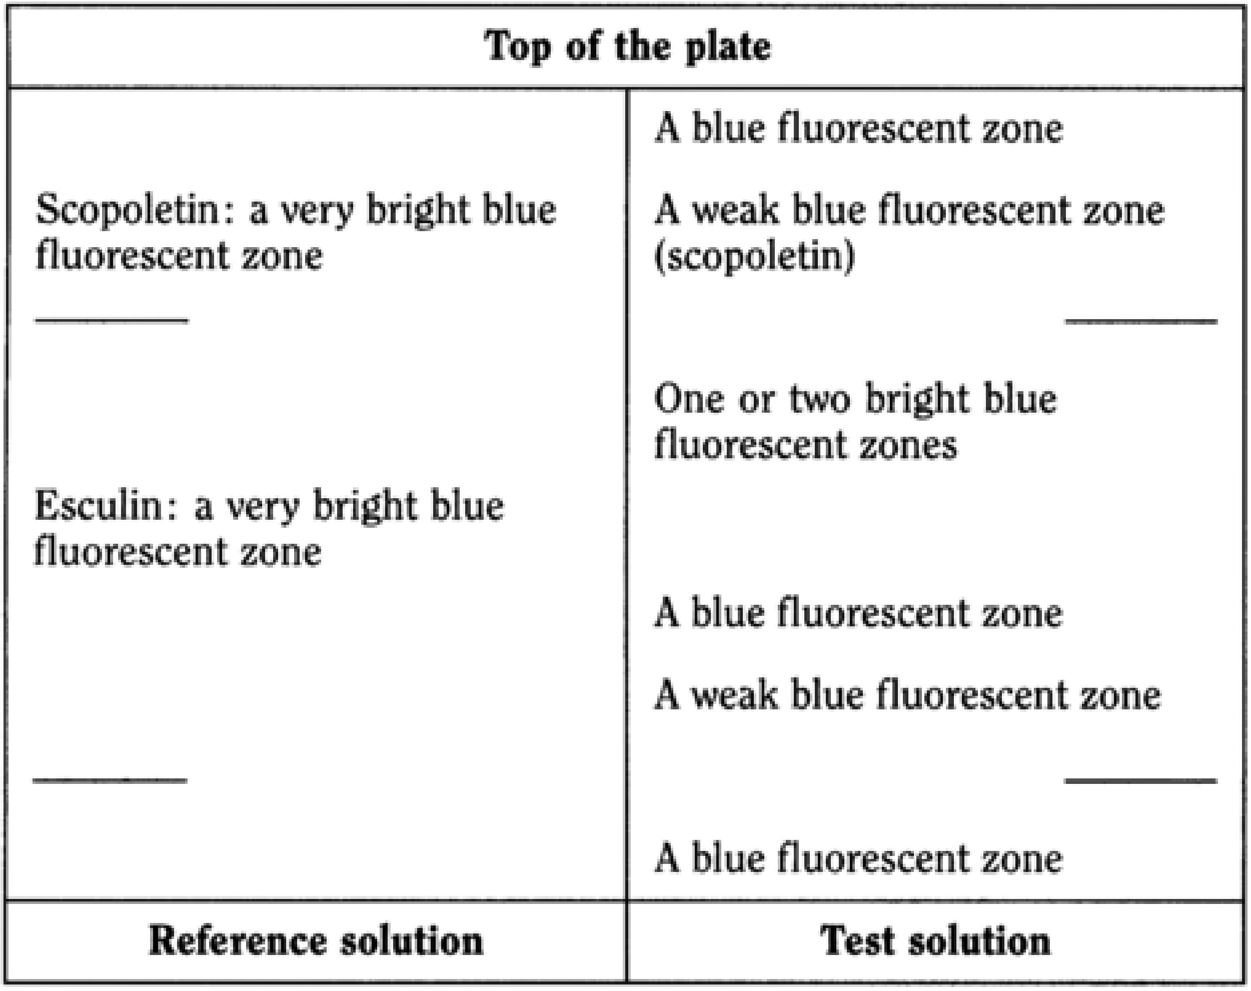
Application 10 µl [or 5 µl] as bands.

Development Over a path of 10 cm [or 6 cm].

Drying In air.

Detection Spray with *alcoholic potassium hydroxide solution R*. Examine in ultraviolet light at 365 nm.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other blue fluorescent zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A blue fluorescent zone
Scopoletin: a very bright blue fluorescent zone	A weak blue fluorescent zone (scopoletin)
_______	_______
	One or two bright blue fluorescent zones
Esculin: a very bright blue fluorescent zone	
	A blue fluorescent zone
	A weak blue fluorescent zone
_______	_______
	A blue fluorescent zone
Reference solution	**Test solution**

TESTS

Loss on drying (*2.2.32*)

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C.

Total ash (*2.4.16*)

Maximum 12.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*)

Maximum 3.0 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs (2.8.14). Use 0.750 g of the powdered drug (180) (*2.9.12*).

Ph Eur

Peppermint Leaf

General Notices

(Ph Eur monograph 0406)

Ph Eur

DEFINITION

Whole or cut dried leaves of *Mentha* × *piperita* L.

Content

Minimum 12 ml/kg of essential oil for the whole drug and minimum 9 ml/kg of essential oil for the cut drug.

CHARACTERS

Characteristic and penetrating odour.

Characteristic aromatic taste.

Peppermint leaf is green or brownish-green, with brownish-violet veins in some varieties. The petioles are green or brownish-violet.

IDENTIFICATION

A. The leaf is entire, broken or cut, thin, fragile and often crumpled; the entire leaf is 3-9 cm long and 1-3 cm wide. The lamina is oval or lanceolate, the apex acuminate, the margin sharply dentate and the base asymmetrical. Venation is pinnate, prominent on the lower surface, with lateral veins leaving the midrib at about 45°. The lower surface is slightly pubescent and secretory trichomes are visible under a lens (6×) as bright yellowish points. The petiole is grooved, usually up to 1 mm in diameter and 0.5-1 cm long.

B. Reduce to a powder (355) (*2.9.12*). The powder is brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: leaf-tissue fragments with cells of the epidermis having sinuous-wavy walls and the cuticle striated over the veins and diacytic stomata (2.8.3) predominantly present on the lower epidermis; epidermis fragments from near the leaf margin with isodiametric cells straighter-walled showing distinct beading and pitting in anticlinal walls; covering trichomes short, conical, unicellular or bicellular, or elongated, uniseriate with 3-8 cells with striated cuticle; glandular trichomes of 2 types: (a) unicellular base with small, rounded unicellular head 15-25 µm in diameter; (b) unicellular base with enlarged oval head 55-70 µm in diameter composed of 8 radiating cells; dorsiventral mesophyll fragment with a single palisade layer and 4-6 layers of spongy parenchyma; yellowish crystals of menthol under the cuticle of secretory cells. Calcium oxalate crystals are absent.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 0.2 g of the recently powdered drug add 2 ml of *methylene chloride R*, shake for a few minutes and filter. Evaporate the filtrate to dryness at about 40 °C and dissolve the residue in 0.1 ml of *toluene R*.

Reference solution Dissolve 50 mg of *menthol R*, 20 µl of *cineole R*, 10 mg of *thymol R* and 10 µl of *menthyl acetate R* in *toluene R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel* GF_{254} *plate R.*

Mobile phase *ethyl acetate R*, *toluene R* (5:95 *V/V*).

Application 10 µl of the reference solution and 20 µl of the test solution, as bands.

Development Over a path of 15 cm.

Drying In air until the solvent has evaporated.

Detection A Examine in ultraviolet light at 254 nm.

Results A The chromatogram obtained with the test solution may show a light quenching zone situated just below the level of the zone due to thymol in the chromatogram obtained with the reference solution (carvone, pulegone).

Detection B Spray with *anisaldehyde solution R* and examine in daylight while heating for 5-10 min at 100-105 °C.

Results B The chromatogram obtained with the reference solution shows, in order of increasing R_F value: in the lower third a deep-blue or violet zone (menthol); a violet-blue or brown zone (cineole); a pink zone (thymol); and a bluish-violet zone (menthyl acetate). The chromatogram obtained with the test solution shows: a zone due to menthol (the most intense); a faint zone due to cineole; at R_F values between those of the cineole and thymol zones in the chromatogram obtained with the reference solution, it may show light pink, or bluish-grey or greyish-green zones (carvone, pulegone, isomenthone); in the middle of the chromatogram, a bluish-violet zone (menthyl acetate) and just below it a greenish-blue zone (menthone) appear; an intense reddish-violet zone (hydrocarbons) appears near the solvent front; other less intensely coloured zones also appear.

TESTS

Foreign matter (*2.8.2*)

Maximum 5 per cent stems, whose diameter is not greater than 1.5 mm; maximum 2 per cent foreign elements; not more than 8 per cent of the leaves show brown stains due to *Puccinia menthae*.

Carry out the determination using 10 g of the drug.

Water (*2.2.13*)

Maximum 110 ml/kg, determined on 20.0 g.

Total ash (*2.4.16*)

Maximum 15.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*)

Maximum 1.5 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs (*2.8.12*). Use 20.0 g of crushed drug, a 500 ml flask, 200 ml of *water R* as the distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 3-4 ml/min for 2 h.

Ph Eur

Peppermint Oil

General Notices

(Ph Eur monograph 0405)

Preparations

Gastro-resistant Peppermint Oil Capsules

Concentrated Peppermint Emulsion

Peppermint Spirit

Ph Eur

DEFINITION

Essential oil obtained by steam distillation from the fresh aerial parts of the flowering plant of *Mentha* × *piperita* L.

CHARACTERS

Appearance

A colourless, pale yellow or pale greenish-yellow liquid.

It has a characteristic odour and taste followed by a sensation of cold.

Solubility

Miscible with alcohol and with methylene chloride.

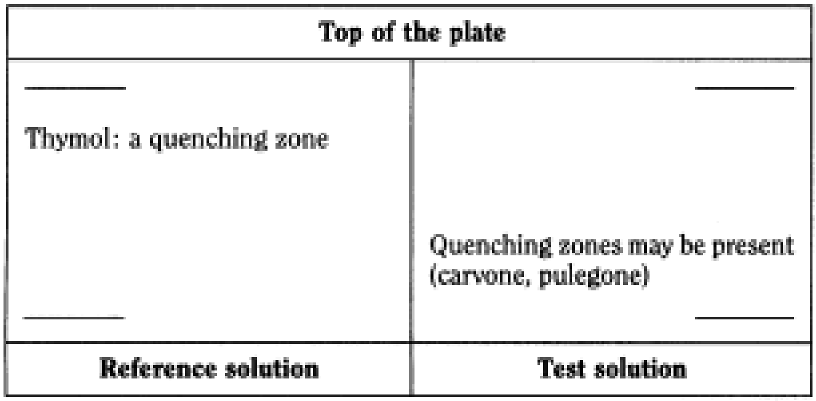
IDENTIFICATION

First identification B.

Second identification A.

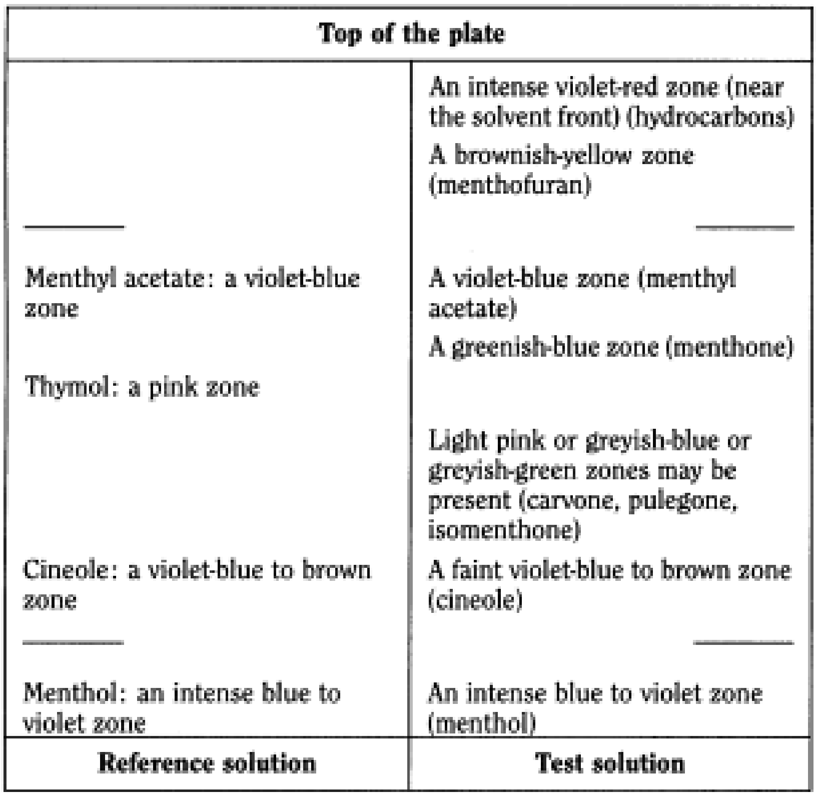
A. Examine the chromatograms obtained in the test for mint oil.

Results A See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
———	———
Thymol: a quenching zone	
	Quenching zones may be present (carvone, pulegone)
———	———
Reference solution	**Test solution**

Results B See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other less intensely coloured zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	An intense violet-red zone (near the solvent front) (hydrocarbons)
	A brownish-yellow zone (menthofuran)
———	———
Menthyl acetate: a violet-blue zone	A violet-blue zone (menthyl acetate)
	A greenish-blue zone (menthone)
Thymol: a pink zone	
	Light pink or greyish-blue or greyish-green zones may be present (carvone, pulegone, isomenthone)
Cineole: a violet-blue to brown zone	A faint violet-blue to brown zone (cineole)
———	———
Menthol: an intense blue to violet zone	An intense blue to violet zone (menthol)
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution. Carvone and pulegone may be present in the chromatogram obtained with the test solution.

TESTS

Relative density (*2.2.5*)

0.900 to 0.916.

Refractive index (*2.2.6*)

1.457 to 1.467.

Optical rotation (*2.2.7*)

- 10° to - 30°.

Acid value (*2.5.1)*

Maximum 1.4, determined on 5.0 g diluted in 50 ml of the prescribed mixture of solvents.

Fatty oils and resinified essential oils (*2.8.7*)

It complies with the test for fatty oils and resinified essential oils.

Mint oil

A. Thin-layer chromatography (*2.2.27*).

Test solution Mix 0.1 g of the substance to be examined with *toluene R* and dilute to 10 ml with the same solvent.

Reference solution Dissolve 50 mg of *menthol R*, 20 µl of *cineole R*, 10 mg of *thymol R* and 10 µl of *menthyl acetate R* in *toluene R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel F_{254} plate R.*

Mobile phase *ethyl acetate R*, *toluene R* (5:95 *V/V*).

Application 10 µl of the reference solution and 20 µl of the test solution, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection A Examine in ultraviolet light at 254 mm.

Detection B Spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min. Examine immediately in daylight.

Result B The chromatogram obtained with the test solution shows no blue zone between the zones due to cineole and menthol.

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The chromatogram obtained with the test solution does not show a peak with the retention time of isopulegol that has an area of more than 0.2 per cent of the total area.

Chromatographic profile

Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution Mix 0.20 g of the substance to be examined with *hexane R* and dilute to 10.0 ml with the same solvent.

Reference solution (a) Dissolve 10 µl of *limonene R,* 20 µl of *cineole R*, 40 µl of *menthone R*, 10 µl of *menthofuran R*, 10 µl of *isomenthone R*, 40 µl of *menthyl acetate R*, 20 µl of *isopulegol R*, 60 mg of *menthol R*, 20 µl of *pulegone R*, 10 µl of *piperitone R* and 10 µl of *carvone R* in *hexane R* and dilute to 10.0 ml with the same solvent.

Reference solution (b) Dissolve 5 µl of *isopulegol R* in *hexane R* and dilute to 10 ml with the same solvent. Dilute 0.1 ml to 5 ml with *hexane R*.

Column:

— *material*: fused silica;

— *size: l* = 60 m, Ø = 0.25 mm;

— *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas *helium for chromatography R*.

Flow rate 1.5 ml/min.

Split ratio 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	60
	10 - 70	60 - 180
	70 - 75	180
Injection port		200
Detector		220

Detection Flame ionisation.

Injection 1 µl.

Elution order Order indicated in the composition of reference solution (a); record the retention times of these substances.

System suitability Reference solution (a):

— *resolution*: minimum 1.5 between the peaks due to limonene and cineole and minimum 1.5 between the peaks due to piperitone and carvone.

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of the reference solution in the chromatogram obtained with the test solution (disregard the peak due to hexane).

Determine the percentage content of the components. The limits are within the following ranges:

— *limonene*: 1.0 per cent to 5.0 per cent;

— *cineole*: 3.5 per cent to 14.0 per cent;

— *menthone*: 14.0 per cent to 32.0 per cent;

— *menthofuran*: 1.0 per cent to 9.0 per cent;

— *isomenthone*: 1.5 per cent to 10.0 per cent;

— *menthyl acetate*: 2.8 per cent to 10.0 per cent;

— *isopulegol*: maximum 0.2 per cent;

— *menthol*: 30.0 per cent to 55.0 per cent;

— *pulegone*: maximum 4.0 per cent;

— *carvone*: maximum 1.0 per cent;

— *disregard limit*: peak area obtained with reference solution (b) (0.05 per cent).

The ratio of cineole content to limonene content is not less than 2.

STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

Ph Eur

Peru Balsam

General Notices

(Ph Eur monograph 0754)

Ph Eur

DEFINITION

Balsam obtained from the scorched and wounded trunk of *Myroxylon balsamum* (L.) Harms var. *pereirae* (Royle) Harms.

Content

45.0 per cent m/m to 70.0 per cent *m/m* of esters, mainly benzyl benzoate and benzyl cinnamate.

CHARACTERS

Appearance

Dark brown, viscous liquid which is transparent and yellowish-brown when viewed in a thin layer; it is not sticky, non-drying and does not form threads.

Solubility

Practically insoluble in water, freely soluble in anhydrous ethanol, not miscible with fatty oils, except for castor oil.

IDENTIFICATION

A. Dissolve 0.20 g in 10 ml of *ethanol (96 per cent) R* . Add 0.2 ml of *ferric chloride solution R1* . A green or yellowish-green colour develops.

B. Thin-layer chromatography *(2.2.27)* .

Test solution Dissolve 0.5 g of the substance to be examined in 10 ml of *ethyl acetate R* .

Reference solution Dissolve 4 mg of *thymol R* , 30 mg of *benzyl cinnamate R* and 80 µl of *benzyl benzoate R* in 5 ml of *ethyl acetate R* .

Plate *TLC silica gel GF$_{254}$ plate R.*

Mobile phase *glacial acetic acid R, ethyl acetate R, hexane R* (0.5:10:90 *V/V/V*).

Application 10 µl, as bands of 20 mm by 3 mm.

Development Twice over a path of 10 cm.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm and mark the quenching zones.

Results A The chromatogram obtained with the reference solution shows in the upper third 2 quenching zones, the higher one due to benzyl benzoate and the lower one due to benzyl cinnamate. The chromatogram obtained with the test solution shows 2 quenching zones at the same levels and of approximately the same size.

Detection B Spray with a freshly prepared 200 g/l solution of *phosphomolybdic acid R* in *ethanol (96 per cent) R*, using 10 ml for a plate 200 mm square and examine in daylight while heating at 100-105 °C for 5-10 min.

Results B The zones due to benzyl benzoate and benzyl cinnamate are blue against a yellow background. The chromatogram obtained with the reference solution shows at about the middle a violet-grey zone (thymol). In the chromatogram obtained with the test solution, a blue zone (nerolidol) is seen just below the level of the zone due to thymol in the chromatogram obtained with the reference solution. Just below the zone due to nerolidol, no blue zone is seen corresponding to a quenching zone seen when examined in ultraviolet light at 254 nm (colophony). In the upper and lower part of the chromatogram obtained with the test solution, other faint blue zones may be seen.

TESTS

Relative density *(2.2.5)*

1.14 to 1.17.

Saponification value *(2.5.6)*

230 to 255, determined on the residue obtained in the assay.

Artificial balsams

Shake 0.20 g with 6 ml of *light petroleum R1*. The light petroleum solution is clear and colourless and the whole of the insoluble parts of the balsam stick to the wall of the test-tube.

Fatty oils

Shake 1 g with 3 ml of a 1000 g/l solution of *chloral hydrate R*. The resulting solution is as clear as the 1000 g/l solution of *chloral hydrate R*.

Turpentine

Evaporate to dryness 4 ml of the solution obtained in the test for artificial balsams. The residue has no odour of turpentine.

ASSAY

To 2.50 g in a separating funnel add 7.5 ml of *dilute sodium hydroxide solution R* and 40 ml of *peroxide-free ether R* and shake vigorously for 10 min. Separate the lower layer and shake it with 3 quantities, each of 15 ml, of *peroxide-free ether R*. Combine the ether layers, dry over 10 g of *anhydrous sodium sulphate R* and filter. Wash the sodium sulphate with 2 quantities, each of 10 ml, of *peroxide-free ether R*. Combine the ether layers and evaporate to dryness. Dry the residue (esters) at 100-105 °C for 30 min and weigh.

STORAGE

Protected from light.

Ph Eur

Pine Silvestris Oil

General Notices

(Ph Eur monograph 1842)

Ph Eur

DEFINITION

Essential oil obtained by steam distillation of the fresh leaves and branches of *Pinus sylvestris* L. A suitable antioxidant may be added.

CHARACTERS

Appearance

Clear, colourless or pale yellow liquid.

Characteristic odour.

IDENTIFICATION

First identification B.

Second identification A.

A. Thin-layer chromatography (*2.2.27*).

Test solution Dilute 1 ml of the substance to be examined to 10 ml with *toluene R*.

Reference solution Dissolve 10 mg of *borneol R* and 10 µl of *bornyl acetate R* in *toluene R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *ethyl acetate R*, *toluene R* (5:95 *V/V*).

Application 10 µl [or 2 µl] as bands.

Development Over a path of 15 cm [or 6 cm].

Drying In air.

Detection Treat with *anisaldehyde solution R*, heat at 100-105 °C for 5-10 min and examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A pink zone (hydrocarbons)
———	———
Bornyl acetate: a brown or grey-brown zone	A brown or grey-brown zone (bornyl acetate)
	A pink zone
———	———
Borneol: a brown or grey-brown zone	A cluster of violet zones
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a).

TESTS

Relative density (*2.2.5*)

0.855 to 0.875.

Refractive index (*2.2.6*)

1.465 to 1.480.

Optical rotation (*2.2.7*)

- 9° to - 30°.

Acid value (*2.5.1*)

Maximum 1.0.

Peroxide value (*2.5.5*)

Maximum 20.

Fatty oils and resinified oils (*2.8.7*)

It complies with the test.

Chromatographic profile

Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution The substance to be examined.

Reference solution (a) Dissolve 30 µl of α-*pinene R*, 10 mg of *camphene R*, 20 µl of β-*pinene R*, 10 µl of *car-3-ene R*, 10 µl of β-*myrcene R*, 20 µl of *limonene R*, 10 µl of *p-cymene R*, 10 µl of *terpinolene R*, 10 µl of *bornyl acetate R* and 10 µl of β-*caryophyllene R* in 1 ml of *heptane R*.

Reference solution (b) Dissolve 10 mg of *camphene R* in *heptane R* and dilute to 2 ml with the same solvent. Dilute 0.1 ml of the solution to 1 ml with *heptane R*.

Column:

- — *material*: fused silica;
- — *size:* l = 60 m, Ø = 0.22 mm;
- — *stationary phase*: *macrogol 20 000 R* (0.2 µm).

Carrier gas *helium for chromatography R*.

Flow rate 1.5 ml/min.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	65
	10 - 41	65 → 220
	41 - 50	220
Injection port		220
Detector		250

Detection Flame ionisation.

Injection 0.2 µl.

Elution order Order indicated in the preparation of reference solution (a). Record the retention times of these substances.

System suitability Reference solution (a):

- — *resolution*: minimum 1.5 between the peaks due to car-3-ene and β-myrcene.

Identification of components Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution. The peak due to β-phellandrene is eluted after the peak due to limonene with a relative retention of about 1.03 with reference to limonene.

Determine the percentage content of these components. The limits are within the following ranges:

— α-*pinene*: 32.0 per cent to 60.0 per cent;

— *camphene*: 0.5 per cent to 2.0 per cent;

— β-*pinene*: 5.0 per cent to 22.0 per cent;

— *car-3-ene*: 6.0 per cent to 18.0 per cent;

— β-*myrcene*: 1.5 per cent to 10.0 per cent;

— *limonene*: 7.0 per cent to 12.0 per cent;

— β-*phellandrene*: maximum 2.5 per cent;

— *p-cymene*: maximum 2.0 per cent;

— *terpinolene*: maximum 4.0 per cent;

— *bornyl acetate*: 1.0 per cent to 4.0 per cent;

— β-*caryophyllene*: 1.0 per cent to 6.0 per cent;

— *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b).

STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

Ph Eur

Pinus Pinaster Type Turpentine Oil

General Notices

(Ph Eur monograph 1627)

Ph Eur

Plantain

General Notices

(Ribwort Plantain, Ph Eur monograph 1884)

Ph Eur

DEFINITION

Whole or fragmented, dried leaf and scape of *Plantago lanceolata* L. *s.l.*

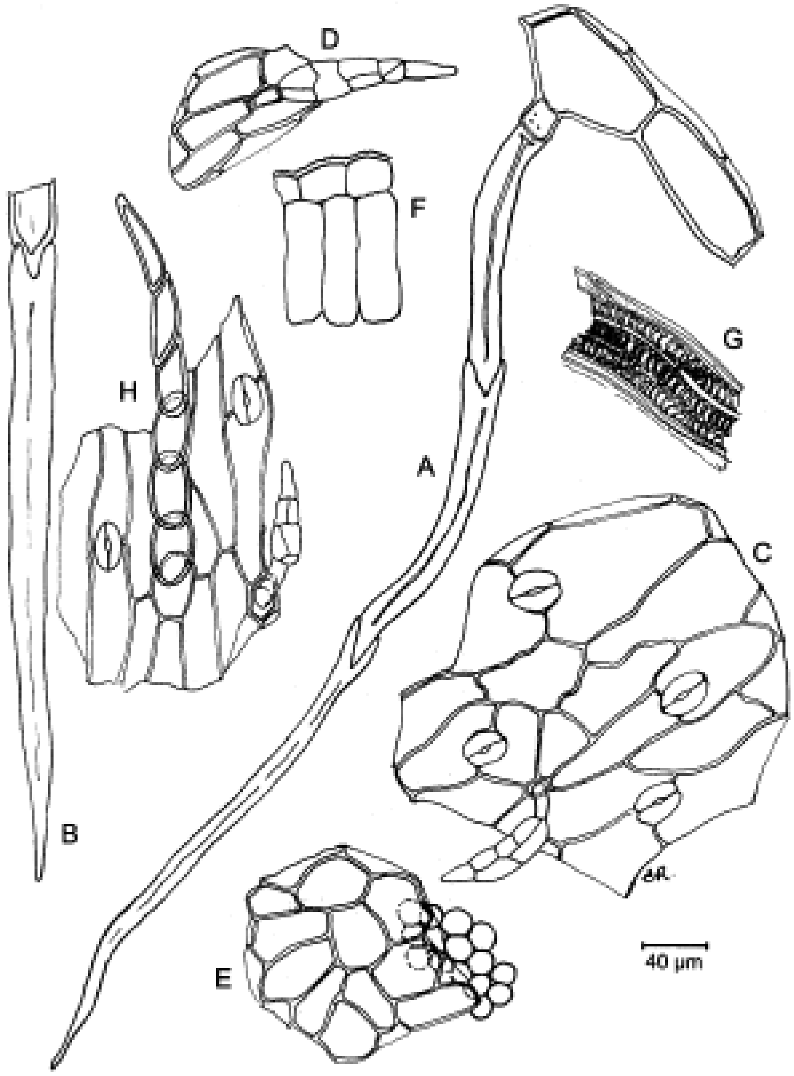
Content

Minimum 1.5 per cent of total *ortho*-dihydroxycinnamic acid derivatives expressed as acteoside ($C_{29}H_{36}O_{15}$; M_r 624.6) (dried drug).

IDENTIFICATION

A. The leaf is up to 30 cm long and 4 cm wide, yellowish-green to brownish-green, with a prominent, whitish-green, almost parallel venation on the abaxial surface. It consists of a lanceolate lamina narrowing at the base into a channelled petiole. The margin is indistinctly dentate and often undulate. It has 3, 5 or 7 primary veins, nearly equal in length and running almost parallel. Hairs may be almost absent, sparsely scattered or sometimes abundant, especially on the lower surface and over the veins. The scape is brownish-green, longer than the leaves, 3-4 mm in diameter and is deeply grooved longitudinally, with 5-7 conspicuous ribs. The surface is usually covered with fine hairs.

B. Reduce to a powder (355) (*2.9.12*). The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of epidermis, composed of cells with irregularly sinuous anticlinal walls, the fragments from the scape with thickened outer walls and a coarsely ridged cuticle; stomata mostly of the diacytic type (2.8.3) and sometimes anomocytic; the multicellular, uniseriate, conical covering trichomes are highly characteristic, with a basal cell larger than the other epidermal cells followed by a short cell supporting 2 or more elongated cells with the lumen narrow and variable, occluded at intervals corresponding to slight swellings in the trichome and giving a jointed appearance; the terminal cell has an acute apex and a filiform lumen; the glandular trichomes have a unicellular cylindrical stalk and a multicellular, elongated, conical head consisting of several rows of small cells and a single terminal cell; dense groups of lignified fibro-vascular tissue with narrow, spirally and annularly thickened vessels and slender, moderately thickened fibres.



A. Covering trichome of the leaf (usually only fragments observed)

B. Fragment of covering trichome of the leaf

C. Lower epidermis of lamina with glandular trichome

D. Glandular trichome

E. Upper epidermis of lamina with palisade parenchyma, in surface view

F. Upper epidermis and palisade parenchyma, in section view

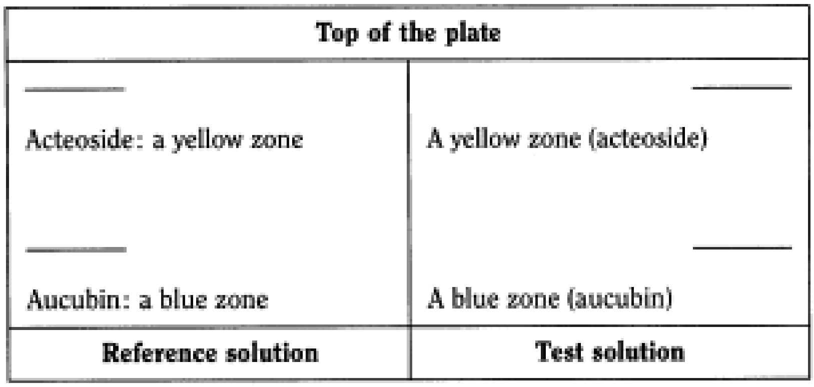
G. Vessels

H. Epidermis from the scape

Figure 1884.-1. – *Illustration of powdered herbal drug of ribwort plantain (see Identification B)*

C. Examine the chromatograms obtained in the test for Digitalis lanata leaves.

Results A See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatograms obtained with the test solution.



Top of the plate	
———	———
Acteoside: a yellow zone	A yellow zone (acteoside)
———	———
Aucubin: a blue zone	A blue zone (aucubin)
Reference solution	**Test solution**

TESTS

***Digitalis lanata* leaves**

Thin layer chromatography (*2.2.27*).

Solvent mixture *water R*, *methanol R* (30:70 *V/V*).

Test solution Use a freshly prepared solution. To 1 g of the powdered drug (355) (*2.9.12*) in a 25 ml flask, add 10 ml of the solvent mixture and shake for 30 min. Filter, rinse the flask and filter with 2 quantities, each of 5 ml, of the solvent mixture. Dilute to 25 ml with the solvent mixture.

Reference solution Dissolve 1 mg of *acteoside R* and 1 mg of *aucubin R* in 1 ml of the solvent mixture.

Plate *TLC silica gel F_{254} plate R.*

Mobile phase *acetic acid R*, *anhydrous formic acid R*, *water R*, *ethyl acetate R* (11:11:27:100 *V/V/V/V*).

Application 10 µl as bands.

Development Over a path of 8 cm; heat immediately after development at about 120 °C for 5-10 min.

Detection A Examine in daylight.

Detection B Examine in ultraviolet light at 365 nm.

Results B The chromatogram obtained with the test solution shows no bright blue fluorescent zone just below the reddish-brown fluorescent zone corresponding to aucubin in the chromatogram obtained with the reference solution.

Foreign matter (***2.8.2***)

Maximum 5 per cent of leaves of different colour and maximum 2 per cent of other foreign matter.

Loss on drying (*2.2.32*)

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 14.0 per cent.

ASSAY

Stock solution In a flask, place 1.000 g of the powdered drug (355) (*2.9.12*) and add 90 ml of *ethanol (50 per cent V/V) R*. Boil in a water-bath under a reflux condenser for 30 min. Allow to cool and filter into a 100 ml volumetric flask. Rinse the flask and the filter with 10 ml of *ethanol (50 per cent V/V) R*. Combine the filtrate and the rinsings and dilute to 100.0 ml with *ethanol (50 per cent V/V) R*.

Test solution To a 10 ml volumetric flask add, mixing after each addition, 1.0 ml of the stock solution, 2 ml of *0.5 M hydrochloric acid*, 2 ml of a solution prepared by dissolving 10 g of *sodium nitrite R* and 10 g of *sodium molybdate R* in 100 ml of *water R*, and 2 ml of dilute sodium hydroxide *solution R*. Dilute to 10.0 ml with *water R*.

Immediately measure the absorbance (*2.2.25*) of the test solution at 525 nm using as compensation liquid a solution prepared as follows: to a 10 ml volumetric flask add 1.0 ml of the stock solution, 2 ml of *0.5 M hydrochloric acid* and 2 ml of *dilute sodium hydroxide solution R*, and dilute to 10.0 ml with *water R*.

Calculate the percentage content of total ortho-dihydroxycinnamic acid derivatives, expressed as acteoside, using the following expression:

$$\frac{A \times 1000}{185 \times m}$$

i.e. taking the specific absorbance to be 185 for acteoside at 525 nm.

A = absorbance of the test solution at 525 nm,

m = mass of the substance to be examined, in grams.

Ph Eur

Podophyllum Resin

General Notices

Podophyllin

Preparation

Compound Podophyllin Paint

DEFINITION

Podophyllum Resin is the resin obtained from rhizomes and roots of *Podophyllum hexandrum* Royle (*P. emodi* Wall.). It contains not less than 50.0% of total aryltetralin lignans, calculated as podophyllotoxin.

CHARACTERISTICS

An amorphous powder varying in colour from light brown to greenish yellow, or brownish grey masses.

Partly soluble in hot *water*, from which it is precipitated on cooling, in *ether* and in 5M *ammonia*.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel* GF_{254} *plate* and a mixture of 1 volume of *methanol* and 25 volumes of *chloroform* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate, as bands, 10 µl of each of the following solutions in *methanol* containing (1) 1% w/v of the substance being examined, (2) 0.5% w/v of *podophyllotoxin* and (3) 0.1% w/v of *phenazone*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. The chromatogram obtained with solution (1) exhibits quenching zones corresponding in position to the principal quenching zones in the chromatograms obtained with solutions (2) and (3). Other quenching zones may be present in the chromatogram obtained with solution (1). Spray the plate with *methanolic sulphuric acid (50%)* and heat at 130° for 10 minutes. The chromatogram obtained with solution (1) exhibits a purplish zone (podophyllotoxin) corresponding in position and colour to the principal zone in solution (2) and a purplish zone (4′-demethylpodophyllotoxin) corresponding in position to the quenching zone found in solution (3). Other coloured zones may be present in the chromatogram obtained with solution (1).

TESTS

Matter insoluble in ethanol (96%)

Shake 1 g, finely powdered, with 20 ml of *ethanol (96%)* for 5 minutes, filter through a sintered-glass crucible (ISO 4793, porosity grade 2, is suitable), wash the filter with *ethanol (96%)* and dry at 105°. The residue weighs not more than 25 mg.

Matter insoluble in 5M ammonia

Shake 0.5 g, finely powdered, with 30 ml of 5M *ammonia* for 30 minutes at about 20°; filter through a sintered-glass crucible (ISO 4793, porosity grade 2, is suitable) and wash the flask and filter with 30 ml of *water*, the time taken for filtering and washing being not more than 10 minutes. Dry the filter and residue to constant weight at 105°. The residue weighs not less than 0.18 g and not more than 0.30 g.

Loss on drying

When dried to constant weight at 105°, loses not more than 5.0% of its weight. Use 1 g.

Sulphated ash

Not more than 1.0%, Appendix IX A.

ASSAY

Dissolve 0.5 g in sufficient *ethanol (96%)* to produce 100 ml. To 10 ml of this solution in a separating funnel add 190 ml of *water* and extract with six 30 ml quantities of *dichloromethane*. Combine the dichloromethane layers, extract with 10 ml of 0.2M *sodium hydroxide* followed by five 10 ml quantities of *water* and wash each of the six aqueous layers separately with the same 20 ml quantity of *dichloromethane*. Combine the dichloromethane solutions, filter through absorbent cotton and evaporate the filtrate to dryness. Dissolve the residue in sufficient *ethanol (96%)* to produce 100 ml, dilute 10 ml of this solution to 50 ml with *ethanol (96%)* and measure the *absorbance* of the resulting solution at the maximum at 292 nm, Appendix II B. Calculate the content of total aryltetralin lignans expressed as podophyllotoxin, taking 105.4 as the value of A (1%, 1 cm) at the maximum at 292 nm.

STORAGE

Podophyllum Resin should be protected from light. On exposure to light, or to temperatures above 25°, it becomes darker in colour.

LABELLING

The label states the botanical source.

Prepared Belladonna

General Notices

Prepared Belladonna Herb

(Ph Eur monograph 0222)

Ph Eur

DEFINITION

Belladonna leaf powder (180) *(2.9.12)* adjusted, if necessary, by adding powdered lactose or belladonna leaf powder with a lower alkaloidal content.

Content

0.28 per cent to 0.32 per cent of total alkaloids, expressed as hyoscyamine (M_r 289.4) (dried drug).

CHARACTERS

Slightly nauseous odour.

IDENTIFICATION

A. The powder is dark green. Examine under a microscope, using *chloral hydrate solution R* . The powder shows the following diagnostic characters: fragments of leaf lamina showing sinuous-walled epidermal cells, a striated cuticle and numerous stomata predominantly present on the lower epidermis (anisocytic and also some anomocytic) *(2.8.3)* ; multicellular uniseriate covering trichomes with smooth cuticle, glandular trichomes with unicellular heads and multicellular, uniseriate stalks or with multicellular heads and unicellular stalks; parenchyma cells including rounded cells containing microsphenoidal crystals of calcium oxalate; annular and spirally thickened vessels. The powdered drug may also show the following: fibres and reticulately thickened vessels from the stems; subspherical pollen grains, 40-50 µm in diameter, with 3 germinal pores, 3 furrows and an extensively pitted exine; fragments of the corolla, with a papillose epidermis or bearing numerous covering or glandular trichomes of the types previously described; brownish-yellow seed fragments containing irregularly sclerified and pitted cells of the testa. Examined in *glycerol (85 per cent) R* , the powder may be seen to contain lactose crystals.

B. Shake 1 g with 10 ml of *0.05 M sulphuric acid* for 2 min. Filter and add to the filtrate 1 ml of *concentrated ammonia R* and 5 ml of *water R* . Shake cautiously with 15 ml of *ether R* , avoiding formation of an emulsion. Separate the ether layer and dry over *anhydrous sodium sulphate R* . Filter and evaporate the ether in a porcelain dish. Add 0.5 ml of *fuming nitric acid R* and evaporate to dryness on a water-bath. Add 10 ml of *acetone R* and, dropwise, a 30 g/l solution of *potassium hydroxide R* in *ethanol (96 per cent) R* . A deep violet colour develops.

C. Examine the chromatograms obtained in the test Chromatography.

Results The principal zones in the chromatograms obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the same volume of the reference solution.

TESTS

Chromatography

Thin-layer chromatography *(2.2.27)* .

Test solution To 0.6 g of the drug to be examined add 15 ml of *0.05 M sulphuric acid* , shake for 15 min and filter. Wash the filter with *0.05 M sulphuric acid* until 20 ml of filtrate is obtained. To the filtrate add 1 ml of *concentrated ammonia R* and shake with 2 quantities, each of 10 ml, of *peroxide-free ether R* . If necessary, separate by centrifugation. Dry the combined ether layers over *anhydrous sodium sulphate R* , filter, and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 ml of *methanol R* .

Reference solution Dissolve 50 mg of *hyoscyamine sulphate R* in 9 ml of *methanol R* . Dissolve 15 mg of *hyoscine hydrobromide R* in 10 ml of *methanol R* . Mix 1.8 ml of the hyoscine hydrobromide solution and 8 ml of the hyoscyamine sulphate solution.

Plate TLC silica gel G plate R.

Mobile phase concentrated ammonia R, water R, acetone R (3:7:90 *V/V/V*).

Application 10 µl and 20 µl of each solution, as bands of 20 mm by 3 mm, leaving 1 cm between each band.

Development Over a path of 10 cm.

Drying At 100-105 °C for 15 min; allow to cool.

Detection A Spray with *potassium iodobismuthate solution R2* , using about 10 ml for a plate 200 mm square, until orange or brown zones become visible against a yellow background.

Results A The zones in the chromatograms obtained with the test solution are similar in position (hyoscyamine in the lower third, hyoscine in the upper third) and colour to those in the chromatograms obtained with the reference solution; the zones in the chromatograms obtained with the test solution are at least equal in size to the corresponding zones in the chromatogram obtained with the same volume of the reference solution; faint secondary zones may appear, particularly in the middle of the chromatogram obtained with 20 µl of the test solution or near the starting-point in the chromatogram obtained with 10 µl of the test solution.

Detection B Spray with *sodium nitrite solution R* until the coating is transparent and examine after 15 min.

Results B The zones due to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from brown to reddish-brown but not to greyish-blue (atropine), and any secondary zones disappear.

Loss on drying *(2.2.32)*

Maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Total ash *(2.4.16)*

Maximum 16.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 4.0 per cent.

ASSAY

a) Determine the loss on drying *(2.2.32)* on 2.000 g by drying in an oven at 105 °C.

b) Moisten 10.00 g with a mixture of 5 ml of *ammonia R*, 10 ml of *ethanol (96 per cent) R* and 30 ml of *peroxide-free ether R* and mix thoroughly. Transfer the mixture to a suitable percolator, if necessary with the aid of the extracting mixture. Allow to macerate for 4 h and percolate with a mixture of 1 volume of *chloroform R* and 3 volumes of *peroxide-free ether R* until the alkaloids are completely extracted. Evaporate to dryness a few millilitres of the liquid flowing from the percolator, dissolve the residue in *0.25 M sulphuric acid* and verify the absence of alkaloids using *potassium tetraiodomercurate solution R*. Concentrate the percolate to about 50 ml by distilling on a water-bath and transfer it to a separating funnel, rinsing with *peroxide-free ether R*. Add a quantity of *peroxide-free ether R* equal to at least 2.1 times the volume of the percolate to produce a liquid of a density well below that of water. Shake the solution with no fewer than 3 quantities, each of 20 ml, of *0.25 M sulphuric acid*, separate the 2 layers by centrifugation if necessary and transfer the acid layers to a 2nd separating funnel. Make the acid layer alkaline with *ammonia R* and shake with 3 quantities, each of 30 ml, of *chloroform R*. Combine the chloroform layers, add 4 g of *anhydrous sodium sulphate R* and allow to stand for 30 min with occasional shaking. Decant the chloroform and wash the sodium sulphate with 3 quantities, each of 10 ml, of *chloroform R*. Add the washings to the chloroform extract, evaporate to dryness on a water-bath and heat in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of *chloroform R*, add 20.0 ml of *0.01 M sulphuric acid* and remove the chloroform by evaporation on a water-bath. Titrate the excess of acid with *0.02 M sodium hydroxide* using *methyl red mixed solution R* as indicator.

Calculate the percentage content of total alkaloids, expressed as hyoscyamine, using the following expression:

$$\frac{57.88 \times (20 - n)}{(100 - d) \times m}$$

d = loss on drying as a percentage;

n = volume of *0.02 M sodium hydroxide* used, in millilitres;

m = mass of drug used, in grams.

STORAGE

In an airtight container.

Ph Eur

Prepared Ipecacuanha

General Notices

(Ph Eur monograph 0093)

Ph Eur

DEFINITION

Ipecacuanha root powder (180) *(2.9.12)* adjusted, if necessary, by the addition of powdered lactose or ipecacuanha root powder with a lower alkaloidal content.

Content

1.9 per cent to 2.1 per cent of total alkaloids, expressed as emetine ($C_{29}H_{40}N_2O_4$; M_r 480.7) (dried drug).

CHARACTERS

Appearance

Light grey or yellowish-brown powder.

Slight odour.

IDENTIFICATION

A. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: parenchymatous cells, raphides of calcium oxalate up to 80 µm in length either in bundles or scattered throughout the powder; fragments of tracheids and vessels usually 10-20 µm in diameter, with bordered pits; larger vessels and sclereids from the rhizome. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows simple or 2-8-compound starch granules contained in parenchymatous cells, the simple granules being up to 15 µm in diameter in *Cephaelis ipecacuanha* and up to 22 µm in diameter in *C. acuminata*. Examined in *glycerol (85 per cent) R*, it may be seen to contain lactose crystals.

B. Thin-layer chromatography *(2.2.27)*.

Test solution To 0.1 g of the drug to be examined in a test-tube add 0.05 ml of *concentrated ammonia R* and 5 ml of *ether R* and stir the mixture vigorously with a glass rod. Allow to stand for 30 min and filter.

Reference solution Dissolve 2.5 mg of *emetine hydrochloride CRS* and 3 mg of *cephaeline hydrochloride CRS* in *methanol R* and dilute to 20 ml with the same solvent.

Plate *TLC silica gel plate R.*

Mobile phase *concentrated ammonia R*, *methanol R*, *ethyl acetate R*, *toluene R* (2:15:18:65 *V/V/V/V*).

Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection A Spray with a 5 g/l solution of *iodine R* in *ethanol (96 per cent) R*; heat at 60 °C for 10 min and examine in daylight.

Results A The chromatograms obtained with the test solution and the reference solution show in the lower part a yellow zone due to emetine and below it a light brown zone due to cephaeline.

Detection B Examine in ultraviolet light at 365 nm.

Results B The zone due to emetine shows an intense yellow fluorescence and that due to cephaeline a light blue fluorescence. The chromatogram obtained with the test solution also shows faint fluorescent zones.

With prepared *C. acuminata*, the principal zones in the chromatogram obtained with the test solution are similar in position, fluorescence and size to the zones in the chromatogram obtained with the reference solution.

With prepared *C. ipecacuanha*, the only difference is that the zone due to cephaeline in the chromatogram obtained with the test solution is much smaller than the corresponding zone in the chromatogram obtained with the reference solution.

TESTS

Loss on drying *(2.2.32)*

Maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Total ash *(2.4.16)*

Maximum 5.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 3.0 per cent.

ASSAY

To 7.5 g in a dry flask, add 100 ml of *ether R* and shake for 5 min. Add 5 ml of *dilute ammonia R1*, shake for 1 h, add 5 ml of *water R* and shake vigorously. Decant the ether layer into a flask through a plug of cotton. Wash the residue in the flask with 2 quantities, each of 25 ml, of *ether R*, decanting each portion through the same plug of cotton. Combine the ether solutions and eliminate the ether by distillation. Dissolve the residue in 2 ml of *ethanol (90 per cent V/V) R*, evaporate the ethanol to dryness and heat at 100 °C for 5 min. Dissolve the residue in 5 ml of previously neutralised *ethanol (90 per cent V/V) R*, warming on a water-bath, add 15.0 ml of *0.1 M hydrochloric acid* and titrate the excess acid with *0.1 M sodium hydroxide* using 0.5 ml of *methyl red mixed solution R* as indicator.

1 ml of *0.1 M hydrochloric acid* is equivalent to 24.03 mg of total alkaloids, expressed as emetine.

STORAGE

In an airtight container.

Prepared Opium

General Notices

(Ph Eur monograph 1840)

Ph Eur

DEFINITION

Raw opium powdered (180) (*2.9.12*), and dried at a temperature not exceeding 70 °C.

Content:

— *morphine* ($C_{17}H_{19}NO_3$; M_r 285.3): 9.8 per cent to 10.2 per cent (drug dried at 100-105 °C for 4 h);

— *codeine* ($C_{18}H_{21}NO_3$; M_r 299.4): minimum 1.0 per cent (drug dried at 100-105 °C for 4 h).

Content adjusted if necessary by adding a suitable excipient or raw opium powder.

CHARACTERS

Appearance

Yellowish-brown or dark brown powder.

IDENTIFICATION

A. Examine under a microscope using a 20 g/l solution of *potassium hydroxide R*. It is seen to consist of granules of latex agglomerated in irregular masses, and of light brown elongated filaments. Some fragments of vessels and rather elongated, refringent crystals are also visible, as well as a smaller number of round pollen grains and fragments of elongated fibres. Hairs of various lengths with sharp points and fragments of epicarp consisting of polygonal cells with thick walls defining a stellate lumen may be present. Examine under a microscope using *glycerol (85 per cent) R*. Particles of excipient and a few grains of starch introduced during the handling of the latex may be seen.

B. Thin-layer chromatography (*2.2.27*).

Test solution Triturate 0.10 g of the drug to be examined with 5 ml of *ethanol (70 per cent V/V) R*, rinse with 3 ml of *ethanol (70 per cent V/V) R*, transfer to a 25 ml conical flask. Heat in a water-bath at 50-60 °C with stirring for 30 min. Cool, filter, wash the filter with *ethanol (70 per cent V/V) R* and dilute the filtrate to 10 ml with the same solvent.

Reference solution Dissolve 2.0 mg of *papaverine hydrochloride R*, 12.0 mg of *codeine phosphate R*, 12.0 mg of *noscapine hydrochloride R* and 25.0 mg of *morphine hydrochloride R* in *ethanol (70 per cent V/V) R* and dilute to 25.0 ml with the same solvent.

Plate *TLC silica gel G plate R.*

Mobile phase *concentrated ammonia R*, *ethanol (96 per cent) R*, *acetone R*, *toluene R* (2:6:40:40 *V/V/V/V*). Use a freshly prepared mixture.

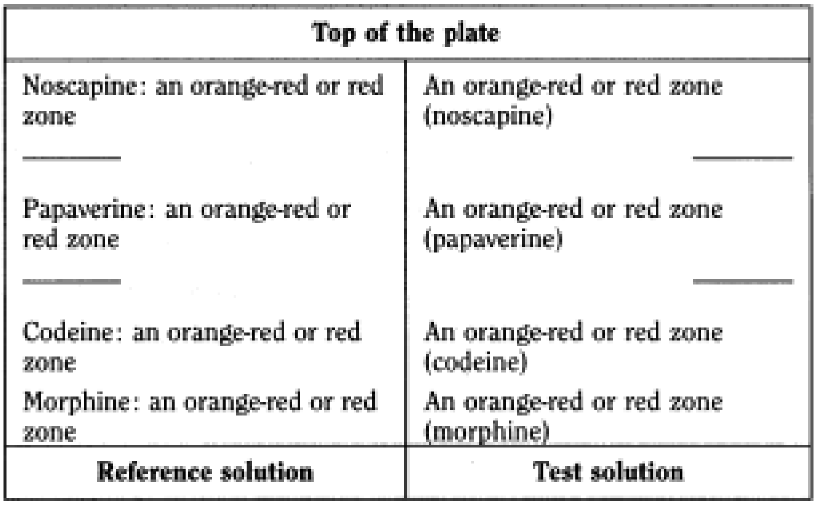
Application 20 µl, as bands of 20 mm by 3 mm.

Development Over a path of 15 cm.

Drying At 100-105 °C for 15 min.

Detection Allow to cool and spray with *potassium iodobismuthate solution R2* and then with a 4 g/l solution of *sulphuric acid R*, examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, a dark red zone (thebaine) situated between the codeine zone and the papaverine zone may be present in the chromatogram obtained with the test solution.



Top of the plate	
Noscapine: an orange-red or red zone	An orange-red or red zone (noscapine)
Papaverine: an orange-red or red zone	An orange-red or red zone (papaverine)
Codeine: an orange-red or red zone	An orange-red or red zone (codeine)
Morphine: an orange-red or red zone	An orange-red or red zone (morphine)
Reference solution	**Test solution**

C. To 1.0 g of the drug to be examined add 5 ml of *water R*, shake for 5 min and filter. To the filtrate add 0.25 ml of *ferric chloride solution R2*. A red colour develops which does not disappear on the addition of 0.5 ml of *dilute hydrochloric acid R*.

TESTS

Thebaine

Liquid chromatography (*2.2.29*).

Test solution Suspend 1.00 g of the drug to be examined in 50 ml of *ethanol (50 per cent V/V) R*, mix using sonication for 1 h, allow to cool and dilute to 100.0 ml with the same solvent. Allow to stand. To 10.0 ml of the supernatant liquid, add 5 ml of *ammonium chloride buffer solution pH 9.5 R*, dilute to 25.0 ml with *water R* and mix. Transfer 20.0 ml of the solution to a chromatography column about 0.15 m long and about 30 mm in internal diameter containing 15 g of *kieselguhr for chromatography R*. Allow to stand for 15 min. Elute with 2 quantities, each of 40 ml, of a mixture of 15 volumes of *2-propanol R* and 85 volumes of *methylene chloride R*. Evaporate the eluate to dryness *in vacuo* at 40 °C. Transfer the residue to a volumetric flask with the aid of the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution Dissolve 25.0 mg of *thebaine R* in the mobile phase and dilute to 25.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Precolumn:
— *size:* *l* = 4 mm, Ø = 4.0 mm;

— *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Column:
— *size:* *l* = 0.25 m, Ø = 4.0 mm;

— *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase Dissolve 1.0 g of sodium *heptanesulphonate monohydrate R* in 420 ml of *water R*, adjust to pH 3.2 with phosphoric acid (4.9 g/l H_3PO_4) (about 5 ml) and add 180 ml of *acetonitrile R*.

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 280 nm.

Injection A suitable volume with a loop injector.

System suitability Reference solution:

— *mass distribution ratio*: minimum 3.0 for the peak due to thebaine.

Calculate the percentage content of alkaloid from the expression:

$$\frac{m_1 \times A_2 \times 125}{m_2 \times A_1} \times \frac{100}{100 - h}$$

m_1 = mass of the alkaloid in the reference solution, in grams,

m_2 = mass of the substance to be examined in the test solution, in grams,

A_1 = area of the peak due to the alkaloid in the chromatogram obtained with the reference solution,

A_2 = area of the peak due to the alkaloid in the chromatogram obtained with the test solution,

h = percentage loss on drying.

Limit:
— *thebaine*: maximum 3.0 per cent (dried drug).

Loss on drying (*2.2.32*)

Maximum 8.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

Total ash (*2.4.16*)

Maximum 6.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for thebaine with the following modifications.

Reference solution Dissolve 0.100 g of *morphine hydrochloride R* and 25.0 mg of *codeine R* in the mobile phase and dilute to 25.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

System suitability Reference solution:

— *resolution*: minimum 2.5 between the peaks due to morphine and codeine; if necessary, adjust the volume of acetonitrile in the mobile phase;

— *repeatability*: maximum relative standard deviation of 1.0 per cent for the peak area due to morphine, determined on 6 replicate injections.

Calculate the percentage content of morphine and codeine from the expression given in the test for thebaine. For the calculation, 1 mg of *morphine hydrochloride R* is taken to be equivalent to 0.759 mg of morphine and 1 mg of *codeine R* is taken to be equivalent to 0.943 mg of codeine.

Ph Eur

Prepared Stramonium

General Notices

(Ph Eur monograph 0247)

Ph Eur

DEFINITION

Stramonium leaf powder (180) *(2.9.12)* adjusted, if necessary, by the addition of powdered lactose or stramonium leaf of lower content of total alkaloids.

Content

0.23 per cent to 0.27 per cent of total alkaloids, expressed as hyoscyamine ($C_{17}H_{23}NO_3$; M_r 289.4) (dried drug).

CHARACTERS

Appearance

Greyish-green powder.

Unpleasant odour.

IDENTIFICATION

A. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of leaf lamina showing epidermal cells with slightly wavy anticlinal walls and smooth cuticle; stomata are more frequent on the lower epidermis (anisocytic and anomocytic) *(2.8.3)*; covering trichomes are conical, uniseriate with 3-5 cells and warty walls; glandular trichomes are short and clavate with heads formed by 2-7 cells; dorsiventral mesophyll, with a single layer of palisade cells and a spongy parenchyma containing cluster crystals of calcium oxalate; annularly and spirally thickened vessels. The powdered drug may also show the following diagnostic characters: fibres and reticulately thickened vessels from the stems; subspherical pollen grains usually about 60-80 µm in diameter with 3 germinal pores and nearly smooth exine; fragments of the corolla with papillose epidermis; seed fragments containing yellowish-brown, sinuous, thick-walled sclereids of testa; occasional prisms and microsphenoidal crystals of calcium oxalate. Examined in *glycerol (85 per cent) R*, it may be seen to contain lactose crystals.

B. Examine the chromatograms obtained in the Chromatography test.

Results The principal zones in the chromatogram obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the same volume of the reference solution.

C. Shake 1 g with 10 ml of *0.05 M sulphuric acid* for 2 min. Filter and add to the filtrate 1 ml of *concentrated ammonia R* and 5 ml of *water R*. Shake cautiously with 15 ml of *peroxide-free ether R*, avoiding the formation of an emulsion. Separate the ether layer and dry over *anhydrous sodium sulphate R*. Filter and evaporate the ether in a porcelain dish. Add 0.5 ml of *nitric acid R* and evaporate to dryness on a water-bath. Add 10 ml of *acetone R* and, dropwise, a 30 g/l solution of *potassium hydroxide R* in *ethanol (96 per cent) R*. A deep violet colour develops.

TESTS

Chromatography

Thin-layer chromatography *(2.2.27)*.

Test solution To 1.0 g of the drug to be examined add 10 ml of *0.05 M sulphuric acid*, shake for 15 min and filter. Wash the filter with *0.05 M sulphuric acid* until 25 ml of filtrate is obtained. To the filtrate add 1 ml of *concentrated ammonia R* and shake with 2 quantities, each of 10 ml, of *peroxide-free ether R*. If necessary, separate by centrifugation. Dry the combined ether layers over *anhydrous sodium sulphate R*, filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 ml of *methanol R*.

Reference solution Dissolve 50 mg of *hyoscyamine sulphate R* in 9 ml of *methanol R*. Dissolve 15 mg of *hyoscine hydrobromide R* in 10 ml of *methanol R*. Mix 3.8 ml of the hyoscyamine sulphate solution and 4.2 ml of the hyoscine hydrobromide solution and dilute to 10 ml with *methanol R*.

Plate TLC silica gel G plate R.

Mobile phase concentrated ammonia R, water R, acetone R (3:7:90 *V/V/V*).

Application 10 µl and 20 µl of each solution as bands of 20 mm by 3 mm, leaving 1 cm between the bands.

Development Over a path of 10 cm.

Drying At 100-105 °C for 15 min and allow to cool.

Detection A Spray with *potassium iodobismuthate solution R2*, using about 10 ml for a plate 200 mm square, until the orange or brown zones become visible against a yellow background.

Results A The zones in the chromatograms obtained with the test solution are similar in position (hyoscyamine in the lower third, hyoscine in the upper third of the chromatogram) and colour to those in the chromatograms obtained with the reference solution. The zones in the chromatograms obtained with the test solution are at least equal in size to the corresponding zones in the chromatogram obtained with the same volume of the reference solution. Faint secondary zones may appear, particularly in the middle of the chromatogram obtained with 20 µl of the test solution or near the starting point in the chromatogram obtained with 10 µl of the test solution.

Detection B Spray with *sodium nitrite solution R* until the coating is transparent; examine after 15 min.

Results B The zones due to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from brown to reddish-brown but not to greyish-blue (atropine) and any secondary zones disappear.

Loss on drying *(2.2.32)*

Maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Total ash *(2.4.16)*

Maximum 20.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 4.0 per cent.

ASSAY

a) Determine the loss on drying *(2.2.32)* on 2.000 g by drying in an oven at 105 °C.

b) Moisten 10.0 g with a mixture of 5 ml of *ammonia R*, 10 ml of *ethanol (96 per cent) R* and 30 ml of *peroxide-free ether R* and mix thoroughly. Transfer the mixture to a suitable percolator, if necessary with the aid of the extracting mixture. Allow to macerate for 4 h and percolate with a mixture of 1 volume of *chloroform R* and 3 volumes of *peroxide-free ether R* until the alkaloids are completely extracted. Evaporate to dryness a few millilitres of the liquid flowing from the percolator, dissolve the residue in *0.25 M sulphuric acid* and verify the absence of alkaloids using *potassium tetraiodomercurate solution R*. Concentrate the percolate to about 50 ml by distilling on a water-bath and transfer it to a separating funnel, rinsing with *peroxide-free ether R*. Add a quantity of *peroxide-free ether R* equal to at least 2.1 times the volume of the percolate to produce a liquid of a density well below that of water. Shake the solution with no fewer than 3 quantities, each of 20 ml, of *0.25 M sulphuric acid*, separate the 2 layers by centrifugation if necessary and transfer the acid layers to a 2nd separating funnel. Make the acid layer alkaline with *ammonia R* and shake with 3 quantities, each of 30 ml, of *chloroform R*. Combine the chloroform layers, add 4 g of *anhydrous sodium sulphate R* and allow to stand for 30 min with occasional shaking. Decant the chloroform and wash the sodium sulphate with 3 quantities, each of 10 ml, of *chloroform R*. Add the washings to the chloroform extract, evaporate to dryness on a water-bath and heat in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of *chloroform R*, add 20.0 ml of *0.01 M sulphuric acid* and remove the chloroform by evaporation on a water-bath. Titrate the excess of acid with *0.02 M sodium hydroxide* using *methyl red mixed solution R* as indicator.

Calculate the percentage content of total alkaloids, expressed as hyoscyamine, using the following expression:

$$\frac{57.88\,(20 - n)}{(100 - d)\,m}$$

d = loss on drying, as a percentage;

n = volume of *0.02 M sodium hydroxide*, in millilitres;

m = mass of drug, in grams.

STORAGE

In an airtight container.

Ph Eur

Primula Root

General Notices

(Ph Eur monograph 1364)

Ph Eur

DEFINITION

Whole or cut, dried rhizome and root of *Primula veris* L. or *Primula elatior* (L.) Hill.

CHARACTERS

Bitter taste.

IDENTIFICATION

A. The coarsely torose, greyish-brown rhizome is straight or slightly curved, about 1-5 cm long and about 2-4 mm thick. The rhizome crown often bears the remains of stems and leaves. Attached to the rhizome are numerous brittle roots, about 1 mm thick and usually 6-8 cm long. The root of *P. elatior* is light brown or reddish-brown, that of *P. veris* light yellow or yellowish-white. The fracture is smooth.

B. Reduce to a powder (355) (*2.9.12*). The powder is greyish-brown. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of parenchyma from the root bark, medulla and bark of the rhizome consisting of rounded cells with thickened and pitted walls; brownish fragments from the surface tissue showing root hairs; vessels with reticulate thickening. Yellowish-green groups of strongly pitted stone cells are characteristic of the presence of *P. elatior*. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows single or compound starch grains of various size and shape.

C. Thin-layer chromatography (*2.2.27*) as described in the test for *Vincetoxicum hirundinaria medicus* root with the following modifications.

Detection Spray with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min. Examine in daylight.

Results The main zone (aescin) in the chromatogram obtained with the reference solution is bluish-violet and is situated near the boundary between the lower and middle thirds. The chromatogram obtained with the test solution shows 1-2 strong dark violet zones a little below the zone due to aescin in the chromatogram obtained with the reference solution; further pale violet, yellowish or brownish-green zones may be visible.

TESTS

Vincetoxicum hirundinaria medicus root

Thin-layer chromatography (*2.2.27*).

Test solution To 1.0 g of the powdered drug (500) (*2.9.12*) add 10 ml of *ethanol (70 per cent V/V) R* and heat under a reflux condenser for 15 min. Cool and filter.

Reference solution Dissolve 10 mg of *aescin R* in 1.0 ml of *ethanol (70 per cent V/V) R*.

Plate *TLC silica gel F_{254} plate R*.

Mobile phase The upper phase of a mixture of 10 volumes of *glacial acetic acid R*, 40 volumes of *water R* and 50 volumes of *butanol R*.

Application 20 µl, as bands.

Development Over a path of 12 cm.

Drying In an oven at 100-105 °C.

Detection A Examine in ultraviolet light at 254 nm.

Results A The chromatograms obtained with the reference solution and the test solution show a quenching zone (aescin) near the boundary between the lower and the middle thirds. Mark this zone.

Detection B Examine in ultraviolet light at 365 nm.

Results B In the chromatogram obtained with the test solution no zones of light-blue or greenish fluorescence occur below the main zone due to aescin in the chromatogram obtained with the reference solution.

Loss on drying (*2.2.32*)

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 9.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*)

Maximum 3.0 per cent.

Ph Eur

Processed Angelica Sinensis Root for use in THMP

General Notices

DEFINITION

Processed Angelica Sinensis Root for use in THMP is the smoked, sliced and dried root of Angelica Sinensis Root for use in THM. The dried root consists of the top (upper most part), main body and small lateral roots (tails). It contains not less than 0.1% of *Z*-ligustilide ($C_{12}H_{14}O_2$), calculated with reference to the dried material.

PRODUCTION

The root is collected in late autumn, removed from rootlet and soil, slightly dried and tied up in small bundles, placed on a shelf and smoke dried. The smoked dried roots may be covered with a moist cloth or sprayed with a gentle mist to allow the roots to soften to facilitate slicing. The roots may be cut transversely or longitudinally to form individual pieces or, 2 to 3 may be pressed together to form one large piece before slicing, "palm slices" (characteristic molar shaped pieces). The sliced roots are dried.

IDENTIFICATION

A. Transversely cut slices are about 3 to 4 mm thick and up to about 2 cm in diameter and the cut surface shows a narrow outer cork layer and a fairly wide, pale brown bark separated by a dark brown cambium from the pale, yellowish-white and radiate central xylem; brown dotted secretory cavities occur throughout the bark and xylem. Longitudinally cut slices form irregular strips up to about 4 cm long and 5 mm thick. Longitudinally cut slices from the compressed roots occur as very smooth, soft and pliable pieces less than 1 mm thick; they are typically molar-shaped, up to about 5 cm wide at the crown and up to 10 cm long. They are light to mid yellow with brown edges and streaks indicating the composite structure from which they are obtained.

B. Reduce to a powder (355). The powder is pale yellowish to buff. Examine under a microscope using *chloral hydrate solution* . The powder shows brown fragments of cork composed of thin-walled cells; abundant thin-walled parenchyma from the secondary cortex, phloem and medullary rays, some of the phloem cells fusiform with slightly thickened walls; lignified vessels in groups of 2 or 3 associated with small celled and pitted xylem parenchyma; the vessels are up to 80 µm in diameter and have reticulate or scalariform thickening. Examine under a microscope using 50% v/v of *glycerol* . The powder shows small groups of single starch granules, spherical to ovoid, up to about 8 µm in diameter.

C. Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions.

(1) Add 4 ml of *heptane* to 1.0 g of the powdered drug, sonicate for 5 minutes and filter (use a 0.22 µm membrane filter).

(2) 0.1% w/v of *linoleic acid* in *methanol* .

(3) 0.1% w/v of *ferulic acid* in *methanol* .

(4) 0.1% w/v of Z-*ligustilide CRS* in *methanol* .

CHROMATOGRAPHIC CONDITIONS

(a) Use a *silica gel F* $_{254}$ precoated plate (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Develop to 15 cm.

(d) Apply 10 µl of solution (1) and 5 µl of solutions (2) to (4) as bands.

(e) Remove the plate, allow to dry in a stream of warm air for 5 minutes or until the solvents are completely removed. Examine under *ultraviolet light (254 nm).* Spray the plate with *methanolic sulphuric acid (5%),* heat at 105º for 3 minutes and examine in daylight.

MOBILE PHASE

1 volume of *formic acid* , 10 volumes of *ethyl acetate* and 90 volumes of *toluene* .

SYSTEM SUITABILITY

When examined under ultraviolet light the violet band with an Rf value of approximately 0.7 in the chromatogram obtained with solution (4) corresponds in colour and position to that in the chromatogram obtained with solution (1). A band with an Rf value of approximately 0.23 in the chromatogram obtained with solution (3) corresponds in position to a band in the chromatogram obtained with solution (1). Other bands may be present in the chromatogram obtained with solution (1).

When sprayed with *methanolic sulphuric acid (5%)* the chromatogram obtained with solution (1) shows three spots with similar Rf values to the spots in the chromatograms obtained with solution (2), (3) and (4). Other spots may be present in the chromatogram obtained with solution (1).

TESTS

Lovage root (*Levisticum officinale*)

Carry out the method for *gas chromatography* , Appendix III B, using the following solutions.

(1) Extract approximately 20 g of the coarsely powdered drug in a 500 ml round-bottomed flask by hydrodistillation for 2 to 3 hours in 200 ml of *water*, collecting the distillate in suitable glassware. Extract the oily drops on top of the distillate with 5 ml of *toluene* .

(2) 0.2% w/v each of *coumarin* and *eugenol* in *toluene* .

(3) 0.1% w/v of Z-*ligustilide CRS* in a*cetonitrile*.

(4) 0.1% w/v of *benzyl alcohol* in *toluene* .

(5) 0.1% w/v of *(-)-carvone* in *toluene* .

(6) 0.1% w/v of *octanoic acid* in *toluene* .

(7) 0.1% w/v of *3-propylidenephthalide* in *toluene* .

CHROMATOGRAPHIC CONDITIONS

(a) Use a fused silica capillary column (50 m × 0.32 mm) bonded with a film (1.05 µm) of 5% phenyl/95% dimethylpolysiloxane (HP 5 is suitable).

(b) Use *helium* as the carrier gas at a flow rate of 1 ml per minute.

(c) Use an oven maintained at an initial temperature of 40° increasing linearly to 220° at a rate of 5° per minute, then maintained at 220°.

(d) Use a split injection system having a split ratio of 20:1 maintained at 250°.

(e) Use a flame ionisation detector maintained at a temperature of 250°.

(f) Inject 1 µl of each solution.

Record the chromatograms for a sufficient length of time to elute all the peaks in the chromatogram obtained with solution (1) (55 minutes may be suitable).

SYSTEM SUITABILITY

The test is not valid unless two clearly separated peaks, eluting at approximately 34 minutes (coumarin) and 37 minutes (eugenol), are observed in the chromatogram obtained with solution (2).

CONFIRMATION

In the chromatogram obtained with solution (1):

there are no peaks corresponding to the principal peaks obtained in the chromatograms obtained with solutions (4), (5), (6) and (7);

there is a peak corresponding to the principal peak in the chromatogram obtained with solution (3).

Loss on drying

When dried at 100° to 105° for 2 hours, loses not more than 10.0 % of its weight. Use 1 g.

Total ash

Not more than 7.0%, Appendix XI J, Method II.

Acid-insoluble ash

Not more than 2.0%, Appendix XI K.

Ethanol-soluble extractive

Not less than 45%, Appendix XI B1.

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Finely powder not less than 5.0 g of the drug being examined. Transfer 0.5 g of the powder into a 25 ml volumetric flask and add 20 ml of *methanol* , place in an ultrasonic bath (maintained at a low temperature by adding ice to the bath) for 100 minutes, equilibrate to ambient temperature and dilute to volume with *methanol* . Centrifuge the solution at 5000 rpm for 5 minutes or until a clear supernatant is obtained. Filter through a 0.45-µm filter.

(2) 0.025% w/v of Z-*ligustilide CRS* in *acetonitrile.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution using the mobile phase below.

(c) Use a flow rate of 1.0 ml per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 350 nm.

(f) Inject 10 µl of each solution.

MOBILE PHASE

A mixture of 8 volumes of *water* and 12 volumes of *acetonitrile* .

SYSTEM SUITABILITY

Inject solution (2) not less than five times. The test is not valid unless the relative standard deviation of the peak areas of the *Z*-ligustilide peak is not more than 3.0%, the relative standard deviation of the retention times of the *Z*-ligustilide peak is not more than 3.0%. The *column efficiency* , determined on the *Z*-ligustilide peak, is not less than 5000 theoretical plates. The *symmetry factor* , determined on the *Z*-ligustilide peak, is not more than 1.3.

Inject solution (1). The test is not valid unless the *resolution factor* between the *Z*-ligustilide peak and the closest peak (relative retention about 0.9 with respect to *Z*-ligustilide) is not less than 1.5.

DETERMINATION OF CONTENT

Using the retention time and the peak area from the chromatograms obtained with solution (2) , locate and integrate the peak due to *Z*-ligustilide in the chromatogram obtained with solution (1).

Calculate the content of *Z*-ligustilide in the sample using the declared content of *Z*-ligustilide in *Z-ligustilide CRS* and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100 - d}$$

A_1 = Area of the peak due to *Z*-ligustilide in the chromatogram obtained with solution (1) .

A_2 = Area of the peak due to *Z*-ligustilide in the chromatogram obtained with solution (2) .

m_1 = Weight of the drug being examined in mg.

m_2 = Weight of Z-*ligustilide CRS* in mg.

V_1 = Dilution volume of solution (1) in ml.

V_2 = Dilution volume of solution (2) in ml.

p = Percentage content of $C_{12}H_{14}O_2$ in Z-*ligustilide CRS .*

d = Percentage loss on drying of the herbal drug being examined.

STORAGE

Processed Angelica Sinensis Root for use in TMHP should be protected from moisture.

Processed Astragalus Root for use in THMP

General Notices

DEFINITION

Processed Astragalus Root for use in THMP is Astragalus Root for use in THM that has been dried and sliced.

PRODUCTION

Astragalus Root for use in THM is washed clean, softened thoroughly and sliced transversely or longitudinally. The longitudinally cut pieces are usually prepared by soaking and pressing or pounding to form spatulate slices.

IDENTIFICATION

A. The transverse or obliquely cut slices are up to about 0.5 cm thick and about 2.5 cm in diameter; fragments of larger pieces are frequently present. The transverse surface varies from cream to yellow and shows an outer zone occupying about a third of the diameter, separated by a darker cambium region from the finely radiate xylem. The central region is dark brown and in the larger pieces this has broken down to form a central hollow surrounded by fragments of disintegrating tissue.

The pounded and pressed longitudinal slices, which resemble tongue depressors, are up to 10 cm or more long by 1.5 to 3 cm wide and about 0.4 cm thick; typically they are rounded at one end and distinctly fibrous at the other end. The surface is yellow and faintly ridged longitudinally, and a number of pieces have the remains of the brown outer layers of the root on the side edges.

B. Reduce to a powder. The powder is yellowish-white. Examine under a microscope using chloral hydrate solution. The fibres are in bundles or scattered, 8 to 30 µm in diameter, thick-walled, with longitudinal fissures on the surface, the primary walls often separated from the secondary walls, both ends often broken to tassel-like, or slightly truncated. Bordered-pitted vessels colourless or orange, bordered pits arranged closely. Stone cells occasionally visible, rounded, oblong or irregular, slightly thick-walled. Examine under a microscope using 50% v/v of *glycerol* in *water*. Starch granules usually simple, ovoid, 5 to 20 µm in diameter, with a visible linear or punctuate hilum.

C. Carry out the method for *thin-layer chromatography* , Appendix III A, using the following solutions.

(1) Place 6 g of the powdered drug in a Soxhlet extractor, add 75 ml of *methanol* , heat under reflux for 7 hours, cool and filter.

(2) 0.3% w/v of *ferulic acid* and 0.3% w/v of *linoleic acid* in *methanol*.

(3) 0.1% w/v each of *astragaloside I CRS, astragaloside II CRS* and *astragaloside IV CRS* in *methanol* .

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating silica gel 60 F_{254} [or high-performance silica gel 60 F_{254} (Merck silica gel 60 F_{254} HPTLC plates are suitable)].

(b) Use the mobile phase described below.

(c) Apply 10 µl of each solution, as bands

(d) Develop the plate to 15 cm [or 7 cm].

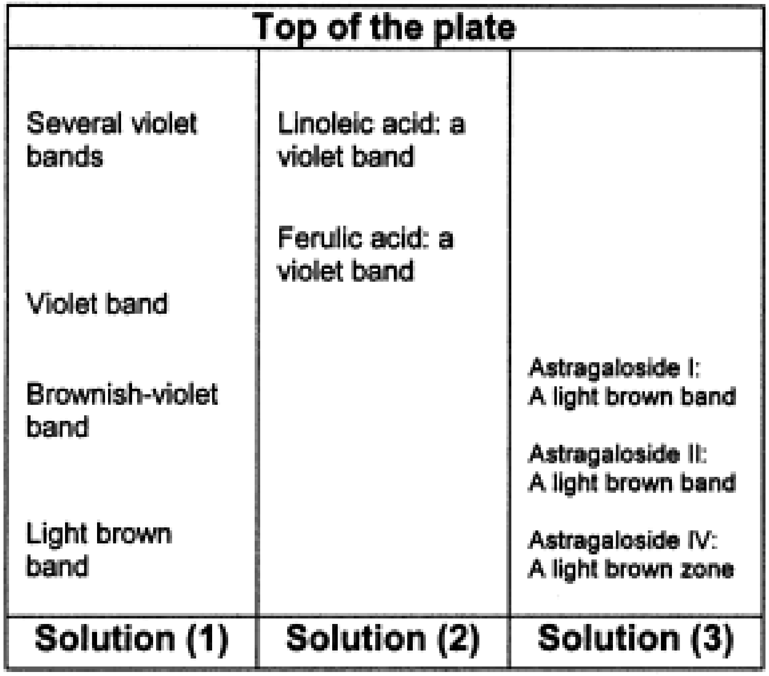
(e) Remove the plate and allow it to dry in cold air for 5 minutes. Examine under *ultraviolet light (254 nm)* . Spray the plate with *anisaldehyde solution* , heat at 100° to 105° for 5 minutes and examine in daylight.

MOBILE PHASE

A mixture of 30 volumes of *water*, 41 volumes of *methanol* and 200 volumes of *ethyl acetate.*

SYSTEM SUITABILITY

The test is not valid unless, when examined under daylight after spraying with *anisaldehyde solution* , the chromatogram obtained with solution (2) shows two clearly separated bands and the chromatogram obtained with solution (3) shows three clearly separated bands.

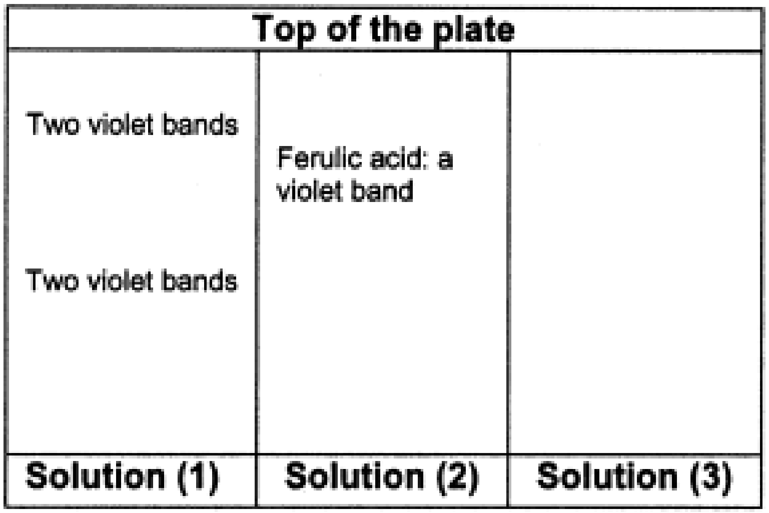


Top of the plate		
Several violet bands	Linoleic acid: a violet band	
	Ferulic acid: a violet band	
Violet band		
Brownish-violet band		Astragaloside I: A light brown band
		Astragaloside II: A light brown band
Light brown band		Astragaloside IV: A light brown zone
Solution (1)	**Solution (2)**	**Solution (3)**

CONFIRMATION

When examined under daylight after spraying with *anisaldehyde solution* the chromatogram obtained with solution (1) shows a band corresponding to astragaloside IV and several other bands as shown above. Other bands may be present.

When examined under *ultraviolet light (254 nm)* the chromatogram obtained with solution (1) shows violet coloured bands with Rf values of approximately 0.4 and 0.8 and no band corresponding to ferulic acid as shown below. Other bands may be present. The chromatogram obtained with solution (2) shows a single violet band with an Rf value of approximately 0.7 (ferulic acid). The chromatogram obtained with solution (3) shows no bands.



Top of the plate		
Two violet bands		
	Ferulic acid: a violet band	
Two violet bands		
Solution (1)	**Solution (2)**	**Solution (3)**

TESTS

Hedysarum root

Macroscopical *Hedysarum polybotrys* root, a known adulterant of Astragalus Root for use in THM has much smaller and more branched roots, with many branches arising from near the crown, also the outer surface is dark reddish-brown.

Thin-layer chromatography In Identification test C, the chromatogram obtained with solution (1) shows no bands due to *astragaloside I CRS* and *astragaloside IV CRS* when examined under daylight after spraying with *anisaldehyde solution* .

Astragalus	***Hedysarum***	**Solution (2)**	**Solution (3)**
Solution (1)			

Acid-insoluble ash

Not more than 1.0%, Appendix XI K, Method I.

Total ash

Not more than 5.0%, Appendix XI J, Method II.

Loss on drying

When dried for 2 hours at 100° to 105°, loses not more than 10.0% of its weight. Use 1 g.

Water-soluble extractive

Not less than 30%, Appendix XI B2.

STORAGE

Processed Astragalus Root for use in THMP should be protected from moisture. Exposure to sunlight for as little as 30 minutes can bleach the yellow colour.

Processed Liquorice Root for use in THMP

General Notices

DEFINITION

Processed Liquorice Root for use in THMP is the processed Liquorice Root for use in THM.

It contains not less than 2.0% of glycyrrhizic acid ($C_{42}H_{62}O_{16}$) calculated with reference to the dried material.

PRODUCTION

Liquorice Root for use in THM is cleaned, softened thoroughly, sliced transversely or longitudinally to form uniform pieces and dried.

IDENTIFICATION

A. The transversely-cut pieces are 0.5 to 2.5 cm in diameter, irregularly circular to ovoid, up to about 3 mm thick. The outer surface is dark reddish-brown and longitudinally wrinkled. The transverse surface is cream to yellow and shows a thin layer of cork and a pale brown cambium line separating the radiate phloem region from the distinctly radiate xylem. In pieces cut from the rhizome there is a central, whitish pith; in those cut from the roots the radiate xylem continues to the centre.

The longitudinally-cut pieces have been sliced obliquely and usually include a small portion of the outer surface at the tapering ends; they are about 6 to 8 cm long, 1 to 1.5 cm wide and 3 mm thick. The outer surface is reddish-brown and longitudinally wrinkled with scattered transverse ridges; the smooth cut surface is cream to yellow, faintly fibrous and shows a distinct cambium; on some of the pieces the vessel cavities are visible in the central region.

B. Reduce to a powder. The powder is yellowish-brown. Examine under a microscope using chloral hydrate solution. The powder shows abundant fibres occurring in groups, each group surrounded by a calcium oxalate prism crystal sheath, the individual fibres have very thick, partially lignified walls and few small pits; lignified bordered-pitted vessels, singly or in small groups and sometimes accompanied by lignified parenchymatous cells with moderately thickened and pitted walls, some of the individual vessels are very large, with pit apertures much elongated and the borders difficult to discern; prism crystals of calcium oxalate up to about 35 µm long occur scattered and in parenchymatous tissue; fragments of cork composed of thin-walled, slightly lignified polygonal cells. Examine under a microscope using 50% w/w glycerol in water. The powder shows abundant starch granules, mostly simple, spherical to ovoid, 3 µm to 20 µm in diameter.

C. Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions.

(1) Add 16 ml of *water* and 4 ml of *hydrochloric acid (25%)* to 0.5 g of the powdered drug, heat on a water-bath under reflux for 30 minutes, cool and filter. Dry the filter paper and residue in a flask at 105° for 60 minutes, add 20 ml of *ether*, heat on a water-bath at 40° under reflux for 5 minutes, cool and filter. Evaporate the filtrate to dryness and dissolve the residue in 5 ml of *ether*.

(2) 0.1% w/v each of *glycyrrhetic acid* and *thymol* in *ether*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating substance *silica gel* $GF_{254.}$ (Merck 10 x 20 cm plates are suitable).

(b) Mobile phase is a mixture of 1 volume of *concentrated ammonia*, 9 volumes of *water*, 25 volumes of *ethanol (96%)* and 65 volumes of *ethyl acetate.*

(c) Apply as a band, an application volume of 10 µl for each solution.

(d) Develop to 15 cm.

(e) Remove the plate and allow it to dry in air for 5 minutes. Examine under *ultraviolet light (254 nm)*. Spray the plate with *anisaldehyde solution* and heat at 100° to 105° for 10 minutes and examine in daylight.

SYSTEM SUITABILITY

Under ultra-violet light, the chromatogram obtained with solution (2) shows in the lower half a quenching zone due to glycyrrhetic acid. When sprayed, the chromatogram obtained with solution (2) shows in the lower half the violet zone of glycyrrhetic acid and in the upper third the red zone of thymol.

VALIDITY

The chromatogram obtained with solution (1) shows in the lower half of violet zone corresponding to the zone of glycyrrhetic acid in the chromatogram obtained with solution (2) and a yellow zone (isoliquiridigenine) in the upper third under the zone of thymol in the chromatogram obtained with solution (2). Further zones may be present.

TESTS

Total Ash

Not more than 5.0 %, Appendix XI J, Method II.

Acid-insoluble ash

Not more than 1.0%, Appendix XI K, Method II.

Loss on drying

When dried for 2 hours at 100° to 105°, loses not more than 10.0% of its weight. Use 1 g.

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Mix with the aid of ultrasound for 30 minutes 1 g of the powdered drug being examined with 100 ml of 0.8% w/v of *ammonia*, centrifuge a part of the supernatant layer, dilute 1 ml of this solution to 5 ml with 0.8 % w/v of *ammonia* and filter through a 0.45-µm filter.

(2) Contains 0.0065% w/v of *monoammonium glycyrrhizate EPCRS* in 0.8% w/v of *ammonia*.

(3) Contains 0.013% w/v of *monoammonium glycyrrhizate EPCRS* in 0.8% w/v of *ammonia*.

(4) Contains 0.0195% w/v of *monoammonium glycyrrhizate EPCRS* in 0.8% w/v of *ammonia*.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (12.5 cm × 4 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS SS is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 1.5 ml per minute.

(d) Ambient column temperature.

(e) Detection wavelength of 254 nm.

(f) Injection volume of 10 µl for each solution.

MOBILE PHASE

A mixture of 6 volumes of *glacial acetic acid*, 30 volumes of *acetonitrile* and 64 volumes of *water*.

SYSTEM SUITABILITY

The assay is not valid unless (a) the *column efficiency,* determined on the peak due to glycyrrhizic acid in the chromatogram obtained with solution (2), is at least 30,000 theoretical plates per metre and (b) the *symmetry factor* of the peak is not more than 1.3.

DETERMINATION OF CONTENT

Inject solution (4). Adjust the sensitivity of the system so that the height of the peaks are at least 50% of the full scale of the recorder. Inject solutions (2), (3) and (4) and determine the peak areas. Prepare a calibration curve with the concentration of the solutions (g per 100 ml) as the abscissa and the corresponding areas as the ordinate. Inject solution (1). Using the retention time and the peak area from the chromatograms obtained with solutions (2), (3) and (4), locate and integrate the peak due to glycyrrhizic acid in the chromatogram obtained with solution (1).

Calculate the percentage content of glycyrrhizic acid from the following expression:

$$A \times \frac{5}{m} \times B \times \frac{822}{840}$$

A = concentration of monoammonium glycyrrhizate in the solution (1) determined from the calibration curve, in g per 100 ml,

B = declared percentage content of *monoammonium glycyrrhizate EPCRS*,

M = weight of the substance being examined in grams,

822 = molecular weight of glycyrrhizic acid,

840 = molecular weight of the monoammonium glycyrrhizate (without any water of crystallisation).

STORAGE

Processed Liquorice Root for use in THMP should be protected from moisture.

Processed Salvia Miltiorrhiza Rhizome and Root for use in THMP

General Notices

DEFINITION

Processed Salvia Miltiorrhiza Rhizome and Root for use in THMP is Salvia Miltiorrhiza Rhizome and Root for use in THM that has been processed. It contains not less than 0.04% of tanshinone II$_A$ ($C_{19}H_{18}O_3$), not less than 0.17% of rosmarinic acid ($C_{18}H_{16}O_8$) and not less than 3.0% of salvianolic acid B ($C_{36}H_{36}O_{16}$), calculated with reference to the dried material.

PRODUCTION

It is collected in spring or autumn, separated from soil, washed clean, softened thoroughly, sliced longitudinally or transversely and dried. It may be stir baked with wine.

IDENTIFICATION

A. The longitudinally-sliced pieces are up to about 5 cm long, 1.5 cm wide and 1 to 2 mm thick; those cut from the thinner roots show the dark brown striated cork covering one longitudinal surface and the yellowish to cream inner tissues on the other; slices cut from the thicker rhizomes are usually cut obliquely so that parts of the outer and inner tissues are included on both longitudinal surfaces. The transversely-cut slices are irregularly elliptical to nearly circular, 4 to 12 mm wide and 2 to 3 mm thick; the outer surface is dark brown and uneven; the smoothed transverse surface shows the outer layers about 1 to 2 mm wide separated by a darker line from the yellowish white, radiate vascular tissue; some pieces show a small, light brown central pith.

B. Reduce to a powder (355). The powder is reddish-brown. Examine under a microscope using chloral hydrate solution. The powder shows a surface view of cork cells almost rectangular or polygonal, containing yellowish-brown pigment, 12 to 151 µm in diameter. Parenchymatous cells in cortex squarish or polygonal, containing reddish-brown pigmental sediments. Xylem fibres usually in bundles, long fusiform, with oblique or criss-cross striations, 11 to 60 µm in diameter, vivid yellow when examined under a polarizing microscope. Numerous mainly bordered or reticulated vessels, 3 to 120 µm in diameter.

C. Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions.

(1) Place 2 g of the powdered drug (355) in a cellulose fingerstall in a continuous extraction apparatus (Soxhlet type). Add 75 ml of *methanol* and heat for 1 hour. Evaporate the extract to 20 ml, cool and filter if necessary.

(2) 0.1% w/v each of *tanshinone II$_A$ CRS*, *rosmarinic acid CRS* and *salvianolic acid B CRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F$_{254}$*.

(b) Use the mobile phase described below.

(c) Apply as bands 8 µl of solution (1) and 5 µl of solution (2).

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (366 nm)*.

MOBILE PHASE

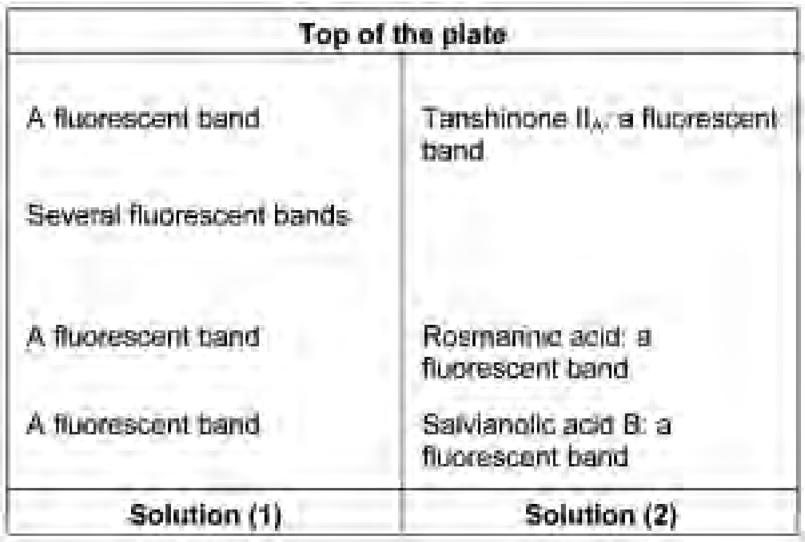
A mixture of 10 volumes of *water*, 13.5 volumes of *methanol* and 100 volumes of *ethyl acetate.*

SYSTEM SUITABILITY

The chromatogram obtained with solution (2) shows three clearly separated bands.

CONFIRMATION

The blue fluorescent bands with Rf values of approximately 0.7 (tanshinone II_A), 0.2 (rosmarinic acid) and 0.06 (salvianolic acid B) in the chromatogram obtained with solution (1) correspond in colour and position to those in the chromatogram obtained with solution (2). Other bands may be present in the chromatogram obtained with solution (1) as shown below.



Top of the plate	
A fluorescent band	Tanshinone II_A: a fluorescent band
Several fluorescent bands	
A fluorescent band	Rosmarinic acid: a fluorescent band
A fluorescent band	Salvianolic acid B: a fluorescent band
Solution (1)	**Solution (2)**

TESTS

Total ash

Not more than 10%, Appendix XI J.

Acid-insoluble ash

Not more than 2.0%, Appendix XI K.

Loss on drying

When dried for 2 hours at 105°, loses not more than 12.0% of its weight. Use 1 g.

ASSAY

For tanshinone II_A

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Finely powder about 5.0 g of the herbal drug being examined. Transfer 0.5 g of the powder into a 25 ml volumetric flask and add 20 ml of the mobile phase given below. Shake and mix with the aid of ultrasound for 30 minutes, shaking intermittently. Add the mobile phase to give a total volume of 25 ml. Filter through a 0.45-µm filter.

(2) 0.002% w/v of *tanshinone* II_A *CRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 ml per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 270 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

0.01 M *sodium octyl sulphonate* in a mixture of 25 volumes of *water* and 75 volumes of *methanol* and adjust to pH 5.0 with *acetic acid*.

SYSTEM SUITABILITY

The test is not valid, unless in the chromatogram obtained with solution (2):

— the *symmetry factor* of the peak due to tanshinone II_A is less than 1.2;

— the number of *theoretical plates* is not less than 4500.

DETERMINATION OF CONTENT

Using the retention time and peak area from the chromatograms obtained with solution (2), locate and integrate the peak due to tanshinone II_A in the chromatogram obtained with solution (1).

Calculate the content of tanshinone II_A in the sample using the declared content of tanshinone II_A ($C_{19}H_{18}O_3$) in *tanshinone* II_A *CRS* and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100-d}$$

A_1 = Area of the peak due to tanshinone II_A in the chromatogram obtained with solution (1).

A_2 = Area of the peak due to tanshinone II_A in the chromatogram obtained with solution (2).

m_1 = Weight of the drug in mg.

m_2 = Weight of *tanshinone* II_A *CRS* in mg.

V_1 = Dilution volume of solution (1) in ml.

V_2 = Dilution volume of solution (2) in ml.

p = Percentage content of tanshinone II_A in *tanshinone* II_A *CRS*.

d = Percentage loss on drying of the herbal drug being examined.

For rosmarinic acid and salvianolic acid B

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use.

(1) Finely powder about 5.0 g of the herbal drug being examined. Transfer 0.5 g of the powder into a 25-ml volumetric flask and add 20 ml of the mobile phase given below. Shake and mix with ultrasound for 30 minutes, shaking intermittently. Add the mobile phase to give a total volume of 25 ml. Filter through a 0.45-µm filter.

(2) 0.003% w/v each of *rosmarinic acid CRS* and *ferulic acid* in *water.*

(3) 0.06% w/v of *salvianolic acid B CRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 ml per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 330 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

22 volumes of *acetonitrile* and 78 volumes of 0.4% v/v of *formic acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the two main peaks, rosmarinic acid and ferulic acid, is at least 5.0.

DETERMINATION OF CONTENT

Rosmarinic acid Using the retention time and peak area from the chromatogram obtained with solution (2), locate and integrate the peak due to rosmarinic acid in the chromatogram obtained with solution (1).

Calculate the content of rosmarinic acid in the sample using the declared content of rosmarinic acid ($C_{18}H_{16}O_8$) in *rosmarinic acid CRS* and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100 - d}$$

A_1 = Area of the peak due to rosmarinic acid in the chromatogram obtained with solution (1).

A_2 = Area of the peak due to rosmarinic acid in the chromatogram obtained with solution (2).

m_1 = Weight of the drug in mg.

m_2 = Weight of *rosmarinic acid CRS* in mg.

V_1 = Dilution volume of solution (1) in ml.

V_2 = Dilution volume of solution (2) in ml.

p = Percentage content of rosmarinic acid in *rosmarinic acid CRS.*

d = Percentage loss on drying of the herbal drug being examined.

Salvianolic acid B Using the retention time and peak area from the chromatogram obtained with solution (3), locate and integrate the peak due to salvianolic acid B in the chromatogram obtained with solution (1).

Calculate the content of salvianolic acid B in the sample using the declared content of salvianolic acid B ($C_{36}H_{36}O_{16}$) in *salvianolic acid B CRS* and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100 - d}$$

A_1 = Area of the peak due to salvianolic acid in the chromatogram obtained with solution (1).

A_2 = Area of the peak due to salvianolic acid in the chromatogram obtained with solution (3).

m_1 = Weight of the drug in mg.

m_2 = Weight of *salvianolic acid B CRS* in mg.

V_1 = Dilution volume of solution (1) in ml.

V_2 = Dilution volume of solution (2) in ml.

p = Percentage content of salvianolic acid B in *salvianolic acid B CRS.*

d = Percentage loss on drying of the herbal drug being examined.

STORAGE

Processed Salvia Miltiorrhiza Rhizome and Root for use in THMP should be protected from moisture.

Processed White Peony Root for use in THMP

General Notices

DEFINITION

Processed White Peony Root for use in THMP is White Peony Root for use in THM that has been the boiled, peeled and dried. It contains not less than 1.6% of paeoniflorin ($C_{23}H_{28}O_{11}$), calculated with reference to the dried material.

PRODUCTION

It is collected in summer and autumn, washed clean, with the two ends and rootlets removed, either peeled after boiling in water or boiled in water after peeling and dried in the sun. The dried root is washed and soaked thoroughly prior to being sliced transversely or longitudinally and dried.

IDENTIFICATION

A. The root slices are greyish-white to pale brown, darker at the edges, and up to about 2 mm thick. They are smooth and compact with a short and even fracture. Those that have been cut transversely occur in oval pieces up to about 4.5 cm in diameter and the cut surface shows a distinctly radiate xylem with narrow lines of vascular tissue separated by wide medullary rays. The longitudinally cut slices are up to 10 cm long and 1.5 cm wide and the cut surface shows raised strands of vascular tissue running longitudinally.

B. Reduce to a powder. The powder is pale yellow. Examine under a microscope using *chloral hydrate solution*. The powder shows abundant rounded, rectangular or elongated parenchymatous cells which occur singly or in groups, some with pitted or slightly beaded walls; many of the cells contain pale yellow or pinkish masses of gelatinised starch which are also found scattered throughout the powder; single cluster crystals of calcium oxalate, 11 to 35 µm in diameter, isolated or packed in rows in parenchymatous cells, sometimes with several crystals in each cell; fragments of lignified vessels, 20 to 65 µm in diameter, usually reticulately thickened but occasionally bordered-pitted; fibres occur rarely, usually accompanying the vessel fragments, they are 15 to 40 µm in diameter, with thickened, slightly lignified and frequently pitted walls.

C. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

D. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake 0.5 g of the powdered root with 10 ml of *ethanol* for 5 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of ethanol.

(2) 0.1% w/v each of *paeoniflorin BPCRS* and *4′-hydroxyacetophenone BPCRS* in *ethanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Merck silica gel 60 precoated plates are suitable).

(b) Use the mobile phase described below.

(c) Apply 10 µl of each solution, as a band.

(d) Develop the plate to 15 cm.

(e) Dry the plate in air. Spray with a 5% w/v solution of *vanillin* in *sulphuric acid*, heat at 105º for 5 minutes and examine immediately.

MOBILE PHASE

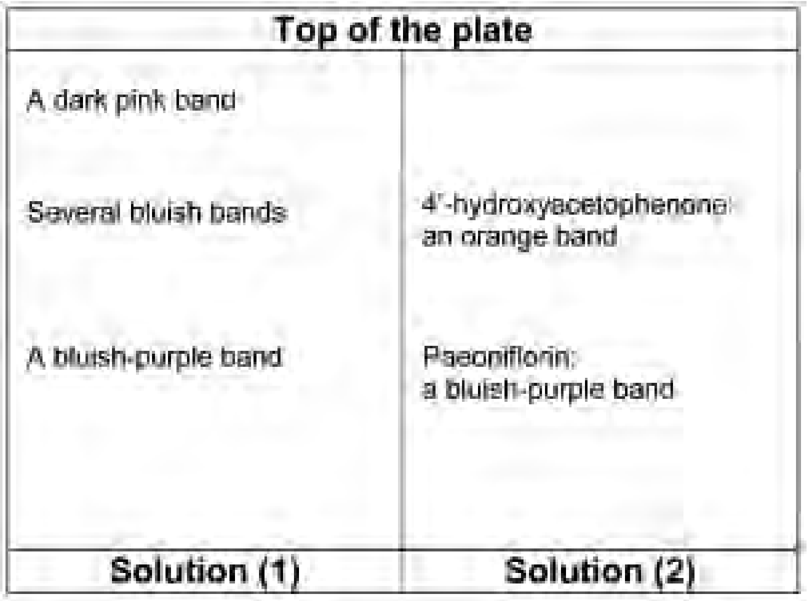
A mixture of 0.2 volumes of *formic acid*, 5 volumes of *ethyl acetate*, 10 volumes of *methanol* and 40 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), two clearly separated spots are observed.

CONFIRMATION

The bluish-purple spot with an Rf value of approximately 0.4 in the chromatogram obtained with solution (1) corresponds in colour and position to that in the chromatogram obtained with solution (2). Other spots are present in the chromatogram obtained with solution (1) as shown below.



Top of the plate	
A dark pink band	
Several bluish bands	4'-hydroxyacetophenone: an orange band
A bluish-purple band	Paeoniflorin: a bluish-purple band
Solution (1)	**Solution (2)**

TESTS

Tree Peony

In the Assay, the chromatogram obtained with solution (1) shows no peak with a relative retention of approximately 1.2 with reference to paeoniflorin.

Loss on drying

When dried for 3 hours at 100º to 105º, loses not more than 12.0% of its weight. Use 1 g.

Acid-insoluble ash

Not more than 0.5%, Appendix XI K.

Ash

Not more than 6.5%, Appendix XI J.

Cadmium

Maximum 3 ppm, Appendix VII.

Lead

Maximum 5 ppm, Appendix VII.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared in 0.05M *potassium dihydrogen orthophosphate* (solution A).

(1) Finely powder not less than 5 g of the herbal drug being examined. Mix 0.15 g of the powdered drug with 3 ml of *methanol* and place in an ultrasonic bath for 30 minutes. Dilute to 10 ml with solution A, mix, filter through a 0.45-µm filter and use the filtrate.

(2) Dissolve a quantity of *paeoniflorin BPCRS* in *methanol* and dilute with solution A to produce a solution containing 0.05% w/v in 3 volumes of methanol and 7 volumes of solution A and mix.

(3) Dissolve a quantity of *4′-hydroxyacetophenone BPCRS* in solution (2) to produce a solution containing 0.05% w/v of *4′-hydroxyacetophenone*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Luna C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 ml per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 230 nm.

(f) Inject 10 µl of each solution.

MOBILE PHASE

A mixture of 30 volumes of *methanol* and 70 volumes of solution A.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the number of *theoretical plates* for each peak due to paeoniflorin is at least 3000, the *symmetry factor* for the peak due to paeoniflorin is not more than 1.3 and the *resolution factor* between the two peaks is not less than 1.7.

DETERMINATION OF CONTENT

Using the retention time and the peak area from the chromatograms obtained with solution (2), locate and integrate the peak due to paeoniflorin in the chromatogram obtained with solution (1).

Calculate the content of $C_{23}H_{28}O_{11}$ in the sample, using the declared content of paeoniflorin ($C_{23}H_{28}O_{11}$) in *paeoniflorin BPCRS* and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100-d}$$

A_1 = Area of the peak due to paeoniflorin in the chromatogram obtained with solution (1).

A_2 = Area of the peak due to paeoniflorin in the chromatogram obtained with solution (2).

m_1 = Weight of the drug being examined in mg.

m_2 = Weight of *paeoniflorin BPCRS* in mg.

V_1 = Dilution volume of solution (1) in ml.

V_2 = Dilution volume of solution (2) in ml.

p = Percentage content of $C_{23}H_{28}O_{11}$ in *paeoniflorin BPCRS.*

d = Percentage loss on drying of the herbal drug being examined.

STORAGE

Processed White Peony Root for use in THMP should be protected from moisture.

Psyllium Seed

General Notices

(Ph Eur monograph 0858)

Ph Eur

DEFINITION

Ripe, whole, dry seeds of *Plantago afra* L. (*Plantago psyllium* L.) or *Plantago indica* L. (*Plantago arenaria* Waldstein and Kitaibel).

CHARACTERS

Sweet taste.

IDENTIFICATION

P. afra seeds are light brown to very dark brown but never black, smooth and shiny having an elliptical oblong shape. They are 2-3 mm long and 0.8-1.0 mm wide, one end being wider than the other. Towards the middle of the dorsal surface there is a fairly marked transverse constriction of light colour. On the ventral surface, there is a linear lighter-coloured groove in the middle of which is a clear spot corresponding to the hilum and bounded by swollen edges.

P. indica seeds are almost identical to the seeds of *P. afra*, but a little less shiny; they are 2-3 mm long and have a maximum diameter of 1.5 mm.

TESTS

Swelling index (*2.8.4*)

Minimum 10.

Foreign matter (*2.8.2*)

Maximum 1.0 per cent, determined on 10.0 g of the drug, including greenish unripe seeds. Psyllium seed does not contain seeds having a dark central spot on the groove (*Plantago lanceolata* L. and *P. major* L.) or seeds with brownish-grey or pinkish outer coats (*P. ovata* Forssk. and *P. sempervirens* Crantz).

Loss on drying (*2.2.32*)

Maximum 14.0 per cent, determined on 1.000 g of drug by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 4.0 per cent.

STORAGE

Store protected from moisture.

Ph Eur

Pygeum Bark

General Notices

(Pygeum Africanum Bark, Ph Eur monograph 1886)

Ph Eur

DEFINITION

Whole or cut, dried bark of the stems and branches of *Prunus africana* (Hook f.) Kalkm. (syn. *Pygeum africanum* Hook f.).

IDENTIFICATION

A. The dark brown to reddish-brown bark occurs in curved, hard, irregular pieces. The outer surface has a wrinkled dark reddish-brown cork with areas of adhering lichen. The reddish-brown to dark brown inner surface bears longitudinal striations. It may also occur in rolled fragments with a fibrous fracture.

B. Reduce to a powder (355) (*2.9.12*). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powdered drug shows thick-walled sclereids, solitary or in groups; calcium oxalate cluster crystals of different size; numerous lignified fibres, thick-walled and with narrow lumen, some of them solitary and most in groups with forked ends; fragments of pigmented polygonal cells of reddish-brown colour; fragments of cork. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*, the powder shows some isolated small starch grains that stain bluish-black against *iodine solution R1*.

C. Thin-layer chromatography (*2.2.27*).

Test solution Extract 15.0 g of powdered drug (250) (*2.9.12*) with *methylene chloride R* for 30 min in a continuous extraction apparatus (Soxhlet type). Filter. Evaporate the solvent to dryness under reduced pressure. Dissolve the residue in 1 ml of *methylene chloride R*.

Reference solution Dissolve 20 mg of *β-sitosterol R* and 20 mg of *ursolic acid R* in 10 ml of a mixture of equal volumes of *methanol R* and *methylene chloride R*.

Plate *TLC silica gel plate R*.

Mobile phase *methanol R*, *methylene chloride R* (10:90 *V/V*).

Application 10 µl, as 1 cm bands.

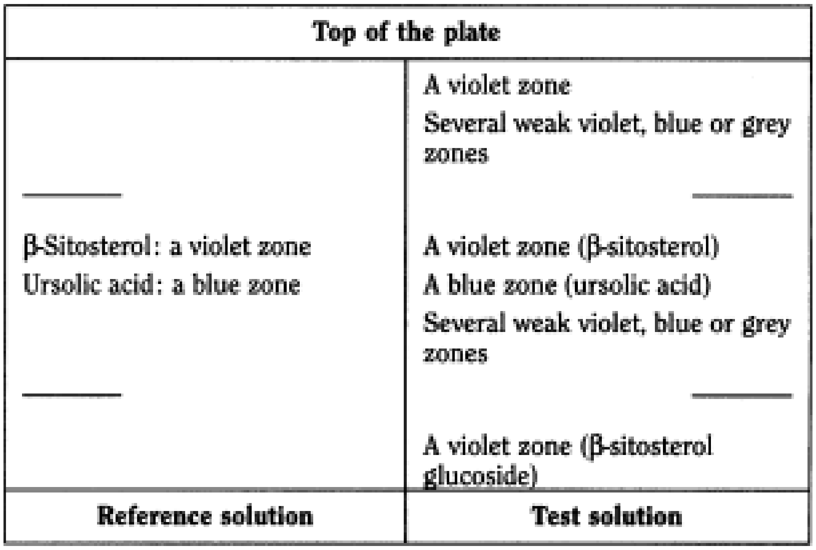
Development Over a path of 15 cm.

Drying In air.

Detection Spray with *vanillin reagent R*. Heat the plate at 100-105 °C for 10 min and allow to cool; examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the

chromatogram obtained with the test solution.



Top of the plate	
	A violet zone Several weak violet, blue or grey zones
———	———
β-Sitosterol: a violet zone Ursolic acid: a blue zone	A violet zone (β-sitosterol) A blue zone (ursolic acid) Several weak violet, blue or grey zones
———	———
	A violet zone (β-sitosterol glucoside)
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*)

Maximum 3.0 per cent.

Loss on drying (*2.2.32*)

Maximum 12.0 per cent, determined on 1.000 g of powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 10.0 per cent.

Extractable matter

Minimum 0.5 per cent.

Extract 20.0 g of the powdered drug (250) (*2.9.12*) with *methylene chloride R* for 4 h in a continuous extraction apparatus (Soxhlet type). Evaporate the solution to dryness on a water-bath *in vacuo* and then dry the residue at 80 °C for 2 h. The residue weighs a minimum of 0.10 g.

Ph Eur

Quantified Hawthorn Leaf and Flower Liquid Extract

General Notices

(Ph Eur monograph 1864)

Ph Eur

DEFINITION

Quantified liquid extract produced from *Hawthorn leaf with flower (1432)*.

Content

0.8 per cent to 3.0 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4).

PRODUCTION

The extract is produced from the herbal drug and ethanol (30 per cent *V/V* to 70 per cent *V/V*) by an appropriate procedure.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)*.

Test solution Dilute 1.0 g in *methanol R* and dilute to 5 ml with the same solvent. Shake and filter.

Reference solution Dissolve 1.0 mg of *chlorogenic acid R* and 2.5 mg of *hyperoside R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 *V/V/V/V*).

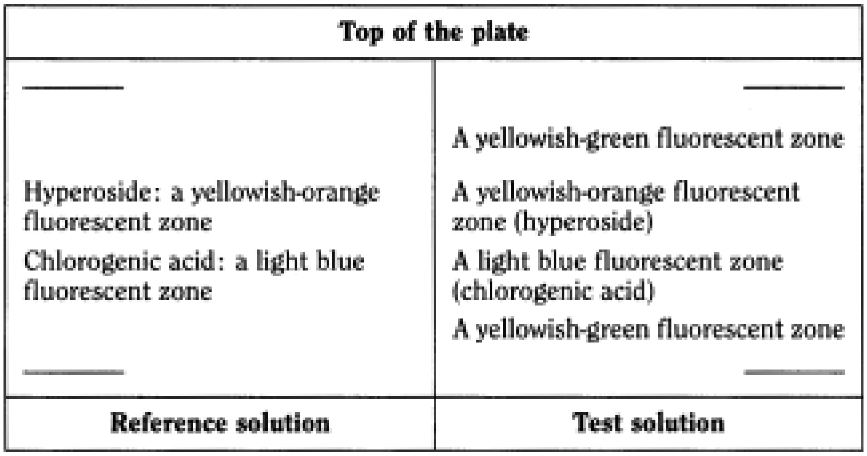
Application 20 µl [or 5 µl] as bands.

Development Over a path of 15 cm [or 6 cm].

Drying At 100-105 °C.

Detection Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester* R in *methanol R*. Subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for about 30 min. Examine in ultraviolet light at 365 nm.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
———	———
	A yellowish-green fluorescent zone
Hyperoside: a yellowish-orange fluorescent zone	A yellowish-orange fluorescent zone (hyperoside)
Chlorogenic acid: a light blue fluorescent zone	A light blue fluorescent zone (chlorogenic acid)
	A yellowish-green fluorescent zone
———	———
Reference solution	**Test solution**

TESTS

Ethanol *(2.9.10)*

95 per cent *V/V* to 105 per cent *V/V* of the quantity stated on the label.

ASSAY

Stock solution Dilute about 0.400 g, accurately weighed, in *ethanol (60 per cent V/V) R* and dilute to 100.0 ml with the same solvent.

Test solution Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the 25 ml volumetric flask. Add 10.0 ml of a solution containing 25.0 g/l of *boric acid R* and 20.0 g/l of *oxalic acid R* in anhydrous *formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

Compensation liquid Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the 25 ml volumetric flask. Add 10.0 ml of *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

After 30 min measure the absorbance *(2.2.25)* of the test solution at 410 nm.

Calculate the percentage content of total flavonoids, expressed as hyperoside, from the following expression:

$$\frac{A \times 1.235}{m}$$

i.e. taking the value of the specific absorbance of hyperoside to be 405.

A = absorbance at 410 nm,

m = mass of the extract to be examined, in grams.

Ph Eur

Quillaia Liquid Extract

General Notices

DEFINITION

Quillaia Liquid Extract is prepared by extracting Quillaia with Ethanol (45 per cent).

Extemporaneous preparation

The following formula and directions apply.

Quillaia, in *moderately fine powder*	1000 g
Ethanol (45 per cent)	A sufficient quantity

Exhaust the Quillaia in *moderately fine powder* with Ethanol (45 per cent) by *percolation*, Appendix XI F, and reserve the first 850 ml of percolate. Evaporate the subsequent percolate to the consistence of a soft extract, dissolve it in the reserved portion and add sufficient Ethanol (45 per cent) to produce 1000 ml. Allow to stand for not less than 24 hours; filter.

The extract complies with the requirements stated under Extracts and with the following requirements.

TESTS

Ethanol content

28 to 34% v/v, Appendix VIII F, Method III.

Dry residue

20 to 30% w/v.

Relative density

1.02 to 1.06, Appendix V G.

Quillaia Tincture

General Notices

DEFINITION

Quillaia Liquid Extract	50 ml
Ethanol (45 per cent)	Sufficient to produce 1000 ml

Extemporaneous preparation

The following directions apply.

Mix, allow to stand for not less than 12 hours and filter.

The tincture complies with the requirements for Tinctures stated under Extracts and with the following requirements.

TESTS

Ethanol content

43 to 45% v/v, Appendix VIII F, Method III.

Dry residue

1.0 to 1.5% w/v. Use 10 ml.

Relative density

0.940 to 0.955, Appendix V G.

Quillaia

General Notices

Quillaia Bark

Preparation

Quillaia Liquid Extract

When Powdered Quillaia is prescribed or demanded, material complying with the appropriate requirements below shall be dispensed or supplied.

DEFINITION

Quillaia is the dried inner part of the bark of *Quillaja saponaria* Molina and of other species of *Quillaja*.

IDENTIFICATION

A. Pieces flat, up to about 1 metre long, 10 to 20 cm broad and 3 to 10 mm, usually 6 mm, thick. Outer surface brownish white or pale reddish brown, longitudinally striated or coarsely reticulated, with occasional blackish brown patches of adherent outer bark; inner surface yellowish white, smooth and very hard; fracture splintery and laminated, the broken surface showing numerous large prisms of calcium oxalate as glistening points. Smoothed transversely cut surface appearing chequered, with delicate radial lines representing medullary rays and tangential lines formed by alternating tangential bands of fibrous and non-fibrous phloem.

B. Outer bark, when present, consisting of reddish brown cork cells alternating with bands of brown parenchyma containing numerous groups of phloem fibres and large prisms of calcium oxalate. Inner bark consisting of alternating bands of tortuous fibres, irregularly enlarged at intervals, about 500 to 1000 µm long and 20 to 50 µm wide and of sieve tissue mixed with parenchyma. Medullary rays mostly three to four, but sometimes up to six cells wide, with occasional pitted, subrectangular sclereids adjacent to the bundles of phloem fibres. Starch granules 5 to 20 µm, usually about 10 µm, in diameter and prisms of calcium oxalate usually 50 to 170 µm long and up to 30 µm wide present in the parenchymatous cells.

TESTS

Extractive soluble in ethanol (45%)

Not less than 22.0%, Appendix XI B1.

Acid-insoluble ash

Not more than 1.0%, Appendix XI K.

Foreign matter

Complies with the test for *foreign matter*, Appendix XI D.

Red Poppy Petals

General Notices

(Ph Eur monograph 1881)

Ph Eur

DEFINITION

Dried, whole or fragmented petals of *Papaver rhoeas* L.

IDENTIFICATION

A. The petal is dark red or dark violet-brown, very thin, floppy, wrinkled, often crumpled into a ball and velvety to the touch. It is broadly ovate with an entire margin, about 6 cm long and 4-6 cm wide, narrowing at the base where there is a black spot. The vascular bundles radiate from the base and they anastomose in a continuous arc, all at the same short distance from the margin.

B. Reduce to a powder (355) (*2.9.12*). Examine under a microscope using *chloral hydrate solution R*. The powder has an intense reddish-pink colour and shows the following diagnostic characters: fragments of epidermis composed of elongated, sinuous-walled cells with small, rounded, anomocytic stomata (*2.8.3*), numerous vascular bundles with spiral vessels embedded in the parenchyma; occasional fragments of the fibrous layer of the anthers; rounded pollen grains, about 30 µm in diameter, with 3 pores and a finely verrucose exine.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *ethanol (60 per cent V/V) R*. Stir for 15 min. Filter through a filter paper.

Reference solution Dissolve 1 mg of *quinaldine red R* and 1 mg of *sulphan blue R* in 2 ml of *methanol R*.

Plate *TLC silica gel plate R*.

Mobile phase *anhydrous formic acid R*, *water R*, *butanol R* (10:12:40 *V/V/V*).

Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other bands may be present in the chromatogram obtained with the test solution.

———	———
	A violet principal zone A violet zone A yellow zone
Sulphan blue: a blue zone	
———	———
	A compact group of violet zones
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*)

Maximum 2.0 per cent of capsules and maximum 1.0 per cent of other foreign matter.

Loss on drying (*2.2.32*)

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 11.0 per cent.

Colouring intensity

Place 1.0 g of the powdered drug (355) (*2.9.12*) in a 250 ml flask and add 100 ml of *ethanol (30 per cent V/V) R.* Allow to macerate for 4 h with frequent stirring. Filter and discard the first 10 ml. Transfer 10.0 ml of the filtrate to a 100 ml volumetric flask and add 2 ml of *hydrochloric acid R*. Dilute to 100.0 ml with *ethanol (30 per cent V/V) R*. Allow to stand for 10 min. The absorbance (*2.2.25*) measured at 523 nm using *ethanol (30 per cent V/V) R* as the compensation liquid is not less than 0.6.

Ph Eur

Refined and Quantified Capsicum Oleoresin

General Notices

(Ph Eur monograph 2336)

Ph Eur

DEFINITION

Refined and quantified oleoresin produced from *Capsicum (1859)* .

Content

6.5 per cent to 8.0 per cent *m/m* of total capsaicinoids, expressed as capsaicin ($C_{18}H_{27}NO_3$; M_r 305.4).

PRODUCTION

The oleoresin is produced from the herbal drug and ethanol (minimum 90 per cent *V/V*) or methanol (minimum 90 per cent *V/V*), by an appropriate procedure.

CHARACTERS

Appearance

Red or brown mobile extract.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)* .

Test solution Dissolve 50 mg of the oleoresin to be examined in 5 ml of *ether R* .

Reference solution Dissolve 2 mg of *capsaicin R* and 2 mg of *dihydrocapsaicin R* in 5 ml of *ether R* .

Plate *TLC octadecylsilyl silica gel plate R* (5-40 µm) [or *TLC octadecylsilyl silica gel plate R* (2-10 µm)].

Mobile phase *water R, methanol R* (20:80 *V/V*).

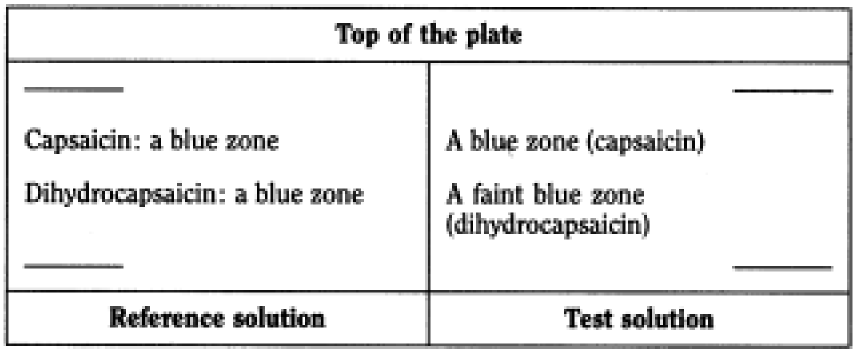
Application 20 µl [or 2 µl] as bands of 15 mm [or 8 mm].

Development Over a path of 12 cm [or 6 cm].

Drying In air.

Detection Spray with a 0.25 g/l solution of *dichloroquinonechlorimide R* in *ethyl acetate R* , expose to ammonia vapour until blue zones appear, then examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
———	———
Capsaicin: a blue zone	A blue zone (capsaicin)
Dihydrocapsaicin: a blue zone	A faint blue zone (dihydrocapsaicin)
———	———
Reference solution	**Test solution**

TESTS

Nonivamide

Liquid chromatography *(2.2.29)* .

Test solution Dissolve 0.300 g of the oleoresin to be examined in 60 ml of *methanol R* and dilute to 100.0 ml with the same solvent.

Reference solution Dissolve 20.0 mg of *capsaicin CRS* and 4.0 mg of *nonivamide CRS* in 100.0 ml of *methanol R* .

Column:

— *size:* l = 0.25 m, Ø = 4.6 mm;

— *stationary phase*: *phenylsilyl silica gel for chromatography R* (5 µm);

— *temperature*: 30 °C.

Mobile phase *acetonitrile R* , 1 g/l solution of *phosphoric acid R* (40:60 *V/V*).

Flow rate 1.0 ml/min.

Detection Spectrophotometer at 225 nm.

Injection 10 µl.

Elution order Nordihydrocapsaicin, nonivamide, capsaicin, dihydrocapsaicin.

System suitability Reference solution:

— *resolution*: minimum 1.5 between the peaks due to nonivamide and capsaicin.

Calculate the percentage content of nonivamide using the following expression:

$$\frac{F_1 \times m_2 \times p_1}{F_2 \times m_1}$$

F_1 = area of the peak due to nonivamide in the chromatogram obtained with the test solution;

F_2 = area of the peak due to nonivamide in the chromatogram obtained with the reference solution;

m_1 = mass of the oleoresin to be examined, in grams;

m_2 = mass of *nonivamide CRS* in the reference solution, in grams;

p_1 = percentage content of nonivamide in *nonivamide CRS*.

Limit:

— *nonivamide*: maximum 5.0 per cent of the total capsaicinoid content.

Water ***(2.5.12)***

Maximum 8.0 per cent, determined on 5.00 g.

ASSAY

Liquid chromatography *(2.2.29)* as described in the test for nonivamide.

Calculate the percentage content of total capsaicinoids, expressed as capsaicin, using the following expression:

$$\frac{(F_3 + F_5 + F_6) \times m_4 \times p_2}{F_4 \times m_3}$$

F_3 = area of the peak due to capsaicin in the chromatogram obtained with the test solution;

F_4 = area of the peak due to capsaicin in the chromatogram obtained with the reference solution;

F_5 = area of the peak due to dihydrocapsaicin in the chromatogram obtained with the test solution;

F_6 = area of the peak due to nordihydrocapsaicin in the chromatogram obtained with the test solution;

m_3 = mass of the oleoresin to be examined, in grams;

m_4 = mass of *capsaicin CRS* in the reference solution, in grams;

p_2 = percentage content of capsaicin in *capsaicin CRS*.

Ph Eur

Refined and Standardised Milk Thistle Dry Extract

General Notices

(Ph Eur monograph 2071)

Ph Eur

DEFINITION

Dry extract, refined and standardised, produced from *Milk-thistle fruit (1860)*.

Content

90 per cent to 110 per cent of the nominal content of silymarin, expressed as silibinin ($C_{25}H_{22}O_{10}$; M_r 482.4), stated on the label. The nominal content of silymarin is within the range 30 per cent *m/m* to 65 per cent *m/m* (dried extract).

The content of silymarin corresponds to:

- — *sum of the contents of silicristin and silidianin* (both $C_{25}H_{22}O_{10}$; M_r 482.4): 20 per cent to 45 per cent, calculated with reference to total silymarin;
- — *sum of the contents of silibinin A and silibinin B* (both $C_{25}H_{22}O_{10}$; M_r 482.4): 40 per cent to 65 per cent, calculated with reference to total silymarin;
- — *sum of the contents of isosilibinin A and isosilibinin B* (both $C_{25}H_{22}O_{10}$; M_r 482.4): 10 per cent to 20 per cent, calculated with reference to total silymarin.

PRODUCTION

The extract is produced from the herbal drug by an appropriate procedure, using one or more of the following solvents:

- — ethyl acetate;
- — acetone or mixture of acetone and water;
- — ethanol or mixture of ethanol and water;
- — methanol or mixture of methanol and water.

CHARACTERS

Appearance

Yellowish-brown, amorphous powder.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)*.

Test solution Dissolve 0.250 g of the extract to be examined in 5 ml of *methanol R*.

Reference solution Dissolve 2 mg of *silibinin R* and 5 mg of *taxifolin R* in 10 ml of *methanol R*.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *anhydrous formic acid R, acetone R, methylene chloride R* (8.5:16.5:75 *V/V/V*) .

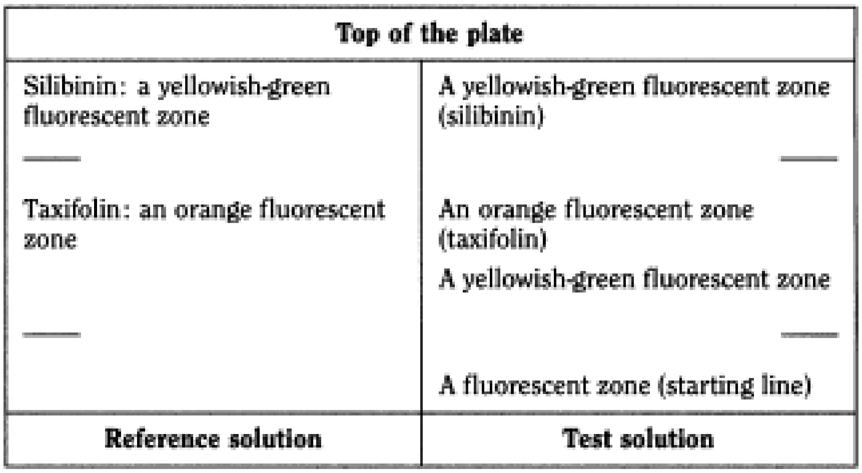
Application 10 µl [or 8 µl] of the test solution and 10 µl [or 2 µl] of the reference solution, as bands.

Development Over a path of 10 cm [or 6 cm].

Drying At 100-105 °C.

Detection Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for about 30 min and examine in ultraviolet light at 365 nm.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other yellowish-green fluorescent zones may be present between the zones due to silibinin and taxifolin in the chromatogram obtained with the test solution.



Top of the plate	
Silibinin: a yellowish-green fluorescent zone	A yellowish-green fluorescent zone (silibinin)
——	——
Taxifolin: an orange fluorescent zone	An orange fluorescent zone (taxifolin)
	A yellowish-green fluorescent zone
——	——
	A fluorescent zone (starting line)
Reference solution	**Test solution**

TESTS

Loss on drying *(2.8.17)*

Maximum 5.0 per cent.

ASSAY

Liquid chromatography *(2.2.29)*.

Test solution Dissolve 60.0 mg of the extract to be examined in *methanol R* and dilute to 100.0 ml with the same solvent.

Reference solution Dissolve a quantity of *milk thistle standardised dry extract CRS* corresponding to 10.0 mg (m_1 g) of silibinin in *methanol R* and dilute to 100.0 ml with the same solvent.

Column:

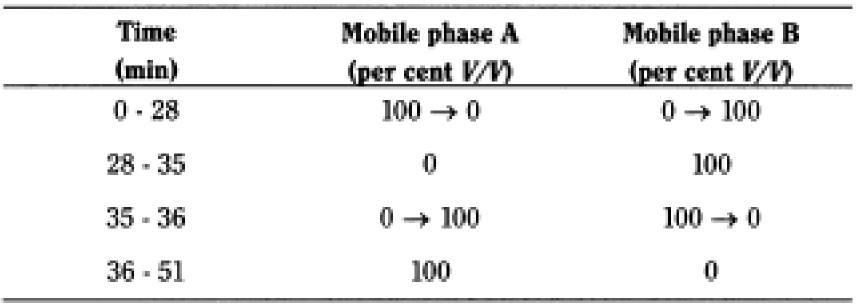
— *size:* l = 0.125 m, Ø = 4 mm;

— *stationary phase: octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

— *mobile phase A: phosphoric acid R, methanol R, water R* (0.5:35:65 *V/V/V*);

— *mobile phase B: phosphoric acid R, methanol R, water R* (0.5:50:50 *V/V/V*);



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 28	100 → 0	0 → 100
28 - 35	0	100
35 - 36	0 → 100	100 → 0
36 - 51	100	0

Flow rate 0.8 ml/min.

Detection Spectrophotometer at 288 nm.

Injection 10 µl.

Retention time Silibinin B = about 30 min; if necessary, adjust the time periods of the gradient.

System suitability Reference solution:

— *resolution*: minimum 1.8 between the peaks due to silibinin A and silibinin B.

— the chromatogram obtained with the reference solution is similar to the chromatogram supplied with *milk thistle standardised dry extract CRS*.

Locate the peaks due to silicristin, silidianin, silibinin A, silibinin B, isosilibinin A and isosilibinin B using the chromatogram supplied with *milk thistle standardised dry extract CRS*. In the chromatogram obtained with the test solution the peak due to silidianin may vary in size or be absent.

Calculate the percentage content of total silymarin, expressed as silibinin, using the following expression:

$$\frac{(F_1 + F_2 + F_3 + F_4 + F_5 + F_6) \times m_1}{(F_7 + F_8) \times m_2}$$

Calculate the percentage content of the sum of silicristin and silidianin, with reference to total silymarin, using the following expression:

$$\frac{(F_1 + F_2) \times 100}{F_1 + F_2 + F_3 + F_4 + F_5 + F_6}$$

Calculate the percentage content of the sum of silibinin A and silibinin B, with reference to total silymarin, using the following expression:

$$\frac{(F_3 + F_4) \times 100}{F_1 + F_2 + F_3 + F_4 + F_5 + F_6}$$

Calculate the percentage content of the sum of isosilibinin A and isosilibinin B, with reference to total silymarin, using the following expression:

$$\frac{(F_5 + F_6) \times 100}{F_1 + F_2 + F_3 + F_4 + F_5 + F_6}$$

F_1 = area of the peak due to silicristin in the chromatogram obtained with the test solution;

F_2 = area of the peak due to silidianin in the chromatogram obtained with the test solution;

F_3 = area of the peak due to silibinin A in the chromatogram obtained with the test solution;

F_4 = area of the peak due to silibinin B in the chromatogram obtained with the test solution;

F_5 = area of the peak due to isosilibinin A in the chromatogram obtained with the test solution;

F_6 = area of the peak due to isosilibinin B in the chromatogram obtained with the test solution;

F_7 = area of the peak due to silibinin A in the chromatogram obtained with the reference solution;

F_8 = area of the peak due to silibinin B in the chromatogram obtained with the reference solution;

M_1 = mass of silibinin in the reference solution, in grams;

M_2 = mass of the extract to be examined, in grams.

Ph Eur

Restharrow Root

General Notices

(Ph Eur monograph 1879)

Ph Eur

DEFINITION

Whole or cut, dried root of *Ononis spinosa* L.

IDENTIFICATION

A. The root is more or less flattened, twisted and branched, deeply wrinkled, brown and grooved longitudinally. The transversely cut surface shows a thin bark and a xylem cylinder with a conspicuously radiate structure. The fracture of the root is short and fibrous.

B. Reduce to a powder (355) (*2.9.12*). The powder is light brown or brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: brown fragments of cork composed of thin-walled polygonal cells; groups of thick-walled narrow fibres, often accompanied by a parenchymatous crystal sheath containing prisms of calcium oxalate; fragments of vessels with numerous small bordered pits; parenchymatous cells with single prisms of calcium oxalate. Examine under a microscope using a mixture of equal volumes of *glycerol R* and *water R*. The powder shows numerous simple, round starch granules, 5-10 µm in diameter.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 1.0 g of the powdered drug (180) (*2.9.12*) add 15.0 ml of *methanol R* and boil under a reflux condenser for 30 min. Cool and filter.

Reference solution Dissolve 10 mg of *resorcinol R* and 50 mg of *vanillin R* in 10 ml of *methanol R*.

Plate *TLC silica gel F_{254} plate R.*

Mobile phase *ethanol (96 per cent) R*, *methylene chloride R*, *toluene R* (10:45:45 *V/V/V*).

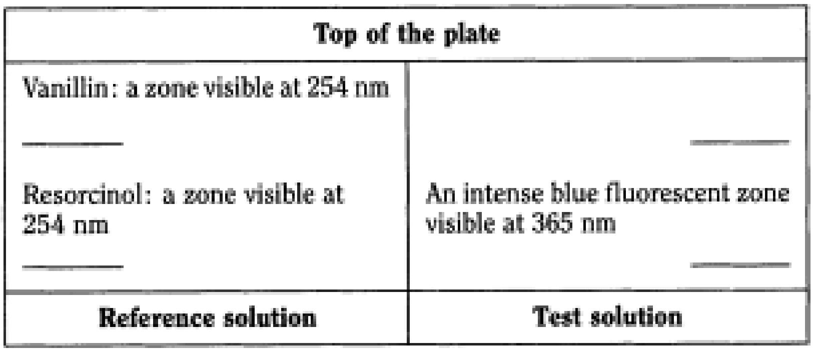
Application 20 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm and 365 nm.

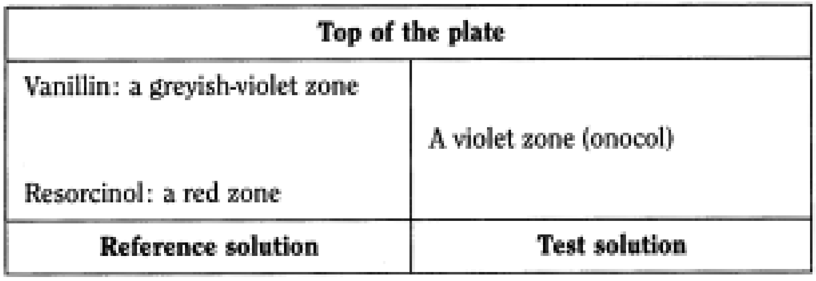
Results A See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones are present in the middle third of the chromatogram obtained with the test solution.



Top of the plate	
Vanillin: a zone visible at 254 nm	
———	———
Resorcinol: a zone visible at 254 nm	An intense blue fluorescent zone visible at 365 nm
———	———
Reference solution	**Test solution**

Detection B Spray with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min. Examine in daylight.

Results B See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
Vanillin: a greyish-violet zone	
	A violet zone (onocol)
Resorcinol: a red zone	
Reference solution	**Test solution**

TESTS

Loss on drying (*2.2.32*)

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 8.0 per cent.

Extractable matter

Minimum 15.0 per cent.

To 2.00 g of the powdered drug (250) (*2.9.12*) add a mixture of 8 g of *water R* and 12 g of *ethanol (96 per cent) R* and allow to macerate for 2 h, shaking frequently. Filter, evaporate 5 g of the filtrate to dryness on a water-bath and dry in an oven at 100-105 °C for 2 h. The residue weighs a minimum of 75 mg.

Ph Eur

Rhatany Root

General Notices

Krameria
(Ph Eur monograph 0289)

Preparation

Rhatany Tincture

When Powdered Rhatany Root is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter shall be dispensed or supplied.

Ph Eur

DEFINITION

Dried, usually fragmented, underground organs of *Krameria triandra* Ruiz and Pavon, known as Peruvian rhatany.

Content

Minimum 5.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1) (dried drug).

IDENTIFICATION

A. The taproot is dark reddish-brown and has a thick, knotty crown. The secondary roots are the same colour and nearly straight or somewhat tortuous. The bark is rugged or scaly in the older pieces and smooth with sharp, transverse fissures in the younger pieces; it separates readily from the wood. The fracture is fibrous in the bark and splintery in the wood. The smooth, transversely cut surface shows a dark brownish-red bark about one third of the radius in thickness; a dense, pale reddish-brown and finely porous wood is present with numerous fine medullary rays; the central heartwood is often darker.

B. Reduce to a powder (355) (*2.9.12*). The powder is brownish-red. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: cork cells containing dark brown phlobaphenes; fragments of unlignified phloem fibres, usually 12-30 µm in diameter with moderately thick walls; phloem parenchyma cells in files containing prisms and microcrystals of calcium oxalate; fragments of vessels usually 20-60 µm in diameter with bordered pits; fragments of tracheids up to 20 µm wide with slit-shaped pits. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows rounded starch granules, simple or 2- to 4-compound, an individual granule measuring up to 30 µm in diameter and some granules being found in the cells of the medullary rays and in the parenchyma.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of a mixture of 3 volumes of *water R* and 7 volumes of *ethanol (96 per cent) R*, shake for 10 min and filter. To the filtrate add 10 ml of *light petroleum R* and shake. Separate the light petroleum layer, add 2 g of *anhydrous sodium sulphate R*, shake and filter. Evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of *methanol R*.

Reference solution Dissolve 5.0 mg of *Sudan red G R* in 10 ml of *methanol R*.

Plate *TLC silica gel plate R.*

Mobile phase *ethyl acetate R*, *toluene R* (2:98 *V/V*).

Application 10 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with a 5 g/l solution of *fast blue B salt R*. Allow to dry in air and spray with *0.1 M ethanolic sodium hydroxide*; examine in daylight.

Results The chromatogram obtained with the reference solution shows in the lower third a red zone due to Sudan red G. The chromatogram obtained with the test solution shows a violet zone due to rhatany phenol I similar in position to the zone of Sudan red G in the chromatogram obtained with the reference solution, below it the brownish zone due to rhatany phenol II and below this the bluish-grey zone due to rhatany phenol III. Further zones may be present.

TESTS

Foreign matter (*2.8.2*)

Maximum 2 per cent of foreign matter and maximum 5 per cent of fragments of crown or root exceeding 25 mm in diameter. Root without bark may be present in very small quantities.

Loss on drying (*2.2.32*)

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C.

Total ash (*2.4.16*)

Maximum 5.5 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs (*2.8.14*). Use 0.750 g of powdered drug (180) (*2.9.12*).

Ph Eur

Rhatany Tincture

General Notices

(Ph Eur monograph 1888)

Ph Eur

DEFINITION

Tincture produced from *Rhatany root (0289).*

Content

Minimum 1.0 per cent *m/m* of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1).

PRODUCTION

The tincture is produced from 1 part of the drug and 5 parts of ethanol (70 per cent *V/V*) by a suitable procedure.

CHARACTERS

Appearance

Reddish-brown liquid.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)*.

Test solution To 5 ml of the tincture to be examined, add 10 ml of *light petroleum R* and shake. Separate the light petroleum layer, add 2 g of *anhydrous sodium sulphate R*, shake and filter. Evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of *methylene chloride R*.

Reference solution Dissolve 5 mg of *thymol R* and 10 mg of *dichlorophenolindophenol, sodium salt R* in 10 ml of *alcohol (60 per cent V/V) R*.

Plate *TLC silica gel plate R*.

Mobile phase *methylene chloride R*.

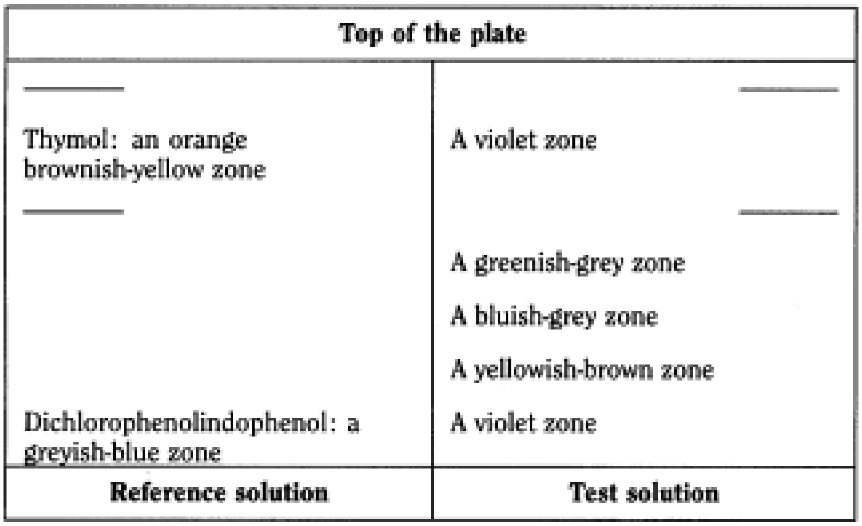
Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with a 5 g/l solution of *fast blue B salt R*; allow the plate to dry in air and spray with *0.1 M ethanolic sodium hydroxide*; examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
———	———
Thymol: an orange brownish-yellow zone	A violet zone
———	———
	A greenish-grey zone
	A bluish-grey zone
	A yellowish-brown zone
Dichlorophenolindophenol: a greyish-blue zone	A violet zone
Reference solution	**Test solution**

TESTS

Ethanol *(2.9.10)*

63 per cent *V/V* to 67 per cent *V/V*.

Methanol and 2-propanol *(2.9.11)*

Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

ASSAY

Carry out the determination of tannins in herbal drugs *(2.8.14)* using 2.500 g of the tincture to be examined.

Ph Eur

Rhubarb

General Notices

(Ph Eur monograph 0291)

Preparation

Compound Rhubarb Tincture

When Powdered Rhubarb is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter shall be dispensed or supplied.

Ph Eur

DEFINITION

Rhubarb consists of the whole or cut, dried underground parts of *Rheum palmatum* L. or of *Rheum officinale* Baillon or of hybrids of these two species or of a mixture. The underground parts are often divided; the stem and most of the bark with the rootlets are removed. It contains not less than 2.2 per cent of hydroxyanthracene derivatives, expressed as rhein ($C_{15}H_8O_6$, M_r 284.2), calculated with reference to the dried drug.

CHARACTERS

Characteristic, aromatic odour.

IDENTIFICATION

A. The appearance is variable: disc-shaped pieces up to 10 cm in diameter and 1 cm to 5 cm in thickness; cylindrical pieces; oval or planoconvex pieces. The surface has a pinkish tinge and is usually covered with a layer of brownish-yellow powder. It shows, especially after moistening, a reticulum of darker lines. This structure causes the marbled appearance of the drug. The fracture is granular. The transverse section of the rhizome shows a narrow outer zone of radiating brownish-red lines. These medullary rays are crossed perpendicularly by a dark cambial ring. Inside this zone is a ring of small star-spot formations of anomalous vascular bundles. The root shows a more radiate structure.

B. Reduce to a powder (355) (*2.9.12*). The powder is orange to brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: large calcium oxalate cluster crystals, which may measure more than 100 µm, and their fragments; reticulately thickened non-lignified vessels measuring up to 175 µm. Numerous groups of rounded or polygonal, thin-walled parenchyma cells. Sclereids and fibres are absent. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows simple, rounded or compound (2 to 4) starch granules with a star-shaped hilum.

C. Examine by thin-layer chromatography (*2.2.27*), using a suitable silica gel as the coating substance.

Test solution Heat 50 mg of the powdered drug (180) (*2.9.12*) in a water-bath for 15 min with a mixture of 1 ml of *hydrochloric acid R* and 30 ml of *water R*. Allow to cool and shake the liquid with 25 ml of *ether R*. Dry the ether layer over *anhydrous sodium sulphate R* and filter. Evaporate the ether layer to dryness and dissolve the residue in 0.5 ml of *ether R*.

Reference solution Dissolve 5 mg of *emodin R* in 5 ml of *ether R*.

Apply separately to the plate as bands 20 µl of each solution. Develop over a path of 10 cm using a mixture of 1 volume of *anhydrous formic acid R*, 25 volumes of *ethyl acetate R* and 75 volumes of *light petroleum R*. Allow the plate to dry in air and examine in ultraviolet light at 365 nm. The chromatogram obtained with the reference solution shows in its central part a zone of orange fluorescence (emodin). The chromatogram obtained with the test solution shows: a zone due to emodin; above the emodin zone, two zones of similar fluorescence (physcione and chrysophanol, in order of increasing R_F value); below the emodin zone, also two zones of similar fluorescence (rhein and aloe-emodin, in order of decreasing R_F value). Spray with a 100 g/l solution of *potassium hydroxide R* in *methanol R*. All the zones become red to violet.

D. To about 50 mg of the powdered drug (180) (*2.9.12*) add 25 ml of *dilute hydrochloric acid R* and heat the mixture on a water-bath for 15 min. Allow to cool, shake with 20 ml of *ether R* and discard the aqueous layer. Shake the ether layer with 10 ml of *dilute ammonia R1*. The aqueous layer becomes red to violet.

TESTS

Rheum rhaponticum

Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

Test solution To 0.2 g of the powdered drug (180) (*2.9.12*) add 2 ml of *methanol R* and boil for 5 min under a reflux condenser. Allow to cool and filter. Use the filtrate as the test solution.

Reference solution Dissolve 10 mg of *rhaponticin R* in 10 ml of *methanol R*.

Apply separately to the plate, as bands not more than 20 mm by 3 mm, 20 µl of each solution. Develop over a path of 12 cm using a mixture of 20 volumes of *methanol R* and 80 volumes of *methylene chloride R*. Allow the plate to dry in air and spray with *phosphomolybdic acid solution R*. The chromatogram obtained with the test solution does not show a blue zone near the starting-line (rhaponticin) corresponding to the zone in the chromatogram obtained with the reference solution.

Loss on drying (*2.2.32*)

Not more than 12.0 per cent, determined on 1.000 g of the powdered drug (180) (*2.9.12*) by drying in an oven at 105 °C.

Total ash (*2.4.16*)

Not more than 12.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*)

Not more than 2.0 per cent.

ASSAY

Carry out the assay protected from bright light.

Introduce 0.100 g of the powdered drug (180) (*2.9.12*) into a 100 ml flask. Add 30.0 ml of *water R*, mix and weigh. Heat in a water-bath under a reflux condenser for 15 min. Allow to cool, add 50 mg of *sodium hydrogen carbonate R*, weigh and adjust to the original mass with *water R*. Centrifuge and transfer 10.0 ml of the liquid to a 100 ml round-bottomed flask with a ground-glass neck. Add 20 ml of *ferric chloride solution R1* and mix. Heat under a reflux condenser on a water-bath for 20 min, add 1 ml of *hydrochloric acid R* and heat for a further 20 min, shaking frequently. Cool, transfer to a separating funnel and shake with three quantities, each of 25 ml, of *ether R* previously used to rinse the flask. Combine the ether extracts and wash with two quantities, each of 15 ml, of *water R*. Filter the ether extracts through a plug of absorbent cotton into a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 10.0 ml carefully to dryness on a water-bath and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (*2.2.25*) at 515 nm, using *methanol R* as the compensation liquid.

Calculate the percentage content of rhein from the expression:

$$\frac{A \times 0.64}{m}$$

i.e. taking the specific absorbance of rhein to be 468, calculated on the basis of the specific absorbance of barbaloin.

A = absorbance at 515 nm;

m = mass of the drug used, in grams.

Ph Eur

Roselle

General Notices

(Ph Eur monograph 1623)

Ph Eur

DEFINITION

Whole or cut dried calyces and epicalyces of *Hibiscus sabdariffa* L. collected during fruiting.

Content

Minimum 13.5 per cent of acids, expressed as citric acid ($C_6H_8O_7$; M_r 192.1) (dried drug).

CHARACTERS

Acidic taste.

IDENTIFICATION

A. The calyx is joined in the lower half to form an urceolate structure, the upper half dividing to form 5 long acuminate recurved tips. The tips have a prominent, slightly protruding midrib and a large, thick nectary gland about 1 mm in diameter. The epicalyx consists of 8-12 small, obovate leaflets, which are adnate to the base of the calyx. The calyx and epicalyx are fleshy, dry, easily fragmented and bright red or deep purple, somewhat lighter at the base of the inner side.

B. Reduce to a powder (355) (*2.9.12*). The powder is red or purplish-red. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: predominantly red fragments of the parenchyma containing numerous crystal clusters of calcium oxalate and, sporadically, mucilage-filled cavities, sometimes associated with polygonal epidermal cells and anisocytic stomata (*2.8.3*); numerous fragments of vascular bundles with spiral and reticulate vessels; sclerenchymatous fibres with a wide lumen; rarely, rectangular, pitted parenchymatous cells; fragments of unicellular, smooth, bent covering trichomes and occasional glandular trichomes; rounded pollen grains with a spiny exine.

C. Thin-layer chromatography (*2.2.27*).

Test solution To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *ethanol (60 per cent V/V) R*. Shake for 15 min and filter.

Reference solution Dissolve 2.5 mg of *quinaldine red R* and 2.5 mg of *sulphan blue R* in 10 ml of *methanol R.*

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *anhydrous formic acid R*, *water R*, *butanol R* (10:12:40 *V/V/V*).

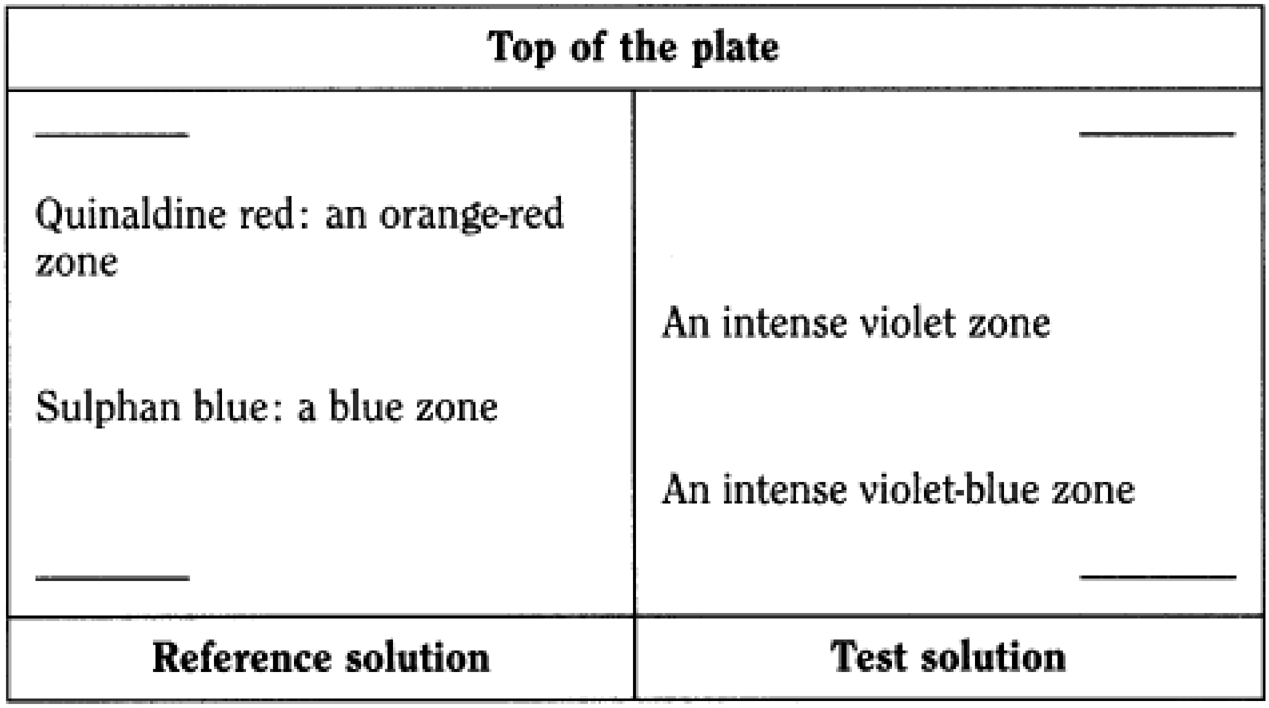
Application 5 µl as bands of 10 mm [or 2 µl as bands of 8 mm].

Development Over a path of 10 cm [or 6 cm].

Drying In air.

Detection Examine immediately in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
_______	_______
Quinaldine red: an orange-red zone	
	An intense violet zone
Sulphan blue: a blue zone	
	An intense violet-blue zone
_______	_______
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*)

Maximum 2 per cent of fragments of fruits (red funicles and parts of the 5-caverned capsule with yellowish-grey pericarp, whose thin walls consist of several layers of differently directed fibres; flattened, reniform seeds with a dotted surface).

Loss on drying (*2.2.32*)

Maximum 11.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 10.0 per cent.

Colouring intensity

Reduce 100 g to a coarse powder (1400) (*2.9.12*) and homogenise. Reduce about 10 g of this mixture to a powder (355) (*2.9.12*). To 1.0 g of the powdered drug (355) (*2.9.12*) add 25 ml of boiling *water R* in a 100 ml flask and heat for 15 min on a water-bath with frequent shaking. Filter the hot mixture into a 50 ml graduated flask; rinse successively the 100 ml flask and the filter with 3 quantities, each of 5 ml, of warm *water R*. After cooling, dilute to 50 ml with *water R*. Dilute 5 ml of this solution to 50 ml with *water R*. Measure the absorbance (*2.2.25*) at 520 nm using *water R* as the compensation liquid. The absorbance is not less than 0.350 for the whole drug and not less than 0.250 for the cut drug.

ASSAY

Shake 1.000 g of the powdered drug (355) (*2.9.12*) with 100 ml of *carbon dioxide-free water R* for 15 min. Filter. To 50.0 ml of the filtrate add 100 ml of *carbon dioxide-free water R*. Titrate with *0.1 M sodium hydroxide* to pH 7.0, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M sodium hydroxide* is equivalent to 6.4 mg of citric acid.

Ph Eur

Rosemary Leaf

General Notices

(Ph Eur monograph 1560)

Ph Eur

DEFINITION

Whole, dried leaf of *Rosmarinus officinalis* L.

Content:

— minimum 12 ml/kg of essential oil (anhydrous drug);

— minimum 3 per cent of total hydroxycinnamic derivatives, expressed as rosmarinic acid ($C_{18}H_{16}O_8$; M_r 360) (anhydrous drug).

CHARACTERS

Strongly aromatic odour.

IDENTIFICATION

A. The leaves are sessile, tough, linear to linear-lanceolate, 1 cm to 4 cm long and 2 mm to 4 mm wide, with recurved edges. The upper surface is dark green, glabrous and grainy, the lower surface is greyish-green and densely tomentose with a prominent midrib.

B. Reduce to a powder (355) (*2.9.12*). The powder is greyish-green to yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of lower epidermis with straight to sinuous-walled cells and numerous diacytic stomata (*2.8.3*); fragments of the upper epidermis with straight-walled cells, slightly thickened and pitted, and an underlying hypodermis composed of large, irregular cells with thickened and beaded anticlinal walls; fragments in sectional view showing the hypodermal cells extending across the lamina at intervals, separating the one or two-layered palisade into large, crescent-shaped areas; numerous multicellular, extensively branched, covering trichomes of the lower epidermis and rare conical covering trichomes of the upper epidermis; glandular trichomes of 2 types, the majority with a short, unicellular stalk and a radiate head composed of 8 cells, others, less abundant, with a unicellular stalk and a spherical, unicellular or bicellular head.

C. Thin-layer chromatography (*2.2.27*).

Test solution Dissolve 20 µl of the oil obtained in the assay in 1 ml of *hexane R*.

Reference solution Dissolve 5 mg of *borneol R*, 5 mg of *bornyl acetate R* and 10 µl of *cineole R* in 1 ml of *hexane R*.

Plate *TLC silica gel G plate R*.

Mobile phase *ethyl acetate R*, *toluene R* (5:95 *V/V*).

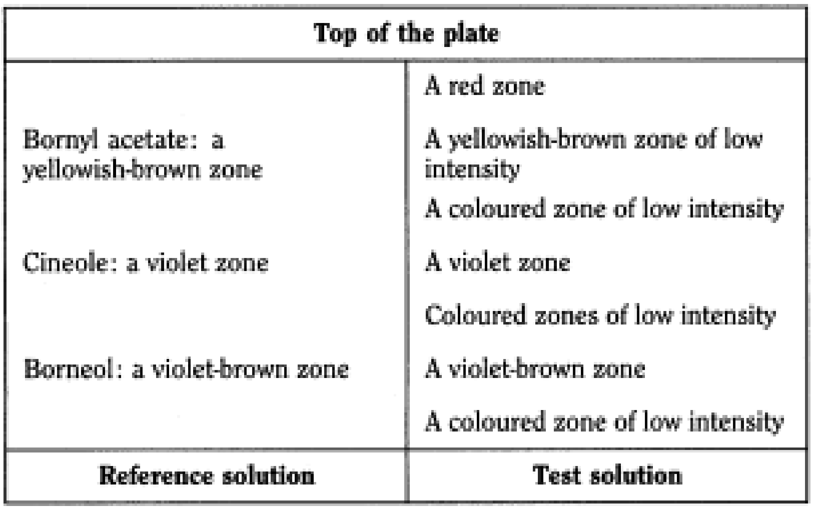
Application 10 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R*. Heat at 100-105 °C for 10 min. Examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
	A red zone
Bornyl acetate: a yellowish-brown zone	A yellowish-brown zone of low intensity
	A coloured zone of low intensity
Cineole: a violet zone	A violet zone
	Coloured zones of low intensity
Borneol: a violet-brown zone	A violet-brown zone
	A coloured zone of low intensity
Reference solution	**Test solution**

D. Thin-layer chromatography (*2.2.27*).

Test solution Grind 1.0 g of the drug in 10 ml of *methanol R* and filter.

Reference solution Dissolve 5.0 mg of *rosmarinic acid R* and 1.0 mg of *caffeic acid R* in 10 ml of *methanol R*.

Plate *TLC silica gel plate R*.

Mobile phase *anhydrous formic acid R*, *acetone R*, *methylene chloride R* (8.5:25:85 *V/V/V*).

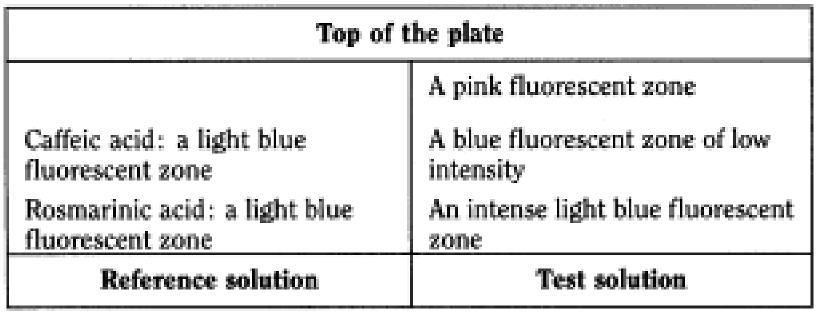
Application 10 µl of the test solution and 20 µl of the reference solution, as bands.

Development Over a path of 8 cm.

Drying In air.

Detection Examine in ultraviolet light at 365 nm.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
	A pink fluorescent zone
Caffeic acid: a light blue fluorescent zone	A blue fluorescent zone of low intensity
Rosmarinic acid: a light blue fluorescent zone	An intense light blue fluorescent zone
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*)

Maximum 5 per cent of stems and maximum 2 per cent of other foreign matter.

Water (*2.2.13*)

Maximum 100 ml/kg, determined on 20.0 g of the powdered drug (355) (*2.9.12*).

Total ash (*2.4.16*)

Maximum 9.0 per cent.

ASSAY

Total hydroxycinnamic derivatives

Stock solution To 0.200 g of the powdered drug (355) (*2.9.12*) add 80 ml of *alcohol (50 per cent V/V) R*. Boil in a water-bath under a reflux condenser for 30 min. Allow to cool and filter. Rinse the filter with 10 ml of *alcohol (50 per cent V/V) R*. Combine the filtrate and the rinsings in a volumetric flask and dilute to 100.0 ml with *alcohol (50 per cent V/V) R*.

Test solution To 1.0 ml of the stock solution add 2 ml of *0.5 M hydrochloric acid*, 2 ml of a solution prepared by dissolving 10 g of *sodium nitrite R* and 10 g of *sodium molybdate R* in 100 ml of *water R* and then add 2 ml of *dilute sodium hydroxide solution R* and dilute to 10.0 ml with *water R*; mix.

Compensation solution Dilute 1.0 ml of the stock solution to 10.0 ml with *water R*.

Measure immediately the absorbance (*2.2.25*) of the test solution at 505 nm.

Calculate the percentage content of total hydroxycinnamic derivatives, expressed as rosmarinic acid, from the expression:

$$\frac{A \times 2.5}{m}$$

i.e. taking the specific absorbance of rosmarinic acid to be 400.

A = absorbance of the test solution at 505 nm,

m = mass of the substance to be examined, in grams.

Essential oil (*2.8.12*)

Use 25.0 g of the crushed drug, a 1000 ml flask and 300 ml of *water R* as the distillation liquid. Distil at a rate of 2-3 ml/min for 3 h.

Ph Eur

Rosemary Oil

General Notices

(Ph Eur monograph 1846)

Ph Eur

DEFINITION

Essential oil obtained by steam distillation from the flowering aerial parts of *Rosmarinus officinalis* L.

CHARACTERS

Appearance

Clear, mobile, colourless to pale yellow liquid with a characteristic odour.

IDENTIFICATION

First identification B.

Second identification A.

A. Thin-layer chromatography (*2.2.27*).

Test solution Dissolve 0.5 ml of the substance to be examined in *toluene R* and dilute to 10 ml with the same solvent.

Reference solution Dissolve 50 mg of *borneol R*, 50 mg of *bornyl acetate R* and 100 µl of *cineole R* in *toluene R* and dilute to 10 ml with the same solvent.

Plate TLC silica gel plate R.

Mobile phase ethyl acetate R, *toluene R* (5:95 *V/V*).

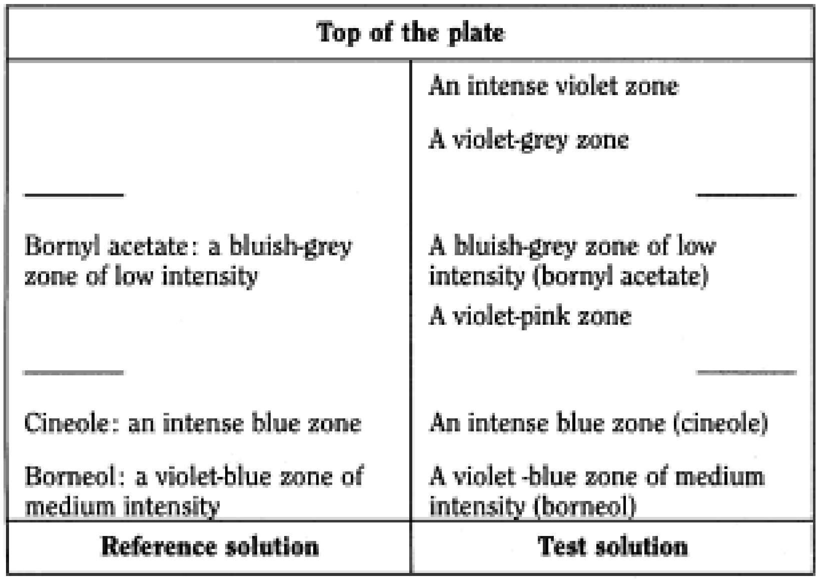
Application 10 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray the plate with *vanillin reagent R* and heat the plate at 100-105 °C for 10 min. Examine immediately in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, several violet-blue to violet-grey zones of medium intensity (terpene alcohols) are present in the lower third of the chromatogram obtained with the test solution.



Top of the plate	
	An intense violet zone
	A violet-grey zone
———	———
Bornyl acetate: a bluish-grey zone of low intensity	A bluish-grey zone of low intensity (bornyl acetate)
	A violet-pink zone
———	———
Cineole: an intense blue zone	An intense blue zone (cineole)
Borneol: a violet-blue zone of medium intensity	A violet -blue zone of medium intensity (borneol)
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (*2.2.5*)

0.895 to 0.920.

Refractive index (*2.2.6*)

1.464 to 1.473.

Optical rotation (*2.2.7*)

- 5° to + 8°.

Acid value (*2.5.1*)

Maximum 1.0.

Chromatographic profile

Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution Dissolve 0.20 ml of the substance to be examined in *hexane R* and dilute to 10.0 ml with the same solvent.

Reference solution Dissolve 20 µl of *α-pinene R*, 10 mg of *camphene R*, 20 µl of *β-pinene R*, 10 µl of *β-myrcene R*, 20 µl of *limonene R*, 50 µl of *cineole R*, 10 µl of *p-cymene R*, 50 mg of *camphor R*, 30 mg of *bornyl acetate R*, 10 mg of *α-terpineol R*, 10 mg of *borneol R* and 10 µl of *verbenone R* in *hexane R* and dilute to 10.0 ml with the same solvent.

Column:

— *material*: fused silica,

— *size:* l = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm,

— *stationary phase*: *macrogol 20 000 R*.

Carrier gas *helium for chromatography R*.

Flow rate 1 ml/min.

Split ratio 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	50
	10 - 85	50 → 200
	85 - 110	200
Injection port		200
Detector		250

Detection Flame ionisation.

Injection 1 µl.

Elution order Order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability Reference solution:

— *resolution*: minimum 1.5 between the peaks due to limonene and cineole and minimum 1.5 between the peaks due to α-terpineol and borneol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of these components.

For rosemary oil, Spanish type, the percentages are within the following ranges:

— α-*pinene*: 18 per cent to 26 per cent,

— *camphene*: 8.0 per cent to 12.0 per cent,

— β-*pinene*: 2.0 per cent to 6.0 per cent,

— β-*myrcene*: 1.5 per cent to 5.0 per cent,

— *limonene*: 2.5 per cent to 5.0 per cent,

— *cineole*: 16.0 per cent to 25.0 per cent,

— *p-cymene*: 1.0 per cent to 2.2 per cent,

— *camphor* : 13.0 per cent to 21.0 per cent,

— *bornyl acetate*: 0.5 per cent to 2.5 per cent,

— α-*terpineol*: 1.0 per cent to 3.5 per cent,

— *borneol*: 2.0 per cent to 4.5 per cent,

— *verbenone*: 0.7 per cent to 2.5 per cent.

For rosemary oil, Moroccan and Tunisian type, the percentages are within the following ranges:

— α-*pinene*: 9.0 per cent to 14.0 per cent,

— *camphene*: 2.5 per cent to 6.0 per cent,

— β-*pinene*: 4.0 per cent to 9.0 per cent,

— β-*myrcene*: 1.0 per cent to 2.0 per cent,

— *limonene*: 1.5 per cent to 4.0 per cent,

— *cineole*: 38.0 per cent to 55.0 per cent,

— *p-cymene*: 0.8 per cent to 2.5 per cent,

— *camphor*: 5.0 per cent to 15.0 per cent,

— *bornyl acetate*: 0.1 per cent to 1.5 per cent,

— α-*terpineol*: 1.0 per cent to 2.6 per cent,

— *borneol*: 1.5 per cent to 5.0 per cent,

— *verbenone*: maximum 0.4 per cent.

STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

LABELLING

The label states that the content is Spanish type or Moroccan and Tunisian type.

Ph Eur

Safflower Flower

General Notices

(Ph Eur monograph 2386)

Ph Eur

DEFINITION

Dried flower of *Carthamus tinctorius* L.

Content

Minimum 1.0 per cent of total flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried drug).

IDENTIFICATION

A. The orange-yellow or reddish-orange, tubular, gametalous, actinomorphic florets are separate from the capitulum. Each consists of a long, filiform tube, about 1 cm long divided into 5 equal, narrow, lanceolate lobes, about 0.5 cm long. From the opening of the tube emerges the hollow cylinder formed by the fused yellow anthers, in which the filiform style persists, thickened near the apex.

B. Reduce to a powder (355) *(2.9.12)*. The powder is orange-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of the corolla tube with epidermis consisting of elongated, thin-walled polygonal cells; fragments of the lobes of the corolla showing at their apices a large number of small, rounded, very prominent papillae; fragments of parenchyma containing vascular bundles surrounded by secretory canals with reddish-brown contents; fragments of anthers consisting of irregularly shaped cells whose walls show thickenings in characteristic bands; fragments of the style, whose lower part consists of elongated cells and which ends in a stigma, bristling with rather long, conical, confluent papillae; rounded or elliptical triporate pollen grains up to 60 µm in diameter with an echinulate exine; calcium oxalate prisms, either isolated or present in parenchyma cells.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 10 ml of *methanol R*. Sonicate for 10 min and centrifuge.

Reference solution Dissolve 1 mg of *rutin R* and 5 mg of *quercetin dihydrate R* in 50 ml of *methanol R*.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *anhydrous formic acid R*, *acetic acid R*, *water R*, *ethyl acetate R* (11:11:27:100 *V/V/V/V*).

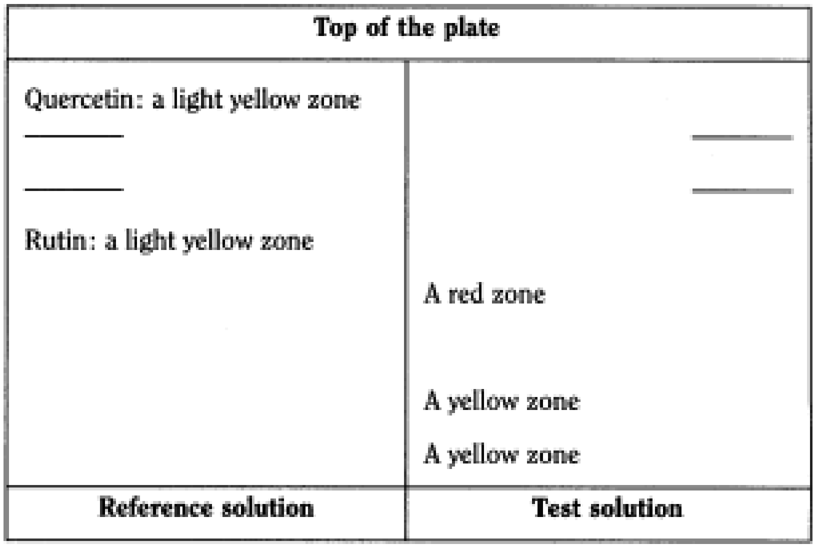
Application 25 µl as bands of 15 mm [or 10 µl as bands of 8 mm].

Development Over a path of 12 cm [or 7 cm].

Drying In air.

Detection A Examine in daylight.

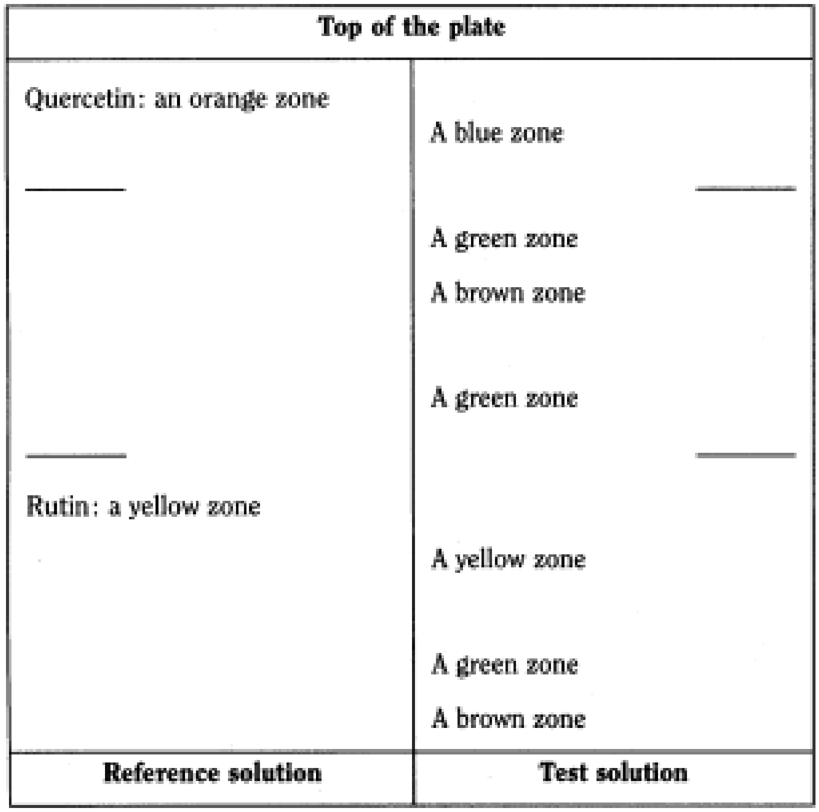
Results A See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
Quercetin: a light yellow zone	
———	———
———	———
Rutin: a light yellow zone	
	A red zone
	A yellow zone
	A yellow zone
Reference solution	**Test solution**

Detection B Heat the plate at 100 °C for 3 min; spray the plate whilst still hot with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*; allow the plate to dry in air for about 30 min; examine in ultraviolet light at 365 nm.

Results B See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
Quercetin: an orange zone	
	A blue zone
———	———
	A green zone
	A brown zone
	A green zone
———	———
Rutin: a yellow zone	
	A yellow zone
	A green zone
	A brown zone
Reference solution	**Test solution**

TESTS

Absorbance *(2.2.25)*.

A. *Yellow pigment*: macerate 0.1 g of the powdered drug (355) *(2.9.12)* in 150 ml of *water R*, stir for 1 h, filter through a sintered-glass filter (40) *(2.1.2)* and dilute to 500.0 ml, washing the residue, with *water R*. The absorbance is not less than 0.40 at 401 nm.

B. *Red pigment*: to 0.25 g of the powdered drug (355) *(2.9.12)* add 50 ml of a mixture of 20 volumes of *water R* and 80 volumes of *acetone R*. Heat on a water-bath at 50 °C for 90 min. Allow to cool, filter through a sintered-glass filter (40) *(2.1.2)* and dilute to 100.0 ml, washing the residue with a mixture of 20 volumes of *water R* and 80 volumes of *acetone R*. The absorbance is not less than 0.40 at 518 nm.

Loss on drying *(2.2.32)*

Maximum 11.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash (2.4.16)

Maximum 10.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 3.0 per cent.

ASSAY

Solution A Place 0.250 g of the powdered drug (180) *(2.9.12)* in a 250 ml flask and add 95 ml of *methanol R*. Heat under a reflux condenser on a water-bath for 30 min. Allow to cool and filter. Rinse the filter with 5 ml of *methanol R*. Combine the filtrate and the rinsing solution in a volumetric flask and dilute to 100.0 ml with *methanol R*.

Test solution Place 5.0 ml of solution A in a volumetric flask and dilute to 20.0 ml with a 20 g/l solution of *aluminium chloride R* in *methanol R*.

Compensation solution Place 5.0 ml of solution A in a volumetric flask and dilute to 20.0 ml with *methanol R*.

After exactly 15 min, measure the absorbance *(2.2.25)* of the test solution at 420 nm by comparison with the compensation solution. Calculate the percentage content of total flavonoids, expressed as hyperoside, using the following expression:

$$\frac{A}{4 \times m}$$

taking the specific absorbance of hyperoside at 420 nm to be 400.

A = absorbance of the test solution, at 420 nm;

m = mass of the substance to be examined, in grams.

Ph Eur

Sage Leaf

General Notices

(Sage Leaf (Salvia officinalis), Ph Eur monograph 1370)

Ph Eur

DEFINITION

Whole or cut dried leaves of *Salvia officinalis* L.

Content

Minimum 15 ml/kg of essential oil for the whole drug and minimum 10 ml/kg of essential oil for the cut drug (anhydrous drug).

CHARACTERS

Sage leaf (*Salvia officinalis*) oil is rich in thujone.

IDENTIFICATION

A. The lamina of whole sage leaf (*Salvia officinalis*) is about 2 cm to 10 cm long and 1 cm to 2 cm wide, oblong-ovate, elliptical. The margin is finely crenate to smooth. The apex is rounded or subacute and the base is shrunken at the petiole and rounded or cordate. The upper surface is greenish-grey and finely granular; the lower surface is white and pubescent and shows a dense network of raised veinlets.

B. Reduce to a powder (355) *(2.9.12)*. The powder is light grey to brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: very numerous articulated and bent trichomes with narrow elongated cells and a very thick cell at the base as well as fragments of these trichomes; fragments of the upper epidermis with pitted, somewhat polygonal cells; fragments of the lower epidermis with sinuous cells and numerous diacytic stomata *(2.8.3)*; rare single glandular trichomes with a uni- or bicellular head and a stalk consisting of 1 to 4 cells; abundant glandular trichomes with a unicellular stalk and a head composed of 8 radiating cells with a raised common cuticle.

C. Thin-layer chromatography *(2.2.27)*.

Test solution Shake 0.5 g of the freshly powdered drug (355) *(2.9.12)* with 5 ml of *ethanol R* for 5 min.

Reference solution Dissolve 20 µl of *thujone R* and 25 µl of *cineole R* in 20 ml of *ethanol R*.

Plate *TLC silica gel plate R*.

Mobile phase *ethyl acetate R, toluene R* (5:95 *V/V*).

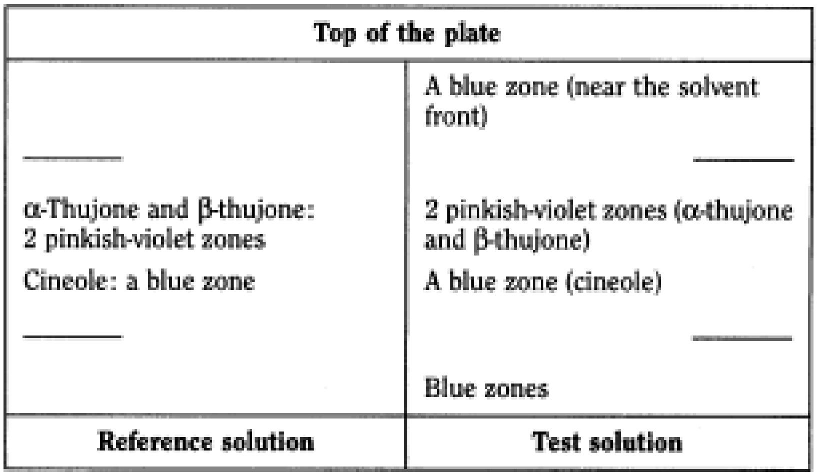
Application 20 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray the plate with a 200 g/l solution of *phosphomolybdic acid R* in *ethanol R* and heat at 100-105 °C for 10 min. Examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.



Top of the plate	
	A blue zone (near the solvent front)
_______	_______
α-Thujone and β-thujone: 2 pinkish-violet zones	2 pinkish-violet zones (α-thujone and β-thujone)
Cineole: a blue zone	A blue zone (cineole)
_______	_______
	Blue zones
Reference solution	**Test solution**

TESTS

Foreign matter ***(2.8.2)***

Maximum 3 per cent of stems and maximum 2 per cent of other foreign matter.

Water ***(2.2.13)***

Maximum 100 ml/kg, determined on 20.0 g.

Total ash ***(2.4.16)***

Maximum 10.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs *(2.8.12)*. Use 20.0 g of the substance to be examined, cut, if necessary, immediately before the assay, a 500 ml flask, 250 ml of *water R* as the distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

Ph Eur

Sage Oil

General Notices

(Clary Sage Oil, Ph Eur monograph 1850)

Ph Eur

DEFINITION

Essential oil obtained by steam distillation from the fresh or dried flowering stems of *Salvia sclarea* L.

CHARACTERS

Appearance

Colourless to brownish-yellow liquid, usually pale yellow, with a characteristic odour.

IDENTIFICATION

First identification *B*.

Second identification *A*.

A. Thin-layer chromatography *(2.2.27)*.

Test solution Dissolve 1 ml of the substance to be examined in *toluene R* and dilute to 10 ml with the same solvent.

Reference solution Dissolve 60 µl of *linalol R*, 200 µl of *linalyl acetate R* and 60 µl of α-*terpineol R* in *toluene R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel plate R*.

Mobile phase *Ethyl acetate R, toluene R* (5:95 *V/V*).

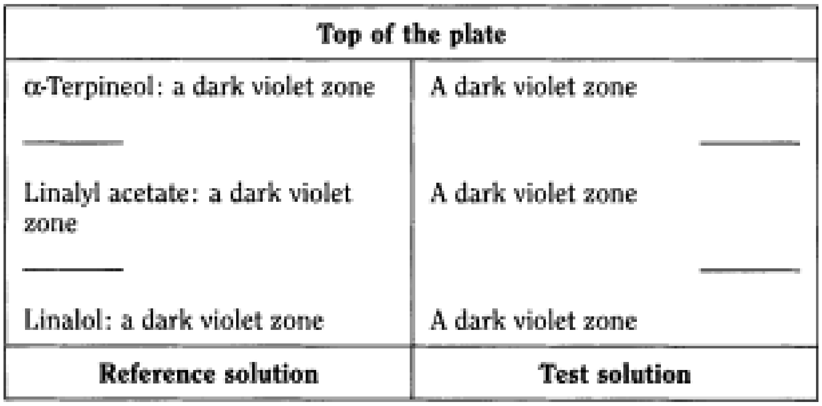
Application 5 µl of the test solution and 10 µl of the reference solution, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with *vanillin reagent R* and heat at 100-105 °C for 5-10 min; examine in daylight within 5 min.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones are present in the chromatogram obtained with the test solution.



Top of the plate	
α-Terpineol: a dark violet zone	A dark violet zone
———	———
Linalyl acetate: a dark violet zone	A dark violet zone
———	———
Linalol: a dark violet zone	A dark violet zone
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The chromatogram obtained with the test solution shows 5 peaks similar in position to the 5 peaks in the chromatogram obtained with the reference solution. The 2 peaks corresponding to α- and β-thujone may be absent.

TESTS

Relative density *(2.2.5)*

0.890 to 0.908.

Refractive index *(2.2.6)*

1.456 to 1.466.

Optical rotation *(2.2.7)*

- 26 ° to - 10 °.

Acid value *(2.5.1)*

Maximum 1.0.

Chromatographic profile

Gas chromatography *(2.2.28)*: use the normalisation procedure.

Test solution. The substance to be examined.

Reference solution To 1 g of *hexane R*, add 5 µl of *thujone R*, 5 µl of *linalol R*, 100 µl of *linalyl acetate R*, 10 µl of α-*terpineol R* and 25 mg (± 20 per cent) of *sclareol R*. Mix thoroughly by stirring.

Column:

— *material*: fused silica;

— *size*: l = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm;

— *stationary phase*: *macrogol 20 000 R*.

Carrier gas *Helium for chromatography R*.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	60
	10 - 75	60 → 190
	75 - 120	190
Injection port		220
Detector		240

Detection Flame ionisation.

Injection 0.2 µl.

Elution order Order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability Reference solution:

- *resolution*: minimum 1.5 between the peaks due to linalol and linalyl acetate,

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution (disregard any peak due to hexane). *Thujone R* is a mixture of α- and β-thujone. α-Thujone elutes before β-thujone under the described conditions.

Determine the percentage content of each of these components.

Also determine the percentage content of germacrene-D. The germacrene-D peak can be identified in the chromatogram obtained with the test solution by its relative retention of 1.23 with reference to linalol under the described operating conditions.

The percentages are within the following ranges:

- α- and β*-thujone*: less than 0.2 per cent;
- *linalol*: 6.5 per cent to 24 per cent;
- *inalyl acetate*: 56 per cent to 78 per cent;
- α*-terpineol*: less than 5.0 per cent;
- *germacrene-D*: 1.0 per cent to 12 per cent;
- *sclareol*: 0.4 per cent to 2.6 per cent.

STORAGE

In an airtight container, protected from light, at a temperature not exceeding 25 °C.

Ph Eur

Sage Tincture

General Notices

(Ph Eur monograph 1889)

Ph Eur

DEFINITION

Tincture produced from *Sage leaf (Salvia officinalis) (1370).*

Content

Minimum 0.1 per cent *m/m* of essential oil.

PRODUCTION

The tincture is produced from 1 part of comminuted drug and 10 parts of ethanol (70 per cent *V/V*) by a suitable procedure.

CHARACTERS

Appearance

Brownish liquid with a characteristic odour.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution The tincture to be examined.

Reference solution Dissolve 20 µl of *thujone R* and 25 µl of *cineole R* in 20 ml of *ethanol R*.

Plate *TLC silica gel plate R.*

Mobile phase *ethyl acetate R*, *toluene R* (5:95 *V/V*).

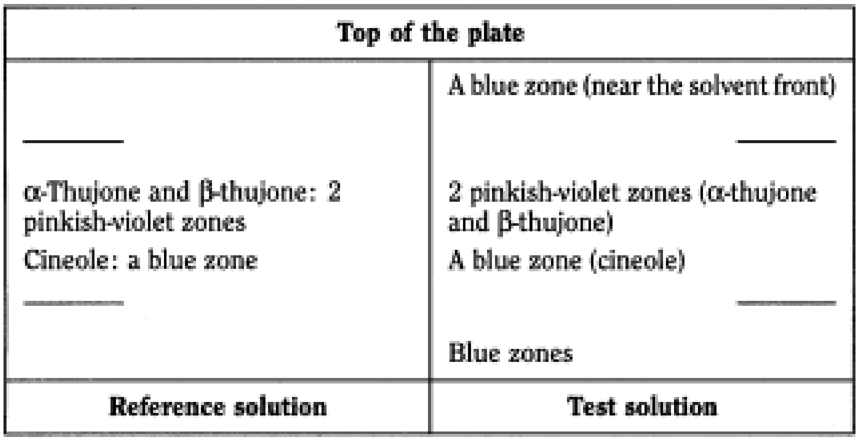
Application 20 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with a 200 g/l solution of *phosphomolybdic acid R* in *ethanol R* and heat at 100-105 °C for 10 min. Examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.



Top of the plate	
	A blue zone (near the solvent front)
_______	_______
α-Thujone and β-thujone: 2 pinkish-violet zones Cineole: a blue zone	2 pinkish-violet zones (α-thujone and β-thujone) A blue zone (cineole)
_______	_______
	Blue zones
Reference solution	**Test solution**

TESTS

Ethanol content *(2.9.10)*

64 per cent *V/V* to 69 per cent *V/V*.

Methanol and 2-propanol *(2.9.11)*

Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent of 2-propanol.

Dry residue *(2.8.16)*

Minimum 2.0 per cent *m/m*, determined on 3.00 g.

ASSAY

In a 500 ml round-bottomed flask, place 30.0 g of the tincture and add 100 ml of *water R*. Distil, using a descending condenser, into a separating funnel which has been marked beforehand at 50 ml. Stop the distillation process as soon as the distillate reaches the 50 ml mark. Rinse the condenser with 10 ml of *pentane R*. Dissolve in the distillate sufficient *sodium chloride R* to produce a saturated solution. Shake with 3 quantities, each of 20 ml, of *pentane R.* Dry the combined pentane layers, including the pentane from rinsing the condenser, over *anhydrous sodium sulphate R* and filter through a plug of absorbent cotton into a weighed 100 ml round-bottomed flask. Wash the sodium sulphate several times with small quantities of *pentane R*. Remove the pentane carefully at a temperature not exceeding 40 °C. Dry the residue in a desiccator over *diphosphorus pentoxide R* and hard paraffin at atmospheric pressure and at room temperature for 2 h. Weigh the residue (essential oil).

Ph Eur

Salvia Miltiorrhiza Rhizome and Root for use in THM

General Notices

DEFINITION

Salvia Miltiorrhiza Rhizome and Root for use in THM consists of the dried root and rhizome of *Salvia miltiorrhiza* Bunge. It contains not less than 0.12% of tanshinone II$_A$ ($C_{19}H_{18}O_3$), not less than 0.17% per cent of rosmarinic acid ($C_{18}H_{16}O_8$) and not less than 3.0% of salvianolic acid B ($C_{36}H_{36}O_{16}$), calculated with reference to the dried material.

It is collected in spring or autumn, separated from soil and dried.

IDENTIFICATION

A. The rhizomes are short and stout, sometimes with the remains of the aerial stem at the apex, and give rise to a number of long, cylindrical, slightly curved and occasionally branched roots up to about 20 cm long and about 0.5 to 0.8 cm in diameter; the external surface is dark reddish brown, rough with longitudinal striations, and the roots bear numerous long, very thin and wiry rootlets along their length. The fracture is short or slightly uneven and the smoothed transverse surface shows a narrow brown outer region surrounding a yellowish-white central area with conspicuous medullary rays.

B. Reduce to a powder (355). The powder is reddish-brown. Examine under a microscope using chloral hydrate solution. The powder shows a surface view of cork cells almost rectangular or polygonal, containing yellowish-brown pigment, 12 to 151 µm in diameter. Parenchymatous cells in cortex squarish or polygonal, containing reddish-brown pigmental sediments. Xylem fibres usually in bundles, long fusiform, with oblique or criss-cross striations, 11 to 60 µm in diameter, vivid yellow when examined under a polarizing microscope. Numerous mainly bordered or reticulated vessels, 3 to 120 µm in diameter.

C. Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions.

(1) Place 2 g of the powdered drug (355) in a cellulose thimble in a continuous extraction apparatus (Soxhlet type). Add 75 ml of *methanol* and heat for 1 hour. Evaporate the extract to 20 ml, cool and filter if necessary.

(2) 0.1% w/v each of *tanshinone II$_A$ CRS*, *rosmarinic acid CRS* and *salvianolic acid B CRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase described below.

(c) Apply as bands 8 µl of solution (1) and 5 µl of solution (2).

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (366 nm)*.

MOBILE PHASE

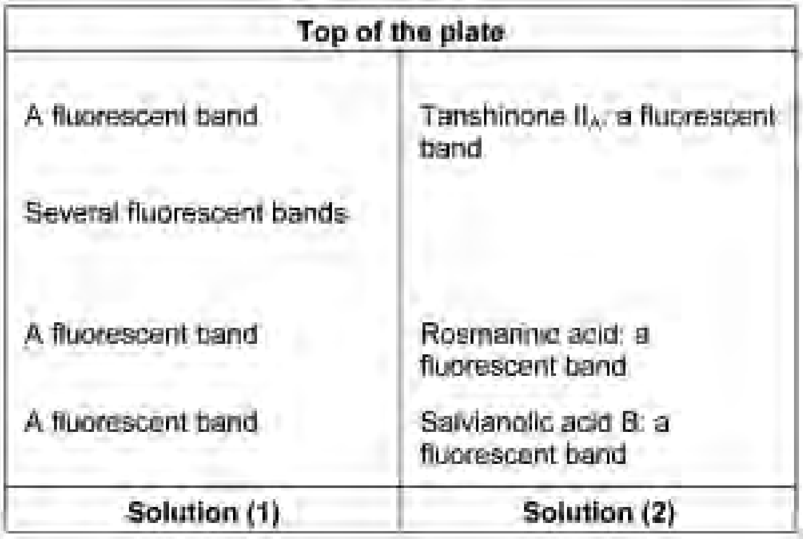
A mixture of 10 volumes of *water*, 13.5 volumes of *methanol* and 100 volumes of *ethyl acetate*.

SYSTEM SUITABILITY

The chromatogram obtained with solution (2) shows three clearly separated bands.

CONFIRMATION

The blue fluorescent bands with Rf values of approximately 0.7 (tanshinone II_A), 0.2 (rosmarinic acid) and 0.06 (salvianolic acid B) in the chromatogram obtained with solution (1) correspond in colour and position to those in the chromatogram obtained with solution (2). Other bands may be present in the chromatogram obtained with solution (1) as shown below.



Top of the plate	
A fluorescent band	Tanshinone II_A: a fluorescent band
Several fluorescent bands	
A fluorescent band	Rosmarinic acid: a fluorescent band
A fluorescent band	Salvianolic acid B: a fluorescent band
Solution (1)	**Solution (2)**

TESTS

Total ash

Not more than 10%, Appendix XI J.

Acid-insoluble ash

Not more than 2.0%, Appendix XI K.

Loss on drying

When dried for 2 hours at 105°, loses not more than 12.0% of its weight. Use 1 g.

ASSAY

For tanshinone II_A

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Finely powder about 5.0 g of the herbal drug being examined. Transfer 0.5 g of the powder into a 25-ml volumetric flask and add 20 ml of the mobile phase given below. Shake and mix with the aid of ultrasound for 30 minutes, shaking intermittently. Add the mobile phase to give a total volume of 25 ml. Filter through a 0.45-µm filter.

(2) 0.002% w/v of *tanshinone II_A CRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 ml per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 270 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

0.01 M *sodium octyl sulphonate* in a mixture of 25 volumes of *water* and 75 volumes of *methanol* and adjust to pH 5.0 with *acetic acid*.

SYSTEM SUITABILITY

The test is not valid, unless in the chromatogram obtained with solution (2):

— the *symmetry factor* of the peak due to tanshinone II_A is less than 1.2;

— the number of *theoretical plates* is not less than 4500.

DETERMINATION OF CONTENT

Using the retention time and peak area from the chromatograms obtained with solution (2), locate and integrate the peak due to tanshinone II_A in the chromatogram obtained with solution (1).

Calculate the content of tanshinone II_A in the sample using the declared content of tanshinone II_A ($C_{19}H_{18}O_3$) in *tanshinone II_A CRS* and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100-d}$$

A_1 = Area of the peak due to tanshinone II_A in the chromatogram obtained with solution (1).

A_2 = Area of the peak due to tanshinone II_A in the chromatogram obtained with solution (2).

m_1 = Weight of the drug in mg.

m_2 = Weight of *tanshinone II_A CRS* in mg.

V_1 = Dilution volume of solution.(1) in ml.

V_2 = Dilution volume of solution (2) in ml.

p = Percentage content of tanshinone II_A in *tanshinone II_A CRS.*

d = Percentage loss on drying of the herbal drug being examined.

For rosmarinic acid and salvianolic acid B

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use.

(1) Finely powder about 5.0 g of the herbal drug being examined. Transfer 0.5 g of the powder into a 25-ml volumetric flask and add 20 ml of the mobile phase given below. Shake and mix with the aid of ultrasound for 30 minutes, shaking intermittently. Add the mobile phase to give a total volume of 25 ml. Filter through a 0.45-µm filter.

(2) 0.003% w/v each of *rosmarinic acid CRS* and *ferulic acid* in *water.*

(3) 0.06% w/v of *salvianolic acid B CRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 ml per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 330 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

22 volumes of *acetonitrile* and 78 volumes of 0.4% v/v *formic acid*.

SYSTEM SUITABILITY

The test is not valid, unless in the chromatogram obtained with solution (2), the *resolution factor* between the two main peaks, rosmarinic acid and ferulic acid, is at least 5.0.

DETERMINATION OF CONTENT

Rosmarinic acid Using the retention time and peak area from the chromatogram obtained with solution (2), locate and integrate the peak due to rosmarinic acid in the chromatogram obtained with solution (1).

Calculate the content of rosmarinic acid in the sample using the declared content of rosmarinic acid ($C_{18}H_{16}O_8$) in *rosmarinic acid CRS* and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m} \times p \times \frac{100}{100-d}$$

A_1 = Area of the peak due to rosmarinic acid in the chromatogram obtained with solution (1).

A_2 = Area of the peak due to rosmarinic acid in the chromatogram obtained with solution (2).

m_1 = Weight of the drug in mg.

m_2 = Weight of *rosmarinic acid CRS* in mg.

V_1 = Dilution volume of solution (1) in ml.

V_2 = Dilution volume of solution (2) in ml.

p = Percentage content of rosmarinic acid in *rosmarinic acid CRS.*

d = Percentage loss on drying of the herbal drug being examined.

Salvianolic acid B Using the retention time and peak area from the chromatogram obtained with solution (3), locate and integrate the peak due to salvianolic acid B in the chromatogram obtained with solution (1).

Calculate the content of salvianolic acid B in the sample using the declared content of salvianolic acid B ($C_{36}H_{36}O_{16}$) in *salvianolic acid B CRS* and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100-d}$$

A_1 = Area of the peak due to salvianolic acid in the chromatogram obtained with solution (1).

A_2 = Area of the peak due to salvianolic acid in the chromatogram obtained with solution (3).

m_1 = Weight of the drug in mg.

m_2 = Weight of *salvianolic acid B CRS* in mg.

V_1 = Dilution volume of solution (1) in ml.

V_2 = Dilution volume of solution (2) in ml.

p = Percentage content of salvianolic acid B in *salvianolic acid B CRS.*

d = Percentage loss on drying of the herbal drug being examined.

STORAGE

Salvia Miltiorrhiza Rhizome and Root for use in THM should be protected from moisture.

Saw Palmetto Fruit

General Notices

(Ph Eur monograph 1848)

Ph Eur

DEFINITION

Dried ripe fruit of *Serenoa repens* (Bartram) Small. (*Sabal serrulata* (Michaux) Nichols).

Content

Minimum 11.0 per cent of total fatty acids (dried drug).

CHARACTERS

Characteristic, strong, unpleasant but not rancid odour.

IDENTIFICATION

First identification A, B, D.

Second identification A, B, C.

A. The fruit is an ovoid to subspherical drupe, with a dark brown to blackish, roughly wrinkled surface and more or less coppery sheen, up to 2.5 cm long and 1.5 cm in diameter. The apex sometimes bears the remains of the style and tubular calyx, with 3 teeth, and the base bears a small depression with the scar of the stalk. The epicarp and underlying mesocarp form a thin fragile layer, which partially peels off, revealing the thin, hard, pale brown endocarp, which is fibrous and easily separable. The seed is irregularly spherical to ovoid, up to 12 mm long and 8 mm in diameter, with a hard, smooth or finely pitted surface which is reddish-brown with a paler, raised and membranous area over the raphe and micropyle; cut transversely, the seed has a thin testa, narrow perisperm and a large area of dense, horny, greyish-white endosperm, with the embryo positioned to one side.

B. Reduce to a powder (710) *(2.9.12)*. The powder is reddish or blackish-brown and oily. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of epicarp composed of several layers of thin-walled, reddish-brown, pigmented, polyhedral cells (10 µm to 40 µm) which are strongly cuticularised; those of the outer layers are much smaller than those of the inner layers. Parenchyma cells of the mesocarp may be large and filled with oil droplets, or smaller and containing nodules of silica. Groups of xylem tissue of the mesocarp show small lignified, annular or spirally thickened vessels. Stone cells of the mesocarp (20 µm to 200 µm) may be found scattered, usually singly but sometimes in small groups, the walls are moderately thickened, distinctly striated and finely pitted. Fragments of endocarp contain groups of elongated sclereids about 300 µm long, with strongly thickened walls and numerous pits. The seed testa consists of small, thin-walled cells with brownish contents and underlying sclereids; albumen cells are thick-walled with large conspicuous pits and contain aleurone grains and fixed oil.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 1.5 g of the powdered drug (710) *(2.9.12)*, add 20 ml of *alcohol R* and stir for 15 min. Filter.

Reference solution Dissolve 4 mg of β-*amyrin R* and 10 mg of β-*sitosterol R* in 10 ml of *alcohol R*.

Plate *TLC silica gel plate R* (2-10 µm).

Mobile phase *Acetic acid R, ethyl acetate R, toluene R* (1:30:70 *V/V/V*).

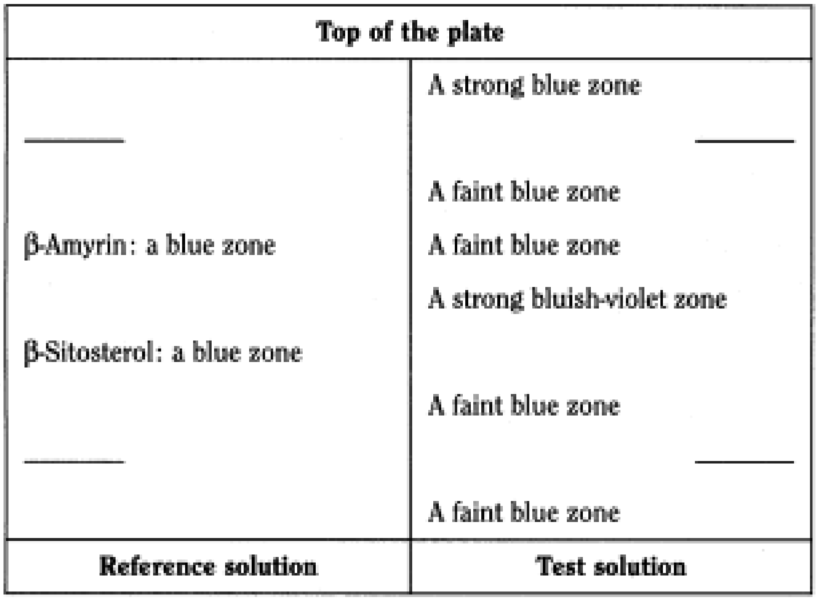
Application 8 µl of the test solution and 2 µl of the reference solution, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R*; dry the plate at 100-105 °C for 5-10 min; examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones are present, especially in the lower third, in the chromatogram obtained with the test solution.



Top of the plate	
	A strong blue zone
———	———
	A faint blue zone
β-Amyrin: a blue zone	A faint blue zone
	A strong bluish-violet zone
β-Sitosterol: a blue zone	
	A faint blue zone
———	———
	A faint blue zone
Reference solution	**Test solution**

D. Examine the chromatograms obtained in the assay of total fatty acids.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to the characteristic peaks in the chromatogram obtained with the reference solution. The principal peak is due to lauric acid.

TESTS

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (710) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash ***(2.4.16)***

Maximum 5.0 per cent.

ASSAY

Total fatty acids

Gas chromatography *(2.2.28).*

Internal standard solution Dissolve 0.47 g of *methyl pelargonate R* and 0.47 g of *methyl margarate R* in 20.0 ml of *dimethylformamide R* and dilute to 100.0 ml with the same solvent.

Test solution Reduce 50 g of the drug to a powder (200). Place 4.0 g of the powdered drug in a 100 ml volumetric flask. Add 60.0 ml of *dimethylformamide R*. Mix using sonication for 15 min and then shake for 30 min. Dilute to 100.0 ml with *dimethylformamide R.* Allow to stand for a few minutes and filter. To 20.0 ml of this solution add 4.0 ml of the internal standard solution and dilute to 25.0 ml with *dimethylformamide R*. To 0.4 ml of this solution add 0.6 ml of an 18.84 g/l solution of *trimethylsulphonium hydroxide R* in *methanol R* and mix.

Reference solution Dissolve 32.0 mg of *caproic acid R*, 62.0 mg of *caprylic acid R*, 68.0 mg of *capric acid R*, 0.699 g of *lauric acid R*, 0.267 g of *myristic acid R*, 10.0 mg of *palmitoleic acid R*, 0.217 g of *palmitic acid R*, 0.115 g of *linoleic acid R*, 18.0 mg of *linolenic acid R*, 0.870 g of *oleic acid R* and 49.0 mg of *stearic acid R* in *dimethylformamide R* and dilute to 10.0 ml with the same solvent. To 1.0 ml of the solution add 4.0 ml of the internal standard solution and dilute to 25.0 ml with *dimethylformamide R*. To 0.4 ml of this solution add 0.6 ml of an 18.84 g/l solution of *trimethylsulphonium hydroxide R* in *methanol R* and mix.

Column:
- *material*: fused silica;
- *size*: *l* = 25 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.20-0.53 mm;
- *stationary phase*: *poly(dimethyl)siloxane R*.

Carrier gas *Helium for chromatography R*.

Flow rate 0.5 ml/min.

Split ratio 1:40.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 2	150
	2 - 7	150 → 190
	7 - 22	190 → 220
Injection port		300
Detector		300

Detection Flame ionisation.

Injection 1.0 µl.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution on the chromatogram obtained with the test solution.

Use the expression below to determine the percentage content of the different fatty acids. Determine the content of caproic acid, caprylic acid, capric acid and lauric acid using methyl pelargonate as the internal standard. Determine the content of myristic acid, palmitoleic acid, palmitic acid, linoleic acid, linolenic acid, oleic acid and stearic acid using methyl margarate as the internal standard. The peak area of lauric acid is not less than 20 per cent of the total area of the peaks.

$$\frac{A_1}{A_3} \times \frac{A_2}{A_4} \times \frac{m_2}{m_1} \times p \times 0.5$$

A_1 = area of the peak due to the considered derivatised fatty acid in the chromatogram obtained with the test solution,

A_2 = area of the peak due to methyl pelargonate or methyl margarate in the chromatogram obtained with the reference solution,

A_3 = area of the peak due to methyl pelargonate or methyl margarate in the chromatogram obtained with the test solution,

A_4 = area of the peak due to the considered derivatised fatty acid in the chromatogram obtained with the reference solution,

m_1 = mass of the test sample, in grams,

m_2 = mass of the considered fatty acid in the reference solution, in grams,

p = percentage purity of the considered fatty acid in the reference solution.

Ph Eur

Senega Root

General Notices

Senega

(Ph Eur monograph 0202)

When Powdered Senega Root is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter shall be dispensed or supplied.

Ph Eur

DEFINITION

Dried and usually fragmented root and root crown of *Polygala senega* L. or of certain other closely related species or of a mixture of these *Polygala* species.

CHARACTERS

Faint, sweet odour, slightly rancid or reminiscent of methyl salicylate.

Reduced to a powder, it is irritant and sternutatory. Shaken with water, the powder produces a copious froth.

IDENTIFICATION

A. The root crown is greyish-brown and wider than the root; it forms an irregular head consisting of numerous remains of stems and tightly packed purplish-brown buds. The taproot is brown or yellow, occasionally branched, sometimes flexuous, usually tortuous and without secondary roots, except in the Japanese varieties and species, which contain numerous fibrous rootlets. The diameter is usually 1-8 mm at the crown, gradually tapering to the tip; the surface is transversely and longitudinally striated and often shows a more or less distinct decurrent, elongated spiral keel. The fracture is short and shows a yellowish cortex of varying thickness surrounding a paler central woody area somewhat circular or irregular in shape depending on the species.

B. Examine under a microscope using *chloral hydrate solution R*. The transverse section of the root shows the following diagnostic characters: cork formed from several layers of thin-walled cells, phelloderm of slightly collenchymatous cells containing droplets of oil; the phloem and xylem arrangement is usually normal, especially near the crown but where a keel is present this is formed by increased development of phloem; other anomalous secondary development sometimes occurs, resulting in the formation of 1 or 2 large wedge-shaped rays in the phloem and xylem, the parenchymatous cells of which contain droplets of oil. The xylem is usually central and consists of vessels up to 60 µm in diameter associated with numerous thin-walled tracheids and a few small lignified parenchymatous cells.

C. Reduce to a powder (355) *(2.9.12)*. The powder is light brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: longitudinal fragments of lignified tissue made up of pitted tracheids and somewhat larger vessels with numerous bordered pits or with reticulate thickening; yellowish parenchyma and collenchymatous cells containing droplets of oil; occasional fragments of cork, and of epidermal tissue with stomata and unicellular trichomes from the bud scales. Crystals and stone cells are absent.

D. Thin-layer chromatography *(2.2.27)*.

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 10 ml of *ethanol (70 per cent V/V) R*, boil under a reflux condenser for 15 min, filter and allow to cool.

Reference solution Dissolve 10 mg of *aescin R* in *ethanol (70 per cent V/V) R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel G plate R*.

Mobile phase The upper layer of a mixture of 10 volumes of *glacial acetic acid R*, 40 volumes of *water R* and 50 volumes of *butanol R*.

Application 10 µl of the test solution and 10 µl and 40 µl of the reference solution, as bands of 20 mm by 3 mm.

Development Over a path of 12 cm.

Drying At 100-105 °C.

Detection A Spray with about 10 ml of *anisaldehyde solution R* for a plate 200 mm square and heat again at 100-105 °C until red zones due to saponosides appear in the chromatogram obtained with the test solution.

Results A In the chromatogram obtained with the test solution, 3-5 red zones appear in the lower and middle parts, similar in position to the grey-violet zones due to aescin in the chromatogram obtained with the reference solution.

Detection B Spray with about 10 ml of a 200 g/l solution of *phosphomolybdic acid R* in *anhydrous ethanol R* and heat at 100-105 °C until the zones due to saponosides become blue.

Results B The intensity and size of the zones in the chromatogram obtained with the test solution are between those of the 2 bands due to aescin in the chromatograms obtained with 10 µl and 40 µl of the reference solution.

TESTS

Total ash *(2.4.16)*

Maximum 6.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 3.0 per cent.

STORAGE

Store protected from humidity.

Ph Eur

Senna Leaf

General Notices

(Ph Eur monograph 0206)

Preparation

Standardised Senna Leaf Dry Extract

When Powdered Senna Leaf is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter shall be dispensed or supplied.

Ph Eur

DEFINITION

Dried leaflets of *Cassia senna* L. (*C. acutifolia* Delile), known as Alexandrian or Khartoum senna, or *Cassia angustifolia* Vahl, known as Tinnevelly senna, or a mixture of the 2 species.

Content

Minimum 2.5 per cent of hydroxyanthracene glycosides, expressed as sennoside B ($C_{42}H_{38}O_{20}$; M_r 863) (dried drug).

CHARACTERS

Slight characteristic odour.

IDENTIFICATION

A. *C. senna* occurs as greyish-green or brownish-green, thin, fragile leaflets, lanceolate, mucronate, asymmetrical at the base, usually 15-40 mm long and 5-15 mm wide, the maximum width being at a point slightly below the centre; the lamina is slightly undulant with both surfaces covered with fine, short trichomes. Pinnate venation is visible mainly on the lower surface, with lateral veins leaving the midrib at an angle of about 60° and anastomosing to form a ridge near the margin.

Stomatal index (2.8.3) 10-12.5-15.

C. angustifolia occurs as yellowish-green or brownish-green leaflets, elongated and lanceolate, slightly asymmetrical at the base, usually 20-50 mm long and 7-20 mm wide at the centre. Both surfaces are smooth with a very small number of short trichomes and are frequently marked with transverse or oblique lines.

Stomatal index (2.8.3) 14-17.5-20

B. Reduce to a powder (355) *(2.9.12)*. The powder is light green or greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: polygonal epidermal cells showing paracytic stomata *(2.8.3)*; unicellular trichomes, conical in shape, with warted walls, isolated or attached to fragments of epidermis; fibres with a crystal sheath of prismatic crystals of calcium oxalate; cluster crystals isolated or in fragments of parenchyma.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 0.5 g of the powdered drug (180) *(2.9.12)* add 5 ml of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* and heat to boiling. Centrifuge and use the supernatant liquid.

Reference solution Dissolve 10 mg of *senna extract CRS* in 1 ml of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* (a slight residue remains).

Plate *TLC silica gel G plate R*.

Mobile phase *glacial acetic acid R, water R, ethyl acetate R, propanol R* (1:30:40:40 *V/V/V/V*).

Application 10 µl, as bands of 20 mm by 2 mm.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with a 20 per cent *V/V* solution of *nitric acid R* and heat at 120 °C for 10 min. Allow to cool and spray with a 50 g/l solution of *potassium hydroxide R* in *alcohol (50 per cent V/V) R* until the zones appear.

Results The principal zones in the chromatogram obtained with the test solution are similar in position (sennosides B, A, D and C in the order of increasing R_F value), colour and size to the principal zones in the chromatogram obtained with the reference solution. Between the zones due to sennosides D and C a red zone due to rhein-8-glucoside may be visible.

D. Place about 25 mg of the powdered drug (180) *(2.9.12)* in a conical flask and add 50 ml of *water R* and 2 ml of *hydrochloric acid R*. Heat in a water-bath for 15 min, cool and shake with 40 ml of *ether R*. Separate the ether layer, dry over *anhydrous sodium sulphate R*, evaporate 5 ml to dryness and to the cooled residue add 5 ml of *dilute ammonia R1*. A yellow or orange colour develops. Heat on a water-bath for 2 min. A reddish-violet colour develops.

TESTS

Foreign matter *(2.8.2)*

Maximum 3 per cent of foreign organs and maximum 1 per cent of foreign elements.

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 12.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 2.5 per cent.

ASSAY

Carry out the assay protected from bright light. Place 0.150 g of the powdered drug (180) *(2.9.12)* in a 100 ml flask. Add 30.0 ml of *water R*, mix, weigh and place in a water-bath. Heat under a reflux condenser for 15 min. Allow to cool, weigh and adjust to the original mass with *water R*. Centrifuge and transfer 20.0 ml of the supernatant liquid to a 150 ml separating funnel. Add 0.1 ml of *dilute hydrochloric acid R* and shake with 3 quantities, each of 15 ml, of *chloroform R*. Allow to separate and discard the chloroform layer. Add 0.10 g of *sodium hydrogen carbonate R* and shake for 3 min. Centrifuge and transfer 10.0 ml of the supernatant liquid to a 100 ml round-bottomed flask with a ground-glass neck. Add 20 ml of *ferric chloride solution R1* and mix. Heat for 20 min in a water-bath under a reflux condenser with the water level above that of the liquid in the flask; add 1 ml of *hydrochloric acid R* and heat for a further 20 min, with frequent shaking, to dissolve the precipitate. Cool, transfer the mixture to a separating funnel and shake with 3 quantities, each of 25 ml, of *ether R* previously used to rinse the flask. Combine the 3 ether layers and wash with 2 quantities, each of 15 ml, of *water R*. Transfer the ether layer to a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 10.0 ml carefully to dryness and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance *(2.2.25)* at 515 nm, using *methanol R* as the compensation liquid.

Calculate the percentage content of hydroxyanthracene glycosides, expressed as sennoside B, using the following expression:

$$\frac{A \times 1.25}{m}$$

i. e. taking the specific absorbance of sennoside B to be 240.

A = absorbance at 515 nm,

m = mass of the substance to be examined, in grams.

STORAGE

Protected from moisture.

Ph Eur

Siam Benzoin Tincture

General Notices

(Ph Eur monograph 2157

Ph Eur

DEFINITION

Tincture produced from *Siam benzoin (2158).*

Content

Minimum 5.0 per cent *m/m* of total acids, calculated as benzoic acid ($C_7H_6O_2$; M_r 122.1).

PRODUCTION

The tincture is produced from 1 part of the drug and 5 parts of ethanol (75 per cent *V/V* to 96 per cent *V/V*) by a suitable procedure.

CHARACTERS

Appearance

Orange-yellow liquid.

It has a characteristic odour of vanillin.

IDENTIFICATION

A. Place 10 ml in a test tube; add 0.5 ml of a 50 g/l solution of *ferric chloride R* in *ethanol (96 per cent) R* . A green colour is produced.

B. Examine the chromatograms obtained in the test for Sumatra benzoin tincture.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Reference solution	**Test solution**

TESTS

Sumatra benzoin tincture

Thin-layer chromatography (*2.2.27*).

Test solution The tincture to be examined.

Reference solution Dissolve 20 mg of *benzoic acid R*, 10 mg of *trans-cinnamic acid R*, 4 mg of *vanillin R* and 20 mg of *methyl cinnamate R* in 20 ml of ethanol of the same concentration as that used for the production of the tincture.

Plate *TLC silica gel* F_{254} *plate R* (5-40 µm) [or *TLC silica gel* F_{254} *plate R* (2-10 µm)].

Mobile phase *glacial acetic acid R*, *di-isopropyl ether R*, *hexane R* (10:40:60 *V/V/V*).

Application 20 µl [or 8 µl] as bands.

Development Over a path of 12 cm [or 6 cm].

Drying In air.

Detection Examine in ultraviolet light at 254 nm.

Results The chromatogram obtained with the test solution does not show any zone in the same position as the zones due to cinnamic acid and methyl cinnamate in the chromatogram obtained with the reference solution.

Ethanol (*2.9.10*)

95 per cent to 105 per cent of the content stated on the label.

ASSAY

Place 3.50 g in a 250 ml borosilicate glass flask and add 15.0 ml of *0.5 M alcoholic potassium hydroxide*. Boil under a reflux condenser on a water-bath for 30 min. Allow to cool and rinse the condenser with 20 ml of *ethanol (96 per cent) R*. Titrate the excess of potassium hydroxide with *1 M hydrochloric acid*, determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

1 ml of *0.5 M alcoholic potassium hydroxide* is equivalent to 61.05 mg of benzoic acid ($C_7H_6O_2$).

Ph Eur

Siam Benzoin

General Notices

(Ph Eur monograph 2158)

Ph Eur

DEFINITION

Resin obtained by incising the trunk of *Styrax tonkinensis* (Pierre) Craib ex Hartwich.

Content

45.0 per cent to 55.0 per cent of total acids, calculated as benzoic acid ($C_7H_6O_2$; M_r 122.1) (dried drug).

CHARACTERS

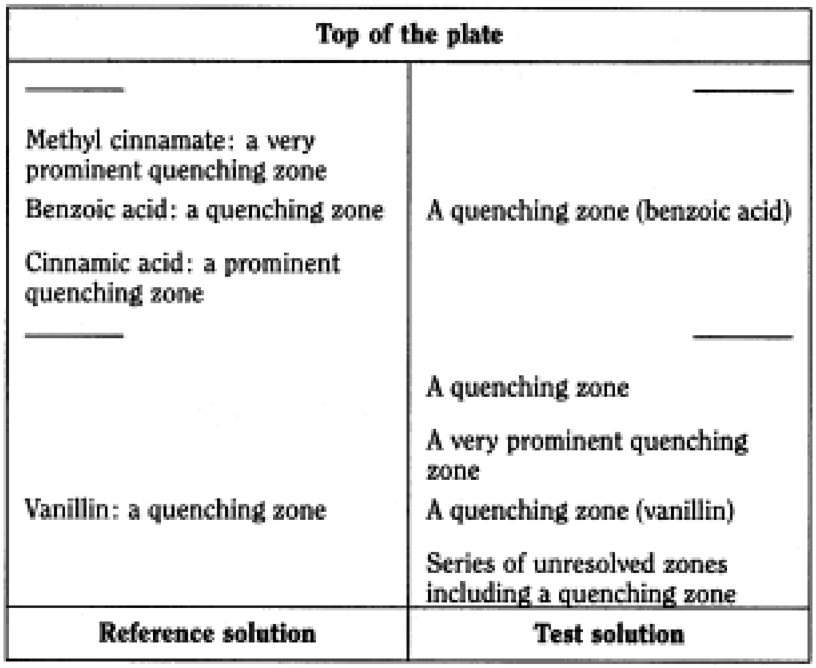
Characteristic odour of vanillin.

IDENTIFICATION

A. Siam benzoin occurs as opaque, granular, rounded or ovoid masses (tears), varying in size from a few millimeters up to 3 cm, separated or sometimes agglomerated together by a reddish-brown, transparent resin. Individual tears are yellowish-white to reddish externally with a waxy, whitish fracture which becomes reddish on exposure to air.

B. Examine the chromatograms obtained in test B for *Styrax benzoin* .

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.



Top of the plate

Reference solution	**Test solution**

TESTS

Styrax benzoin

A. To 0.2 g of the finely powdered drug add 10 ml of *ethanol (96 per cent) R*. Shake vigorously until almost completely dissolved and filter. Place 5 ml of the filtrate in a test-tube and add 0.5 ml of a 50 g/l solution of *ferric chloride R* in *ethanol (96 per cent) R.* A green colour is produced. No yellow colour is produced.

B. Thin-layer chromatography *(2.2.27)*.

Test solution Sonicate 0.2 g of the finely powdered drug in 5 ml of *ethanol (96 per cent) R* and filter. Collect the filtrate.

Reference solution Dissolve 20 mg of *benzoic acid R*, 10 mg of *trans-cinnamic acid R*, 4 mg of *vanillin R* and 20 mg of *methyl cinnamate R* in 10 ml of *ethanol (96 per cent) R*.

Plate *TLC silica gel F_{254} plate R*.

Mobile phase *glacial acetic acid R, di-isopropyl ether R, hexane R* (10:40:60 *V/V/V*).

Application 10 µl as bands.

Development Over a path of 12 cm.

Drying In air.

Detection Examine in ultraviolet light at 254 nm.

Results The chromatogram obtained with the test solution shows no zone in the same position as the zone due to cinnamic acid in the chromatogram obtained with the reference solution.

Matter insoluble in ethanol

Maximum 5 per cent.

To 2 g of the powdered drug add 25 ml of *ethanol (90 per cent V/V) R*. Boil until almost completely dissolved. Filter through a previously tared sintered-glass filter (16) *(2.1.2)* and wash with 3 quantities, each of 5 ml, of boiling *ethanol (90 per cent V/V) R*. Heat the glass filter and its contents in an oven at 100-105 °C for 2 h. Weigh after cooling.

Loss on drying *(2.2.32)*

Maximum 5.0 per cent, determined on 2.00 g of the coarsely powdered drug by drying *in vacuo* for 4 h.

Total ash *(2.4.16)*

Maximum 2.0 per cent.

ASSAY

Place 0.750 g of the finely powdered drug in a 250 ml borosilicate glass flask and add 15.0 ml of *0.5 M alcoholic potassium hydroxide*. Boil under a reflux condenser on a water-bath for 30 min. Allow to cool and rinse the condenser with 20 ml of *ethanol (96 per cent) R*. Titrate the excess of potassium hydroxide with *0.5 M hydrochloric acid*. Determine the end-point potentiometrically *(2.2.20)*. Carry out a blank titration.

1 ml of *0.5 M alcoholic potassium hydroxide* is equivalent to 61.05 mg of benzoic acid ($C_7H_6O_2$).

Ph Eur

Spanish Sage Oil

General Notices

(Ph Eur monograph 1849)

Ph Eur

DEFINITION

Essential oil obtained by steam distillation from the aerial parts of *Salvia lavandulifolia* Vahl, collected at the flowering stage.

CHARACTERS

Appearance

Clear, colourless or pale yellow, mobile liquid.

Camphor-like odour.

IDENTIFICATION

First identification B.

Second identification A.

A. Thin-layer chromatography *(2.2.27)*.

Test solution Dissolve 0.1 ml of the oil to be examined in 10 ml of *toluene R*.

Reference solution Dissolve 20 µl of *thujone R* and 30 µl of *cineole R* in 10 ml of *toluene R*.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *ethyl acetate R, toluene R* (5:95 *V/V*).

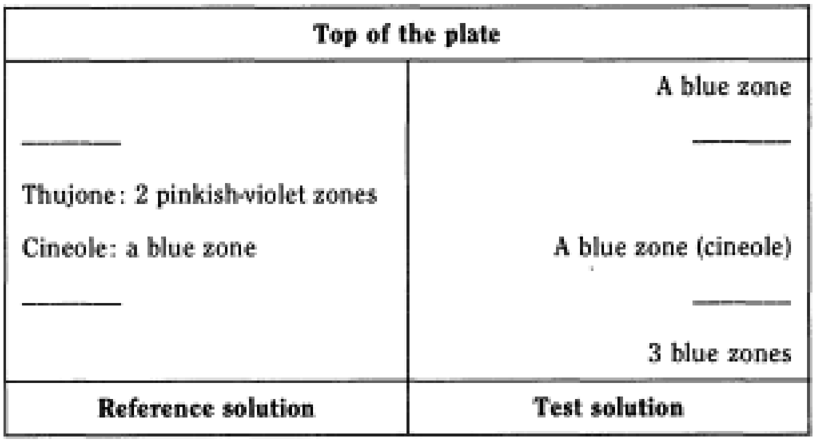
Application 10 µl [or 3 µl] as bands of 10 mm [or 6 mm].

Development Over a path of 15 cm [or 6 cm].

Drying In air.

Detection Spray with a freshly prepared 200 g/l solution of *phosphomolybdic acid R* in *ethanol (96 per cent) R* and heat at 105 °C for 10 min; examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A blue zone
———	———
Thujone: 2 pinkish-violet zones	
Cineole: a blue zone	A blue zone (cineole)
———	———
	3 blue zones
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a).

TESTS

Relative density ***(2.2.5)***

0.907 to 0.932.

Refractive index ***(2.2.6)***

1.465 to 1.473.

Optical rotation ***(2.2.7)***

+ 7° to + 17°.

Acid value ***(2.5.1)***

Maximum 2.0, determined on 5.00 g.

Solubility in alcohol ***(2.8.10)***

1 volume is soluble in 2 volumes and more of *ethanol (80 per cent V/V) R*.

Chromatographic profile

Gas chromatography *(2.2.28)*: use the normalisation procedure.

Test solution Dissolve 0.200 g of the oil to be examined in *heptane R* and dilute to 10.0 ml with the same solvent.

Reference solution (a) Dissolve 0.200 g of *Spanish sage oil for peak identification CRS* in *heptane R* and dilute to 10.0 ml with the same solvent.

Reference solution (b) Dissolve 5 µl of *limonene R* in *heptane R* and dilute to 50.0 ml with the same solvent. Dilute 0.5 ml of this solution to 5.0 ml with *heptane R*.

Column:
- *material*: fused silica;
- *size: l* = 60 m, Ø = 0.25 mm;

— *stationary phase: macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas *helium for chromatography R*.

Flow rate 1.5 ml/min.

Split ratio 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 43	60 → 232
Injection port		250
Detector		250

Detection Flame ionisation.

Injection 1 µl.

System suitability Reference solution (a):

- the chromatogram obtained is similar to the chromatogram supplied with *Spanish sage oil for peak identification CRS*;
- *resolution*: minimum 1.5 between the peaks due to limonene and 1,8-cineole and minimum 1.5 between the peaks due to α-terpinyl acetate and borneol.

Use the chromatogram supplied with *Spanish sage oil for peak identification CRS* and the chromatogram obtained with reference solution (a) to locate the peaks due to α-pinene, sabinene, limonene, 1,8-cineole, thujone, camphor, linalol, linalyl acetate, terpinen-4-ol, sabinyl acetate, α-terpinyl acetate and borneol.

Determine the percentage content of each of these components. The percentages are within the following ranges:

— α-*pinene*: 4.0 per cent to 11.0 per cent;

— *sabinene*: 0.1 per cent to 3.5 per cent;

— *limonene*: 2.0 per cent to 6.5 per cent;

— *1,8-cineole*: 10.0 per cent to 30.5 per cent;

— *thujone*: less than 0.5 per cent;

— *camphor*: 11.0 per cent to 36.0 per cent;

— *linalol*: 0.3 per cent to 4.0 per cent;

— *linalyl acetate*: less than 5.0 per cent;

— *terpinen-4-ol*: less than 2.0 per cent;

— *sabinyl acetate*: 0.5 per cent to 9.0 per cent;

— α-*terpinyl acetate*: 0.5 per cent to 9.0 per cent;

— *borneol*: 1.0 per cent to 7.0 per cent;

— *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

STORAGE

At a temperature not exceeding 25 °C.

Ph Eur

Spearmint Oil

General Notices

DEFINITION

Spearmint Oil is obtained by distillation from fresh flowering plants of *Mentha spicata* L. and *Mentha* × *cardiaca* (Gray) Bak.

CHARACTERISTICS

A clear, colourless, pale yellow or greenish yellow liquid when recently distilled, but becoming darker and viscous on keeping; visibly free from water; odour, that of spearmint.

IDENTIFICATION

Examine the chromatograms obtained in the test for Chromatographic profile. The retention times of the principal peaks in the chromatogram obtained with solution (1) are similar to those of the principal peaks in the chromatogram obtained with solution (2).

TESTS

Optical rotation

American-type oil, –45° to –60°; Chinese-type oil, –50° to –62°; Appendix V F.

Refractive index

1.484 to 1.491, Appendix V E.

Solubility in ethanol

Soluble, at 20°, in 1 part of *ethanol (80%)*, Appendix X M. The solution may become cloudy when diluted.

Weight per ml

American-type oil, 0.917 to 0.934 g; Chinese-type oil, 0.935 to 0.952 g, Appendix V G.

Chromatographic profile

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions. Solution (1) is the substance being examined. For solution (2) mix carefully 0.1 g of *limonene*, 0.2 g of *cineole*, 0.4 g of *menthone*, 0.1 g of (+)-*isomenthone*, 0.4 g of *menthyl acetate*, 0.2 g of *pulegone*, 0.6 g of *menthol* and 0.1 g of *carvone* with 1 g of *hexane*.

The chromatographic procedure may be carried out using (a) a glass capillary column (25 m to 60 m × about 0.25 mm) coated with *polyethylene glycol 20,000* as bonded phase (Carbowax 20M is suitable) and (b) *helium* as the carrier gas at a flow rate of 1.5 ml per minute. Maintain the temperature of the column at 55° for 6 minutes then increase it at the rate of 4° per minute to 180°; keep the injection port temperature at 220° and the detector at 230°.

Inject 0.1 µl of solution (2). When the chromatograms are recorded in the prescribed conditions, the components elute in the order indicated in the composition of the reference solution. Record the retention times of these substances. The test is not valid unless the number of *theoretical plates* calculated from the limonene peak is at least 30,000 and the *resolution factor* between the peaks corresponding to limonene and cineole is at least 1.5.

Inject 0.1 µl of solution (1). Using the retention times determined from the chromatogram obtained with solution (2) locate the components of the reference solution on the chromatogram obtained with solution (1) (disregard the peak due to hexane). Determine the percentage content of the components by *normalisation*. The percentages are within the following ranges:

Limonene 2.0 to 25.0%.

Cineole less than 2.5%.

Menthone less than 2.5%.

Isomenthone less than 1.0%.

Menthyl acetate less than 1.0%.

Pulegone less than 0.5%.

Menthol less than 2.0%.

Carvone Not less than 55.0%.

STORAGE

Spearmint Oil should be kept in a well-filled container and protected from light.

LABELLING

The label states whether the oil is American-type oil or Chinese-type oil.

Squill Liquid Extract

General Notices

DEFINITION

Squill Liquid Extract is prepared by extracting Squill with Ethanol (70 per cent).

Extemporaneous preparation

The following formula and directions apply.

Squill, in *coarse powder*	1000 g
Ethanol (70 per cent)	A sufficient quantity

Exhaust the Squill, in *coarse powder*, with Ethanol (70 per cent) by *percolation*, Appendix XI F. Reserve the first 850 ml of the percolate; evaporate the subsequent percolate to the consistence of a soft extract and dissolve it in the reserved portion. Add sufficient Ethanol (70 per cent) to produce 1000 ml and filter.

The extract complies with the requirements stated under Extracts and with the following requirements.

TESTS

Ethanol content

34 to 50% v/v, Appendix VIII F, Method III.

Dry residue

40 to 55% w/v.

Relative density

1.00 to 1.14, Appendix V G.

Squill

General Notices

Preparations

Squill Liquid Extract

Squill Oxymel

When Powdered Squill is prescribed or demanded, material complying with the appropriate requirements below shall be dispensed or supplied.

DEFINITION

Squill consists of the bulb of *Drimia maritima* (L.) Stearn, collected soon after the plant has flowered, divested of its dry, outer, membranous coats, cut into transverse slices and dried. It is known in commerce as white squill.

IDENTIFICATION

A. Transverse slices, about 5 to 8 mm thick, occurring as straight or curved triangular pieces about 5 to 50 mm long and 3 to 8 mm wide at mid-point, tapering towards each end, yellowish white, texture horny, somewhat translucent, breaking with an almost glassy fracture when quite dry, but readily absorbing moisture when exposed to the air and becoming tough and flexible; transversely cut surface showing a single row of prominent, vascular bundles near the concave edge and numerous smaller bundles scattered throughout the mesophyll.

B. Epidermis: cells polygonal and axially elongated, 1 to 2 times longer than wide, cuticle thick, stratified; stomata very rare, *anomocytic*, Appendix XI H, and nearly circular in outline, about 50 to 60 µm in diameter; mesophyll of colourless, thin-walled parenchyma containing very occasional starch granules, many cells containing bundles of acicular crystals of calcium oxalate embedded in mucilage, crystals up to about 1 mm long and about 1 to 15 µm wide; other cells containing sinistrin; vascular bundles collateral, scattered throughout the mesophyll; xylem vessels with spiral and annular wall thickening; trichomes absent.

C. The mucilage contained in the cells of the mesophyll is stained red with alkaline *corallin* solution but produces no red colour with *ruthenium red* solution and no purple colour with 0.01M *iodine*.

TESTS

Acid-insoluble ash

Not more than 1.5%, Appendix XI K, Method I.

Extractive soluble in ethanol (60%)

Not less than 68.0%, Appendix XI B1. Use material that has been dried for 1 hour at 105° and powdered.

STORAGE

Squill should be stored in a dry place.

St John's Wort

General Notices

Hypericum
(Ph Eur monograph 1438)

Ph Eur

DEFINITION

Whole or cut, dried flowering tops of *Hypericum perforatum* L., harvested during flowering time.

Content

Minimum 0.08 per cent of total hypericins, expressed as hypericin ($C_{30}H_{16}O_8$; M_r 504.4) (dried drug).

IDENTIFICATION

A. The branched and bare stem shows 2 more-or-less prominent longitudinal ridges. The leaves are opposite, sessile, exstipulate, oblong-oval and 15-30 mm long; present on the leaf margins are glands which appear as black dots and over all the surface of the leaves many small, strongly translucent excretory glands which are visible in transmitted light. The flowers are regular and form corymbose clusters at the apex of the stem. They have 5 green, acute sepals, with black secretory glands on the margins; 5 orange-yellow petals, also with black secretory glands on the margins; 3 staminal blades, each divided into many orange-yellow stamens and 3 carpels surmounted by red styles.

The drug may also show the following: immature and ripe fruits and seeds. Immature fruits are green or yellowish, seeds are whitish. Occasional ripe fruits may be present; these are dry trilocular capsules containing numerous seeds, brown, broad or small-ovate, 5-10 mm long, with broad linear or punctiform glands, irregularly striated ducts, conducting secretions. Ripe seeds are 1-1.3 mm long, cylindrical or trigonous, shortly pointed at both ends, brown or almost black, minutely pitted longitudinally.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of polygonal cells of the epidermis with thickened and beaded walls and paracytic or anomocytic stomata *(2.8.3)*; fragments of the leaf and sepal with large oil glands and red pigment cells; thin-walled, elongated cells of the petal epidermis with straight or wavy anticlinal walls; tracheids and tracheidal vessels with pitted walls and groups of thick-walled fibres; fragments of rectangular, lignified and pitted parenchyma; fibrous layer of the anther and elongated, thin-walled cells of the filament with a striated cuticle; numerous pollen grains with 3 pores and a smooth exine, occur singly or in dense groups, and calcium oxalate cluster crystals.

The powder may also show the following diagnostic characters: fragments of the fruit, exocarp solid with rounded polygonal-cells, endocarp with blunt, thick-walled fibres; fragments of the seed testa, whitish or brown with thick-walled hexagonal or rounded polygonal cells;

fragments of the nutritive tissue and embryo, abundant oil droplets.

C. Thin-layer chromatography *(2.2.27)*.

Test solution Stir 0.5 g of the powdered drug (500) *(2.9.12)* in 10 ml of *methanol R* in a water-bath at 60 °C for 10 min and filter.

Reference solution Dissolve 5 mg of *rutin R* and 5 mg of *hyperoside R* in *methanol R*, then dilute to 5 ml with the same solvent.

Plate *TLC silica gel plate R.*

Mobile phase *anhydrous formic acid R*, *water R*, *ethyl acetate R* (6:9:90 *V/V/V*).

Application 10 µl of the test solution and 5 µl of the reference solution, as bands of 10 mm.

Development Over a path of 10 cm.

Drying At 100-105 °C for 10 min.

Detection Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. After about 30 min, examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the reference solution shows in the lower third the zone due to rutin and above it the zone due to hyperoside, both with yellow-orange fluorescence. The chromatogram obtained with the test solution shows in the lower third the reddish-orange fluorescent zones of rutin and hyperoside and in the lower part of the upper third the zone of pseudohypericin and above it the zone of hypericin, both with red fluorescence. Other yellow or blue fluorescent zones are visible.

TESTS

Foreign matter *(2.8.2)*

Maximum 3 per cent of stems with a diameter greater than 5 mm and maximum 2 per cent of other foreign matter.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (500) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 7.0 per cent.

ASSAY

Test solution In a 100 ml round-bottomed flask, introduce 0.800 g of the powdered drug (500) *(2.9.12)*, 60 ml of a mixture of 20 volumes of *water R* and 80 volumes of *tetrahydrofuran R* and a magnetic stirrer. Boil the mixture in a water-bath at 70 °C under a reflux condenser for 30 min. Centrifuge (2 min at 700 g) and decant the supernatant into a 250 ml flask. Take up the residue with 60 ml of a mixture of 20 volumes of *water R* and 80 volumes of *tetrahydrofuran R*. Heat again under a reflux condenser for 30 min. Centrifuge (2 min at 700 g) and decant the supernatant. Combine the extracts and evaporate to dryness. Take up the residue with 15 ml of *methanol R* with the help of ultrasound and transfer to a 25 ml measuring flask. Rinse the 250 ml flask with *methanol R* and dilute to 25.0 ml with the same solvent. Centrifuge again, filter 10 ml through a syringe filter (0.2 µm). Discard the first 2 millilitres of the filtrate. Introduce 5.0 ml of the filtrate into a measuring flask and dilute to 25.0 ml with *methanol R*.

Compensation liquid *methanol R*.

Measure the absorbance *(2.2.25)* at 590 nm of the test solution, by comparison with the compensation liquid.

Calculate the percentage content of total hypericins, expressed as hypericin, using the following expression:

$$\frac{A \times 125}{m \times 870}$$

i.e. taking the specific absorbance of hypericin to be 870.

A = absorbance at 590 nm,

m = mass of the drug to be examined, in grams.

Ph Eur

St. John's Wort Dry Extract, Quantified

General Notices

(Ph Eur monograph 1874)

Ph Eur

DEFINITION

Quantified dry extract obtained from *St. John's wort (1438)*.

Content:

— *total hypericins, expressed as hypericin* ($C_{30}H_{16}O_8$; M_r 504.5): 0.10 per cent to 0.30 per cent (dried extract);

— *flavonoids, expressed as rutin* ($C_{27}H_{30}O_{16}$; M_r 610.5): minimum 6.0 per cent (dried extract);

— *hyperforin* ($C_{35}H_{52}O_4$; M_r 536.8): maximum 6.0 per cent (dried extract) and not more than the content stated on the label.

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (50-80 per cent *V/V*) or methanol (50-80 per cent *V/V*).

CHARACTERS

Appearance

Brownish-grey powder.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)*.

Test solution Disperse 0.25 g of the extract to be examined in 5 ml of *methanol R*.

Reference solution Dissolve 5 mg of *rutin R* and 5 mg of *hyperoside R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *anhydrous formic acid R, water R, ethyl acetate R* (6:9:90 *V/V/V*).

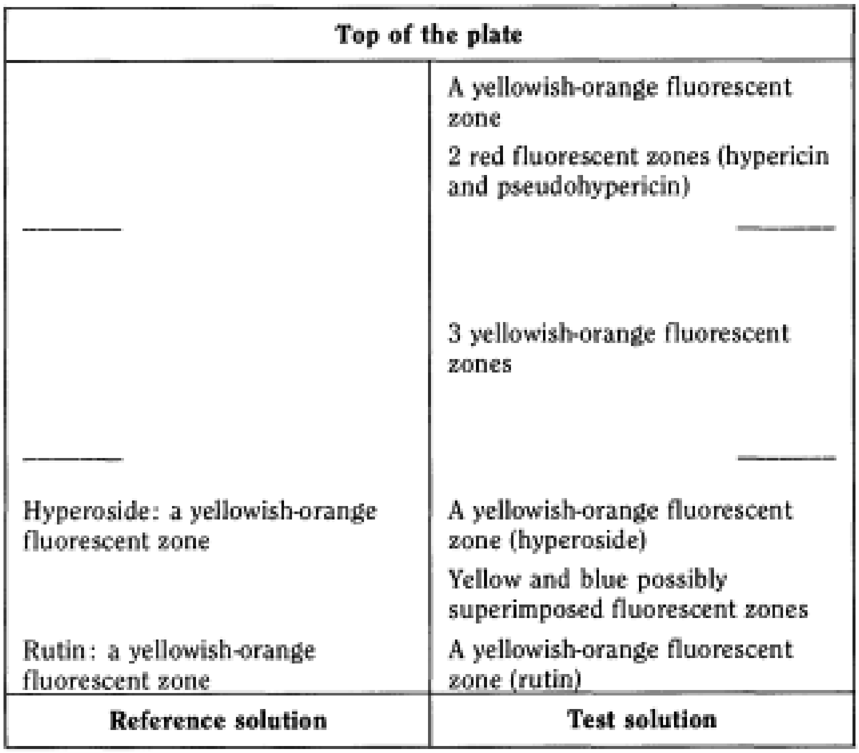
Application 10 µl [or 5 µl] as bands of 10 mm [or 8 mm].

Development Over a path of 10 cm [or 7.5 cm] .

Drying At 100-105 °C for 10 min.

Detection Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Examine after about 30 min in ultraviolet light at 365 nm.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A yellowish-orange fluorescent zone 2 red fluorescent zones (hypericin and pseudohypericin)

Hyperoside: a yellowish-orange fluorescent zone	A yellowish-orange fluorescent zone (hyperoside) Yellow and blue possibly superimposed fluorescent zones
Rutin: a yellowish-orange fluorescent zone	A yellowish-orange fluorescent zone (rutin)
Reference solution	**Test solution**

ASSAY

Total hypericins

Liquid chromatography *(2.2.29)*.

Test solution Dissolve 70.0 mg of the extract to be examined in 25.0 ml of *methanol R*. Sonicate and centrifuge the solution. Expose the solution to a xenon lamp at about 765 W/m^2 for 8 min.

Reference solution Dissolve a quantity of *St. John's wort standardised dry extract CRS* corresponding to 0.15 mg of hypericin in 25.0 ml of *methanol R*. Sonicate and centrifuge. Expose the solution to a xenon lamp at about 765 W/m^2 for 8 min.

Column:

— *size:* *l* = 0.15 m, Ø = 4.6 mm;

— *stationary phase: octadecylsilyl silica gel for chromatography R* (5 µm);

— *temperature*: 40 °C.

Mobile phase Mix 39 volumes of *ethyl acetate R*, 41 volumes of a 15.6 g/l solution of *sodium dihydrogen phosphate R* adjusted to pH 2 with *phosphoric acid R* and 160 volumes of *methanol R*.

Flow rate 1.0 ml/min.

Detection Spectrophotometer at 590 nm.

Injection 20 µl.

Run time 15 min.

Identification of peaks Use the chromatogram supplied with *St. John's wort standardised dry extract CRS* and the chromatogram obtained with the reference solution to identify the peaks due to pseudohypericin and hypericin.

System suitability Reference solution:

— the chromatogram obtained is similar to the chromatogram supplied with *St. John's wort standardised dry extract CRS*;

— *resolution*: minimum 2 between the peaks due to pseudohypericin and hypericin.

Calculate the percentage content of total hypericins, expressed as hypericin, using the following expression:

$$\frac{(A_1 + A_2) \times m_2 \times p}{A_3 \times m_1}$$

A_1 = area of the peak due to pseudohypericin in the chromatogram obtained with the test solution;

A_2 = area of the peak due to hypericin in the chromatogram obtained with the test solution;

A_3 = area of the peak due to hypericin in the chromatogram obtained with the reference solution;

m_1 = mass of the extract to be examined used to prepare the test solution, in grams;

m_2 = mass of *St. John's wort standardised dry extract CRS* used to prepare the reference solution, in grams;

p = percentage content of hypericin in *St. John's wort standardised dry extract CRS*.

Hyperforin and flavonoids

Liquid chromatography *(2.2.29)*. *Carry out the assay protected from light*.

Solvent mixture *water R, methanol R* (20:80 *V/V*).

Test solution Dissolve 75.0 mg of the extract to be examined in 20.0 ml of the solvent mixture. Sonicate and centrifuge.

Reference solution (a) Dissolve 20.0 mg of *rutoside trihydrate CRS* in 200.0 ml of the solvent mixture.

Reference solution (b) Dissolve 75.0 mg of *St. John's wort standardised dry extract CRS* in

20.0 ml of the solvent mixture. Sonicate and centrifuge.

Column:

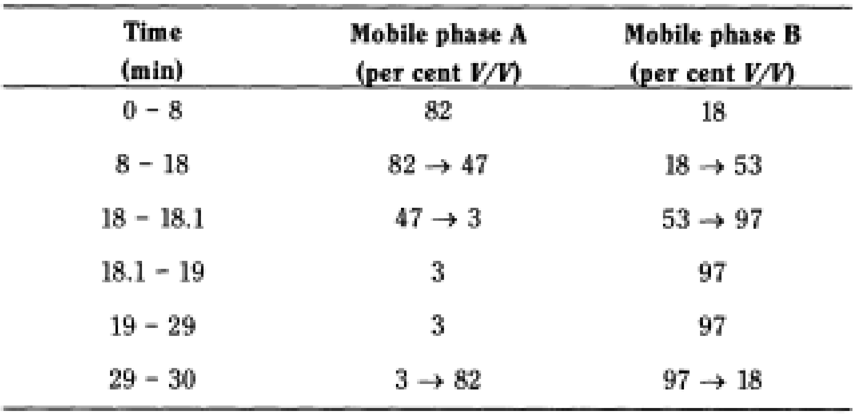
— *size:* l = 0.15 m, Ø = 4.6 mm;

— *stationary phase: octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase:

— *mobile phase A: phosphoric acid R, water R* (3:1000 *V/V*);

— *mobile phase B: phosphoric acid R, acetonitrile R* (3:1000 *V/V*);



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 8	82	18
8 - 18	82 → 47	18 → 53
18 - 18.1	47 → 3	53 → 97
18.1 - 19	3	97
19 - 29	3	97
29 - 30	3 → 82	97 → 18

Detection Spectrophotometer at 360 nm, then at 275 nm after the elution of biapigenin (about 22 min).

Injection 10 µl.

Identification of peaks Use the chromatogram supplied with *St. John's wort standardised dry extract CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to rutin, hyperoside, isoquercitroside, quercitroside, quercetin, biapigenin, hyperforin and adhyperforin.

System suitability Reference solution (b):

— the chromatogram obtained is similar to the chromatogram supplied with *St. John's wort standardised dry extract CRS*;

— *resolution*: minimum 2.0 between the peaks due to rutin and hyperoside, and minimum 2.0 between the peaks due to hyperforin and adhyperforin.

Calculate the percentage content of hyperforin using the following expression:

$$\frac{A_4 \times m_4 \times p \times 2.3}{A_5 \times m_3 \times 10}$$

A_4 = area of the peak due to hyperforin in the chromatogram obtained with the test solution;

A_5 = area of the peak due to rutin in the chromatogram obtained with reference solution (a);

m_3 = mass of the extract to be examined used to prepare the test solution, in grams;

m_4 = mass of *rutoside trihydrate CRS* used to prepare the reference solution, in grams;

2.3 = correction factor for hyperforin with respect to rutin;

p = percentage content of rutin in *rutoside trihydrate CRS*.

Calculate the percentage content of flavonoids, expressed as rutin, using the following expression:

$$\frac{m_4 \times p \times (A_6 + A_7 + A_8 + A_9 + A_{10} + A_{11})}{m_3 \times A_5 \times 10}$$

A_5 = area of the peak due to rutin in the chromatogram obtained with reference solution (a);

A_6 = area of the peak due to rutin in the chromatogram obtained with the test solution;

A_7 = area of the peak due to hyperoside in the chromatogram obtained with the test solution;

A_8 = area of the peak due to isoquercitroside in the chromatogram obtained with the test solution;

A_9 = area of the peak due to quercitroside in the chromatogram obtained with the test solution;

A_{10} = area of the peak due to quercetin in the chromatogram obtained with the test solution;

A_{11} = area of the peak due to biapigenin in the chromatogram obtained with the test solution;

m_3 = mass of the extract to be examined used to prepare the test solution, in grams;

m_4 = mass of *rutoside trihydrate CRS* used to prepare the reference solution, in grams;

p = percentage content of rutin in *rutoside trihydrate CRS*

LABELLING

The label states the content of hyperforin.

Ph Eur

Standardised Aloes Dry Extract

General Notices

(Ph Eur monograph 0259)

Ph Eur

DEFINITION

Standardised dry extract prepared from Barbados aloes or Cape aloes, or a mixture of both.

Content

19.0 per cent to 21.0 per cent of hydroxyanthracene derivatives, expressed as barbaloin ($C_{21}H_{22}O_9$; M_r 418.4) adjusted, if necessary (dried extract).

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using boiling water.

CHARACTERS

Appearance

Brown or yellowish-brown powder.

Solubility

Sparingly soluble in boiling water.

IDENTIFICATION

A. Thin-layer chromatography *(2.2.27)* .

Test solution To 0.25 g of the extract to be examined add 20 ml of *methanol R* and heat to boiling in a water-bath. Shake for a few minutes and decant the solution. Store at about 4 °C and use within 24 h.

Reference solution Dissolve 25 mg of *barbaloin R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel G plate R.*

Mobile phase *water R, methanol R, ethyl acetate R* (13:17:100 *V/V/V*).

Application 10 µl as bands of 20 mm by not more than 3 mm.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with a 100 g/l solution of *potassium hydroxide R* in *methanol R* and examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the test solution shows, in the central part, a zone of yellow fluorescence (barbaloin) similar in position to the zone due to barbaloin in the chromatogram obtained with the reference solution and in the lower part, a zone of light blue fluorescence (aloesine). In the lower part of the chromatogram obtained with the test solution 2 zones of yellow fluorescence (aloinosides A and B) (Cape aloes) and a zone of violet fluorescence just below the zone due to barbaloin (Barbados aloes) may be present.

B. Shake 1 g with 100 ml of boiling *water R* . Cool, add 1 g of *talc R* and filter. To 10 ml of the filtrate add 0.25 g of *disodium tetraborate R* and heat to dissolve. Pour 2 ml of this solution into 20 ml of *water R* . A yellowish-green fluorescence appears which is particularly marked in ultraviolet light at 365 nm.

TESTS

Loss on drying *(2.8.17)*

Maximum 4.0 per cent m/m.

Total ash *(2.4.16)*

Maximum 2.0 per cent.

ASSAY

Carry out the assay protected from bright light.

Introduce 0.400 g into a 250 ml conical flask. Moisten with 2 ml of *methanol R* , add 5 ml of *water R* warmed to about 60 °C, mix, add a further 75 ml of *water R* at about 60 °C and shake for 30 min. Cool, filter into a volumetric flask, rinse the conical flask and the filter with 20 ml of *water R* , add the rinsings to the volumetric flask and dilute to 1000.0 ml with *water R* . Transfer 10.0 ml of this solution to a 100 ml round-bottomed flask containing 1 ml of a 600 g/l solution of *ferric chloride R* and 6 ml of *hydrochloric acid R* . Heat in a water-bath under a reflux condenser for 4 h, with the water level above that of the liquid in the flask. Allow to cool, transfer the solution to a separating funnel, rinse the flask successively with 4 ml of *water R* , 4 ml of *1 M sodium hydroxide* and 4 ml of *water R* , and add the rinsings to the separating funnel. Shake the contents of the separating funnel with 3 quantities, each of 20 ml, of *ether R* . Wash the combined ether layers with 2 quantities, each of 10 ml, of *water R* . Discard the washings and dilute the organic layer to 100.0 ml with *ether R* . Evaporate 20.0 ml carefully to dryness on a water-bath and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R* . Measure the absorbance *(2.2.25)* at 512 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of hydroxyanthracene derivatives, expressed as barbaloin, using the following expression:

$$\frac{A \times 19.6}{m}$$

i.e. taking the specific absorbance of barbaloin to be 255.

A = absorbance at 512 nm;

m = mass of the substance to be examined, in grams.

Ph Eur

Standardised Belladonna Leaf Dry Extract

General Notices

(Ph Eur monograph 1294)

Ph Eur

DEFINITION

Standardised dry extract obtained from *Belladonna leaf (0221)*.

Content

0.95 per cent to 1.05 per cent of total alkaloids, expressed as hyoscyamine ($C_{17}H_{23}NO_3$; M_r 289.4) (dried extract).

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (70 per cent *V/V*).

CHARACTERS

Appearance

Brown or greenish, hygroscopic powder.

IDENTIFICATION

A. Thin-layer chromatography *(2.2.27)* .

Test solution To 1 g of the extract to be examined add 5.0 ml of *methanol R* . Shake for 2 min and filter.

Reference solution Dissolve 1.0 mg of *chlorogenic acid R* and 2.5 mg of *rutin R* in 10 ml of *methanol R* .

Plate *TLC silica gel plate R.*

Mobile phase *anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R* (10:10:30:50 *V/V/V/V*).

Application 20 µl as bands.

Development Over a path of 15 cm.

Drying At 100-105 °C.

Detection Spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*; allow to dry in air for 30 min and examine in ultraviolet light at 365 nm.

Results The chromatograms obtained with the reference solution and the test solution show in the central part a light blue fluorescent zone (chlorogenic acid) and in the lower part a yellowish-brown fluorescent zone (rutin); furthermore, the chromatogram obtained with the test solution shows a little above the start a yellowish-brown fluorescent zone and directly above that a yellow fluorescent zone, and a yellow or yellowish-brown fluorescent zone between the zone due to rutin and the zone due to chlorogenic acid. Further zones may be present.

B. Examine the chromatograms obtained in the test for atropine.

Results The principal zones in the chromatogram obtained with the test solution are similar in position and colour to the principal zones in the chromatogram obtained with the reference solution.

TESTS

Atropine

Thin-layer chromatography *(2.2.27)*.

Test solution To 0.20 g of the extract to be examined add 10.0 ml of *0.05 M sulphuric acid*, shake for 2 min and filter. Add 1.0 ml of *concentrated ammonia R* and shake with 2 quantities, each of 10 ml, of *peroxide-free ether R*. If necessary, separate by centrifugation. Dry the combined ether layers over about 2 g of *anhydrous sodium sulphate R*, filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 ml of *methanol R*.

Reference solution Dissolve 50 mg of *hyoscyamine sulphate R* in 9 ml of *methanol R*. Dissolve 15 mg of *hyoscine hydrobromide R* in 10 ml of *methanol R*. Mix 1.8 ml of the hyoscine hydrobromide solution and 8 ml of the hyoscyamine sulphate solution.

Plate *TLC silica gel plate R.*

Mobile phase *concentrated ammonia R, water R, acetone R* (3:7:90 *V/V/V*).

Application 20 µl as bands.

Development Over a path of 10 cm.

Drying At 100-105 °C for 15 min; allow to cool.

Detection A Spray with *potassium iodobismuthate solution R2*, until orange or brown zones become visible against a yellow background.

Results A The zones in the chromatogram obtained with the test solution are similar in position (hyoscyamine in the lower third, hyoscine in the upper third) and colour to those in the chromatogram obtained with the reference solution. Other faint zones may be present in the chromatogram obtained with the test solution.

Detection B Spray with *sodium nitrite solution R* until the coating is transparent and examine after 15 min.

Results B The zones due to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from orange or brown to reddish-brown but not to greyish-blue (atropine).

Loss on drying *(2.8.17)*

Maximum 5.0 per cent.

Microbial contamination

Total viable aerobic count *(2.6.12)* not more than 10^4 micro-organisms per gram of which not more than 10^2 fungi per gram, determined by plate count. It complies with the tests for *Escherichia coli* and for *Salmonella (2.6.13)* .

ASSAY

At each extraction stage it is necessary to check that the alkaloids have been completely extracted. If the extraction is into the organic phase this is done by evaporating to dryness a few millilitres of the last organic layer, dissolving the residue in *0.25 M sulphuric acid* and verifying the absence of alkaloids using *potassium tetraiodomercurate solution R* . If the extraction is into the acid aqueous phase, this is done by taking a few millilitres of the last acid aqueous phase and verifying the absence of alkaloids using *potassium tetraiodomercurate solution R* .

Disperse 3.00 g in a mixture of 5 ml of *ammonia R* and 15 ml of *water R* . Shake with no fewer than 3 quantities, each of 40 ml, of a mixture of 1 volume of *methylene chloride R* and 3 volumes of *peroxide-free ether R* until the alkaloids are completely extracted. Concentrate the combined organic layers to about 50 ml by distilling on a water-bath and transfer the resulting liquid to a separating funnel, rinsing with *peroxide-free ether R* . Add a quantity of *peroxide-free ether R* equal to at least 2.1 times the volume of the liquid to produce a layer having a density well below that of water. Shake the resulting solution with no fewer than 3 quantities, each of 20 ml, of *0.25 M sulphuric acid* until the alkaloids are completely extracted. Separate the layers by centrifugation, if necessary, and transfer the acid layers to a 2nd separating funnel. Make the combined acid layers alkaline with *ammonia R* and shake with no fewer than 3 quantities, each of 30 ml, of *methylene chloride R* until the alkaloids are completely extracted. Combine the organic layers, add 4 g of *anhydrous sodium sulphate R* and allow to stand for 30 min with occasional shaking. Decant the methylene chloride and wash the sodium sulphate with 3 quantities, each of 10 ml, of *methylene chloride R* . Combine the organic extracts and evaporate to dryness on a water-bath. Heat the residue in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of *methylene chloride R* , evaporate to dryness on a water-bath and again heat the residue in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of *methylene chloride R* , add 20.0 ml of *0.01 M sulphuric acid* and remove the methylene chloride by evaporation on a water-bath. Titrate the excess of acid with *0.02 M sodium hydroxide* using *methyl red mixed solution R* as indicator.

Calculate the percentage content of total alkaloids, expressed as hyoscyamine, using the following expression:

$$\frac{57.88 \times (20 - n)}{100 \times m}$$

n = volume of *0.02 M sodium hydroxide* used, in millilitres;

m = mass of drug used, in grams.

Ph Eur

Standardised Capsicum Tincture

General Notices

(Ph Eur monograph 2337)

Ph Eur

DEFINITION

Standardised tincture produced from *Capsicum (1859)* or *Refined and quantified capsicum oleoresin (2336)*.

Content

90 per cent to 110 per cent of the nominal content of total capsaicinoids, expressed as capsaicin ($C_{18}H_{27}NO_3$; M_r 305.4), stated on the label, which is between 0.020 per cent *m/m* and 0.060 per cent *m/m*.

PRODUCTION

The tincture is produced from the herbal drug or oleoresin and ethanol (70 per cent *V/V* to 85 per cent *V/V*) by an appropriate procedure.

CHARACTERS

Appearance

Yellowish-orange or reddish-orange liquid.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)* .

Test solution Shake 10 ml of the tincture to be examined with 10 ml of *hexane R* . Allow to separate and use the lower layer.

Reference solution Dissolve 1 mg of *capsaicin R* and 1 mg of *dihydrocapsaicin R* in 5 ml of *ether R* .

Plate *TLC octadecylsilyl silica gel plate R* (5-40 µm) [or *TLC octadecylsilyl silica gel plate R* (2-10 µm)].

Mobile phase *water R, methanol R* (20:80 *V/V*).

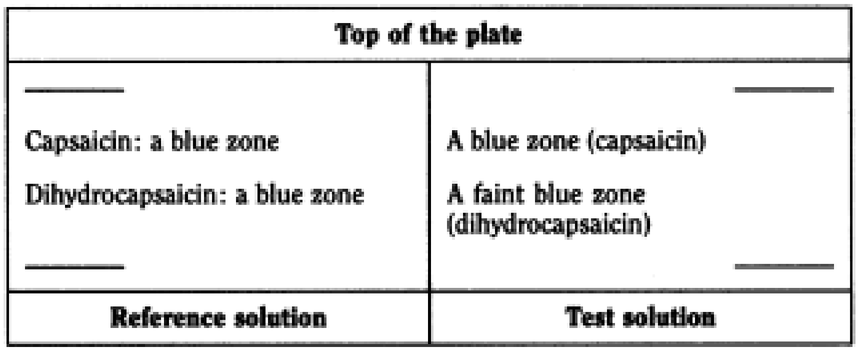
Application 20 µl [or 2 µl] as bands of 15 mm [or 8 mm].

Development Over a path of 12 cm [or 6 cm].

Drying In air.

Detection Spray with a 0.25 g/l solution of *dichloroquinonechlorimide R* in *ethyl acetate R*, expose to ammonia vapour until blue zones appear, then examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
Capsaicin: a blue zone	A blue zone (capsaicin)
Dihydrocapsaicin: a blue zone	A faint blue zone (dihydrocapsaicin)
Reference solution	**Test solution**

TESTS

Nonivamide

Liquid chromatography *(2.2.29)*.

Test solution Dilute 50.0 g of the tincture to be examined to 100.0 ml with *methanol R*.

Reference solution Dissolve 20.0 mg of *capsaicin CRS* and 4.0 mg of *nonivamide CRS* in 100.0 ml of *methanol R*.

Column:

— *size: l* = 0.25 m, Ø = 4.6 mm;

— *stationary phase: phenylsilyl silica gel for chromatography R* (5 µm);

— *temperature*: 30 °C.

Mobile phase *acetonitrile R*, 1 g/l solution of *phosphoric acid R* (40:60 *V/V*).

Flow rate 1.0 ml/min.

Detection Spectrophotometer at 225 nm.

Injection 10 µl.

Elution order Nordihydrocapsaicin, nonivamide, capsaicin, dihydrocapsaicin.

System suitability Reference solution:

— *resolution*: minimum 1.5 between the peaks due to nonivamide and capsaicin.

Calculate the percentage content of nonivamide using the following expression:

$$\frac{F_1 \times m_2 \times p_1}{F_2 \times m_1}$$

F_1 = area of the peak due to nonivamide in the chromatogram obtained with the test solution;

F_2 = area of the peak due to nonivamide in the chromatogram obtained with the reference solution;

m_1 = mass of the tincture to be examined, in grams;

m_2 = mass of *nonivamide CRS* in the reference solution, in grams;

p_1 = percentage content of nonivamide in *nonivamide CRS*.

Limit:
— *nonivamide*: maximum 5.0 per cent of the total capsaicinoid content.

Ethanol *(2.9.10)*

95 per cent to 105 per cent of the content stated on the label.

Methanol and 2-propanol *(2.9.11)*

Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

ASSAY

Liquid chromatography *(2.2.29)* as described in the test for nonivamide.

Calculate the percentage content of total capsaicinoids, expressed as capsaicin, using the following expression:

$$\frac{(F_3 + F_5 + F_6) \times m_4 \times p_2}{F_4 \times m_3}$$

F_3 = area of the peak due to capsaicin in the chromatogram obtained with the test solution;

F_4 = area of the peak due to capsaicin in the chromatogram obtained with the reference solution;

F_5 = area of the peak due to dihydrocapsaicin in the chromatogram obtained with the test solution;

F_6 = area of the peak due to nordihydrocapsaicin in the chromatogram obtained with the test solution;

m_3 = mass of the tincture to be examined, in grams;

m_4 = mass of *capsaicin CRS* in the reference solution, in grams;

p_2 = percentage content of capsaicin in *capsaicin CRS*.

Ph Eur

Standardised Cascara Dry Extract

General Notices

(Ph Eur monograph 1844)

Ph Eur

DEFINITION

Standardised dry extract obtained from *Cascara (0105)* .

Content

90 per cent to 110 per cent of the nominal content of hydroxyanthracene glycosides, expressed as cascaroside A ($C_{27}H_{32}O_{14}$; M_r 580.5), stated on the label; minimum 60 per cent of the hydroxyanthracene glycosides are cascarosides, expressed as cascaroside A. The nominal content of hydroxyanthracene glycosides is within the range 8.0 per cent to 25.0 per cent *m/m* (dried extract).

PRODUCTION

The extract is produced from the herbal drug by an appropriate procedure using either boiling water or a hydroalcoholic solvent at least equivalent in strength to ethanol (60 per cent *V/V*).

CHARACTERS

Appearance

Brown, free-flowing powder.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)* .

Test solution To 0.2 g of the extract to be examined add 5 ml of *ethanol (70 per cent V/V) R* and heat to boiling. Cool and centrifuge. Decant the supernatant solution immediately and use within 30 min.

Reference solution Dissolve 20 mg of *barbaloin R* and 2 mg of *emodin R* in *ethanol (70 per cent V/V) R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *water R, methanol R* , *ethyl acetate R* (13:17:100 *V/V/V*).

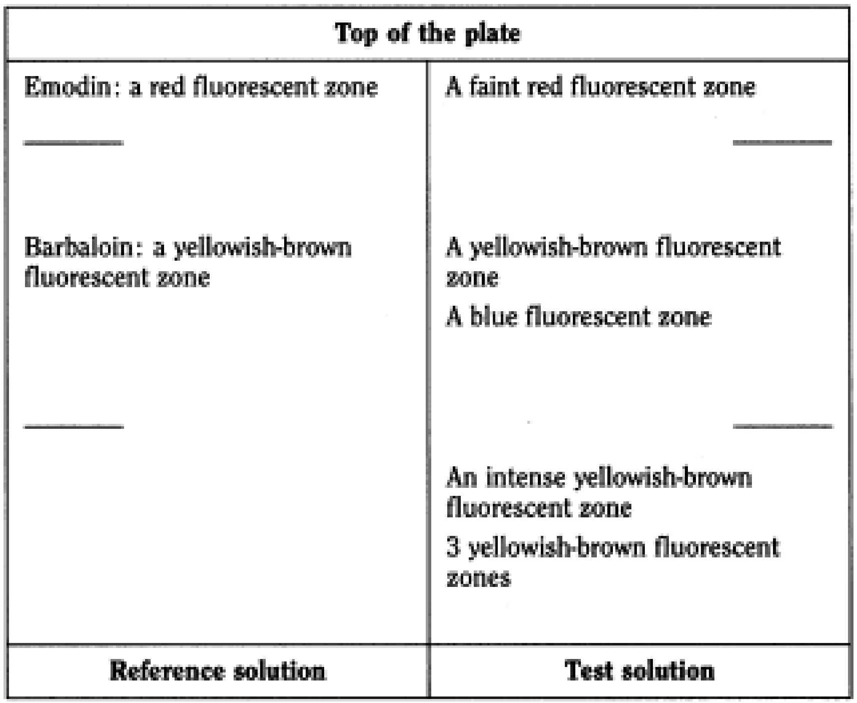
Application 10 µl [or 2 µl] as bands.

Development Over a path of 10 cm [or 6 cm].

Drying In air for 5 min.

Detection Spray with a 50 g/l solution of *potassium hydroxide R* in *ethanol (50 per cent V/V) R* and heat to 100-105 °C for 15 min; examine in ultraviolet light at 365 nm.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
Emodin: a red fluorescent zone	A faint red fluorescent zone
———	———
Barbaloin: a yellowish-brown fluorescent zone	A yellowish-brown fluorescent zone A blue fluorescent zone
———	———
	An intense yellowish-brown fluorescent zone 3 yellowish-brown fluorescent zones
Reference solution	**Test solution**

TESTS

Loss on drying *(2.8.17)*

Maximum 5.0 per cent.

ASSAY

Carry out the assay within 24 h, protected from bright light.

To 0.500 g of the extract to be examined add 80 ml of *ethanol (70 per cent V/V) R*. Shake, and allow to stand in the dark for at least 8 h. Dilute to 100.0 ml with *ethanol (70 per cent V/V) R*. Shake and filter, discarding the first 20 ml of filtrate. Transfer 10.0 ml of the filtrate to a separating funnel, add 0.1 ml of *1 M hydrochloric acid* and shake with 2 quantities, each of 20 ml, of a mixture of 1 volume of *ether R* and 3 volumes of *hexane R*. Wash the combined organic extracts with 5 ml of *water R*. Discard the organic layer and return the rinsings to the hydroalcoholic layer. Shake with 4 quantities, each of 30 ml, of *ethyl acetate R* freshly saturated with *water R* (prepared as follows: to 150 ml of *ethyl acetate R* add 15 ml of *water R*, shake for 3 min and allow to stand), on each occasion allowing the layers to separate until the organic layer is clear. Combine the ethyl acetate extracts. Use the aqueous layer for the assay of cascarosides and the organic layer for the assay of hydroxyanthracene glycosides other than cascarosides.

Hydroxyanthracene glycosides other than cascarosides

Transfer the organic layer to a round-bottomed flask and remove the solvent by distillation, evaporating almost to dryness. Dissolve the residue in 0.5 ml of *methanol R*, add 10 ml of *water R* at 40 °C and transfer to a 50 ml volumetric flask, rinsing the round-bottomed flask with *water R* at 40 °C and adding the rinsings to the hydromethanolic solution. Allow to cool and dilute to 50.0 ml with *water R*. Transfer 20.0 ml of the solution to a 100 ml round-bottomed flask with a ground-glass neck containing 2 g of *ferric chloride R* and 12 ml of *hydrochloric acid R*. Attach a reflux condenser and place the flask in a water-bath so that the level of the water is above that of the liquid in the flask and heat for 4 h. Allow to cool, transfer the solution to a separating funnel and rinse the flask successively with 4 ml of *1 M sodium hydroxide* and 4 ml of *water R*, adding the rinsings to the separating funnel. Shake the contents of the separating funnel with 3 quantities, each of 30 ml, of a mixture of 1 volume of *ether R* and 3 volumes of *hexane R*. Wash the combined organic layers with 2 quantities, each of 10 ml, of *water R* and discard the rinsings. Dilute the organic layer to 100.0 ml with a mixture of 1 volume of *ether R* and 3 volumes of *hexane R*. Take 20.0 ml of the solution, evaporate carefully to dryness on a water-bath and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance *(2.2.25)* at 440 nm and 515 nm, using *methanol R* as the compensation liquid. If the ratio of the absorbance at 515 nm to that at 440 nm is less than 2.4, the assay is invalid.

Calculate the percentage content of hydroxyanthracene glycosides other than cascarosides, expressed as cascaroside A, using the following expression:

$$\frac{A \times 6.95}{m}$$

i.e. taking the specific absorbance to be 180.

A = absorbance at 515 nm;

m = mass of the substance to be examined, in grams.

Cascarosides

Dilute the aqueous layer to 50.0 ml with *water R*. Treat 20.0 ml of this solution as described above in the assay of hydroxyanthracene glycosides other than cascarosides. Measure the absorbance *(2.2.25)* at 440 nm and 515 nm. If the ratio of the absorbance at 515 nm to that at 440 nm is less than 2.7, the assay is invalid.

Calculate the percentage content of cascarosides, expressed as cascaroside A, using the following expression:

$$\frac{A \times 6.95}{m}$$

i.e. taking the specific absorbance to be 180.

A = absorbance at 515 nm;

m = mass of the substance to be examined, in grams.

LABELLING

The label states the nominal content of hydroxyanthracene glycosides, expressed as cascaroside A.

Ph Eur

Standardised Frangula Bark Dry Extract

General Notices

(Ph Eur monograph 1214)

Ph Eur

DEFINITION

Standardised dry extract obtained from *Frangula bark (0025)*.

Content

15.0 per cent to 30.0 per cent of glucofrangulins, expressed as glucofrangulin A ($C_{27}H_{30}O_{14}$; M_r 578.5) (dried extract); the measured content does not deviate from that stated on the label by more than ± 10 per cent.

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (50-80 per cent *V/V*).

CHARACTERS

Appearance

Yellowish-brown, fine powder.

IDENTIFICATION

A. Thin-layer chromatography *(2.2.27)*.

Test solution To 0.05 g of the extract to be examined add 5 ml of *ethanol (70 per cent V/V) R* and heat to boiling. Cool and centrifuge. Decant the supernatant solution immediately and use within 30 min.

Reference solution Dissolve 20 mg of *barbaloin R* in *ethanol (70 per cent V/V) R* and dilute to 10 ml with the same solvent.

Plate TLC silica gel plate R.

Mobile phase water R, methanol R, ethyl acetate R (13:17:100 *V/V/V*).

Application 10 µl as bands.

Development Over a path of 10 cm.

Drying In air for 5 min.

Detection Spray with a 50 g/l solution of *potassium hydroxide R* in *ethanol (50 per cent V/V) R* and heat at 100-105 °C for 15 min; examine immediately after heating.

Results The chromatogram obtained with the reference solution shows in the median third a reddish-brown zone due to barbaloin. The chromatogram obtained with the test solution shows 2 orange-brown zones (glucofrangulins) in the lower third and 2-4 red zones (frangulins, not always clearly separated, and above them frangula-emodin) in the upper third.

B. To about 25 mg add 25 ml of *dilute hydrochloric acid R* and heat the mixture on a water-bath for 15 min. Allow to cool, shake with 20 ml of *ether R* and discard the aqueous layer. Shake the ether layer with 10 ml of *dilute ammonia R1*. The aqueous layer becomes reddish-violet.

TESTS

Loss on drying *(2.8.17)*

Maximum 5.0 per cent.

Microbial contamination

Total viable aerobic count *(2.6.12)* not more than 10^4 per gram of which not more than 10^2 fungi per gram, determined by plate count. It complies with the test for *Escherichia coli* and *Salmonella (2.6.13)*.

ASSAY

Carry out the assay protected from bright light.

In a tared round-bottomed flask with a ground-glass neck, weigh 0.100 g. Add 25.0 ml of a 70 per cent *V/V* solution of *methanol R*, mix and weigh again. Heat the flask in a water-bath under a reflux condenser at 70 °C for 15 min. Allow to cool, weigh and adjust to the original mass with a 70 per cent *V/V* solution of *methanol R*. Filter and transfer 5.0 ml of the filtrate to a separating funnel. Add 50 ml of *water R* and 0.1 ml of *hydrochloric acid R*. Shake with 5 quantities, each of 20 ml, of *light petroleum R1*. Allow the layers to separate and transfer the aqueous layer to a 100 ml volumetric flask. Combine the light petroleum layers and wash with 2 quantities, each of 15 ml, of *water R*. Use this water for washing the separating funnel and add it to the aqueous solution in the volumetric flask. Add 5 ml of a 50 g/l solution of *sodium carbonate R* and dilute to 100.0 ml with *water R*. Discard the light petroleum layer. Transfer 40.0 ml of the aqueous solution to a 200 ml round-bottomed flask with a ground-glass neck. Add 20 ml of a 200 g/l solution of *ferric chloride R* and heat under a reflux condenser for 20 min in a water-bath with the water level above that of the liquid in the flask. Add 2 ml of *hydrochloric acid R* and continue heating for 20 min, shaking frequently, until the precipitate is dissolved. Allow to cool, transfer the mixture to a separating funnel and shake with 3 quantities, each of 25 ml, of *ether R*, previously used to rinse the flask. Combine the ether extracts and wash with 2 quantities, each of 15 ml, of *water R*. Transfer the ether layer to a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 20.0 ml carefully to dryness and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance *(2.2.25)* at 515 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of glucofrangulins, expressed as glucofrangulin A, using the following expression:

$$\frac{A \times 3.06}{m}$$

i.e. taking the specific absorbance of glucofrangulin A to be 204, calculated on the basis of the specific absorbance of barbaloin.

A = absorbance at 515 nm;

m = mass of the preparation to be examined, in grams.

LABELLING

The label states the content of glucofrangulins.

Ph Eur

Standardised Ipecacuanha Liquid Extract

General Notices

(Ph Eur monograph 1875)

Ph Eur

DEFINITION

Standardised liquid extract produced from *Ipecacuanha root (0094).*

Content

1.80 per cent to 2.20 per cent of total alkaloids, calculated as emetine ($C_{29}H_{40}N_2O_4$; M_r 480.7) .

PRODUCTION

The extract is produced from the herbal drug and ethanol (60 to 80 per cent *V/V*) by an appropriate procedure.

CHARACTERS

Appearance

Dark brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution Dilute 5.0 ml of the extract to be examined to 50 ml with *ethanol (70 per cent V/V) R*. To 2.0 ml of this solution add 2 ml of *water R* and 0.1 ml of *concentrated ammonia R*. Add 10 ml of *ether R* and shake. Separate the upper layer, dry it over about 2 g of *anhydrous sodium sulphate R* and filter.

Reference solution Dissolve 2.5 mg of *emetine hydrochloride CRS* and 3 mg of *cephaeline hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate TLC silica gel plate R.

Mobile phase concentrated ammonia R, *methanol R*, *ethyl acetate R*, *toluene R* (2:15:18:65 *V/V/V/V*).

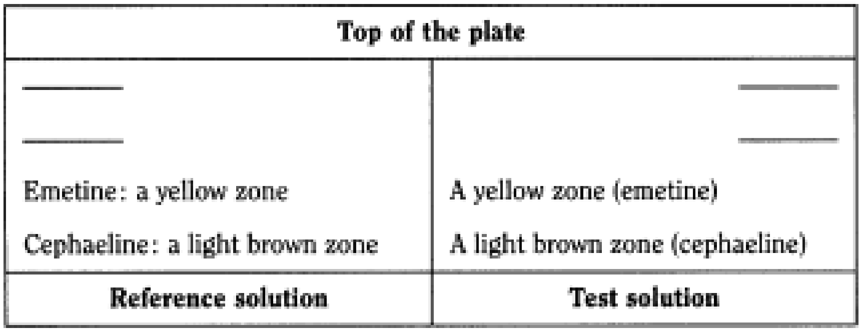
Application 10 µl as bands.

Development Over a path of 10 cm.

Drying In air.

Detection A Spray with a 5 g/l solution of *iodine R* in *ethanol (96 per cent) R*. Heat at 60 °C for 10 min and allow to cool for 30 min. Examine in daylight.

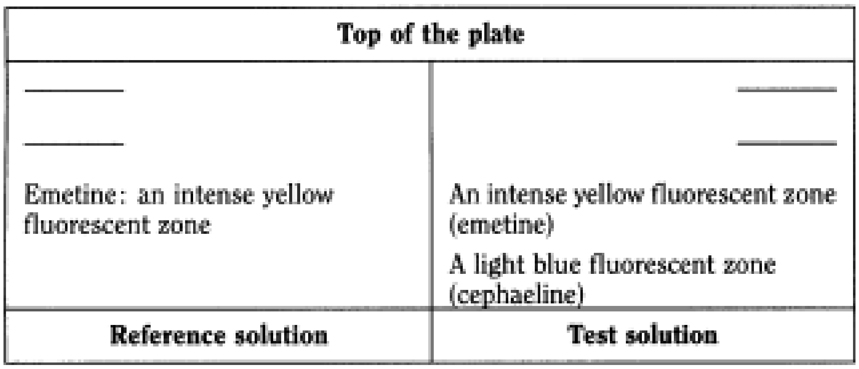
Results A See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
———	———
———	———
Emetine: a yellow zone	A yellow zone (emetine)
Cephaeline: a light brown zone	A light brown zone (cephaeline)
Reference solution	**Test solution**

Detection B Examine the plate in ultraviolet light at 365 nm.

Results B See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones are present in the chromatogram obtained with the test solution.



Top of the plate	
———	———
———	———
Emetine: an intense yellow fluorescent zone	An intense yellow fluorescent zone (emetine)
	A light blue fluorescent zone (cephaeline)
Reference solution	**Test solution**

With a liquid extract from *Cephaelis acuminata* root, the zones of emetine and cephaeline in the chromatogram obtained with the test solution are of similar size.

With a liquid extract from *Cephaelis ipecacuanha* root, the zone of emetine is much larger than the zone of cephaeline in the chromatogram obtained with the test solution.

TESTS

Ethanol (*2.9.10*)

95 per cent to 105 per cent of the quantity stated on the label.

ASSAY

Dilute 1.00 g of the extract to be examined to 10 ml with *ethanol (70 per cent V/V) R* and transfer to a chromatography column about 0.2 m long and about 15 mm in internal diameter, containing 8 g of *basic aluminium oxide R*, using a glass rod. After infiltration into the aluminium oxide layer, rinse the flask, glass rod and internal wall of the column with 3 quantities, each of 2 ml, of *ethanol (70 per cent V/V) R*. Elute in portions with 40 ml of *ethanol (70 per cent V/V) R*. Avoid disturbance or drying of the surface of the aluminium oxide layer. Collect the whole of the eluate. Evaporate the eluate on a water-bath to about 10 ml. Allow to cool. Add 10.0 ml of *0.02 M hydrochloric acid* and 20 ml of *carbon dioxide-free water R*. Titrate the excess acid with *0.02 M sodium hydroxide* using 0.15 ml of *methyl red mixed solution R* as indicator.

Perform a blank assay by replacing the extract to be examined with 10.0 ml of alcohol of the strength stated on the label.

1 ml of *0.02 M hydrochloric acid* is equivalent to 4.807 mg of total alkaloids, calculated as emetine.

Ph Eur

Standardised Ipecacuanha Tincture

General Notices

(Ph Eur monograph 1530)

Ph Eur

DEFINITION

Tincture produced from *Ipecacuanha root (0094).*

Content

0.18 per cent (*m/m*) to 0.22 per cent (*m/m*) of total alkaloids, calculated as emetine ($C_{29}H_{40}N_2O_4$; M_r 480.7).

PRODUCTION

The tincture is produced from the herbal drug and ethanol (70 per cent *V/V*) by an appropriate procedure.

CHARACTERS

Appearance

Yellowish-brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution To 2.0 ml of the tincture to be examined add 2 ml of *water R* and 0.1 ml of *concentrated ammonia R*. Add 10 ml of *ether R* and shake. Separate the ether layer, dry it over about 2 g of *anhydrous sodium sulphate R* and filter.

Reference solution Dissolve 2.5 mg of *emetine hydrochloride CRS* and 3 mg of *cephaeline hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate TLC silica gel plate R.

Mobile phase concentrated ammonia R, *methanol R*, *ethyl acetate R*, *toluene R* (2:15:18:65 *V/V/V/V*).

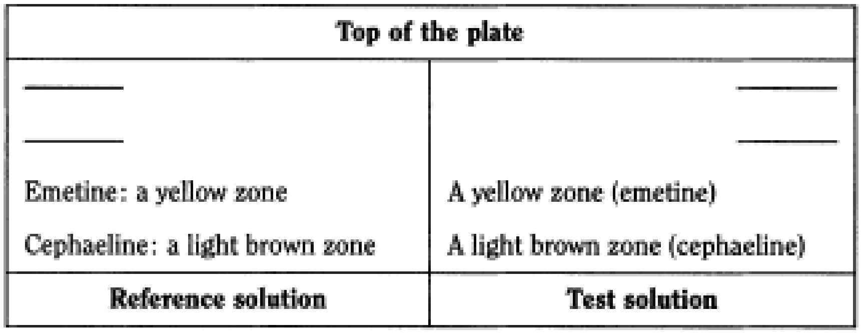
Application 10 µl as bands.

Development Over a path of 10 cm.

Drying In air.

Detection A Spray with a 5 g/l solution of *iodine R* in *ethanol (96 per cent) R* and heat at 60 °C for 10 min. Examine in daylight.

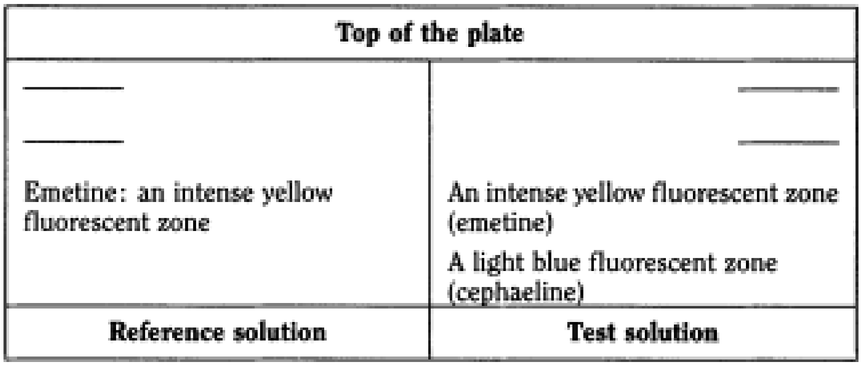
Results A See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
———	———
———	———
Emetine: a yellow zone	A yellow zone (emetine)
Cephaeline: a light brown zone	A light brown zone (cephaeline)
Reference solution	**Test solution**

Detection B Examine the plate in ultraviolet light at 365 nm.

Results B See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones are present in the chromatogram obtained with the test solution.



Top of the plate	
———	———
———	———
Emetine: an intense yellow fluorescent zone	An intense yellow fluorescent zone (emetine)
	A light blue fluorescent zone (cephaeline)
Reference solution	**Test solution**

With a tincture from *Cephaelis acuminata* root, the zones of emetine and cephaeline in the chromatogram obtained with the test solution are similar in size.

With a tincture from *Cephaelis ipecacuanha* root, the zone of emetine is much larger than the zone of cephaeline in the chromatogram obtained with the test solution.

TESTS

Ethanol *(2.9.10)*

95 per cent to 105 per cent of the quantity stated on the label.

ASSAY

Transfer 10.00 g of the tincture to be examined to a chromatography column about 0.2 m long and about 15 mm in internal diameter, filled with 8 g of *basic aluminium oxide R*. After infiltration into the aluminium oxide layer rinse the internal wall of the column with 3 quantities, each of 2 ml, of *ethanol (70 per cent V/V) R*. Elute in portions, with 40 ml of *ethanol (70 per cent V/V) R*. Avoid whirling or drying of the surface of the aluminium oxide layer. Collect the whole of the eluate. Evaporate the eluate on a water-bath to about 10 ml. Allow to cool. Add 10.0 ml of *0.02 M hydrochloric acid* and 20 ml of *carbon dioxide-free water R*. Titrate the excess acid with *0.02 M sodium hydroxide* using 0.15 ml of *methyl red mixed solution R* as indicator.

Perform a blank assay replacing the tincture to be examined with 10.0 ml of alcohol of the strength stated on the label.

1 ml of *0.02 M hydrochloric acid* is equivalent to 4.807 mg of total alkaloids, calculated as emetine.

Ph Eur

Standardised Liquorice Ethanolic Liquid Extract

General Notices

(Ph Eur monograph 1536)

Ph Eur

DEFINITION

Standardised ethanolic liquid extract produced from *Liquorice root (0277)*.

Content

3.0 per cent to 5.0 per cent of glycyrrhizic acid ($C_{42}H_{62}O_{16}$; M_r 823).

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure for liquid extracts using ethanol (70 per cent *V/V*).

CHARACTERS

Appearance

Dark brown, clear liquid.

It has a faint characteristic odour and a sweet taste.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)*.

Test solution Place 1.0 g of the extract to be examined in a 50 ml round-bottomed flask, add 16.0 ml of *water R* and 4.0 ml of *hydrochloric acid R1* and heat on a water-bath under a reflux condenser for 30 min. Allow to cool and filter. Dry the filter and the round-bottomed flask at 105 °C for 60 min. Transfer the filter to the round-bottomed flask, add 20 ml of *ether R* and heat in a water-bath at 40 °C under a reflux condenser for 5 min. Allow to cool and filter. Evaporate the filtrate to dryness and dissolve the residue in 5.0 ml of *ether R*.

Reference solution Dissolve 5.0 mg of *glycyrrhetic acid R* and 5.0 mg of *thymol R* in 5 ml of *ether R*.

Plate *TLC silica gel F_{254} plate R.*

Mobile phase *concentrated ammonia R, water R, ethanol (96 per cent) R, ethyl acetate R* (1:9:25:65 *V/V/V/V*).

Application 10 µl as bands.

Development Over a path of 15 cm.

Drying In air for 5 min.

Detection A Examine in ultraviolet light at 254 nm.

Results A The chromatograms obtained with the test solution and the reference solution show in the lower half a quenching zone due to glycyrrhetic acid.

Detection B Spray with *anisaldehyde solution R*; heat at 100-105 °C for 5-10 min and examine in daylight.

Results B The chromatogram obtained with the reference solution shows in the lower half a violet zone (glycyrrhetic acid), and in the upper third a red zone (thymol); the chromatogram obtained with the test solution shows in the lower half a violet zone corresponding to glycyrrhetic acid in the chromatogram obtained with the reference solution, and in the upper third, below the zone of thymol in the chromatogram obtained with the reference solution, a yellow zone due to isoliquiritigenin; further zones are present.

TESTS

Ethanol *(2.9.10)*

52 per cent *V/V* to 65 per cent *V/V*.

Methanol and 2-propanol *(2.9.11)*

Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

ASSAY

Liquid chromatography *(2.2.29)*.

Solvent mixture *dilute ammonia R1, water R* (8:92 *V/V*).

Test solution Dilute 1.000 g of the extract to be examined to 100 ml with the solvent mixture and centrifuge. Dilute 2.0 ml of the supernatant to 10.0 ml with the solvent mixture.

Stock solution Dissolve 0.130 g of *monoammonium glycyrrhizate CRS* in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a) Dilute 5.0 ml of the stock solution to 100.0 ml with the solvent mixture.

Reference solution (b) Dilute 10.0 ml of the stock solution to 100.0 ml with the solvent mixture.

Reference solution (c) Dilute 15.0 ml of the stock solution to 100.0 ml with the solvent mixture.

Column:
- *size:* *l* = 0.10 m, Ø = 4 mm;
- *stationary phase: octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase *glacial acetic acid R, acetonitrile R, water R* (6:30:64 *V/V/V*).

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 254 nm.

Injection 10 µl.

Establish a calibration curve with the concentrations of the reference solutions (g/100 ml) as the abscissa and the corresponding peak areas as the ordinate.

Using the retention times and the peak areas determined from the chromatograms obtained with the reference solutions, locate and integrate the peak due to glycyrrhizic acid in the chromatogram obtained with the test solution.

Calculate the percentage content of glycyrrhizic acid using the following expression:

$$A \times \frac{5}{m} \times B \times \frac{822}{840}$$

A = concentration of monoammonium glycyrrhizate in the test solution, determined from the calibration curve, in g/100 ml;

B = declared percentage content of *monoammonium glycyrrhizate CRS*;

m = mass of the extract to be examined, in grams;

822 = molecular mass of glycyrrhizic acid;

840 = molecular mass of monoammonium glycyrrhizate (without any water of crystallisation)

Ph Eur

Standardised Opium Dry Extract

General Notices

(Ph Eur monograph 1839)

Ph Eur

DEFINITION

Standardised dry extract produced from *Raw opium (0777).*

Content:

- *morphine* ($C_{17}H_{19}NO_3$; M_r 285.3): 19.6 per cent to 20.4 per cent (dried extract);
- *codeine* ($C_{18}H_{21}NO_3$; M_r 299.4): minimum 2.0 per cent (dried extract).

Content adjusted if necessary by adding a suitable excipient (e.g. lactose, dextrin).

PRODUCTION

It is produced from the drug and water by a suitable procedure.

CHARACTERS

Appearance

Brown, amorphous powder.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

Test solution Triturate 0.05 g of the extract to be examined with 5 ml of *ethanol (70 per cent V/V) R*. Transfer to a 25 ml conical flask. Rinse with 3 ml of *ethanol (70 per cent V/V) R* and transfer to the same 25 ml conical flask. Heat in a water-bath at 50-60 °C, with stirring, for 30 min. Cool, filter, wash the filter with *ethanol (70 per cent V/V) R* and dilute the combined filtrate and washings to 10 ml with the same solvent.

Reference solution Dissolve 5 mg of *morphine hydrochloride R* in the solution prepared as follows and dilute to 5 ml with the same solution: dissolve 2 mg of *papaverine hydrochloride R*, 12 mg of *codeine phosphate R* and 12 mg of *noscapine hydrochloride R* in *ethanol (70 per cent V/V) R* and dilute to 25 ml with the same solvent.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *concentrated ammonia R*, *ethanol (96 per cent) R*, *acetone R*, *toluene R* (2:6:40:40 *V/V/V/V*). Use a freshly prepared mixture.

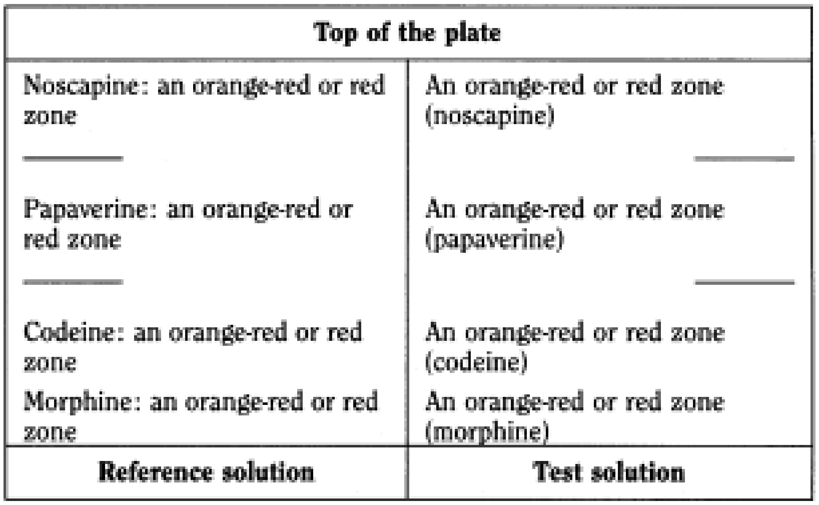
Application 20 µl [or 6 µl] as bands.

Development Over a path of 15 cm [or 8 cm].

Drying At 100-105 °C for 15 min.

Detection Allow to cool and spray with *potassium iodobismuthate solution R2* and then with a 4 g/l solution of *sulphuric acid R*; examine in daylight.

Results See below the sequences of zones present in the chromatograms obtained with the reference solution and the test solution. A dark red zone (thebaine) situated between the zone due to codeine and the zone due to papaverine may be present in the chromatogram obtained with the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
Noscapine: an orange-red or red zone	An orange-red or red zone (noscapine)
Papaverine: an orange-red or red zone	An orange-red or red zone (papaverine)
Codeine: an orange-red or red zone	An orange-red or red zone (codeine)
Morphine: an orange-red or red zone	An orange-red or red zone (morphine)
Reference solution	**Test solution**

B. To 0.5 g of the extract to be examined add 5 ml of *water R*, shake for 5 min and filter. To the filtrate add 0.25 ml of *ferric chloride solution R2.* A red colour develops, which does not disappear on the addition of 0.5 ml of *dilute hydrochloric acid R*.

TESTS

Thebaine

Liquid chromatography (*2.2.29*).

Test solution Suspend 0.500 g of the extract to be examined in 50 ml of *ethanol (50 per cent V/V) R*, mix with the aid of ultrasound for 1 h, allow to cool and dilute to 100.0 ml with the same solvent. Allow to stand. To 10.0 ml of the supernatant liquid, add 5 ml of *ammonium chloride buffer solution pH 9.5 R,* dilute to 25.0 ml with *water R* and mix. Transfer 20.0 ml of this solution to a chromatography column about 0.15 m long and about 30 mm in internal diameter containing 15 g of *kieselguhr for chromatography R*. Allow to stand for 15 min. Elute with 2 quantities, each of 40 ml, of a mixture of 15 volumes of *2-propanol R* and 85 volumes of *methylene chloride R*. Evaporate the eluate to dryness *in vacuo* at 40 °C. Transfer the residue to a volumetric flask with the aid of the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a) Dissolve 5.0 mg of *thebaine CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b) Dissolve 12.0 mg of *morphine hydrochloride CRS* in the mobile phase and dilute to 15.0 ml with the mobile phase (solution A). Dissolve 10.0 mg of *codeine CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. To 10.0 ml of this solution add 10.0 ml of solution A and mix.

Precolumn:
— *size:* *l* = 4 mm, Ø = 4.0 mm;

— *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Column:
— *size:* *l* = 0.25 m, Ø = 4.0 mm;

— *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase Dissolve 1.0 g of *sodium heptanesulphonate monohydrate R* in 420 ml of *water R*, adjust to pH 3.2 with a 4.9 g/l solution of *phosphoric acid R* and add 180 ml of *acetonitrile R*.

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 280 nm.

Injection 20 µl.

System suitability:
— *resolution*: minimum 2.5 between the peaks due to morphine and codeine in the chromatogram obtained with reference solution (b);

— *mass distribution ratio*: minimum 3.0 for the peak due to thebaine in the chromatogram obtained with reference solution (a).

Calculate the percentage content of thebaine using the following expression:

$$\frac{A_1 \times m_2 \times F \times p}{A_2 \times m_1}$$

A_1 = area of the peak due to the relevant alkaloid in the chromatogram obtained with the test solution,

A_2 = area of the peak due to the relevant alkaloid in the chromatogram obtained with the reference solution,

m_1 = mass of the extract to be examined in the test solution, in grams,

m_2 = mass of the relevant alkaloid in the reference solution, in grams,

p = percentage content of the alkaloid in the relevant alkaloid CRS,

F = 6.250 for the determination of thebaine.

Limit:
— *thebaine*: maximum 6.0 per cent (dried extract).

Loss on drying (*2.2.32*)

Maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for thebaine with the following modifications.

Injection Test solution and reference solution (b).

System suitability:

— *repeatability*: maximum relative standard deviation of 1.0 per cent for the area of the peak due to morphine after 6 injections of reference solution (b).

Calculate the percentage content of morphine and codeine from the expression given in the test for thebaine, assigning *F* as 10.417 for morphine and as 3.125 for codeine.

Ph Eur

Standardised Opium Tincture

General Notices

(Ph Eur monograph 1841)

Ph Eur

DEFINITION

Standardised tincture produced from *Raw opium (0777)*.

Content:

— *morphine* ($C_{17}H_{19}NO_3$; M_r 285.3): 0.95 per cent to 1.05 per cent;

— *codeine* ($C_{18}H_{21}NO_3$; M_r 299.4): minimum 0.1 per cent.

PRODUCTION

It is produced from the drug and equal volumes of ethanol (70 per cent *V/V*) and water by an appropriate procedure.

CHARACTERS

Appearance: reddish-brown liquid.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)*.

Test solution Dilute 1.0 ml of the tincture to be examined to 10 ml with *ethanol (70 per cent V/V) R*.

Reference solution Dissolve 5 mg of *morphine hydrochloride R* in the solution prepared as follows and dilute to 5 ml with the same solution: dissolve 2 mg of *papaverine hydrochloride R*, 12 mg of *codeine phosphate R* and 12 mg of *noscapine hydrochloride R* in *ethanol (70 per cent V/V) R* and dilute to 25 ml with the same solvent.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *concentrated ammonia R*, *ethanol (96 per cent) R*, *acetone R*, *toluene R* (2:6:40:40 *V/V/V/V*). Use a freshly prepared mixture.

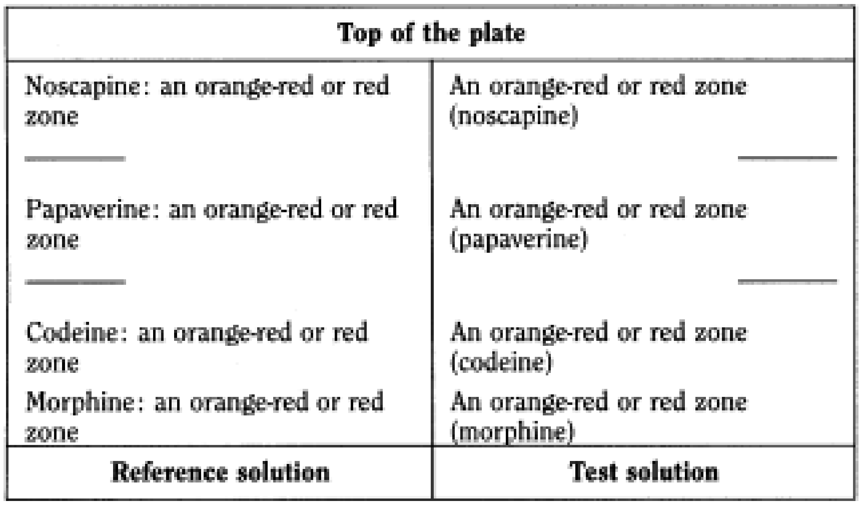
Application 20 µl [or 6 µl] as bands.

Development Over a path of 15 cm [or 8 cm].

Drying At 100-105 °C for 15 min.

Detection: allow to cool and spray the plate with *potassium iodobismuthate solution R2* and then with a 4 g/l solution of *sulphuric acid R*; examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. A dark red zone (thebaine) situated between the zone due to codeine and the zone due to papaverine may be present in the chromatogram obtained with the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
Noscapine: an orange-red or red zone	An orange-red or red zone (noscapine)
Papaverine: an orange-red or red zone	An orange-red or red zone (papaverine)
Codeine: an orange-red or red zone	An orange-red or red zone (codeine)
Morphine: an orange-red or red zone	An orange-red or red zone (morphine)
Reference solution	**Test solution**

TESTS

Ethanol *(2.9.10)*

31 per cent *V/V* to 34 per cent *V/V*.

Thebaine

Liquid chromatography *(2.2.29)*.

Test solution Dilute 2.000 g of the tincture to be examined to 25.0 ml with *ethanol (50 per cent V/V) R*. To 10.0 ml of the solution add 5 ml of *ammonium chloride buffer solution pH 9.5 R*, dilute to 25.0 ml with *water R* and mix. Transfer 20.0 ml of this solution to a chromatography column about 0.15 m long and about 30 mm in internal diameter containing 15 g of *kieselguhr for chromatography R*. Allow to stand for 15 min. Elute with 2 quantities, each of 40 ml, of a mixture of 15 volumes of *2-propanol R* and 85 volumes of *methylene chloride R*. Evaporate the eluate to dryness *in vacuo* at 40 °C. Transfer the residue to a volumetric flask with the aid of the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a) Dissolve 5.0 mg of *thebaine CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b) Dissolve 12.0 mg of *morphine hydrochloride CRS* in the mobile phase and dilute to 15.0 ml with the mobile phase (solution A). Dissolve 10.0 mg of *codeine CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. To 10.0 ml of this solution add 10.0 ml of solution A and mix.

Precolumn:
— *size:* l = 4 mm, Ø = 4.0 mm;
— *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Column:

— *size:* l = 0.25 m, Ø = 4.0 mm;

— *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase Dissolve 1.0 g of *sodium heptanesulphonate monohydrate R* in 420 ml of *water R*, adjust to pH 3.2 with a 4.9 g/l solution of *phosphoric acid R* and add 180 ml of *acetonitrile R.*

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 280 nm.

Injection 20 µl.

System suitability Reference solution (b):

— *resolution*: minimum 2.5 between the peaks due to morphine and codeine.

Calculate the percentage content of thebaine using the following expression:

$$\frac{A_1 \times m_2 \times F \times p}{A_2 \times m_1}$$

A_1 = area of the peak due to the relevant alkaloid in the chromatogram obtained with the test solution

A_2 = area of the peak due to the relevant alkaloid in the chromatogram obtained with the reference solution

m_1 = mass of the tincture to be examined in the test solution, in grams

m_2 = mass of the relevant alkaloid in the reference solution, in grams

p = percentage content of the alkaloid in the relevant alkaloid CRS

F = 1.563 for the determination of thebaine.

Limit:
— *thebaine*: maximum 0.3 per cent.

Dry residue *(2.8.16)*

Minimum 4.0 per cent *m/m*, determined on 3.00 g.

ASSAY

Liquid chromatography *(2.2.29)* as described in the test for thebaine with the following modifications.

Injection Test solution and reference solution (b).

System suitability:
— *repeatability*: maximum relative standard deviation of 1.0 per cent for the area of the peak due to morphine after 6 injections of reference solution (b).

Calculate the percentage content of morphine and codeine from the expression given in the test for thebaine, assigning *F* as 2.604 for morphine and 0.781 for codeine.

Ph Eur

Standardised Senna Leaf Dry Extract

General Notices

(Ph Eur monograph 1261)

Ph Eur

DEFINITION

Standardised dry extract produced from *Senna leaf (0206)*.

Content

5.5 per cent to 8.0 per cent of hydroxyanthracene glycosides, expressed as sennoside B ($C_{42}H_{38}O_{20}$; M_r 863) (dried extract). The measured content does not deviate from the value stated on the label by more than ± 10 per cent.

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (50-80 per cent *V/V*).

CHARACTERS

Appearance

Brownish or brown powder.

IDENTIFICATION

A. Thin-layer chromatography *(2.2.27)*.

Solvent mixture *ethanol (96 per cent) R*, *water R* (50:50 *V/V*).

Test solution To 0.1 g of the extract to be examined add 5 ml of the solvent mixture and heat to boiling. Cool and centrifuge. Use the supernatant liquid.

Reference solution Dissolve 10 mg of *senna extract CRS* in 1 ml of the solvent mixture (a slight residue remains).

Plate *TLC silica gel plate R.*

Mobile phase *glacial acetic acid R*, *water R*, *ethyl acetate R*, *1-propanol R* (1:30:40:40 *V/V/V/V*).

Application 10 µl as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with a 20 per cent *V/V* solution of *nitric acid R* and heat at 120 °C for 10 min; allow to cool and spray with a 50 g/l solution of *potassium hydroxide R* in *ethanol (50 per cent V/V) R* until the zones appear.

Results The principal zones in the chromatogram obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the reference solution. The chromatograms show in the lower third a prominent brown zone due to sennoside B and above it a yellow zone followed by another prominent brown zone due to sennoside A. In the upper half of the chromatograms are visible, in order of increasing R_F value, a prominent reddish-brown zone and an orange-brown zone followed by a faint pink zone and 2 yellow zones. Close to the solvent front a dark pink zone appears, which may be followed by several faint zones.

B. Place about 25 mg of the extract to be examined in a conical flask and add 50 ml of *water R* and 2 ml of *hydrochloric acid R*. Heat in a water-bath for 15 min, cool and shake with 40 ml of *ether R*. Separate the ether layer, dry over *anhydrous sodium sulphate R*, evaporate 5 ml to dryness and to the cooled residue add 5 ml of *dilute ammonia R1*. A yellow or orange colour develops. Heat on a water-bath for 2 min. A reddish-violet colour develops.

TESTS

Loss on drying *(2.8.17)*

Maximum 5.0 per cent.

Microbial contamination

Total viable aerobic count *(2.6.12)* not more than 10^4 micro-organisms per gram, of which not more than 10^2 fungi per gram, determined by plate-count. It complies with the tests for *Escherichia coli* and *Salmonella (2.6.13)*.

ASSAY

Carry out the assay protected from bright light.

Place 0.150 g of the extract to be examined in a 100 ml flask, dissolve in *water R* and dilute to 100.0 ml with the same solvent. Filter the solution, discard the first 10 ml of the filtrate. Transfer 20.0 ml of the filtrate to a 150 ml separating funnel. Add 0.1 ml of *dilute hydrochloric acid R* and shake with 3 quantities, each of 15 ml, of *ether R*. Allow the layers to separate and discard the ether layer. Add 0.10 g of *sodium hydrogen carbonate R* to the aqueous layer and shake for 3 min. Centrifuge and transfer 10.0 ml of the supernatant liquid to a 100 ml round-bottomed flask with a ground-glass neck. Add 20 ml of *ferric chloride solution R1* and mix. Heat for 20 min under a reflux condenser in a water-bath with the water level above that of the liquid in the flask; add 3 ml of *hydrochloric acid R* and heat for a further 30 min with frequent shaking to dissolve the precipitate. Cool, transfer the mixture to a separating funnel and shake with 3 quantities, each of 25 ml, of *ether R* previously used to rinse the flask. Combine the ether layers and wash with 2 quantities, each of 15 ml, of *water R*. Transfer the ether layers to a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 10.0 ml carefully to dryness and dissolve the residue in 10.0 ml of a 5.0 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance *(2.2.25)* at 515 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of hydroxyanthracene glycosides expressed as sennoside B using the following expression:

$$\frac{A \times 4.167}{m}$$

i.e. taking the specific absorbance of sennoside B to be 240.

A = absorbance at 515 nm;

m = mass of the herbal drug to be examined, in grams.

LABELLING

The label states the content of hydroxyanthracene glycosides.

Ph Eur

Star Anise Oil

General Notices

(Ph Eur monograph 2108)

Ph Eur

DEFINITION

Essential oil obtained by steam distillation from the dry ripe fruits of *Illicium verum* Hook. fil.

CHARACTERS

Appearance

Clear, colourless or pale yellow liquid.

IDENTIFICATION

First identification B.

Second identification A.

A. Thin-layer chromatography *(2.2.27)* .

Test solution Dissolve 1 g of the substance to be examined in *toluene R* and dilute to 10 ml with the same solvent.

Reference solution Dissolve 10 µl of *linalol R* , 30 µl of *anisaldehyde R* and 200 µl of *anethole R* and in *toluene R* and dilute to 15 ml with the same solvent. Dilute 1 ml of this solution to 5 ml with *toluene R* .

Plate *TLC silica gel* F_{254} *plate R* .

Mobile phase *ethyl acetate R* , *toluene R* (7:93 *V/V*).

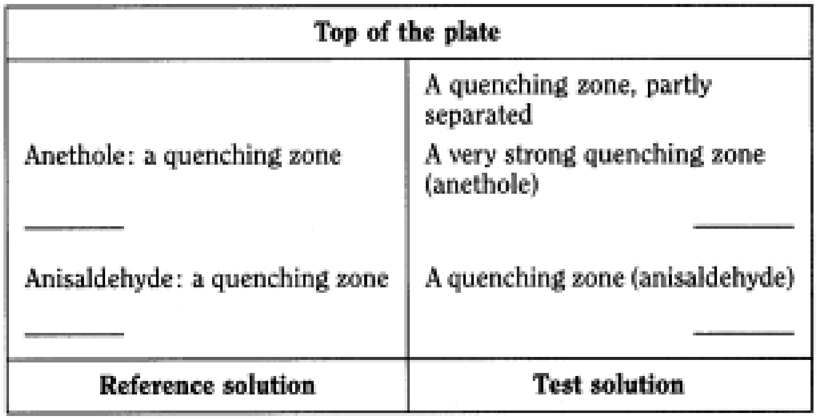
Application 5 µl as bands of 10 mm (for normal TLC plates) or 2 µl as bands of 10 mm (for fine particle TLC plates).

Development Over a path of 15 cm (for normal TLC plates) or over a path of 6 cm (for fine particle size plates).

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

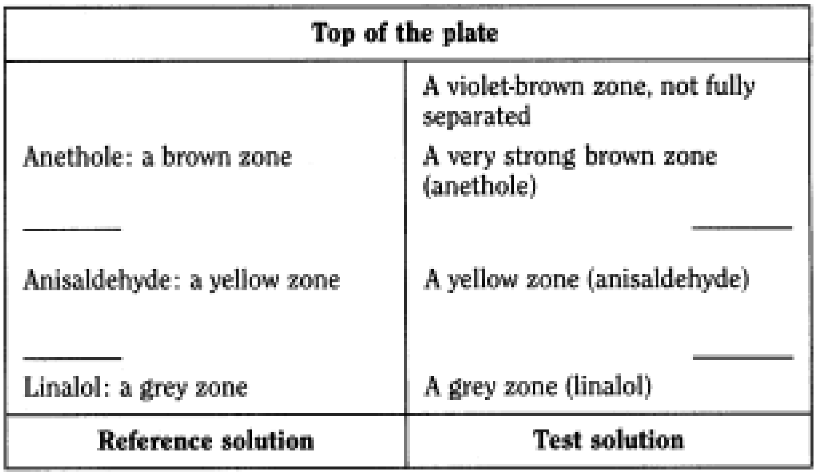
Results A See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A quenching zone, partly separated
Anethole: a quenching zone	A very strong quenching zone (anethole)
_______	_______
Anisaldehyde: a quenching zone	A quenching zone (anisaldehyde)
_______	_______
Reference solution	**Test solution**

Detection B Spray with *methyl 4-acetylbenzoate reagent R* and heat at 100-105 °C for 10 min; examine the still hot plate in daylight within 10 min.

Results B See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A violet-brown zone, not fully separated
Anethole: a brown zone	A very strong brown zone (anethole)
_______	_______
Anisaldehyde: a yellow zone	A yellow zone (anisaldehyde)
_______	_______
Linalol: a grey zone	A grey zone (linalol)
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density ***(2.2.5)***

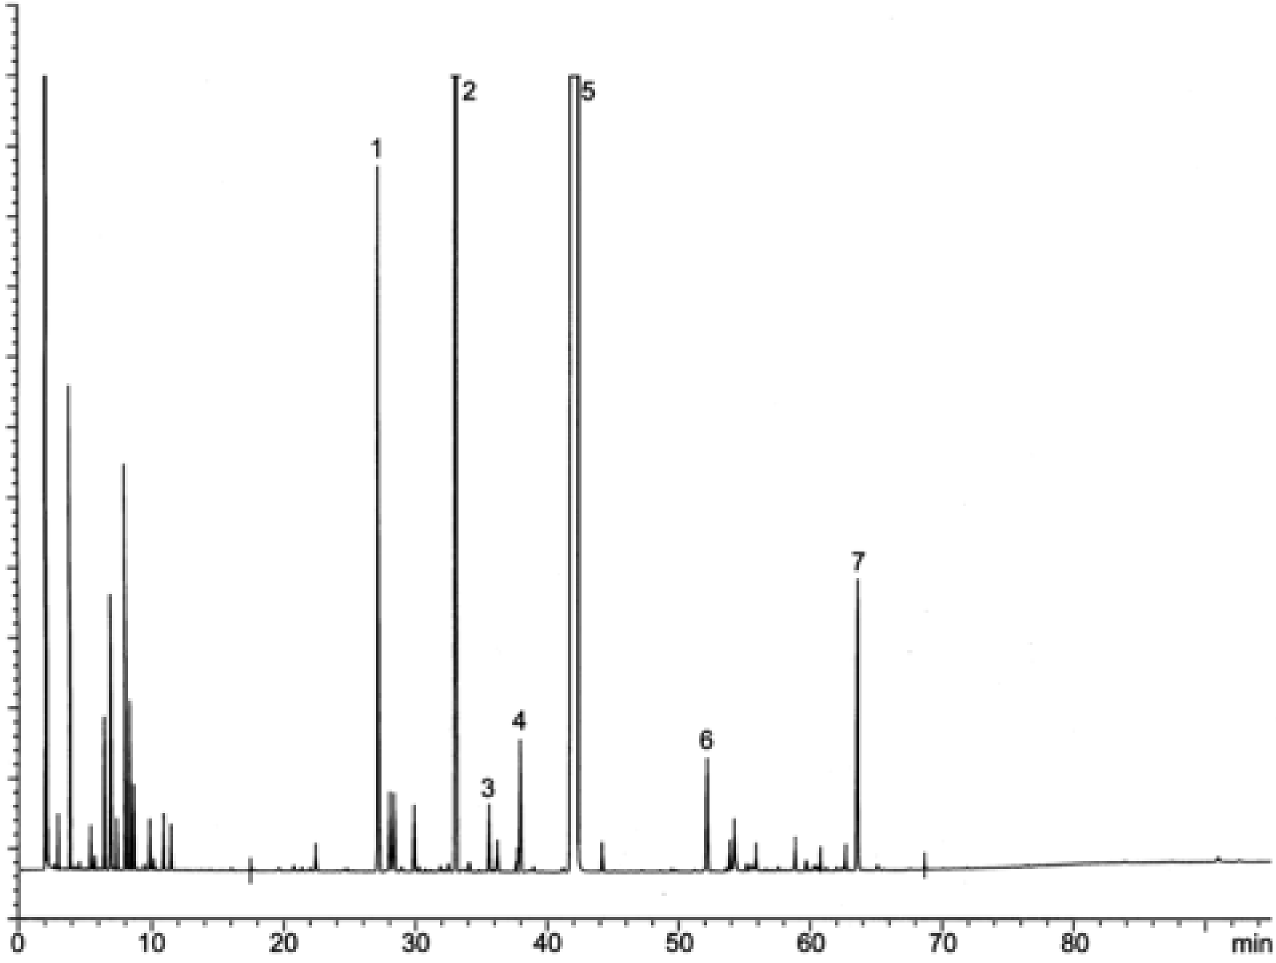
0.979 to 0.985.

Refractive index ***(2.2.6)***

1.553 to 1.556.

Freezing point ***(2.2.18)***

15 °C to 19 °C.



1. linalol
2. estragole
3. α-terpineol
4. *cis*-anethole
5. *trans*-anethole
6. anisaldehyde
7. foeniculin

Figure 2108.-1. – *Chromatogram for the test for chromatographic profile of star anise oil*

Fenchone

Gas chromatography *(2.2.28)* as described in the test for chromatographic profile with the following modifications.

Test solution Dissolve 400 µl of the substance to be examined in 2.0 ml of *hexane R* .

Reference solution (a) Dilute 10 µl of *fenchone R* to 1.2 g with *hexane R* .

Reference solution (b) Dilute 100 µl of reference solution (a) to 100 ml with *hexane R* .

System suitability Reference solution (b):

— *signal-to-noise ratio* : minimum 10 for the principal peak.

Limit:
— *fenchone* : maximum 0.01 per cent.

Pseudoisoeugenyl 2-methylbutyrate

Gas chromatography *(2.2.28)* as described in the test for chromatographic profile with the following modifications.

Test solution The substance to be examined.

Reference solution (a) Dilute 10 mg of the test solution to 1.000 g with *hexane R*. Dilute 0.5 ml of this solution to 100 ml with *hexane R*.

Reference solution (b) *Pseudoisoeugenyl 2-methylbutyrate for peak identification CRS*.

System suitability:

— the chromatogram obtained with reference solution (b) is similar to the chromatogram provided with *pseudoisoeugenyl 2-methylbutyrate for peak identification CRS*.

— *signal-to-noise ratio*: minimum 10 for the principal peak in the chromatogram obtained with reference solution (a).

Limit Locate the peak due to pseudoisoeugenyl 2-methylbutyrate by comparison with the chromatogram provided with *pseudoisoeugenyl 2-methylbutyrate for peak identification CRS*.

— *pseudoisoeugenyl 2-methylbutyrate*: maximum 0.01 per cent.

Fatty oils and resinified essential oils ***(2.8.7)***

It complies with the test for fatty oils and resinified essential oils.

Chromatographic profile

Gas chromatography *(2.2.28)*: use the normalisation procedure.

Test solution Dissolve 200 µl of the substance to be examined in 1.0 ml of *hexane R*.

Reference solution To 1.0 ml of *hexane R*, add 20 µl of *linalol R*, 20 µl of *estragole R*, 20 µl of *α-terpineol R*, 60 µl of *anethole R* and 30 µl of *anisaldehyde R*.

Column:

— *material*: fused silica,

— *size:* *l* = 30 m, Ø = 0.25 mm,

— *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas *helium for chromatography R.*

Flow rate 1.0 ml/min.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 5	60
	5 - 80	60 → 210
	80 - 95	210
Injection port		200
Detector		220

Detection Flame ionisation.

Injection 0.2 µl.

Elution order Order indicated in the composition of the reference solution; record the retention times of these substances.

System suitability Reference solution:

— *resolution*: minimum 1.5 between the peaks due to estragole and α-terpineol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution and locate *cis*-anethole and foeniculin using the chromatogram shown in Figure 2108.-1 (disregard any peak due to hexane).

Determine the percentage content of these components. The percentages are within the following ranges:

— *linalol* : 0.2 per cent to 2.5 per cent,

— *estragole* : 0.5 per cent to 6.0 per cent,

— α-*terpineol* : less than 0.3 per cent,

— *cis-anethole* : 0.1 per cent to 0.5 per cent,

— *trans-anethole* : 86 per cent to 93 per cent,

— *anisaldehyde* : 0.1 per cent to 0.5 per cent,

— *foeniculin*: 0.1 per cent to 3.0 per cent.

STORAGE

In a well-filled, airtight container, protected from light and at a temperature not exceeding 25 °C.

Ph Eur

Star Anise

General Notices

(Ph Eur monograph 1153)

Ph Eur

DEFINITION

Dried composite fruit of *Illicium verum* Hooker fil.

Content:

— minimum 70 ml/kg of essential oil (anhydrous drug),

— minimum 86.0 per cent of *trans*-anethole in the essential oil.

CHARACTERS

The fruit carpels are brown.

Odour of anethole.

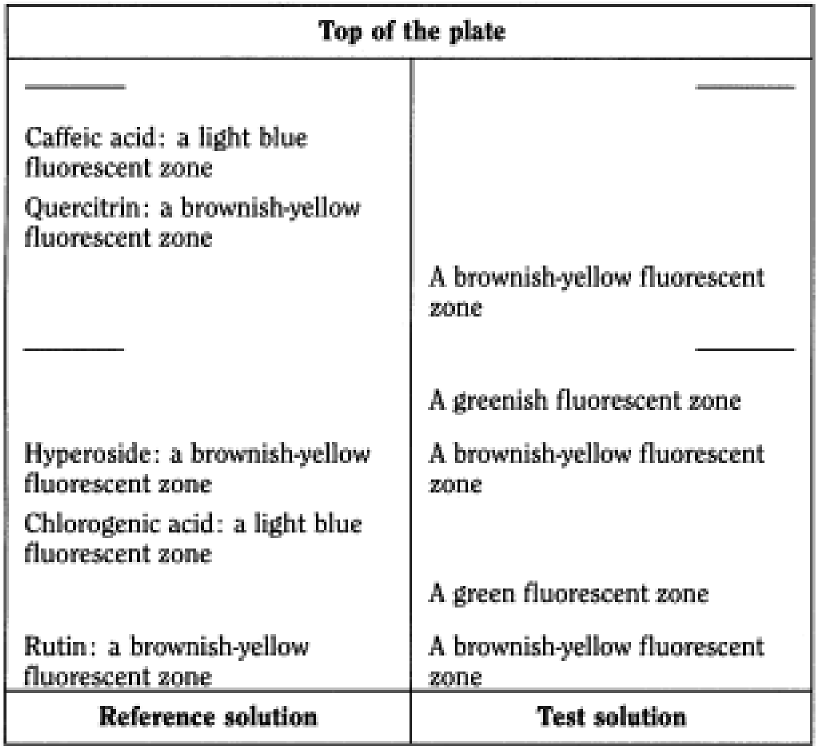
IDENTIFICATION

A. The fruit generally consists of 8 developed, one-seeded follicles, each 12-22 mm long and 6-12 mm high, radially arranged around a short, central, blunt-ending columella. In some fruits 1 or 2 follicles may be missing, but their position is clearly visible. Each follicle is boat-shaped or boot-shaped, with a greyish-brown dorsal surface showing rough markings and lateral surfaces bearing scars from the neighbouring follicles. One or more follicles are split open along the ventral suture, exposing a single, lenticular, shiny, reddish-brown seed about 8 mm in diameter. The markings on the dorsal surface are not visible from the ventral surface. Some of the follicles (1-3) may be imperfectly developed. Isolated follicles, pedicels and seeds may be present.

B. Reduce to a powder (355) *(2.9.12)*. The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: brown epicarpal cells, polygonal in surface view, with a strongly striated cuticle and occasional anomocytic stomata *(2.8.3)* ; fragments of the endocarp with long palisade-like cells; fragments of the mesocarp with large parenchymatous cells, vessels, oil-containing cells and groups of stone cells; fragments of the seed testa with palisade-like, sclerified, strongly pitted, yellow cells up to 200 µm long; fragments of the columella and the fruit stalk with strongly and irregularly thickened, star-shaped stone cells about 400 µm long and 150 µm wide; rhomboidal or rectangular crystals of calcium oxalate.

C. Examine the chromatograms obtained in test B for *Illicium anisatum* (= *I. religiosum*) and certain other *Illicium* spp.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weaker zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
———	———
Caffeic acid: a light blue fluorescent zone	
Quercitrin: a brownish-yellow fluorescent zone	
	A brownish-yellow fluorescent zone
———	———
	A greenish fluorescent zone
Hyperoside: a brownish-yellow fluorescent zone	A brownish-yellow fluorescent zone
Chlorogenic acid: a light blue fluorescent zone	
	A green fluorescent zone
Rutin: a brownish-yellow fluorescent zone	A brownish-yellow fluorescent zone
Reference solution	**Test solution**

TESTS

Illicium anisatum **(=** ***I. religiosum*****) and certain other** ***Illicium*** **spp.**

A. Adulteration with *Illicium anisatum* or certain other *Illicium* spp. is indicated by the presence of fruits mainly consisting of more than 8 follicles; fruits either smaller than 2.5 cm or greater than 3.5 cm; follicles with the suture edged with a thickening extending to the neighbouring follicle, or with dorsal markings visible from the ventral surface; follicles somewhat undulate and ending in a fine beak or a small, ventrally turned hook; follicles with a profile fitting into a rectangle; pedicels more than 5 cm long; seedless fruits; seeds either very flat or almost spherical.

B. Thin-layer chromatography *(2.2.27)* .

Test solution To 2.0 g of the powdered drug (355) *(2.9.12)* add 10 ml of *methanol R* and heat under a reflux condenser in a water-bath at 60 °C for 5 min. Allow to cool and filter.

Reference solution Dissolve 1 mg of *caffeic acid R* , 1 mg of *chlorogenic acid R* , 2.5 mg of *quercitrin R* , 2.5 mg of *rutin R* and 2.5 mg of *hyperoside R* in 10 ml of *methanol R* .

Plate *TLC silica gel plate R* (2-10 µm).

Mobile phase *anhydrous formic acid R* , *glacial acetic acid R* , *water R* , *ethyl acetate R* (11:11:26:100 *V/V/V/V*).

Application 5 µl as bands.

Development Over a path of 6 cm.

Drying In a current of warm air.

Detection Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*; after 30 min, examine in ultraviolet light at 365 nm.

Results The chromatogram obtained with the test solution shows no brownish-yellow fluorescent zone at or above the position of the zone due to quercitrin in the chromatogram obtained with the reference solution. No yellow fluorescent zone is seen at or above the position of the zone due to caffeic acid in the chromatogram obtained with the reference solution. No brownish-yellow fluorescent zone is seen directly above the zone due to hyperoside in the chromatogram obtained with the reference solution.

Water *(2.2.13)*

Maximum 100 ml/kg, determined by distillation on 20.0 g of the powdered drug (355) *(2.9.12)*.

Total ash *(2.4.16)*

Maximum 4.0 per cent.

ASSAY

Essential oil

Carry out the determination of essential oils in herbal drugs *(2.8.12)*. Use a 250 ml round-bottomed flask and 100 ml of *water R* as the distillation liquid. Immediately before the determination, reduce 50.0 g of the drug to a coarse powder (1400) *(2.9.12)* and mix. Further reduce about 10.0 g of this mixture to a finer powder (710) *(2.9.12)*. Use 2.50 g of the powder for the determination. Introduce 0.50 ml of *xylene R* into the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

trans-Anethole

Gas chromatography *(2.2.28)* : use the normalisation procedure.

Test solution Dilute the mixture of essential oil and *xylene R* obtained in the assay of essential oil to 5.0 ml with *xylene R* by rinsing the apparatus.

Reference solution To 1.0 ml of *xylene R* add 20 µl of *estragole R*, 20 mg of α-*terpineol R* and 60 µl of *anethole R*.

Column:

- *material*: fused silica;
- *size*: *l* = 30 m, Ø = 0.25 mm;
- *stationary phase*: *macrogol 20 000 R*.

Carrier gas *helium for chromatography R*.

Flow rate 1.0 ml/min.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 5	60
	5 - 80	60 → 210
	80 - 95	210
Injection port		200
Detector		220

Detection Flame ionisation.

Injection 1 µl.

Elution order Order indicated in the preparation of the reference solution.

System suitability Reference solution:

— *resolution*: minimum 5 between the peaks due to estragole and α-terpineol.

Use the retention times from the chromatogram obtained with the reference solution locate the components of the reference solution in the chromatogram obtained with the test solution.

Calculate the percentage content of *trans*-anethole. Disregard any peak due to the solvent or with an area less than 0.05 per cent of the area of the principal peak in the chromatogram obtained with the test solution.

Ph Eur

Sterculia

General Notices

Sterculia Gum; Karaya Gum

Preparation

Sterculia Granules

When Powdered Sterculia is prescribed or demanded, material complying with the appropriate requirements below and containing not less than 10.0% of volatile acid shall be dispensed or supplied.

DEFINITION

Sterculia is the gum obtained from *Sterculia urens* Roxb. and other species of *Sterculia*.

CHARACTERISTICS

It has the macroscopical and microscopical characters described under Identification tests A and B.

Sparingly soluble in *water*, but swells into a homogeneous, adhesive, gelatinous mass. Practically insoluble in *ethanol (96%)*.

IDENTIFICATION

A. Irregular or vermiform pieces, about 5 to 20 mm thick; greyish white with a brown or pink tinge; surface striated.

B. When powdered and mounted in *ethanol (96%)* it appears as small, transparent, angular particles of various sizes and shapes; the particles lose their sharp edges when *water* is added and each gradually swells until a large, indefinite, almost structureless mass results; when mounted in *ruthenium red solution* the particles are stained red; no blue coloured particles (starch) are visible when mounted in *iodine solution R1*.

C. Add 1 g to 80 ml of *water* and allow to stand for 24 hours, shaking occasionally. A tacky and viscous granular mucilage is produced. Retain the mucilage for use in test D.

D. Boil 4 ml of the mucilage obtained in test C with 0.5 ml of *hydrochloric acid*, add 1 ml of 5M *sodium hydroxide*, filter, add 3 ml of *cupri-tartaric solution R1* to the filtrate and heat. A red precipitate is produced.

E. Warm 0.5 g with 2 ml of 5M *sodium hydroxide*. A brown colour is produced.

TESTS

Acid-insoluble ash

Not more than 1.0%, Appendix XI K.

Foreign matter

Complies with the *test for foreign matter*, Appendix XI D.

Ash

Not more than 7.0%, Appendix XI J.

Volatile acid

Not less than 14.0%, calculated as acetic acid, $C_2H_4O_2$, when determined by the following method. To 1 g contained in a 700 ml Kjeldahl flask add 100 ml of *water* and 5 ml of *orthophosphoric acid*, allow to stand for several hours, or until the gum is completely swollen, and boil gently under a reflux condenser for 2 hours. Steam distil until 800 ml of distillate is obtained and the acid residue measures about 20 ml and titrate the distillate with 0.1M *sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Repeat the operation without the substance being examined. The difference between the titrations represents the amount of alkali required to neutralise the volatile acid. Each ml of 0.1M *sodium hydroxide VS* is equivalent to 6.005 mg of volatile acid, calculated as $C_2H_4O_2$.

Microbial contamination

1.0 g is free from *Escherichia coli*, Appendix XVI B1.

STORAGE

Sterculia should be stored in a dry place.

Stramonium Leaf

General Notices

(Ph Eur monograph 0246)

Preparation

Prepared Stramonium

When Stramonium Leaf or Powdered Stramonium Leaf is prescribed, Prepared Stramonium shall be dispensed.

Ph Eur

DEFINITION

Dried leaf or dried leaf and flowering, and occasionally fruit-bearing, tops of *Datura stramonium* L. and its varieties.

Content

Minimum 0.25 per cent of total alkaloids, expressed as hyoscyamine ($C_{17}H_{23}NO_3$; M_r 289.4) (dried drug). The alkaloids consist mainly of hyoscyamine with varying proportions of hyoscine (scopolamine).

CHARACTERS

Unpleasant odour.

IDENTIFICATION

A. The leaves are dark brownish-green or dark greyish-green, often much twisted and shrunken during drying, thin and brittle, ovate or triangular-ovate, dentately lobed with an acuminate apex and often unequal at the base. Young leaves are pubescent on the veins, older leaves are nearly glabrous. Stems are green or purplish-green, slender, curved and twisted, wrinkled longitudinally and sometimes wrinkled transversely, branched dichasially, with a single flower or an immature fruit in the fork. Flowers, on short pedicels, have a gamosepalous calyx with 5 lobes and trumpet-shaped brownish-white or purplish corolla. The fruit is a capsule, usually covered with numerous short, stiff emergences; seeds are brown or black with a minutely pitted testa.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greyish-green. Examine under a microscope using *chloral hydrate solution R.* The powder shows the following diagnostic characters: fragments of leaf lamina showing epidermal cells with slightly wavy anticlinal walls and smooth cuticle; stomata are more frequent on the lower epidermis (anisocytic and anomocytic) *(2.8.3)*; covering trichomes are conical, uniseriate with 3-5 cells and warty walls; glandular trichomes are short and clavate with heads formed by 2-7 cells; dorsiventral mesophyll, with a single layer of palisade cells and a spongy parenchyma containing cluster crystals of calcium oxalate; annularly and spirally thickened vessels. The powdered drug may also show: fibres and reticulately thickened vessels from the stems; subspherical pollen grains about 60-80 µm in diameter with 3 germinal pores and nearly smooth exine; fragments of the corolla with a papillose epidermis; seed fragments containing yellowish-brown, sinuous, thick-walled sclereids of testa; occasional prisms and microsphenoidal crystals of calcium oxalate.

C. Examine the chromatograms obtained in the Chromatography test.

Results The principal zones in the chromatograms obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the same volume of the reference solution.

D. Shake 1 g of the powdered drug (180) *(2.9.12)* with 10 ml of *0.05 M sulphuric acid* for 2 min. Filter and add to the filtrate 1 ml of *concentrated ammonia R* and 5 ml of *water R*. Shake cautiously with 15 ml of *peroxide-free ether R,* avoiding the formation of an emulsion. Separate the ether layer and dry over *anhydrous sodium sulphate R*. Filter and evaporate the ether in a porcelain dish. Add 0.5 ml of *nitric acid R* and evaporate to dryness on a water-bath. Add 10 ml of *acetone R* and, dropwise, a 30 g/l solution of *potassium hydroxide R* in *ethanol (96 per cent) R*. A deep violet colour develops.

TESTS

Chromatography

Thin-layer chromatography *(2.2.27)*.

Test solution To 1.0 g of the powdered drug (180) (*2.9.12*) add 10 ml of *0.05 M sulphuric acid,* shake for 15 min and filter. Wash the filter *with 0.05 M sulphuric acid* until 25 ml of filtrate is obtained. To the filtrate add 1 ml of *concentrated ammonia R* and shake with 2 quantities, each of 10 ml, of *peroxide-free ether R*. If necessary, separate by centrifugation. Dry the combined ether layers over *anhydrous sodium sulphate R,* filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 ml of *methanol R*.

Reference solution Dissolve 50 mg of *hyoscyamine sulphate R* in 9 ml of *methanol R*. Dissolve 15 mg of *hyoscine hydrobromide R* in 10 ml of *methanol R*. Mix 3.8 ml of the hyoscyamine sulphate solution and 4.2 ml of the hyoscine hydrobromide solution and dilute to 10 ml with *methanol R*.

Plate *TLC silica gel G plate R*.

Mobile phase *concentrated ammonia R, water R, acetone R* (3:7:90 *V/V/V*).

Application 10 µl and 20 µl, as bands of 20 mm by 3 mm, leaving 1 cm between the bands.

Development Over a path of 10 cm.

Drying At 100-105 °C for 15 min and allow to cool.

Detection A Spray with *potassium iodobismuthate solution R2*, using about 10 ml for a plate 200 mm square, until the orange or brown zones become visible against a yellow background.

Results A The zones in the chromatograms obtained with the test solution are similar in position (hyoscyamine in the lower third, hyoscine in the upper third of the chromatogram) and colour to those in the chromatograms obtained with the reference solution. The zones in the chromatograms obtained with the test solution are at least equal in size to the corresponding zones in the chromatogram obtained with the same volume of the reference solution. Faint secondary zones may appear, particularly in the middle of the chromatogram obtained with 20 µl of the test solution or near the starting point in the chromatogram obtained with 10 µl of the test solution.

Detection B Spray with *sodium nitrite solution R* until the coating is transparent; examine after 15 min.

Results B The zones due to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from brown to reddish-brown but not to greyish-blue (atropine) and any secondary zones disappear.

Foreign matter *(2.8.2)*

Maximum 3 per cent stems with a diameter greater than 5 mm.

Total ash *(2.4.16)*

Maximum 20.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 4.0 per cent.

ASSAY

a) Determine the loss on drying *(2.2.32)* on 2.000 g of the powdered drug (180) *(2.9.12)* by drying in an oven at 105 °C.

b) Moisten 10.0 g of the powdered drug (180) *(2.9.12)* with a mixture of 5 ml of *ammonia R*, 10 ml of *ethanol (96 per cent) R* and 30 ml of *peroxide-free ether R* and mix thoroughly. Transfer the mixture to a suitable percolator, if necessary with the aid of the extracting mixture. Allow to macerate for 4 h and percolate with a mixture of 1 volume of *chloroform R* and 3 volumes of *peroxide-free ether R* until the alkaloids are completely extracted. Evaporate to dryness a few millilitres of the liquid flowing from the percolator, dissolve the residue in *0.25 M sulphuric acid* and verify the absence of alkaloids using *potassium tetraiodomercurate solution R*. Concentrate the percolate to about 50 ml by distilling on a water-bath and transfer it to a separating funnel, rinsing with *peroxide-free ether R*. Add a quantity of *peroxide-free ether R* equal to at least 2.1 times the volume of the percolate to produce a liquid of a density well below that of water. Shake the solution with no fewer than 3 quantities, each of 20 ml, of *0.25 M sulphuric acid*, separate the 2 layers by centrifugation if necessary and transfer the acid layers to a second separating funnel. Make the acid layer alkaline with *ammonia R* and shake with 3 quantities, each of 30 ml, of *chloroform R.* Combine the chloroform layers, add 4 g of *anhydrous sodium sulphate R* and allow to stand for 30 min with occasional shaking. Decant the chloroform and wash the anhydrous sodium sulphate with 3 quantities, each of 10 ml, of *chloroform R.* Add the washings to the chloroform extract, evaporate to dryness on a water-bath and heat in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of *chloroform R*, add 20.0 ml of *0.01 M sulphuric acid* and remove the chloroform by evaporation on a water-bath. Titrate the excess of acid with *0.02 M sodium hydroxide* using *methyl red mixed solution R* as indicator.

Calculate the percentage content of total alkaloids, expressed as hyoscyamine, using the following expression:

$$\frac{57.88\,(20-n)}{(100-d)\,m}$$

d = loss on drying, as a percentage

n = volume of *0.02 M sodium hydroxide*, in millilitres

m = mass of drug, in grams

STORAGE

Protected from moisture.

Ph Eur

Strong Ginger Tincture

General Notices

Ginger Essence

DEFINITION

Ginger, in moderately coarse powder	500 g
Ethanol (90 per cent)	Sufficient to produce 1000 ml

Extemporaneous preparation

The following directions apply.

Prepare by *percolation*, Appendix XI F.
The tincture complies with the requirements for Tinctures stated under Extracts and with the following requirements.

TESTS

Ethanol content

80 to 88% v/v, Appendix VIII F, Method III.

Dry residue

2.0 to 3.0% w/v.

Relative density

0.832 to 0.846, Appendix V G.

Sumatra Benzoin Tincture

General Notices

(Ph Eur monograph 1813)

Ph Eur

DEFINITION

Tincture produced from *Sumatra benzoin (1814)*.

Content

Minimum 4.0 per cent *m/m* of total acids, calculated as benzoic acid ($C_7H_6O_2$; M_r 122.1).

PRODUCTION

The tincture is produced from 1 part of the drug and 5 parts of ethanol (75 per cent *V/V* to 96 per cent *V/V*) by a suitable procedure.

CHARACTERS

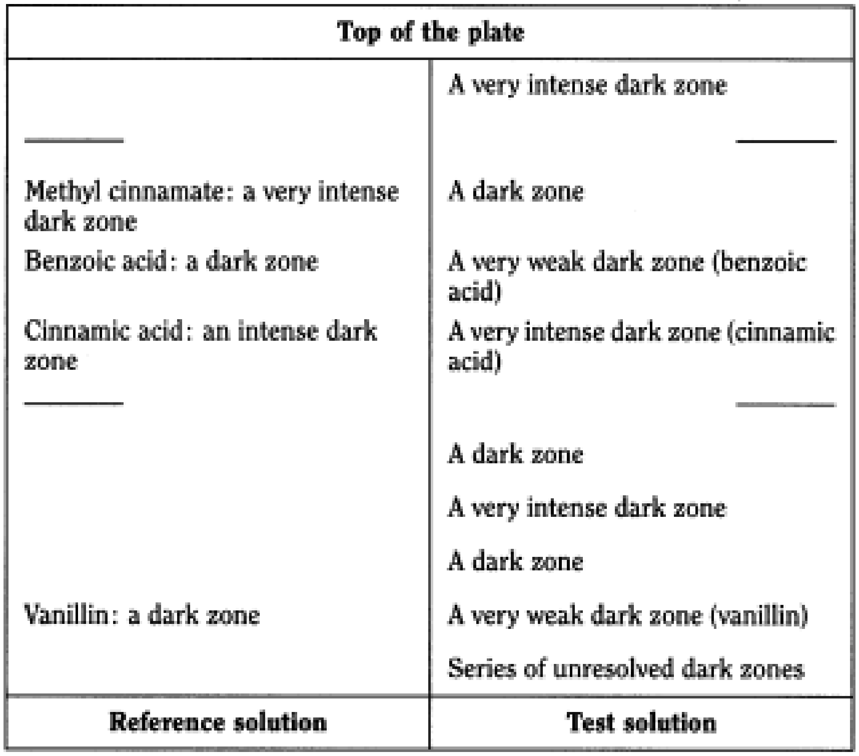
Appearance

Orange-yellow liquid.

IDENTIFICATION

Examine the chromatograms obtained in the test for Siam benzoin tincture.

Results See below the sequence of quenching zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A very intense dark zone
———	———
Methyl cinnamate: a very intense dark zone	A dark zone
Benzoic acid: a dark zone	A very weak dark zone (benzoic acid)
Cinnamic acid: an intense dark zone	A very intense dark zone (cinnamic acid)
———	———
	A dark zone
	A very intense dark zone
	A dark zone
Vanillin: a dark zone	A very weak dark zone (vanillin)
	Series of unresolved dark zones
Reference solution	**Test solution**

TESTS

Siam benzoin tincture

Thin-layer chromatography *(2.2.27)* .

Test solution The tincture to be examined.

Reference solution Dissolve 20 mg of *benzoic acid R* , 10 mg of *trans-cinnamic acid R* , 4 mg of *vanillin R* and 20 mg of *methyl cinnamate R* in 20 ml of ethanol of the same concentration as that used for the production of the tincture.

Plate *TLC silica gel* F_{254} *plate R* (5-40 µm) [or *TLC silica gel* F_{254} *plate R* (2-10 µm)].

Mobile phase *glacial acetic acid R, di-isopropyl ether R, hexane R* (10:40:60 *V/V/V*).

Application 20 µl [or 8 µl] as bands.

Development Over a path of 12 cm [or 6 cm].

Drying In air.

Detection Examine in ultraviolet light at 254 nm.

Results The chromatogram obtained with the test solution does not show zones due to benzoic acid and vanillin that are more intense than the corresponding zones in the chromatogram obtained with the reference solution.

Ethanol *(2.9.10)*

95 per cent to 105 per cent of the content stated on the label.

ASSAY

Place 3.50 g in a 250 ml borosilicate glass flask and add 15.0 ml of *0.5 M alcoholic potassium hydroxide* . Boil under a reflux condenser on a water-bath for 30 min. Allow to cool and rinse the condenser with 20 ml of *ethanol (96 per cent) R* . Titrate the excess of potassium hydroxide with *1 M hydrochloric acid* , determining the end-point potentiometrically *(2.2.20)* . Carry out a blank titration.

1 ml of *0.5 M alcoholic potassium hydroxide* is equivalent to 61.05 mg of benzoic acid ($C_7H_6O_2$).

Preparations

Benzoin Inhalation

Compound Benzoin Tincture

Sumatra Benzoin Tincture

Ph Eur

DEFINITION

Resin obtained by incising the trunk of *Styrax benzoin* Dryander.

Content

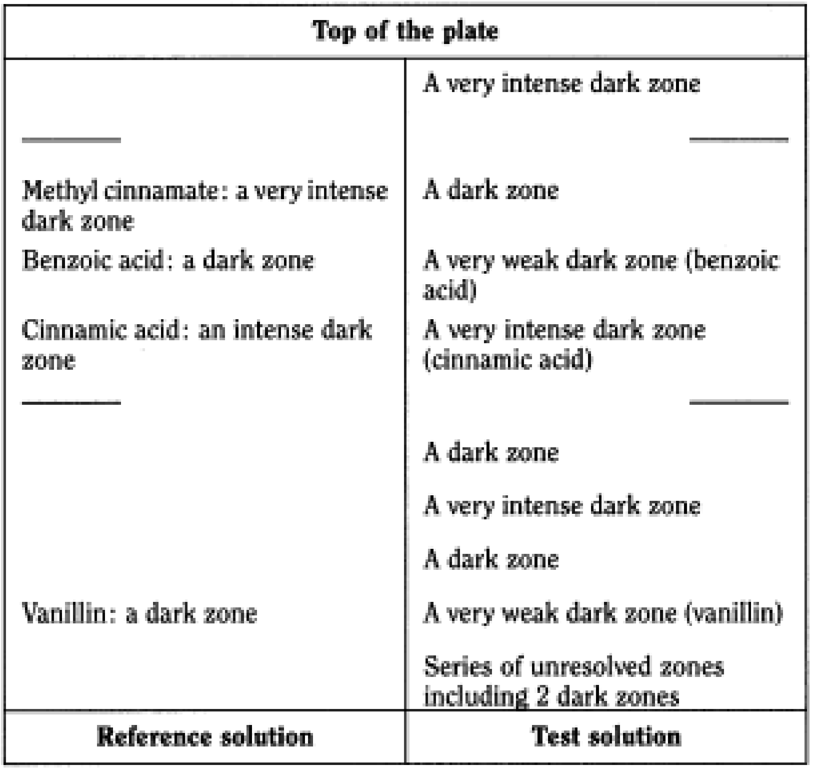
25.0 per cent to 50.0 per cent of total acids, calculated as benzoic acid ($C_7H_6O_2$; M_r 122.1) (dried drug).

IDENTIFICATION

A. Sumatra benzoin occurs as creamy white, rounded to ovoid tears, which may be embedded in a dull greyish-brown or reddish-brown matrix. It is hard and brittle and the fractured surface is dull and uneven.

B. Examine the chromatograms obtained in test B for *Styrax tonkinensis*.

Results See below the sequence of quenching zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A very intense dark zone
———	———
Methyl cinnamate: a very intense dark zone	A dark zone
Benzoic acid: a dark zone	A very weak dark zone (benzoic acid)
Cinnamic acid: an intense dark zone	A very intense dark zone (cinnamic acid)
———	———
	A dark zone
	A very intense dark zone

Vanillin: a dark zone	A very weak dark zone (vanillin)
	Series of unresolved zones including 2 dark zones
Reference solution	**Test solution**

TESTS

Dammar gum

Thin-layer chromatography *(2.2.27)* .

Test solution Dissolve 0.2 g of the drug to be examined with gentle heating in 10 ml of *ethanol (90 per cent V/V) R* and centrifuge.

Plate *TLC aluminium oxide G plate R* .

Mobile phase *Light petroleum R4, ether R* (40:60 *V/V*).

Application 5 µl.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R* and heat at 100-105 °C for 5 min.

Results The chromatogram obtained does not show any prominent spot with an R_F between 0.4 and 1.0.

Styrax tonkinensis

A. To 0.2 g of the finely powdered drug add 10 ml of *ethanol (96 per cent) R* . Shake vigorously until almost completely dissolved and filter. Place 5 ml of the filtrate in a test-tube and add 0.5 ml of a 50 g/l solution of *ferric chloride R* in *ethanol (96 per cent) R* . A yellowish, slightly green colour is produced.

B. Thin-layer chromatography *(2.2.27)* .

Test solution Sonicate 0.2 g of the finely powdered drug in 5 ml of *ethanol (96 per cent) R* and filter. Collect the filtrate.

Reference solution Dissolve 20 mg of *benzoic acid R*, 10 mg of *trans-cinnamic acid R*, 4 mg of *vanillin R* and 20 mg of *methyl cinnamate R* in 10 ml of *ethanol (96 per cent) R*.

Plate *TLC silica gel F_{254} plate R* (5-40 µm) [or *TLC silica gel F_{254} plate R* (2-10 µm)].

Mobile phase *glacial acetic acid R*, *di-isopropyl ether R*, *hexane R* (10:40:60 *V/V/V*).

Application 10 µl [or 2 µl] as bands.

Development Over a path of 12 cm [or 5 cm].

Drying In air.

Detection Examine in ultraviolet light at 254 nm.

Results The chromatogram obtained with the test solution shows 2 faint zones in the same positions as the dark zones due to benzoic acid and vanillin in the chromatogram obtained with the reference solution.

Matter insoluble in ethanol

Maximum 20.0 per cent.

To 2.0 g of the powdered drug add 25 ml of *ethanol (90 per cent V/V) R*. Boil until almost completely dissolved. Filter through a tared sintered-glass filter (16) *(2.1.2)* and wash with 3 quantities, each of 5 ml, of boiling *ethanol (90 per cent V/V) R*. Heat the glass filter and its contents in an oven at 100-105 °C for 2 h. Allow to cool and weigh.

Loss on drying *(2.2.32)*

Maximum 5.0 per cent, determined on 2.000 g of the coarsely powdered drug by drying *in vacuo* for 4 h.

Total ash *(2.4.16)*

Maximum 2.0 per cent.

ASSAY

Place 0.750 g of the finely powdered drug in a 250 ml borosilicate glass flask and add 15.0 ml of *0.5 M alcoholic potassium hydroxide*. Boil under a reflux condenser on a water-bath for 30 min. Allow to cool and rinse the condenser with 20 ml of *ethanol (96 per cent) R*. Titrate the excess of potassium hydroxide with *0.5 M hydrochloric acid*, determining the end-point potentiometrically *(2.2.20)*. Carry out a blank titration.

1 ml of *0.5 M alcoholic potassium hydroxide* is equivalent to 61.05 mg of benzoic acid ($C_7H_6O_2$).

Ph Eur

Sweet Fennel

General Notices

(Ph Eur monograph 0825)

Ph Eur

DEFINITION

Dry cremocarps and mericarps of *Foeniculum vulgare* Miller sp. *vulgare* var. *dulce* (Miller) Thellung.

Content:

— *essential oil*: minimum 20 ml/kg (anhydrous drug);

— *anethole* : minimum 80.0 per cent in the essential oil.

CHARACTERS

Sweet fennel is pale green or pale yellowish-brown.

IDENTIFICATION

A. The fruit of sweet fennel is a cremocarp of almost cylindrical shape with a rounded base and a narrowed summit crowned with a large stylopod. It is generally 3-12 mm long and 3-4 mm wide. The mericarps, usually free, are glabrous. Each bears 5 prominent, slightly carenated ridges. When cut transversely, 4 vittae on the dorsal surface and 2 on the commissural surface may be seen with a lens.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greyish-brown or greyish-yellow. Examine under a microscope using *chloral hydrate solution R* . The powder shows the following diagnostic characters: yellow fragments of wide secretory canals, often made up of yellowish-brown-walled polygonal secretory cells, frequently associated with a layer of thin-walled transversely elongated cells 2-9 µm wide, having a parquetry arrangement; reticulate parenchyma of the mesocarp; numerous fibre bundles from the ridges, often accompanied by narrow spiral vessels; very numerous endosperm fragments containing aleurone grains and very small calcium oxalate microrosette crystals, as well as some fibre bundles from the carpophore.

C. Thin-layer chromatography *(2.2.27)* .

Test solution Shake 0.3 g of the freshly powdered drug (1400) *(2.9.12)* with 5.0 ml of *methylene chloride R* for 15 min. Filter and carefully evaporate the filtrate to dryness on a water-bath at 60 °C. Dissolve the residue in 0.5 ml of *toluene R* .

Reference solution Dissolve 60 µl of *anethole R* in 5.0 ml of *hexane R* .

Plate *TLC silica gel GF_{254} plate R.*

Mobile phase *hexane R* , *toluene R* (20:80 *V/V*).

Application 10 µl, as bands of 20 mm by 3 mm.

Development Over a path of 10 cm.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

Results A The chromatograms show in the central part a quenching zone due to anethole.

Detection B Spray with *sulphuric acid R* and heat at 140 °C for 5 min; examine in daylight.

Results B The chromatograms show in the central part a violet band due to anethole; the chromatogram obtained with the test solution also shows a reddish-brown zone in the upper third (terpenes).

TESTS

Estragole and fenchone

Gas chromatography *(2.2.28)* : use the normalisation procedure.

Test solution Dilute the mixture of essential oil and *xylene R* obtained in the assay of essential oil to 5.0 ml with *xylene R* , by rinsing the apparatus.

Reference solution Dissolve 5 mg of *estragole R* and 5 mg of *fenchone R* in 0.5 ml of *xylene R* .

Column:
— *size*: *l* = 30-60 m, Ø = 0.3 mm;
— *stationary phase*: *macrogol 20 000 R* .

Carrier gas *nitrogen for chromatography R.*

Flow rate 0.40 ml/min.

Split ratio 1:200.

	Time (min)	Temperature (°C)
Column	0 - 4	60
	4 - 26	60 → 170
	26 - 41	170
Injection port		220
Detector		270

Detection Flame ionisation.

Injection 1 µl.

Limits:

- *estragole* : maximum 10.0 per cent in the essential oil;
- *fenchone* : maximum 7.5 per cent in the essential oil.

Foreign matter ***(2.8.2)***

Maximum 1.5 per cent of peduncles and maximum 1.5 per cent of other foreign matter.

Water ***(2.2.13)***

Maximum 80 ml/kg, determined on 20.0 g of the powdered drug (710) *(2.9.12)*.

Total ash ***(2.4.16)***

Maximum 10.0 per cent.

ASSAY

Essential oil

Carry out the determination of essential oils in herbal drugs *(2.8.12)* . Use a 500 ml round-bottomed flask and 200 ml of *water R* as the distillation liquid. Reduce the drug to a coarse powder (1400) *(2.9.12)* and immediately use 10.0 g for the determination. Introduce 0.50 ml of *xylene R* into the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

Anethole

Gas chromatography *(2.2.28)* as described in the test for estragole and fenchone with the following modification.

Reference solution Dissolve 5 mg of *anethole R* in 0.5 ml of *xylene R* .

STORAGE

Protected from moisture.

Ph Eur

Sweet Orange Oil

General Notices

(Ph Eur monograph 1811)

Ph Eur

DEFINITION

Essential oil obtained without heating, by suitable mechanical treatment from the fresh peel of the fruit of *Citrus sinensis* (L.) Osbeck (*Citrus aurantium* L. var. *dulcis* L.). A suitable antioxidant may be added.

CHARACTERS

Appearance

Clear, pale yellow to orange, mobile liquid, which may become cloudy when chilled.

It has a characteristic odour of fresh orange peel.

IDENTIFICATION

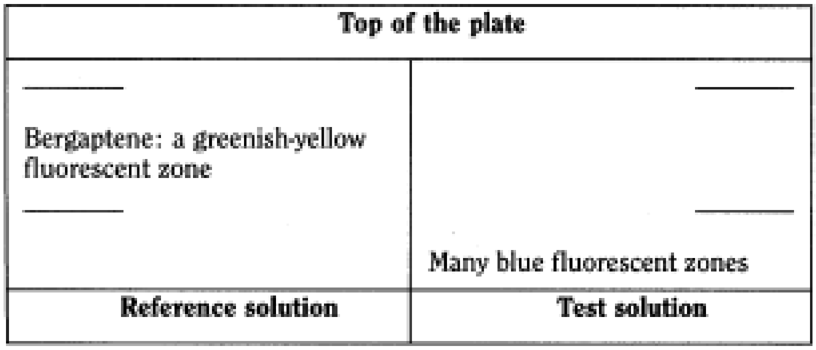
First identification *B.*

Second identification *A.*

A. Thin-layer chromatography (*2.2.27*).

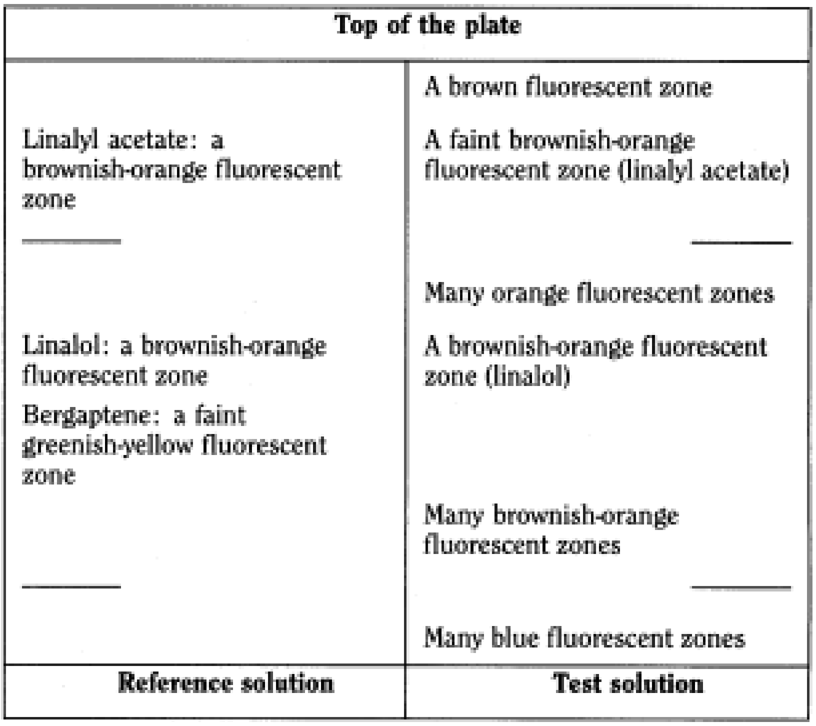
Examine the chromatograms obtained in the test for bergapten.

Results A See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
_______	_______
Bergaptene: a greenish-yellow fluorescent zone	
_______	_______
	Many blue fluorescent zones
Reference solution	**Test solution**

Results B See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
	A brown fluorescent zone
Linalyl acetate: a brownish-orange fluorescent zone	A faint brownish-orange fluorescent zone (linalyl acetate)
_______	_______
	Many orange fluorescent zones
Linalol: a brownish-orange fluorescent zone	A brownish-orange fluorescent zone (linalol)
Bergaptene: a faint greenish-yellow fluorescent zone	
	Many brownish-orange fluorescent zones
_______	_______
	Many blue fluorescent zones
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (*2.2.5*)

0.842 to 0.850.

Refractive index (*2.2.6*)

1.470 to 1.476.

Optical rotation (*2.2.7*)

+ 94 ° to + 99 °.

Peroxide value (*2.5.5, Method B*)

Maximum 20.

Fatty oils and resinified essential oils (*2.8.7*)

It complies with the test for fatty oils and resinified essential oils.

Bergaptene

Thin-layer chromatography (*2.2.27*).

Test solution Dilute 0.2 ml of the substance to be examined in 1 ml of *alcohol R*.

Reference solution Dissolve 2 mg of *bergaptene R*, 10 µl *of linalol R* and 20 µl of *linalyl acetate R* in 10 ml of *alcohol R*.

Plate *TLC silica gel plate R.*

Mobile phase *ethyl acetate R*, *toluene R* (15:85 *V/V*).

Application 10 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection A Examine in ultraviolet light at 365 nm.

Results A The chromatogram obtained with the test solution shows no greenish-yellow fluorescent zone present in the chromatogram obtained with the reference solution.

Detection B Spray with *anisaldehyde solution R* and heat at 100-105 °C for 10 min; examine the plate in ultraviolet light at 365 nm.

Chromatographic profile

Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution Dilute 300 µl of the substance to be examined to 1 ml with *acetone R*.

Reference solution (a) Dilute 10 µl of α-*pinene R*, 10 µl of β-*pinene R*, 10 µl of *sabinene R*, 20 µl of β-*myrcene R*, 800 µl of *limonene R*, 10 µl of octanal, 10 µl of *decanal R*, 10 µl of *linalol R*, 10 µl of *citral R* (composed of neral and geranial) and 10 µl of *valencene R* in 1 ml of *acetone R*.

Reference solution (b) Dissolve 5 µl of β-*pinene R* in 10 ml of *acetone R*. Dilute 0.5 ml to 10 ml with *acetone R*.

Column:

— *material*: fused silica;

— *size: l* = 30 m, Ø = 0.53 mm;

— *stationary phase*: *macrogol 20 000 R* (film thickness 1 µm).

Carrier gas *helium for chromatography R*.

Flow rate 1 ml/min.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 6	50
	6 - 31	50 → 150
	31 - 41	150 → 180
	41 - 55	180
Injection port		250
Detector		250

Detection Flame ionisation.

Injection 0.5 µl.

Elution order Order indicated in the composition of reference solution (a). Record the retention times of these substances.

System suitability Reference solution (a)

- *resolution*: minimum 3.9 between the peaks due to β-pinene and sabinene and minimum 1.5 between the peaks due to valencene and geranial.

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

Determine the percentage content of these components. The limits are within the following ranges:

- α-*pinene*: 0.4 per cent to 0.6 per cent;
- β-*pinene*: 0.02 per cent to 0.3 per cent;
- *sabinene*: 0.2 per cent to 1.1 per cent;
- β-*myrcene*: 1.7 per cent to 2.5 per cent;
- *limonene*: 92.0 per cent to 97.0 per cent;
- *octanal*: 0.1 per cent to 0.4 per cent;
- *decanal*: 0.1 per cent to 0.4 per cent;
- *linalol*: 0.2 per cent to 0.7 per cent;
- *neral*: 0.02 per cent to 0.10 per cent;
- *valencene*: 0.02 per cent to 0.5 per cent;
- *geranial*: 0.03 per cent to 0.20 per cent.

Disregard limit: area of the peak in the chromatogram obtained with reference solution (b) (0.01 per cent).

Residue on evaporation

1.0 per cent to 5.0 per cent.

Evaporate 5.0 g to dryness on a water-bath and dry at 100-105 °C for 4 h.

STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

Tea Tree Oil

General Notices

Melaleuca Oil

(Ph Eur monograph 1837)

Ph Eur

DEFINITION

Essential oil obtained by steam distillation from the foliage and terminal branchlets of *Melaleuca alternifolia* (Maiden and Betch) Cheel, *M. linariifolia* Smith, *M. dissitiflora* F. Mueller and/or other species of *Melaleuca*.

CHARACTERS

Appearance

Clear, mobile, colourless to pale yellow liquid with a characteristic odour.

IDENTIFICATION

First identification *B.*

Second identification *A.*

A. Thin-layer chromatography *(2.2.27)*.

Test solution Dissolve 0.1 ml of the substance to be examined in 5 ml of *heptane R.*

Reference solution Dissolve 30 µl of *cineole R*, 60 µl of *terpinen-4-ol R* and 10 mg of α-*terpineol R* in 10 ml of *heptane R*.

Plate *TLC silica gel plate R*.

Mobile phase *ethyl acetate R, heptane R* (20:80 *V/V*).

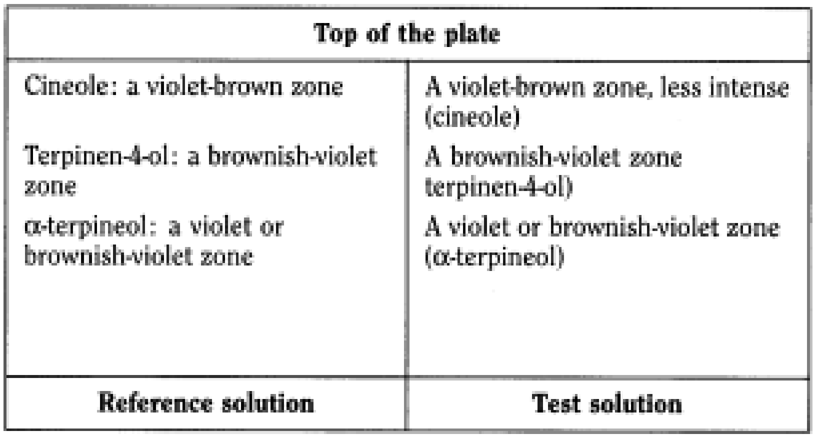
Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min while observing. Examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.



Top of the plate	
Cineole: a violet-brown zone	A violet-brown zone, less intense (cineole)
Terpinen-4-ol: a brownish-violet zone	A brownish-violet zone terpinen-4-ol)
α-terpineol: a violet or brownish-violet zone	A violet or brownish-violet zone (α-terpineol)
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density *(2.2.5)*

0.885 to 0.906.

Refractive index *(2.2.6)*

1.475 to 1.482.

Optical rotation *(2.2.7)*

+ 5° to + 15°.

Chromatographic profile

Gas chromatography *(2.2.28)*: use the normalisation procedure.

Test solution Dissolve 0.15 ml of the substance to be examined in 10 ml of *hexane R*.

Reference solution Dissolve 5 µl of α-*pinene R,* 5 µl of *sabinene R*, 15 µl of α-*terpinene R,* 5 µl of *limonene R*, 5 µl of *cineole R,* 30 µl of γ-*terpinene R*, 5 µl of p-cymene R, 5 µl of *terpinolene R*, 60 µl of *terpinen-4-ol R*, 5 µl of *aromadendrene R* and 5 mg of α-*terpineol R* in 10 ml of *hexane R*.

Column:

— *material*: fused silica;

— *size*: *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm;

— *stationary phase: macrogol 20 000 R*.

Carrier gas *helium for chromatography R*.

Flow rate 1.3 ml/min.

Split ratio 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	50
	1 - 37	50 → 230
	37 - 45	230
Injection port		240
Detector		240

Detection Flame ionisation.

Injection 1 µl.

Elution order Order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability Reference solution:

— *resolution*: minimum 2.7 between the peaks due to terpinen-4-ol and aromadendrene.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution. Disregard the peak due to hexane.

Determine the percentage content of these components. The percentages are within the following ranges:

— α-*pinene*: 1.0 per cent to 6.0 per cent;

— *sabinene*: less than 3.5 per cent;

— α-*terpinene*: 5.0 per cent to 13.0 per cent;

— *limonene*: 0.5 per cent to 4.0 per cent;

— *cineole*: less than 15.0 per cent;

— γ-*terpinene*: 10.0 per cent to 28.0 per cent;

— *p-cymene*: 0.5 per cent to 12.0 per cent;

— *terpinolene*: 1.5 per cent to 5.0 per cent;

— *terpinen-4-ol* : minimum 30.0 per cent;

— *aromadendrene*: less than 7.0 per cent;

— α-*terpineol* : 1.5 per cent to 8.0 per cent.

STORAGE

In an airtight, well-filled container, protected from light, at a temperature not exceeding 25 °C.

Ph Eur

Terminalia Arjuna Stem Bark for use in THMP

General Notices

DEFINITION

Terminalia Arjuna Stem Bark for use in THMP consists of cut dried bark of the stems of *Terminalia arjuna* W. and A. It contains not less than 6% of tannins, expressed as pyrogallol, calculated with reference to the dried drug.

IDENTIFICATION

A. Irregularly flattened or slightly curved or recurved pieces, up to about 8 cm long, 4 cm wide and 1 cm thick; outer surface uneven, dark brown or sometimes mottled greyish-brown, smooth or, more frequently, irregularly striated longitudinally with occasional transverse ridges; inner surface pink to reddish brown with longitudinal striations and occasional paler brown patches. Fracture short and starchy in the inner part, the outer part frequently laminated.

B. Reduce to a powder (355). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution*. The powder shows a variety of parenchymatous cells, some thin-walled, square or round and others yellowish, polygonal and thick-walled. Rectangular or polygonal, pitted, thin-walled, light brown, lightly lignified cells from the cork layer or outer areas of the cortex are present.

Fibres occur singly and in small or large groups, individual cells narrowing to highly pointed ends, and possibly showing wavy invaginations of the walls where surrounding cells have become detached; degree of lignification varies; walls are yellowish brown, some pitted, others not. Single fibres may be complete, but those in groups are usually fragmented, individual cells being straight or noticeably curved in places. Rounded cells of the medullary rays, which are one cell wide, intersperse the fibres.

Small, calcium oxalate cluster crystals occur scattered throughout as well as being found within parenchymatous cells, some forming a crystal sheath alongside the fibres. Other crystals are very large and less well defined, and usually free.

Examine under a microscope using 50% v/v of *glycerol*. Starch granules are frequent, but not abundant, mainly free, but some in parenchymatous cells. They are small, simple, round, oval or irregular in shape, and occasionally in 2 to 3 compound granules, without visible hila. More or less frequent scattered lumps of brown pigment may be found sometimes in parenchymatous cells.

C. Carry out the method for *thin-layer chromatography,* Appendix III A, using the following solutions.

(1) Shake 1.0 g of the powdered drug with 10 ml of *absolute ethanol*, centrifuge at 3000 rpm for 5 minutes and filter (Whatman GF/C is suitable).

(2) 0.01% w/v each of *arjunolic acid* and *gallic acid* in *absolute ethanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating high performance silica gel (Merck silica gel 60 HPTLC plates are suitable).

(b) Use the mobile phase described below.

(c) Apply as bands 8 µl of each solution.

(d) Develop the plate to 8 cm.

(e) Remove the plate and allow it to dry in air for 5 minutes. Spray the plate with *anisaldehyde solution*, heat at 100° to 105° for 5 minutes and examine in daylight.

MOBILE PHASE

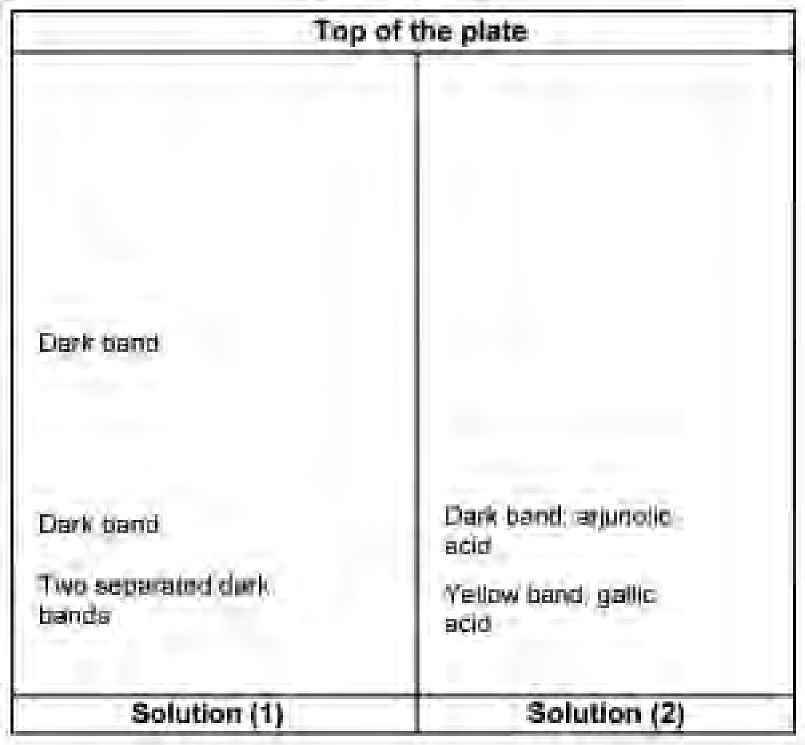
A mixture of 15 volumes of *ethyl acetate,* 15 volumes of *formic acid* and 70 volumes of *toluene*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated bands.

CONFIRMATION

The chromatogram obtained with solution (1) shows a band with an Rf value of approximately 0.30 corresponding in colour and position to the band obtained for arjunolic acid in solution (2) ; two clearly separated dark bands with an Rf value of approximately 0.2; a band with an Rf value of 0.63 is present. Other bands may be present.



Top of the plate

Solution (1)	**Solution (2)**

TESTS

Ash

Not more than 25%, Appendix XI J.

Loss on drying

When dried for 2 hours at 100° to 105°, loses not more than 10% of its weight. Use 1 g.

Water soluble extractive

Not less than 20%, Appendix XI B2.

ASSAY

Carry out the determination of *tannins in herbal drugs*, Appendix XI M. Use 1.0 g of powdered drug.

Terminalia Belerica Fruit for use in THMP

General Notices

DEFINITION

Terminalia Belerica Fruit for use in THMP consists of pericarp of dried ripe fruits of *Terminalia belerica* Roxb. It contains not less than 10% of tannins, expressed as pyrogallol, calculated with reference to the dried drug.

IDENTIFICATION

A. The dried fruits are spherical to subspherical, about 3 to 5 cm in diameter, slightly depressed at the upper end and more or less tapering to the scar of the pedicel at the lower end. The surface is brown to yellowish brown with a grey velvety sheen, irregularly wrinkled and sometimes with faint, incomplete, longitudinal ridges. Cut transversely, the fruit shows the pericarp about 4 to 5 mm thick enclosing a very hard, yellowish-white seed.

B. Reduce to a powder (355). The powder is light-brown. Examine under a microscope using *chloral hydrate solution*. The powder shows many free, unicellular, straight or slightly bent trichomes from the epicarp. A variety of thick–walled, heavily pitted, lignified fibro-sclereids of elongated and spherical shapes occur in large and small groups; occasional medium sized reticulate vessels; heavily pitted, lignified parenchymatous cells and others with reticulate thickenings; many lignified, pitted, thin walled sclereids and groups of fragmented, thick-walled, pitted, fibres are present. Rarely oil globules, starch granules, and calcium oxalate crystals may be found in the parenchymatous cells from the embryo. Examine under a microscope using 50% v/v of *glycerol*. The powder shows minute, either single or 2 to 4 compound starch granules, some scattered, but mainly filling parenchymatous cells. Some have slit or stellate hila; simple granules are often not perfectly spherical. Larger calcium oxalate crystals, with fewer small ones, are scattered or in parenchymatous cells.

C. Carry out the method for *thin-layer chromatography,* Appendix III A, using the following solutions.

(1) Add 10 ml of *absolute ethanol* to 1.0 g of the powdered drug, centrifuge at 3000 rpm for 5 minutes and filter (Whatman GF/C is suitable).

(2) 0.01% w/v each of *arjunolic acid*, *gallic acid* and *ellagic acid* in *absolute ethanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating high performance silica gel F_{254} (Merck silica gel 60 F_{254} HPTLC plates are suitable).

(b) Use the mobile phase described below.

(c) Apply as bands 8 µl of each solution.

(d) Develop the plate to 8 cm.

(e) Remove the plate and allow it to dry in air for 5 minutes. Examine under *ultraviolet light (254 nm)*. Spray the plate with *anisaldehyde solution*, heat at 100° to 105° for 5 minutes and examine in daylight.

MOBILE PHASE

A mixture of 15 volumes of *ethyl acetate,* 15 volumes of *formic acid* and 70 volumes of *toluene*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated bands under both *ultraviolet light (254 nm)* and daylight.

CONFIRMATION

Under *ultraviolet light (254 nm)* the chromatogram obtained with solution (1) shows bands with Rf values of approximately 0.11 and 0.15 corresponding in colour and position to the bands obtained with ellagic acid and gallic acid in solution (2) and light blue bands with Rf values of approximately 0.04 and 0.36. Other bands may be present.

Not more than 7%, Appendix XI J.

Loss on drying

When dried for 2 hours at 100° to 105°, loses not more than 5.0% of its weight. Use 1 g.

Water soluble extractive

Not less than 45%, Appendix XI B2.

ASSAY

Carry out the determination of *tannins in herbal drugs*, Appendix XI M. Use 1.0 g of powdered drug.

Terminalia Chebula Fruit for use in THMP

General Notices

DEFINITION

Terminalia Chebula Fruit for use in THMP consists of pericarp of mature fruits of *Terminalia chebula* Retz. It contains not less than 20% of tannins, expressed as pyrogallol, calculated with reference to the dried drug.

IDENTIFICATION

A. The dried fruits are sub-globular to ovoid, 3 to 4 cm long and 1.5 to 2 cm wide, bluntly pointed at the tip and tapering towards the base. The surface is yellowish to greenish, sometimes brown, shiny and more or less wrinkled and has distinct longitudinal ridges. Cut transversely, the fruit shows the pericarp about 3 to 4 mm thick, non-adherent to the very hard, creamy-white seed.

B. Reduce to a powder (355). The powder is yellowish brown. Examine under a microscope using *chloral hydrate solution*. The powder shows round, oval or elongated, thin-walled parenchymatous cells in groups. Occasional narrow-walled, unpitted, lightly lignified fibres occur in small or larger groups, some forming wave-like arrangements. Large groups of fragmented, heavily lignified and pitted fibres also occur. A variety of thick–walled, heavily pitted, lignified fibro-sclereids of elongated, rectangular, and irregular shapes occur in large and small groups. Fewer pitted, lignified parenchyma, or thinner-walled, less lignified and pitted sclereids, with broad lumens, are also found. There are very occasional small, spiral, lignified vessel fragments. Small, greenish, thick-walled polygonal epicarp cells are seen in surface view. Parenchymatous cells with reticulate thickenings across the surface are rare, as are others without such thickenings, but containing oil globules. Examine under a microscope using 50% v/v of *glycerol*. The powder shows minute, either single or 2 to 4 compound granules, some scattered, but mainly filling parenchymatous cells. Some have slit or stellate hila; simple granules are often not perfectly spherical. Larger calcium oxalate crystals, with fewer small ones, are scattered or in parenchymatous cells.

C. Carry out the method for *thin-layer chromatography,* Appendix III A, using the following solutions.

(1) To 1.0 g of the powdered drug, add 10 ml of *absolute ethanol*, centrifuge at 3000 rpm for 5 minutes and filter (Whatman GF/C is suitable).

(2) 0.01% w/v each of *arjunolic acid*, *gallic acid* and *ellagic acid* in *absolute ethanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating high performance silica gel F_{254} (Merck silica gel 60 F_{254} HPTLC plates are suitable).

(b) Use the mobile phase described below.

(c) Apply as bands 8 µl of each solution.

(d) Develop the plate to 8 cm.

(e) Remove the plate and allow it to dry in air for 5 minutes. Examine under *ultraviolet light*

(254 nm). Spray the plate with *anisaldehyde solution*, heat at 100° to 105° for 5 minutes and examine in daylight.

MOBILE PHASE

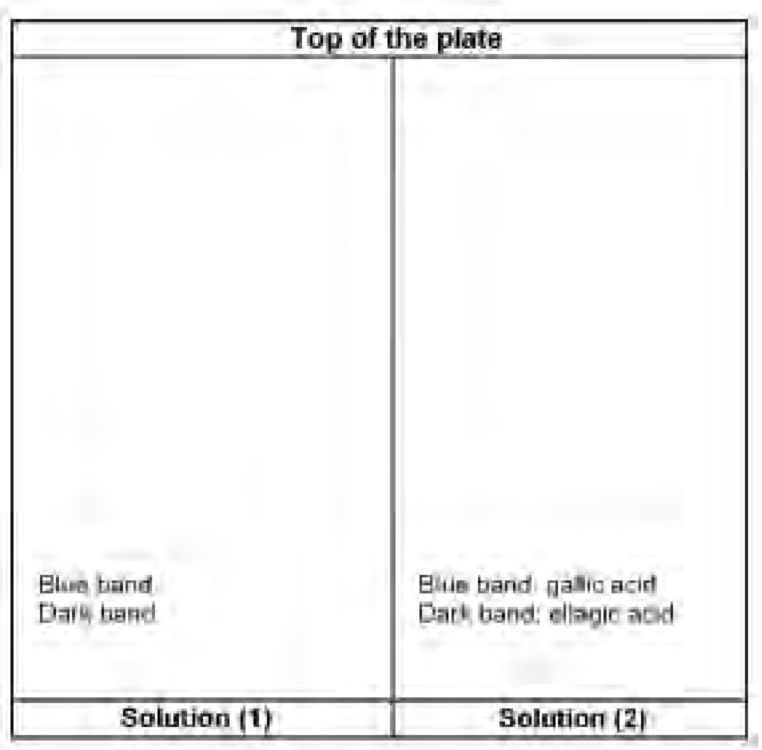
A mixture of 15 volumes of *ethyl acetate,* 15 volumes of *formic acid* and 70 volumes of *toluene*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated bands under both *ultraviolet light (254 nm)* and daylight.

VALIDITY

When examined under *ultraviolet light (254 nm)* the chromatogram obtained with solution (1) shows bands with Rf values of approximately 0.11 and 0.15 corresponding in colour and position to the bands obtained with gallic acid and ellagic acid in solution (2).



When examined under daylight after spraying with *anisaldehyde solution* the chromatogram obtained with solution (1) shows a band with an Rf value of approximately 0.15 corresponding in colour and position to the band obtained for gallic acid in solution (2) and a dark band with an Rf value of approximately 0.30. There may be some faint brown bands with Rf values of approximately 0.40 and 0.70.

Terpeneless Lemon Oil

General Notices

Preparations

Lemon Spirit

Compound Orange Spirit

DEFINITION

Terpeneless Lemon Oil may be prepared by concentrating Lemon Oil under reduced pressure until most of the terpenes have been removed or by solvent partition. It contains not less than 40% w/w of aldehydes calculated as citral, $C_{10}H_{16}O$.

CHARACTERISTICS

A clear, colourless or pale yellow liquid, visibly free from water; odour and taste, those of lemon.

TESTS

Optical rotation

–5° to +2°, Appendix V F.

Refractive index

1.475 to 1.485, Appendix V E.

Solubility in ethanol

Soluble, at 20°, in 1 volume of *ethanol (80%)*, Appendix X M.

Weight per ml

0.880 to 0.895 g, Appendix V G.

ASSAY

Carry out the method for *determination of aldehydes*, Appendix X K, using 1 g, omitting the *toluene* and using a volume, not less than 7 ml, of *alcoholic hydroxylamine solution* that exceeds by 1 to 2 ml the volume of 0.5M *potassium hydroxide in ethanol (60%) VS* required. Each ml of 0.5M *potassium hydroxide in ethanol (60%) VS* is equivalent to 76.73 mg of $C_{10}H_{16}O$.

STORAGE

Terpeneless Lemon Oil should be kept in a well-filled container and protected from light.

Terpeneless Orange Oil

General Notices

Preparation

Compound Orange Spirit

DEFINITION

Terpeneless Orange Oil may be prepared by concentrating orange oil under reduced pressure until most of the terpenes have been removed or by solvent partition.

CHARACTERISTICS

A clear, yellow or orange-yellow liquid, visibly free from water.

TESTS

Optical rotation

Not more than +60°, Appendix V F.

Refractive index

1.461 to 1.473, Appendix V E.

Solubility in ethanol

Soluble, at 20°, in 1 part of *ethanol (90%)*, Appendix X M.

Weight per ml

0.855 to 0.880 g, Appendix V G.

Content of aldehydes

Not less than 18% w/w, calculated as decanal, $C_{10}H_{20}O$. Carry out the method for the *determination of aldehydes*, Appendix X K, using 1.5 g, omitting the *toluene* and using a volume, not less than 7 ml, of *alcoholic hydroxylamine solution* that exceeds by 1 to 2 ml the volume of 0.5M *potassium hydroxide in ethanol (60%) VS* required. Each ml of 0.5M *potassium hydroxide in ethanol (60%) VS* is equivalent to 78.76 mg of $C_{10}H_{20}O$.

STORAGE

Terpeneless Orange Oil should be kept in a well-filled container and protected from light.

Three-lobed Sage Leaf

General Notices

(Ph Eur monograph 1561)

Ph Eur

DEFINITION

Whole or cut, dried leaves of *Salvia fructicosa* Mill. (*S. triloba* L. fil).

Content

Minimum 18 ml/kg of essential oil in the whole drug (anhydrous drug) and minimum 12 ml/kg of essential oil in the cut drug (anhydrous drug).

CHARACTERS

Spicy odour when ground, similar to eucalyptus oil.

IDENTIFICATION

A. The lamina of the whole three-lobed sage leaf is about 8-50 mm long and about 4-20 mm wide, and oblong-ovate or lanceolate. The margin is finely crenate and undulate but indistinct owing to the dense hairy covering on both surfaces. The base is obtuse and sometimes bears 1 or 2 more or less developed lobes. The upper surface is grey-tomentose pubescent, the lower surface is densely white-tomentose pubescent; the venation is indistinct. The densely white-tomentose pubescent petiole is about 1 mm in diameter.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greyish-green and tomentose. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: very numerous, whole or fragmented, covering and glandular trichomes, scattered and attached to fragments of the epidermises; covering trichomes articulated, uniseriate, thick-walled and bluntly tapering, those on the upper epidermis straight, those on the lower epidermis longer, tortuous and more densely packed; glandular trichomes, some with a unicellular or bicellular head and a stalk consisting of from 1-4 cells, the majority having a short, unicellular stalk and a head composed of 8 radiating cells with a raised common cuticle; the upper epidermis with pitted and beaded cells, somewhat polygonal, with a few diacytic stomata *(2.8.3)*; the lower epidermis with sinuous or wavy-walled cells and numerous diacytic stomata.

C. Examine the chromatogram obtained in the test for thujone.

Results The chromatogram obtained with the test solution shows a blue zone due to cineole, equal or greater in size and intensity to the zone in the chromatogram obtained with the reference solution. Further zones are present.

TESTS

Thujone

Thin-layer chromatography *(2.2.27)*.

Test solution Shake 0.3 g of the freshly powdered drug (355) *(2.9.12)* with 5.0 ml of *anhydrous ethanol R* for 5 min.

Reference solution Dissolve 20 µl of *thujone R* and 25 µl of *cineole R* in 20 ml of *anhydrous ethanol R*.

Plate *TLC silica gel plate R*.

Mobile phase *Ethyl acetate R, toluene R* (5:95 *V/V*).

Application 20 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with a 200 g/l solution of *phosphomolybdic acid R* in *anhydrous ethanol R* and heat at 100-105 °C for 10 min. Examine in daylight.

Results The chromatogram obtained with the reference solution shows in the middle part a blue zone (cineole) and in the upper part a pink-blue zone (thujone). The chromatogram obtained with the test solution shows no zone or a very faint pink-blue zone due to thujone.

Foreign matter ***(2.8.2)***

Maximum 8 per cent of stems and maximum 2 per cent of other foreign matter.

Water ***(2.2.13)***

Maximum 100 ml/kg, determined on 20.0 g.

Total ash ***(2.4.16)***

Maximum 10.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs *(2.8.12)*. Use 20.0 g of drug, if necessary cut immediately before the assay, a 500 ml flask, 250 ml of *water R* as the distillation liquid. Add 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

Ph Eur

Thyme Oil

General Notices

(Ph Eur monograph 1374)

Ph Eur

DEFINITION

Essential oil obtained by steam distillation from the fresh flowering aerial parts of *Thymus vulgaris* L., *T. zygis* Loefl. ex L. or a mixture of both species.

CHARACTERS

Appearance

Clear, yellow or very dark reddish-brown, mobile liquid with a characteristic, aromatic, spicy odour, reminiscent of thymol.

Solubility

Miscible with ethanol and with light petroleum.

IDENTIFICATION

First identification B.

Second identification A.

A. Thin-layer chromatography *(2.2.27)*.

Test solution Dissolve 0.2 g of the substance to be examined in *pentane R* and dilute to 10 ml with the same solvent.

Reference solution Dissolve 0.15 g of *thymol R*, 25 mg of α-*terpineol R*, 40 µl of *linalol R* and 10 µl of *carvacrol R* in *pentane R* and dilute to 10 ml with the same solvent.

Plate TLC silica gel plate R.

Mobile phase ethyl acetate R, *toluene R* (5:95 *V/V*).

Application 20 µl, as bands.

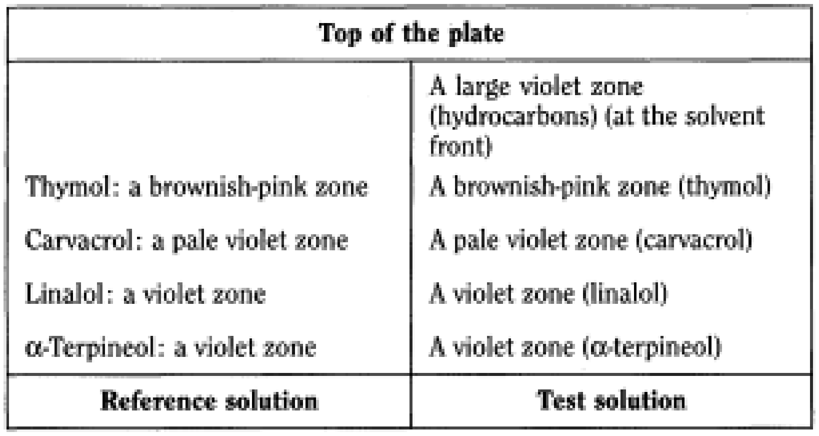
Development Over a path of 15 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R* and heat the plate at 100-105 °C for 5-10 min while observing. Examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other bands may be present in the

chromatogram obtained with the test solution.



Top of the plate	
	A large violet zone (hydrocarbons) (at the solvent front)
Thymol: a brownish-pink zone	A brownish-pink zone (thymol)
Carvacrol: a pale violet zone	A pale violet zone (carvacrol)
Linalol: a violet zone	A violet zone (linalol)
α-Terpineol: a violet zone	A violet zone (α-terpineol)
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density *(2.2.5)*

0.915 to 0.935.

Refractive index *(2.2.6)*

1.490 to 1.505.

Chromatographic profile

Gas chromatography *(2.2.28)*: use the normalisation procedure.

Test solution The substance to be examined.

Reference solution Dissolve 0.15 g of β-*myrcene R*, 0.1 g of γ-*terpinene R*, 0.1 g of *p-cymene R*, 0.1 g of *linalol R*, 0.2 g of *terpinen-4-ol R*, 0.2 g of *thymol R* and 50 mg of *carvacrol R* in 5 ml of *hexane R.*

Column:

— *material*: fused silica;

— *size*: *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm;

— *stationary phase: macrogol 20 000 R*.

Carrier gas *helium for chromatography R*.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 15	60
	15 - 55	60→180
Injection port		200
Detector		220

Detection Flame ionisation.

Injection 0.2 µl.

Elution orde Order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability Reference solution:

— *resolution*: minimum 1.5 between the peaks due to thymol and carvacrol;

— *number of theoretical plates*: minimum 30 000, calculated for the peak due to p-cymene at 80 °C.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution on the chromatogram obtained with the test solution. Disregard the peak due to hexane.

Determine the percentage content of these components. The limits are within the following ranges:

— β-*myrcene*: 1.0 per cent to 3.0 per cent;

— γ-*terpinene*: 5.0 per cent to 10.0 per cent;

— *p-cymene*: 15.0 per cent to 28.0 per cent;

— *linalol*: 4.0 per cent to 6.5 per cent;

— *terpinen-4-ol*: 0.2 per cent to 2.5 per cent;

— *thymol*: 36.0 per cent to 55.0 per cent;

— *carvacrol*: 1.0 per cent to 4.0 per cent.

STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

Ph Eur

Thyme

General Notices

(Ph Eur monograph 0865)

Ph Eur

DEFINITION

Whole leaves and flowers separated from the previously dried stems of *Thymus vulgaris* L. or *Thymus zygis* L. or a mixture of both species.

Content:

— *essential oil*: minimum 12 ml/kg (anhydrous drug);

— *sum of the contents of thymol and carvacrol* (both $C_{10}H_{14}O$; M_r 150.2): minimum 40 per cent in the essential oil.

CHARACTERS

Strong aromatic odour reminiscent of thymol.

IDENTIFICATION

A. The leaf of *Thymus vulgaris* is usually 4 mm to 12 mm long and up to 3 mm wide, sessile or with a very short petiole. The lamina is tough, entire, lanceolate to ovate, covered on both surfaces by a grey or greenish-grey indumentum; the edges are markedly rolled up towards the abaxial surface. The midrib is depressed on the adaxial surface and is very prominent on the abaxial surface. The calyx is green, often with violet spots and is tubular; at the end are 2 lips of which the upper one is bent back and at the end has 3 lobes, the lower is longer and has 2 hairy teeth. After flowering, the calyx tube is closed by a crown of long, stiff hairs. The corolla, about twice as long as the calyx, is usually brownish in the dry state and is slightly bilabiate.

The leaf of *Thymus zygis* is usually 1.7 mm to 6.5 mm long and 0.4 mm to 1.2 mm wide; it is acicular to linear-lanceolate and the edges are markedly rolled towards the abaxial surface. Both surfaces of the lamina are green to greenish-grey and the midrib is sometimes violet; the edges, in particular at the base, have long, white hairs. The dried flowers are very similar to those of *Thymus vulgaris*.

B. Reduce to a powder (355) *(2.9.12)*. The powder of both species is greyish-green or greenish-brown. Examine under a microscope using *chloral hydrate solution R.* The epidermises of the leaves have cells with anticlinal walls which are sinuous and beaded and the stomata are diacytic *(2.8.3)*; numerous secretory trichomes made up of 12 secretory cells, the cuticle of which is generally raised by the secretion to form a globular to ovoid bladder-like covering; the glandular trichomes have a unicellular stalk and a globular to ovoid head; the covering trichomes of the adaxial surface are common to both species; they have warty walls and are shaped as pointed teeth; the warty covering trichomes of the abaxial surface are of many types: unicellular, straight or slightly curved, and bicellular or tricellular, and often elbow-shaped (*Thymus vulgaris*); bicellular or tricellular, more or less straight (*Thymus zygis*). Fragments of calyx are covered by numerous, uniseriate trichomes with 5 or 6 cells and with a weakly striated cuticle. Fragments of the corolla have numerous uniseriate covering trichomes, often collapsed, and secretory trichomes generally with 12 cells. Pollen grains are relatively rare, spherical and smooth with 6 germinal slit-like pores, measuring about 35 µm in diameter. The powder of *Thymus zygis* also contains numerous thick bundles of fibres from the main veins and from fragments of stems.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 5 ml of *methylene chloride R* and shake for 3 min, filter through about 2 g of *anhydrous sodium sulphate R*.

Reference solution Dissolve 5 mg of *thymol R* and 10 µl of *carvacrol R* in 10 ml of *methylene chloride R.*

Plate *TLC silica gel F_{254} plate R.*

Mobile phase *methylene chloride R*.

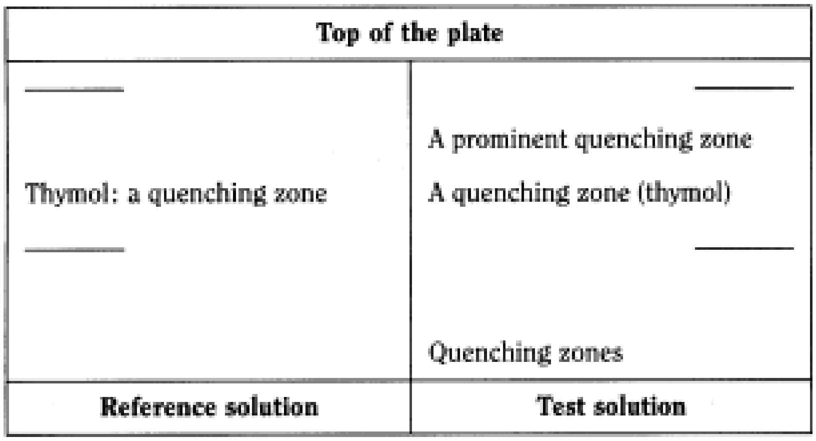
Application 20 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

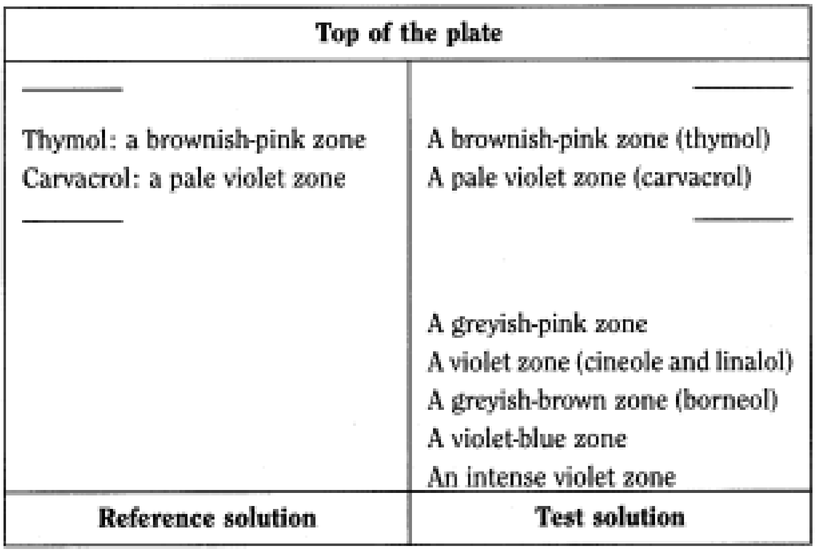
Results A See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
_______	_______
	A prominent quenching zone
Thymol: a quenching zone	A quenching zone (thymol)
_______	_______
	Quenching zones
Reference solution	**Test solution**

Detection B Spray with *anisaldehyde solution R* using 10 ml for a plate 200 mm square and heat at 100-105 °C for 10 min.

Results B See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the lower third of the chromatogram obtained with the test solution. The intensity of the zones due to thymol and carvacrol depends upon the species examined.



Top of the plate

	A greyish-pink zone
	A violet zone (cineole and linalol)
	A greyish-brown zone (borneol)
	A violet-blue zone
	An intense violet zone
Reference solution	**Test solution**

D. Examine the chromatograms obtained in the assay for thymol and carvacrol.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Foreign matter *(2.8.2)*

Maximum 10 per cent of stems and maximum 2 per cent of other foreign matter. Stems must not be more than 1 mm in diameter and 15 mm in length. Leaves with long trichomes at their base and with weakly pubescent other parts (*Thymus serpyllum* L.) are absent.

Water *(2.2.13)*

Maximum 100 ml/kg, determined on 20.0 g of the powdered drug (355) *(2.9.12)*.

Total ash *(2.4.16)*

Maximum 15.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 3.0 per cent.

ASSAY

Essential oil *(2.8.12)*

Use 30.0 g of the drug, a 1000 ml round-bottomed flash and 400 ml of *water R* as the distillation liquid. Distil at a rate of 2-3 ml/min for 2 h without *xylene R* in the graduated tube.

Thymol and carvacrol

Gas chromatography *(2.2.28)*: use the normalisation procedure.

Test solution Filter the essential oil obtained in the determination of essential oil over a small amount of *anhydrous sodium sulphate R* and dilute to 5.0 ml with *hexane R* by rinsing the apparatus and the anhydrous sodium sulphate.

Reference solution Dissolve 0.20 g of *thymol R* and 50 mg of *carvacrol R* in *hexane R* and dilute to 5.0 ml with the same solvent.

Column:

— *material*: fused silica;

— *size: l* = 30-60 m, Ø = 0.25 mm;

— *stationary phase: macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas *nitrogen for chromatography R* or *helium for chromatography R*.

Flow rate 1-2 ml/min.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 45	40 → 220
Injection port		190
Detector		210

Detection Flame ionisation.

Injection 0.2 µl.

Elution order Order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability Reference solution:

— *resolution*: minimum 1.5 between the peaks due to thymol and carvacrol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of thymol and carvacrol. Disregard the peak due to hexane.

Ph Eur

Tinctures of the British Pharmacopoeia

General Notices

In addition to the requirements for Tinctures of the European Pharmacopoeia (stated under Extracts), the following statements apply to those tinctures that are the subject of an individual monograph in the British Pharmacopoeia.

DEFINITION

Certain preparations of the British Pharmacopoeia entitled Tinctures do not conform strictly to the definition of the European Pharmacopoeia and consequently application of some of the above requirements is inappropriate. Any necessary exceptions are stated in the relevant individual monographs.

Tinnevelly Senna Fruit

General Notices

(Tinnevelly Senna Pods, Ph Eur monograph 0208)

Preparations

Senna Liquid Extract

Senna Tablets

When Powdered Tinnevelly Senna Fruit is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter shall be dispensed or supplied.

Ph Eur

DEFINITION

Dried fruit of *Cassia angustifolia* Vahl.

Content

Minimum 2.2 per cent of hydroxyanthracene glycosides, expressed as sennoside B ($C_{42}H_{38}O_{20}$; M_r 863) (dried drug).

CHARACTERS

Slight odour.

IDENTIFICATION

A. Flattened, slightly reniform pods, yellowish-brown or brown with dark brown patches at the positions corresponding to the seeds, usually 35-60 mm long and 14-18 mm wide. At one end is a stylar point and at the other a short stalk. The pods contain 5-8 flattened and obovate seeds, green or pale brown, with incomplete, wavy, transverse ridges on the testa.

B. Reduce to a powder (355) *(2.9.12)*. The powder is brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: epicarp with polygonal cells and a small number of conical warty trichomes and occasional anomocytic or paracytic stomata *(2.8.3)*; fibres in 2 crossed layers accompanied by a crystal sheath of calcium oxalate prisms; characteristic palisade cells in the seed and stratified cells in the endosperm; clusters and prisms of calcium oxalate.

C. Thin-layer chromatography *(2.2.27).*

Test solution To 0.5 g of the powdered drug (180) *(2.9.12)* add 5 ml of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* and heat to boiling. Centrifuge and use the supernatant liquid.

Reference solution Dissolve 10 mg of *senna extract CRS* in 1 ml of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* (a slight residue remains).

Plate *TLC silica gel G plate R*.

Mobile phase *Glacial acetic acid R*, *water R*, *ethyl acetate R*, *propanol R* (1:30:40:40 *V/V/V/V*).

Application 10 µl, as bands of 20 mm by 2 mm.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with a 20 per cent *V/V* solution of *nitric acid R* and heat at 120 °C for 10 min; allow to cool and spray with a 50 g/l solution of *potassium hydroxide R* in *ethanol (50 per cent V/V) R* until the zones appear.

Results The principal zones in the chromatogram obtained with the test solution are similar in position (sennosides B, A, D and C in the order of increasing R_F value), colour and size to the principal zones in the chromatogram obtained with the reference solution. Between the zones due to sennosides D and C a red zone due to rhein-8-glucoside may be visible. The zones due to sennosides D and C are faint in the chromatogram obtained with the test solution.

D. Place about 25 mg of the powdered drug (180) (*2.9.12*) in a conical flask and add 50 ml of *water R* and 2 ml of *hydrochloric acid R*. Heat in a water-bath for 15 min, cool and shake with 40 ml of *ether R*. Separate the ether layer, dry over *anhydrous sodium sulphate R*, evaporate 5 ml to dryness and to the cooled residue add 5 ml of *dilute ammonia R1*. A yellow or orange colour develops. Heat on a water-bath for 2 min. A reddish-violet colour develops.

TESTS

Foreign matter *(2.8.2)*

Maximum 1 per cent.

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 9.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 2.0 per cent.

ASSAY

Carry out the assay protected from bright light.

Place 0.150 g of the powdered drug (180) *(2.9.12)* in a 100 ml flask. Add 30.0 ml of *water R*, mix, weigh and place in a water-bath. Heat under a reflux condenser for 15 min. Allow to cool, weigh and adjust to the original mass with *water R*. Centrifuge and transfer 20.0 ml of the supernatant liquid to a 150 ml separating funnel. Add 0.1 ml of *dilute hydrochloric acid R* and shake with 3 quantities, each of 15 ml, of *chloroform R*. Allow to separate and discard the chloroform layer. Add 0.10 g of *sodium hydrogen carbonate R* and shake for 3 min. Centrifuge and transfer 10.0 ml of the supernatant liquid to a 100 ml round-bottomed flask with a ground-glass neck. Add 20 ml of *ferric chloride solution R1* and mix. Heat for 20 min in a water-bath under a reflux condenser, with the water level above that of the liquid in the flask; add 1 ml of *hydrochloric acid R* and heat for a further 20 min, with frequent shaking, to dissolve the precipitate. Cool, transfer the mixture to a separating funnel and shake with 3 quantities, each of 25 ml, of *ether R* previously used to rinse the flask. Combine the 3 ether layers and wash with 2 quantities, each of 15 ml, of *water R*. Transfer the ether layer to a volumetric flask and dilute to 100.0 ml with *ether R*. Carefully evaporate 10.0 ml to dryness and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance *(2.2.25)* at 515 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of hydroxyanthracene glycosides, expressed as sennoside B, using the following expression:

$$\frac{A \times 1.25}{m}$$

taking the specific absorbance of sennoside B to be 240.

A = absorbance at 515 nm;

m = mass of the substance to be examined, in grams.

STORAGE

Protected from moisture.

Ph Eur

Tolu Balsam

General Notices

(Ph Eur monograph 1596)

Ph Eur

DEFINITION

Oleo-resin obtained from the trunk of *Myroxylon balsamum* (L.) Harms var. *balsamum*.

Content

25.0 per cent to 50.0 per cent of free or combined acids, expressed as cinnamic acid ($C_9H_8O_2$; M_r 148.2) (dried drug).

CHARACTERS

Appearance

Hard, friable, brownish to reddish-brown mass; thin fragments are brownish-yellow when examined against the light.

Reminiscent odour of vanillin.

Solubility

Practically insoluble in water, very soluble to freely soluble in alcohol, practically insoluble in light petroleum.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)* .

Test solution Stir 0.40 g of the fragmented drug with 10 ml of *methylene chloride R* for 5 min and filter.

Reference solution Dissolve 50 mg of *benzyl cinnamate R* in *methylene chloride R,* add 50 µl of *benzyl benzoate R* and dilute to 10 ml with *methylene chloride R* .

Plate *TLC silica gel G plate R* .

Mobile phase *Light petroleum R, toluene R* (5:95 *V/V*).

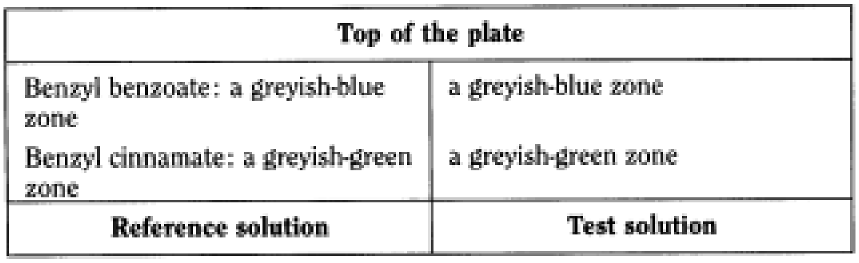
Application 20 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with *vanillin reagent R* and heat at 100-105 °C for 5 min. Examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the test and reference solutions. Furthermore, other coloured zones are present in the chromatogram obtained with the test solution.



Top of the plate	
Benzyl benzoate: a greyish-blue zone	a greyish-blue zone
Benzyl cinnamate: a greyish-green zone	a greyish-green zone
Reference solution	**Test solution**

TESTS

Acid value

100 to 160.

Dissolve 0.5 g of the fragmented drug in 50 ml of *alcohol R*. Add 0.5 ml of *acid blue 93 solution R* and 5.0 ml of *0.5 M alcoholic potassium hydroxide*. Stir vigorously and titrate with *0.5 M hydrochloric acid* until the colour changes from brownish-red to blackish-green (n1 ml of *0.5 M hydrochloric acid*). Carry out a blank test in the same manner (n_2 ml of *0.5 M hydrochloric acid*). Calculate the acid value in the same manner as the saponification value *(2.5.6).*

Matter insoluble in alcohol

Maximum 5 per cent.

Boil 2.0 g of the fragmented drug with 25 ml of *alcohol (90 per cent V/V) R* and filter. Wash the residue with *alcohol (90 per cent V/V) R*, boiling until completely extracted, then dry the residue at 100-105 °C. Weigh the residue.

Loss on drying *(2.2.32)*

Maximum 5.0 per cent, determined on 2.000 g of the fragmented drug by spreading on a flat evaporating dish 9 cm in diameter and allowing to dry *in vacuo* for 4 h.

Total ash *(2.4.16)*

Maximum 0.3 per cent.

ASSAY

Boil 1.500 g under a reflux condenser with 25 ml of *0.5 M alcoholic potassium hydroxide* for 1 h. Evaporate the ethanol and heat the residue with 50 ml of *water R* until the substance is homogeneously distributed. After cooling, add 80 ml of *water R* and a solution of 1.5 g of *magnesium sulphate R* in 50 ml of *water R*. Mix, and allow to stand for 10 min. Filter through a pleated filter paper and wash the residue with 20 ml of *water R*. Combine the filtrate and the washings, acidify with *hydrochloric acid R* and extract with 4 quantities, each of 40 ml, of *ether R*. Discard the aqueous layer. Combine the organic extracts and wash with 2 quantities, each of 20 ml, and with 3 quantities, each of 10 ml, of a 50 g/l solution of sodium bicarbonate *R*. Discard the ether layer. Combine the aqueous extracts, acidify with *hydrochloric acid R* and stir once with 30 ml, twice with 20 ml and once with 10 ml of *methylene chloride R*. Dry the combined methylene chloride extracts over *anhydrous sodium sulphate R*. Filter through a pleated filter and wash the residue with 10 ml of *methylene chloride R*. Reduce the combined methylene chloride extracts to 10 ml by distillation and eliminate the remaining methylene chloride in a current of air. Dissolve the residue with heating in 10 ml of *alcohol R* previously neutralised to *phenol red solution R*. After cooling, titrate with *0.1 M sodium hydroxide*, using the same indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 14.82 mg of total acids, expressed as cinnamic acid.

STORAGE

Do not store in powdered form.

Ph Eur

Tormentil Tincture

General Notices

(Ph Eur monograph 1895)

Ph Eur

DEFINITION

Tincture produced from *Tormentil (1478).*

Content

Minimum 1.5 per cent *m/m* of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1).

PRODUCTION

The tincture is produced from 1 part of comminuted drug and 5 parts of ethanol (70 per cent *V/V*) by a suitable procedure.

CHARACTERS

Red or reddish-brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution Mix 1.0 ml of the tincture to be examined with 1.0 ml of *alcohol (70 per cent V/V) R*.

Reference solution Dissolve 1.0 mg of *catechin R* in 1.0 ml of *methanol R*.

Plate *TLC silica gel plate R*.

Mobile phase *ether R*, *glacial acetic acid R*, *hexane R*, *ethyl acetate R* (20:20:20:40 *V/V/V/V*).

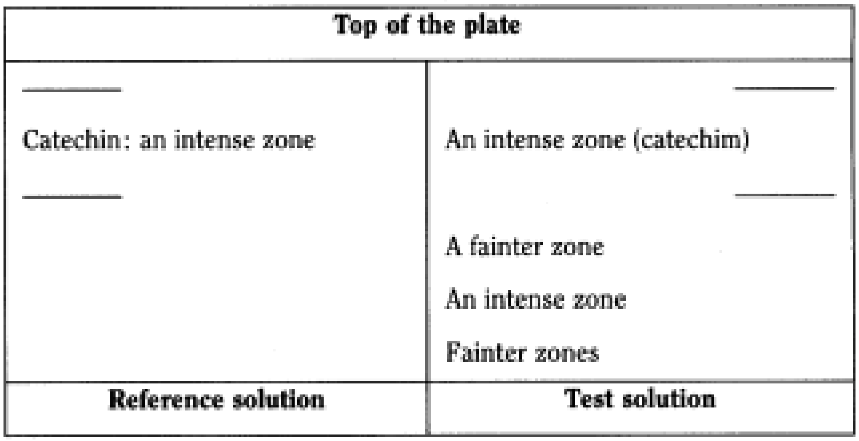
Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air for 10-15 min.

Detection Spray with a freshly prepared 5 g/l solution of *fast blue B salt R*. Reddish zones appear. Expose the plate to ammonia vapour, the zones become more intense, turning reddish-brown. Examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
———	———
Catechin: an intense zone	An intense zone (catechim)
———	———
	A fainter zone
	An intense zone
	Fainter zones
Reference solution	**Test solution**

TESTS

Ethanol content (*2.9.10*)

64 per cent *V/V* to 69 per cent *V/V*.

Methanol and 2-propanol (*2.9.11*)

Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

ASSAY

Carry out the determination of tannins in herbal drugs *(2.8.14)*. Use 2.50 g of the tincture to be examined.

Ph Eur

Tormentil

General Notices

(Ph Eur monograph 1478)

Ph Eur

DEFINITION

Whole or cut, dried rhizome, freed from the roots, of *Potentilla erecta* (L.) Raeusch. (*P. tormentilla Stokes*).

Content

Minimum 7 per cent of tannins, expressed as pyrogallol ($C_6 H_6O_3$; M_r 126.1) (dried drug).

IDENTIFICATION

A. The rhizome is cylindrically spindle-shaped, with a very irregular appearance, often forming, twisted, knotty tubers, up to 10 cm long and 1 cm to 2 cm thick, very hard and scarcely branched. The surface is brown to reddish-brown, rugose and has remains of roots and transversely elongated depressed whitish scars from the stems. At the top of the rhizome the remains of numerous aerial stems may be present. The fracture is short and granular, dark red to brownish-yellow.

B. Reduce to a powder (355) *(2.9.12)*. The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: coarsely serrate cluster crystals of calcium oxalate, up to 60 µm in diameter; fragments of thin-walled parenchyma containing reddish-brown tannin; groups of narrow, bordered-pitted vessels with lateral pores; thick-walled and pitted, polygonal parenchyma; groups and fragments of sclerenchymatous thick-walled fibres; occasional fragments of cork with thin-walled, brown, tabular cells. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows spherical or elliptical starch granules, up to about 20 µm in length.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 0.5 g of the powdered drug (355) *(2.9.12)* add 10 ml of *water R*, shake for 10 min and filter. Shake the filtrate with 2 quantities, each of 10 ml, of *ethyl acetate R* and filter the combined upper phases over 6 g of *anhydrous sodium sulphate R*. Evaporate the filtrate to dryness under reduced pressure and dissolve the residue in 1.0 ml of *ethyl acetate R.*

Reference solution Dissolve 1.0 mg of *catechin R* in 1.0 ml of *methanol R*.

Plate *TLC silica gel plate R*.

Mobile phase *glacial acetic acid R*, *ether R, hexane R*, *ethyl acetate R* (20:20:20:40 *V/V/V/V*) .

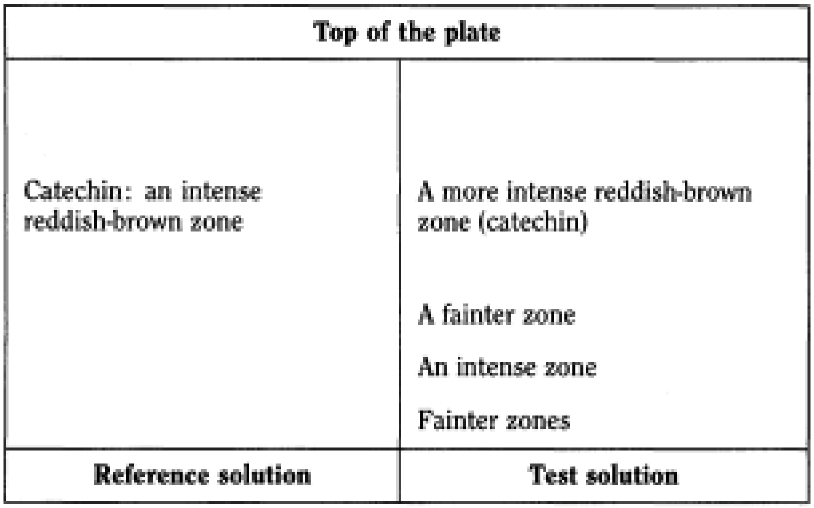
Application 10 µl, as bands.

Development Over a path of 10 cm.

Drying In air for 10-15 min.

Detection Spray with a freshly prepared 5 g/l solution of *fast blue B salt R*. Reddish zones appear. Expose the plate to ammonia vapour, the zones become more intense turning reddish-brown. Examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fainter zones are present in the chromatogram obtained with the test solution.



Top of the plate	
Catechin: an intense reddish-brown zone	A more intense reddish-brown zone (catechin)
	A fainter zone
	An intense zone
	Fainter zones
Reference solution	**Test solution**

TESTS

Foreign matter *(2.8.2)*

Maximum 3 per cent of root and stems as well as rhizomes with black fracture and maximum 2 per cent of other foreign matter.

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 5.0 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs *(2.8.14)*. Use 0.500 g of the powdered drug (180) *(2.9.12)*.

Ph Eur

Tragacanth

General Notices

(Ph Eur monograph 0532)

When Powdered Tragacanth is prescribed or demanded, material complying with the requirements below with the exception of Identification test A shall be dispensed or supplied.

Ph Eur

DEFINITION

Air-hardened, gummy exudate, flowing naturally or obtained by incision from the trunk and branches of *Astragalus gummifer* Labill. and certain other species of *Astragalus* from western Asia.

IDENTIFICATION

A. Tragacanth occurs in thin, flattened, ribbon-like, white or pale yellow, translucent strips, about 30 mm long and 10 mm wide and up to 1 mm thick, more or less curved, horny, with a short fracture; the surface is marked by fine longitudinal striae and concentric transverse ridges. It may also contain pieces similar in shape but somewhat thicker, more opaque and more difficult to fracture.

B. Reduce to a powder (355) *(2.9.12)*. The powder is white or almost white and forms a mucilaginous gel with about 10 times its mass of *water R*. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows in the gummy mass numerous stratified cellular membranes that turn slowly violet when treated with *iodinated zinc chloride solution R*. The gummy mass includes starch grains, isolated or in small groups, usually rounded in shape and sometimes deformed, with diameters varying between 4 µm and 10 µm, occasionally up to 20 µm, and a central hilum visible between crossed nicol prisms.

C. Examine the chromatograms obtained in the test for acacia.

Results The chromatogram obtained with the test solution shows 3 zones due to galactose, arabinose and xylose. A faint yellowish zone at the solvent front and a greyish-green zone between the zones due to galactose and arabinose may be present.

D. Moisten 0.5 g of the powdered drug (355) *(2.9.12)* with 1 ml of *ethanol (96 per cent) R* and add gradually, while shaking, 50 ml of *water R* until a homogeneous mucilage is obtained. To 5 ml of the mucilage add 5 ml of *water R* and 2 ml of *barium hydroxide solution R*. A slight flocculent precipitate is formed. Heat on a water-bath for 10 min. An intense yellow colour develops.

TESTS

Acacia

Thin-layer chromatography *(2.2.27)*.

Test solution To 100 mg of the powdered drug (355) *(2.9.12)* in a thick-walled centrifuge test-tube, add 2 ml of a 100 g/l solution of *trifluoroacetic acid R*, shake vigorously to dissolve the forming gel, stopper the test-tube and heat the mixture at 120 °C for 1 h. Centrifuge the resulting hydrolysate, transfer the clear supernatant carefully into a 50 ml flask, add 10 ml of *water R* and evaporate the solution to dryness under reduced pressure. To the resulting clear film add 0.1 ml of *water R* and 0.9 ml of *methanol R*. Centrifuge to separate the amorphous precipitate, collect the supernatant and, if necessary, dilute to 1 ml with *methanol R*.

Reference solution Dissolve 10 mg of *arabinose R*, 10 mg of *galactose R*, 10 mg of *rhamnose R* and 10 mg of *xylose R* in 1 ml of *water R* and dilute to 10 ml with *methanol R*.

Plate TLC silica gel plate R.

Mobile phase 16 g/l solution of *sodium dihydrogen phosphate R, butanol R, acetone R* (10:40:50 *V/V/V*).

Application 10 µl as bands.

Development A Over a path of 10 cm.

Drying A In a current of warm air for a few minutes.

Development B Over a path of 15 cm using the same mobile phase.

Drying B At 110 °C for 10 min.

Detection Spray with *anisaldehyde solution R* and dry at 110 °C for 10 min.

Results The chromatogram obtained with the reference solution shows 4 clearly separated coloured zones due to galactose (greyish-green or green), arabinose (yellowish-green), xylose (greenish-grey or yellowish-grey) and rhamnose (yellowish-green), in order of increasing R_F value; the chromatogram obtained with the test solution does not show a yellowish-green zone corresponding to the zone of rhamnose in the chromatogram obtained with the reference solution.

Methylcellulose

Examine the chromatograms obtained in the test for acacia.

Results The chromatogram obtained with the test solution does not show a red zone near the solvent front.

Sterculia gum

A. Place 0.2 g of the powdered drug (355) *(2.9.12)* in a 10 ml ground-glass-stoppered cylinder graduated in 0.1 ml. Add 10 ml of *ethanol (60 per cent V/V) R* and shake. Any gel formed occupies not more than 1.5 ml.

B. To 1.0 g of the powdered drug (355) *(2.9.12)* add 100 ml of *water R* and shake. Add 0.1 ml of *methyl red solution R*. Not more than 5.0 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Foreign matter

Maximum 1.0 per cent.

Place 2.0 g of the powdered drug (355) *(2.9.12)* in a 250 ml round-bottomed flask and add 95 ml of *methanol R*. Swirl to moisten the powder and add 60 ml of *hydrochloric acid R1*. Add a few glass beads about 4 mm in diameter and heat on a water-bath under a reflux condenser for 3 h, shaking occasionally. Remove the glass beads and filter the hot suspension *in vacuo* through a sintered-glass filter (160) *(2.1.2)*. Rinse the flask with a small quantity of *water R* and pass the rinsings through the filter. Wash the residue on the filter with about 40 ml of *methanol R* and dry to constant mass at 110 °C (about 1 h). Allow to cool in a desiccator and weigh. The residue weighs a maximum of 20 mg.

Flow time

Minimum 10 s, or minimum 50 s if the substance to be examined is to be used for the preparation of emulsions.

Place 1.0 g of the powdered drug (125-250) *(2.9.12)* in a 1000 ml round-bottomed flask with a ground-glass stopper, add 8.0 ml of *ethanol (96 per cent) R* and close the flask. Disperse the suspension over the inner surface of the flask by shaking, taking care not to wet the stopper. Open the flask and add as a single portion 72.0 ml of *water R*. Stopper the flask and shake vigorously for 3 min. Allow to stand for 24 h and shake vigorously again for 3 min. Eliminate air bubbles by applying vacuum above the mucilage for 5 min. Transfer the mucilage to a 50 ml cylinder. Dip in the mucilage a piece of glass tubing 200 mm long and 6.0 mm in internal diameter and graduated at 20 mm and 120 mm from the lower end; the tubing must not be rinsed with surface-active substances. When the mucilage has reached the upper mark, close the tube with a finger. Withdraw the closed tube, remove the finger and measure with a stop-watch the time needed for the meniscus to reach the lower graduation. Carry out this operation 4 times and determine the average value of the last 3 determinations.

Total ash *(2.4.16)*

Maximum 4.0 per cent.

Microbial contamination

Total viable aerobic count *(2.6.12)* not more than 10^4 micro-organisms per gram, determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella (2.6.13)*.

LABELLING

The label states whether or not the contents are suitable for preparing emulsions.

Ph Eur

Turpentine Oil

General Notices

Preparation

White Liniment

DEFINITION

Turpentine Oil is obtained by distillation from the oleoresin obtained from various species of *Pinus* and rectified.

CHARACTERISTICS

A clear, bright, colourless liquid, visibly free from water; odour, characteristic.

TESTS

Refractive index

1.467 to 1.477, Appendix V E.

Solubility in ethanol

Soluble, at 20°, in 7 volumes of *ethanol (90%)* and in 3 volumes of *ethanol (96%)*, Appendix X M.

Weight per ml

0.855 to 0.868 g, Appendix V G.

Residue on evaporation

Not more than 1.0% when determined by the method for *residue on evaporation of volatile oils*, Appendix X M. Use 2 g and heat for 4 hours.

STORAGE

Turpentine Oil should be kept in a well-filled container and protected from light.

Valerian Dry Hydroalcoholic Extract

General Notices

(Ph Eur monograph 1898)

Ph Eur

DEFINITION

Extract produced from *Valerian root (0453)*.

Content

Minimum 0.25 per cent *m/m* of sesquiterpenic acids, expressed as valerenic acid ($C_{15}H_{22}O_2$; M_r 234.3) (dried extract).

PRODUCTION

The extract is produced from the drug using ethanol (45 to 80 per cent *V/V*) or methanol (40 to 55 per cent *V/V*) by an appropriate procedure.

CHARACTERS

Appearance

Brown, hygroscopic powder.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)*.

Test solution Suspend 1 g of the extract to be examined in 10 ml of *methanol R* and sonicate for 10 min. Filter the supernatant through a membrane filter (0.45 µm). Use the filtrate as the test solution.

Reference solution Dissolve 5 mg of *acetoxyvalerenic acid R* and 5 mg of *valerenic acid R* in 20 ml of *methanol R*.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *glacial acetic acid R, ethyl acetate R, cyclohexane R* (2:38:60 *V/V/V*).

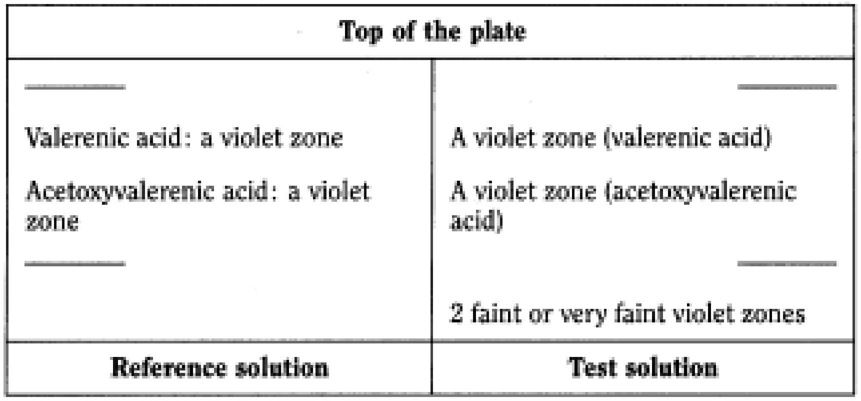
Application 20 µl [or 5 µl] as bands.

Development Over a path of 10 cm [or 6 cm].

Drying In air.

Detection Spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other violet zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
———	———
Valerenic acid: a violet zone	A violet zone (valerenic acid)
Acetoxyvalerenic acid: a violet zone	A violet zone (acetoxyvalerenic acid)
———	———
	2 faint or very faint violet zones
Reference solution	**Test solution**

TESTS

Loss on drying *(2.8.17)*

Maximum 6.0 per cent.

ASSAY

Liquid chromatography *(2.2.29)*.

Test solution Suspend 1.00 g of the extract to be examined in 50.0 ml of *methanol R1*, sonicate for 10 min and filter.

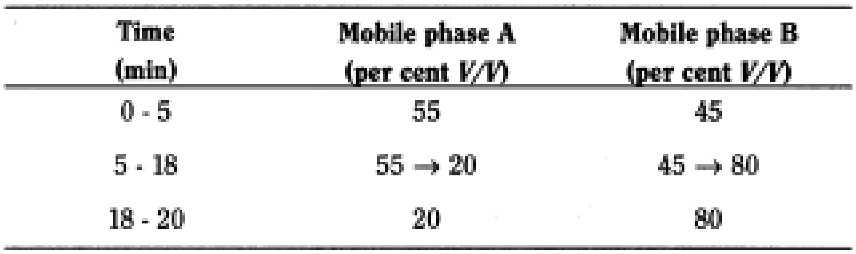
Reference solution Dissolve an amount of *valerian standardised dry extract CRS* corresponding to 1.0 mg of valerenic acid in *methanol R1* and dilute to 10.0 ml with the same solvent.

Column:

- *size: l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase: octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

- *mobile phase A: acetonitrile R1*, 5 g/l solution of *phosphoric acid R* (20:80 *V/V*);
- *mobile phase B*: 5 g/l solution of *phosphoric acid R, acetonitrile R1* (20:80 *V/V*);



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 5	55	45
5 - 18	55 → 20	45 → 80
18 - 20	20	80

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 220 nm.

Injection 20 µl.

Peak identification Use the chromatogram supplied with *valerian standardised dry extract CRS* and the chromatogram obtained with the reference solution to identify the peaks due to acetoxyvalerenic acid and valerenic acid.

System suitability Reference solution:

— *relative retention* with reference to valerenic acid (retention time = about 21 min): acetoxyvalerenic acid = about 0.5.

Calculate the percentage content of sesquiterpenic acids, expressed as valerenic acid, using the following expression:

$$\frac{(A_1 + A_2) \times m_2 \times p \times 5}{A_3 \times m_1}$$

A_1 = area of the peak due to acetoxyvalerenic acid in the chromatogram obtained with the test solution;

A_2 = area of the peak due to valerenic acid in the chromatogram obtained with the test solution;

A_3 = area of the peak due to valerenic acid in the chromatogram obtained with the reference solution;

m_1 = mass of the dried extract to be examined, in grams;

m_2 = mass of *valerian standardised dry extract CRS* used to prepare the reference solution, in grams;

p = percentage content of valerenic acid in *valerian standardised dry extract CRS*.

Ph Eur

Valerian Tincture

General Notices

(Ph Eur monograph 1899)

Ph Eur

DEFINITION

Tincture produced from *Valerian root (0453)*.

Content

Minimum 0.015 per cent *m/m* of sesquiterpenic acids, expressed as valerenic acid ($C_{15}H_{22}O_2$; M_r 234.3).

PRODUCTION

The tincture is produced from 1 part of the drug and 5 parts of ethanol (60 to 80 per cent *V/V*) by an appropriate procedure.

CHARACTERS

Appearance

Brown liquid.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)*.

Test solution Dilute 5 ml of the tincture to be examined with 5 ml of *ethanol (70 per cent V/V) R*.

Reference solution Dissolve 5 mg of *acetoxyvalerenic acid R* and 5 mg of *valerenic acid R* in 20 ml of *methanol R*.

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *glacial acetic acid R, ethyl acetate R, cyclohexane R* (2:38:60 *V/V/V*).

Application 20 µl [or 5 µl] as bands.

Development Over a path of 10 cm [or 6 cm].

Drying In air.

Detection Spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other violet zones may be present in the

chromatogram obtained with the test solution.

TESTS

Ethanol *(2.9.10)*

95 per cent to 105 per cent of the quantity stated on the label.

ASSAY

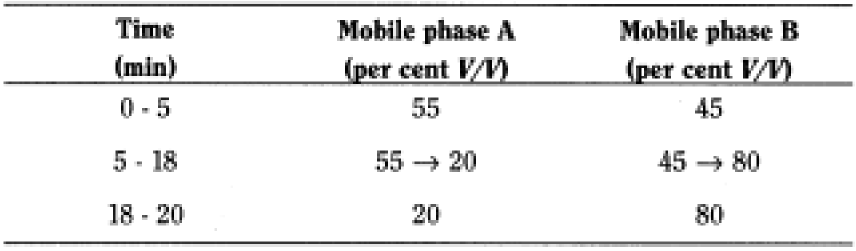
Liquid chromatography *(2.2.29)*.

Test solution Dilute 10.0 g of the tincture to be examined to 50.0 ml with *methanol R1*.

Reference solution Dissolve an amount of *valerian standardised dry extract CRS* corresponding to 1.0 mg of valerenic acid in *methanol R1* and dilute to 10.0 ml with the same solvent.

Column:
- *size: l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase: octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:
- *mobile phase A: acetonitrile R1*, 5 g/l solution of *phosphoric acid R* (20:80 *V/V*);
- *mobile phase B*: 5 g/l solution of *phosphoric acid R*, *acetonitrile R1* (20:80 *V/V*);



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 5	55	45
5 - 18	55 → 20	45 → 80
18 - 20	20	80

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 220 nm.

Injection 20 µl.

Peak identification Use the chromatogram supplied with *valerian standardised dry extract CRS* and the chromatogram obtained with the reference solution to identify the peaks due to acetoxyvalerenic acid and valerenic acid.

System suitability Reference solution:

— *relative retention* with reference to valerenic acid (retention time = about 20 min): acetoxyvalerenic acid = about 0.5.

Calculate the percentage content of sesquiterpenic acids, expressed as valerenic acid, using the following expression:

$$\frac{(A_1 + A_2) \times m_2 \times p \times 5}{A_3 \times m_1}$$

A_1 = area of the peak due to acetoxyvalerenic acid in the chromatogram obtained with the test solution;

A_2 = area of the peak due to valerenic acid in the chromatogram obtained with the test solution;

A_3 = area of the peak due to valerenic acid in the chromatogram obtained with the reference solution;

m_1 = mass of the tincture to be examined, in grams;

m_2 = mass of *valerian standardised dry extract CRS* used to prepare the reference solution, in grams;

p = percentage content of valerenic acid in *valerian standardised dry extract CRS*.

Ph Eur

Valerian

General Notices

(Valerian Root, Ph Eur monograph 0453)

When Powdered Valerian is prescribed or demanded, material complying with the appropriate requirements below shall be dispensed or supplied.

Ph Eur

DEFINITION

Dried, whole or fragmented underground parts of *Valeriana officinalis* L. *s.l.*, including the rhizome surrounded by the roots and stolons.

Content:

— *whole or fragmented drug*;
  — *essential oil*: minimum 4 ml/kg (dried drug);
  — *sesquiterpenic acids*: minimum 0.17 per cent *m/m*, expressed as valerenic acid ($C_{15}H_{22}O_2$; M_r 234.3) (dried drug);

— *cut drug*;
  — *essential oil*: minimum 3 ml/kg (dried drug);
  — *sesquiterpenic acids*: minimum 0.10 per cent m/m expressed as valerenic acid ($C_{15}H_{22}O_2$; M_r 234.3) (dried drug).

IDENTIFICATION

A. The rhizome is yellowish-grey or pale brownish-grey, obconical to cylindrical, up to about 50 mm long and 30 mm in diameter; the base is elongated or compressed, usually entirely covered by numerous roots. The apex usually exhibits a cup-shaped scar from the aerial parts; stem bases are rarely present. When cut longitudinally, the pith exhibits a central cavity transversed by septa. The roots are numerous, almost cylindrical, of the same colour as the rhizome, 1-3 mm in diameter and sometimes more than 100 mm long. A few filiform fragile secondary roots are present. The fracture is short. The stolons show prominent nodes separated by longitudinally striated internodes, each 20-50 mm long, with a fibrous fracture.

B. Reduce to a powder (355) *(2.9.12).* The powder is pale yellowish-grey or pale greyish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: cells containing a pale brown resin or droplets of essential oil; groups of small, rectangular sclereids with thick walls and a narrow, channelled branched lumen; occasional groups of larger, thinner-walled sclereids from the stem bases; lignified, reticulately-thickened vessels, singly or in small groups; thin-walled, elongated cells of the piliferous layer, some with root hairs; occasional fragments of cork. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows abundant starch granules, mainly compound with up to 4-6 components but frequently separated to form single granules, rounded to irregular and up to about 15 µm in diameter; most of the granules show a rather indistinct cleft or radiate hilum.

C. Thin-layer chromatography *(2.2.27)*.

Test solution Suspend 1 g of the powdered drug (355) *(2.9.12)* in 10 ml of *methanol R* and sonicate for 10 min. Filter the supernatant through a membrane filter (0.45 µm). Use the filtrate as the test solution.

Reference solution Dissolve 5 mg of *acetoxyvalerenic acid R* and 5 mg of *valerenic acid R* in 20 ml of *methanol R*.

Plate *TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R* (2-10 µm)].

Mobile phase *glacial acetic acid R, ethyl acetate R, cyclohexane R* (2:38:60 *V/V/V*).

Application 20 µl [or 5 µl] as bands.

Development Over a path of 10 cm [or 6 cm].

Drying In air.

Detection Spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other violet zones may be present in the chromatogram obtained with the test solution.

TESTS

Foreign matter *(2.8.2)*

Maximum 5 per cent of stem bases and maximum 2 per cent of other foreign matter.

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of well homogenised powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 12.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 5.0 per cent.

ASSAY

Essential oil *(2.8.12)*

Use 40.0 g of freshly powdered drug (500) *(2.9.12)*, a 2000 ml flask, 500 ml of *water R* as the distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 3-4 ml/min for 4 h.

Sesquiterpenic acids

Liquid chromatography *(2.2.29)*.

Test solution Place 1.50 g of the powdered drug (710) (2.9.12) in a 100 ml round-bottomed flask with a ground-glass neck. Add 20 ml of *methanol R1.* Mix and heat on a water-bath under a reflux condenser for 30 min. Allow to cool and filter. Place the filter with the residue in the 100 ml round-bottomed flask. Add 20 ml of *methanol R1* and heat on a water-bath under the reflux condenser for 15 min. Allow to cool and filter. Combine the filtrates and dilute to 50.0 ml with *methanol R1*, rinsing the round-bottomed flask and the filter.

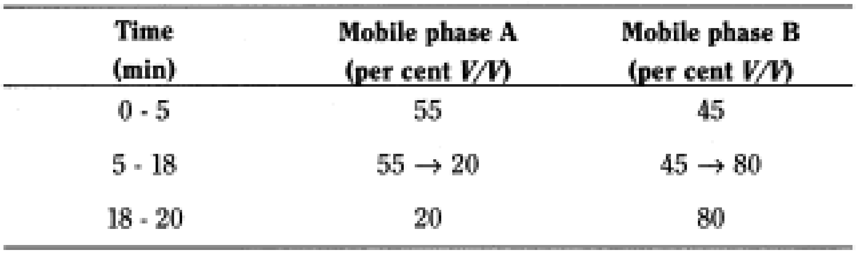
Reference solution Dissolve an amount of *valerian standardised dry extract CRS* corresponding to 1.0 mg of valerenic acid in *methanol R1* and dilute to 10.0 ml with the same solvent.

Column:
— *size: l* = 0.25 m, Ø = 4.6 mm;

— *stationary phase: octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:
— *mobile phase A*: *acetonitrile R1*, 5 g/l solution of *phosphoric acid R* (20:80 *V/V*);

— *mobile phase B*: 5 g/l solution of *phosphoric acid R, acetonitrile R1* (20:80 *V/V*);



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 5	55	45
5 - 18	55 → 20	45 → 80
18 - 20	20	80

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 220 nm.

p = percentage content of valerenic acid in *valerian standardised dry extract CRS.*

Ph Eur

Verbena Herb

General Notices

(Ph Eur monograph 1854)

Ph Eur

DEFINITION

Whole or fragmented, dried aerial parts of *Verbena officinalis* L. collected during flowering.

Content

Minimum 1.5 per cent of verbenalin ($C_{17}H_{24}O_{10}$; M_r 388.4) (dried drug).

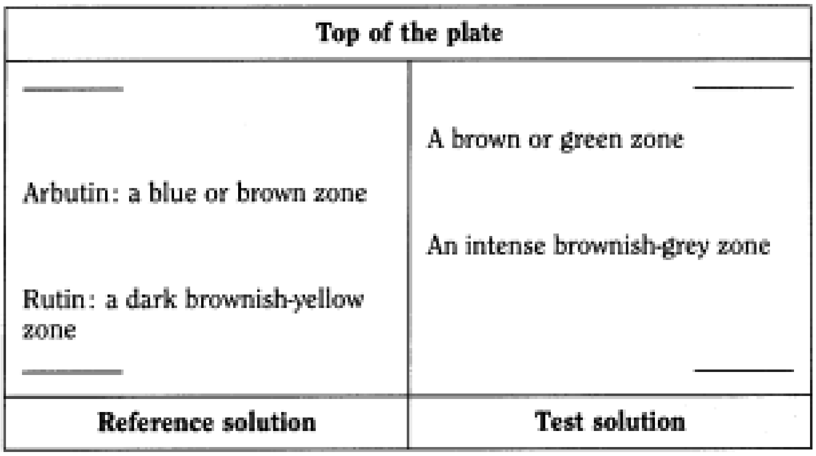
IDENTIFICATION

A. The stem is greenish-brown, quadrangular, longitudinally grooved and roughly hairy, especially on the angles. The larger leaves are petiolate and deeply pinnately lobed, with bluntly dentate margins, the smaller leaves are sessile, not lobed, with crenate to dentate margins; the surfaces are rough and covered with bristly hairs, particularly over the veins which are prominent on the lower surface. The flowers are numerous, arranged in a slender pike in the axils of leaf-like bracts; the tubular calyx has 5 acutely pointed lobes with the pale pink to lilac corolla forming a tube about twice as long as the calyx.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greenish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: long, polygonal to rectangular epidermal cells of the stems with thickened outer walls; fragments of the leaves in surface view showing sinuous-walled epidermal cells with anomocytic or anisocytic stomata *(2.8.3)*, more numerous on the lower epidermis; covering trichomes short, unicellular, thick-walled, up to 500 µm long, wide at the base and arising from the centre of a single ring of domed, spherical epidermal cells; occasional glandular trichomes of 2 types: (a) multicellular stalk with a flattened, 4- to 8-celled head about 25 µm in diameter and (b) unicellular stalk and an enlarged ovate head about 65 µm in diameter composed of 8 radiating cells; fragments of the fibrous layer of the anther with well-marked thickenings; triangular to ovoid or rounded pollen grains about 30 µm in diameter, with 3 pores and a smooth exine; abundant groups of fibres, bordered-pitted vessels and parenchymatous tissue from the stems.

C. Examine the chromatograms obtained in test B for Aloysia citrodora.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
———	———
	A brown or green zone
Arbutin: a blue or brown zone	
	An intense brownish-grey zone
Rutin: a dark brownish-yellow zone

Reference solution	**Test solution**

TESTS

Aloysia citrodora

A. A lemon-like odour indicates the presence of *Aloysia citrodora*.

B. Thin-layer chromatography *(2.2.27)*.

Test solution To 0.50 g of the powdered drug (710) *(2.9.12)* add 5 ml of *methanol R*. Heat in a water-bath at 60 °C for 10 min. Cool and filter.

Reference solution Dissolve 10 mg of *arbutin R* and 10 mg of *rutin R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate TLC silica gel plate R (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase anhydrous formic acid R, glacial acetic acid R, water R, ethyl acetate R (11:11:27:100 *V/V/V/V*).

Application 20 µl [or 5 µl] as bands.

Development Over a path of 12 cm [or 6 cm].

Drying In air.

Detection Spray with *anisaldehyde solution R* and heat at 100-105 °C for about 10 min. Examine in daylight.

Results The chromatogram obtained with the test solution shows no intense blue or violet zone approximately at the position of rutin in the chromatogram obtained with the reference solution.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 10.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 2.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

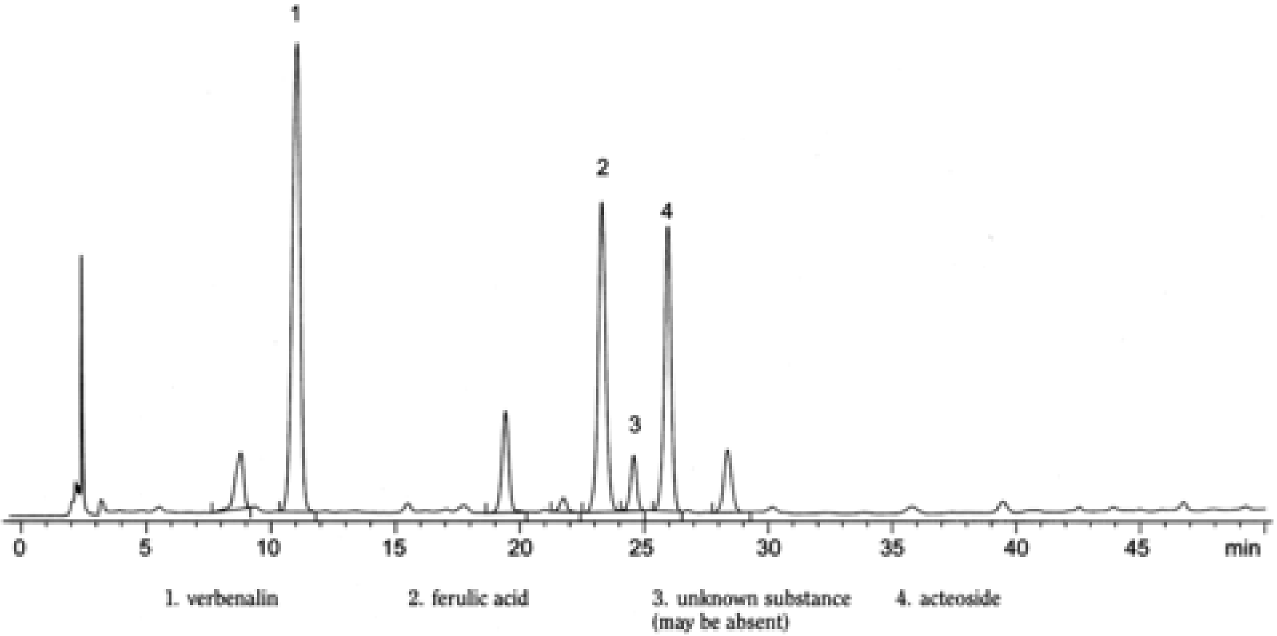

Figure 1854.-1. – *Chromatogram for the assay of verbena herb: test solution*

Internal standard solution Dissolve 10.0 mg of *ferulic acid R* in *ethanol (60 per cent V/V) R* and dilute to 100.0 ml with the same solvent.

Test solution To 1.00 g of the powdered drug (710) *(2.9.12)* add 50.0 ml of the internal standard solution and stir with a magnetic stirrer for 2 h. Centrifuge for 15 min and filter the supernatant using a membrane filter of 0.45 µm pore size.

Reference solution Dissolve the contents of a vial of *verbenalin CRS* in the internal standard solution and dilute to 5.0 ml with the same solution.

Precolumn:
— *size*: *l* = 0.01 m, Ø = 4.0 mm;

— *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

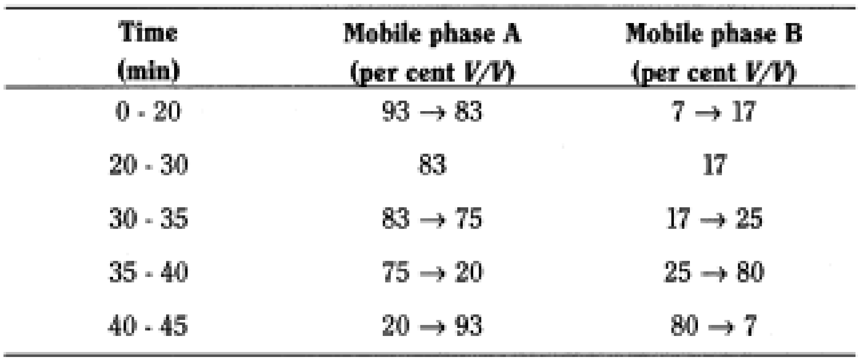
Column:
— *size*: *l* = 0.25 m, Ø = 4.0 mm;

— *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);

— *temperature*: 20 °C.

Mobile phase:
— *mobile phase A*: 0.3 per cent *V/V* solution of *phosphoric acid R;*

— *mobile phase B*: *acetonitrile R*;



Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 20	93 → 83	7 → 17
20 - 30	83	17
30 - 35	83 → 75	17 → 25
35 - 40	75 → 20	25 → 80
40 - 45	20 → 93	80 → 7

Flow rate 1.0 ml/min.

Detection Spectrophotometer at 240 nm.

Injection 20 µl.

System suitability Test solution:

— the chromatogram obtained is similar to the chromatogram shown in Figure 1854.-1;

— *resolution*: minimum 3.5 between the peaks due to ferulic acid and acteoside.

Calculate the percentage content of verbenalin from the following expression:

$$\frac{A_1 \times A_4 \times m_2 \times 10}{A_2 \times A_3 \times m_1}$$

A_1 = area of the peak due to verbenalin in the chromatogram obtained with the test solution;

A_2 = area of the peak due to verbenalin in the chromatogram obtained with the reference solution;

A_3 = area of the peak due to ferulic acid in the chromatogram obtained with the test solution;

A_4 = area of the peak due to ferulic acid in the chromatogram obtained with the reference solution;

m_1 = mass of the drug used to prepare the test solution, in grams;

m_2 = mass of verbenalin in the reference solution, in grams.

Ph Eur

Weak Ginger Tincture

General Notices

DEFINITION

Strong Ginger Tincture	200 ml
Ethanol (90 per cent)	Sufficient to produce 1000 ml

The tincture complies with the requirements for Tinctures stated under Extracts and with the following requirements.

TESTS

Ethanol content

86 to 90% v/v, Appendix VIII F, Method III.

Dry residue

Not less than 0.4% w/v. Use 10 ml.

Relative density

0.825 to 0.835, Appendix V G.

White Horehound

General Notices

(Ph Eur monograph 1835)

Ph Eur

DEFINITION

Whole or fragmented dried flowering aerial parts of *Marrubium vulgare* L.

Content

Minimum 0.7 per cent of marrubiin ($C_{20}H_{28}O_4$; M_r 332.4) (dried drug).

CHARACTERS

Bitter taste.

IDENTIFICATION

A. The stems are up to 50 cm long, quadrangular, up to 7 mm wide, young stems are densely covered with whitish downy hairs, older stems are greenish-grey and less hairy. The lower leaves are broadly ovate to almost orbicular, upper leaves less broadly ovate, both petiolate; lamina 1.5-4 cm long, 1-3.5 cm wide, apex sub-acute, base tapering or somewhat cordate, margin dentate to crenate, petiole up to 3 cm long; venation pinnate, prominent on the lower surface, distinctly depressed on the upper surface. Both leaf surfaces are densely covered with fine, white, woolly hairs, older leaves having fewer hairs on the dark greyish-green upper surface. The flowers are small, sessile in dense axillary clusters. The calyx is 5 mm long, persistent, with 5 long and 5 short, alternating, hooked, recurved fringing spines; throat of calyx with an internal ring of long silky hairs; corolla 7 mm long, dull white, 4-lobed, upper lobe 2-lipped, lower-lobe 3-lipped; 4 short stamens; style with bifid stigma.

B. Reduce to a powder (710) *(2.9.12)*. The powder is greyish-green. Examine under a microscope under *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of leaves with sinuous, polygonal epidermal cells, diacytic stomata *(2.8.3)*, more numerous on the lower surface and cells of the mesophyll with small needles and cluster crystals of calcium oxalate; covering trichomes very numerous, twisted or coiled, 100-200 µm long, unicellular or multicellular and unseriate with 2-6 cells, enlarged at the joints; stellate trichomes of 2 types, one with 15-20 branches arising from a short unicellular stalk and the other with fewer branches arising from a sessile base; 8-celled secretory trichomes of lamiaceous type; glandular trichomes with 1 or 2 celled stalk and 1 to 4 celled head; the covering trichomes on the inner surface of the calyx are up to 1000 µm long with 2 to 3 cells, strongly thickened at the swollen joint and with the upper cell elongated; pollen grains spherical, about 25 µm in diameter with smooth exine; fragments of vascular tissue from the stems and veins.

C. Thin-layer chromatography *(2.2.27)*.

Test solution (a) To 1.0 g of the powdered drug (710) *(2.9.12)* add 2 ml of *dilute hydrochloric* *acid R* and 8 ml of *methanol R*. Heat under a reflux condenser for 30 min, cool and filter.

Test solution (b) To 1.0 g of the powdered drug (710) *(2.9.12)* add 10 ml of *methanol R*. Heat under a reflux condenser for 30 min, cool and filter.

Reference solution Dissolve 10 mg of *cholesterol R* and 10 mg of *guaiazulene R* in 10 ml of *methanol R.*

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *methanol R*, *toluene R* (5:95 *V/V*).

Application 20 µl [or 5 µl] of test solutions (a) and (b) and 10 µl [or 2 µl] of the reference solution, as bands.

Development Over a path of 10 cm [or 6 cm].

Drying In air.

Detection Spray with a 5 g/l solution of *vanillin R* in a mixture of 20 volumes of *ethanol (96 per cent) R* and 80 volumes of *sulphuric acid R* and examine in daylight immediately after heating at 130 °C for 5-10 min.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and test solutions (a) and (b). Further zones in the chromatograms obtained with test solutions (a) and (b) may be present. The zone due to marrubiin in the chromatogram obtained with test solution (a) is more intense than that in the chromatogram obtained with test solution (b). During extraction with hydrochloric acid and methanol, conversion of pre-marrubiin to marrubiin takes place which leads to an increase in intensity of the zone.

Ph Eur

White Peony Root for use in THM

General Notices

DEFINITION

White Peony Root for use in THM is the dried whole root of *Paeonia lactiflora* Pallas (*Paeonia albiflora* Pallas; *Paeonia edulis* Salisb.; *Paeonia officinalis* Thunb.). It contains not less than 1.6% of paeoniflorin ($C_{23}H_{28}O_{11}$), calculated with reference to the dried material.

It is collected in summer and autumn, washed clean, with the two ends and rootlet removed and dried.

IDENTIFICATION

A. Cylindrical, straight or slightly curved, two ends truncate, 5 to 20 cm long, 1 to 2.5 cm in diameter. Externally light brown to reddish brown, with longitudinal wrinkles, rootlet scars and with laterally elongated lenticels. Texture compact, easily broken, fracture relatively even, internally whitish or pale brownish-red. Cambium ring distinct and rays radial.

B. Reduce to a powder. The powder is pale yellow. Examine under a microscope using *chloral hydrate solution*. The powder shows abundant rounded, rectangular or elongated parenchymatous cells which occur singly or in groups, some with pitted or slightly beaded walls; single cluster crystals of calcium oxalate, 11 to 35 µm in diameter, isolated or packed in rows in parenchymatous cells, sometimes with several crystals in each cell; fragments of lignified vessels, 20 to 65 µm in diameter, usually reticulately thickened but occasionally bordered-pitted; fibres occur rarely, usually accompanying the vessel fragments, they are 15 to 40 µm in diameter, with thickened, slightly lignified and frequently pitted walls. Examine under a microscope using a 50% v/v solution of *glycerol* in *water*. Many of the parenchymatous cells contain masses of starch grains which may also be found scattered throughout the powder.

C. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

D. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake 0.5 g of the powdered root with 10 ml of *ethanol* for 5 minutes, filter and evaporate the filtrate to dryness and dissolve the residue in 1 ml of *absolute ethanol*.

(2) 0.1% w/v each of *paeoniflorin BPCRS* and *4′-hydroxyacetophenone BPCRS* in *ethanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Merck silica gel 60 precoated plates are suitable).

(b) Use the mobile phase described below.

(c) Apply 10 µl for each solution, as a band.

(d) Develop the plate to 15 cm.

(e) Dry the plate in air. Spray with a 5% w/v solution of *vanillin* in *sulphuric acid*, heat at 105º for 5 minutes and examine immediately.

MOBILE PHASE

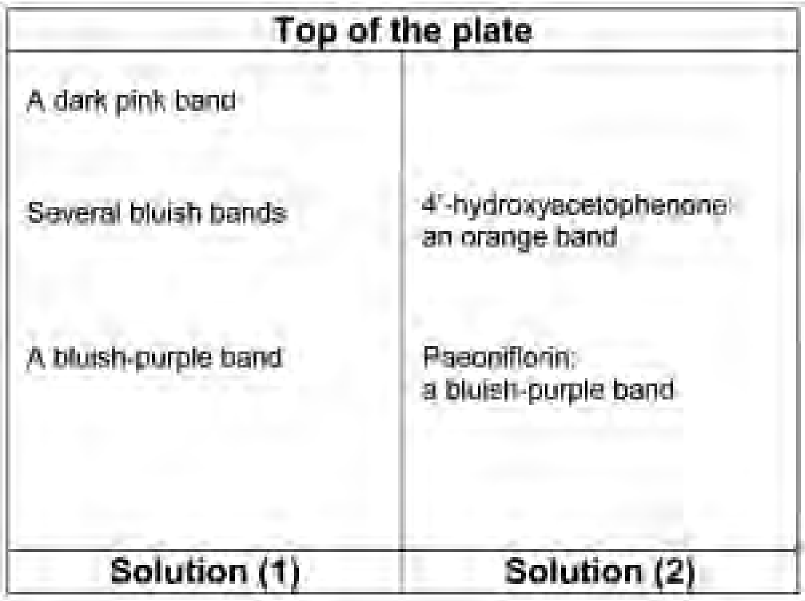
A mixture of 0.2 volumes of *formic acid*, 5 volumes of *ethyl acetate*, 10 volumes of *methanol* and 40 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), two clearly separated bands are observed.

CONFIRMATION

The bluish-purple band with an Rf value of approximately 0.4 in the chromatogram obtained with solution (1) corresponds in colour and position to that in the chromatogram obtained with solution (2). Other bands are present in the chromatogram obtained with solution (1) as shown below.



Top of the plate	
A dark pink band	
Several bluish bands	4'-hydroxyacetophenone: an orange band
A bluish-purple band	Paeoniflorin: a bluish-purple band
Solution (1)	Solution (2)

TESTS

Tree Peony

In the Assay, the chromatogram obtained with solution (1) shows no peak with a relative retention of approximately 1.2 with reference to paeoniflorin.

Loss on drying

When dried for 3 hours at 100º to 105º, loses not more than 12.0% of its weight. Use 1 g.

Acid-insoluble ash

Not more than 0.5%, Appendix XI K.

Ash

Not more than 6.5%, Appendix XI J.

Cadmium

Maximum 3 ppm, Appendix VII.

Lead

Maximum 5 ppm, Appendix VII.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared in 0.05M *potassium dihydrogen orthophosphate* (solution A).

(1) Finely powder not less than 5 g of the herbal drug being examined. Mix 0.15 g of the powdered drug with 3 ml of *methanol* and place in an ultrasonic bath for 30 minutes. Dilute to 10 ml with solution A, mix, filter through a 0.45-µm filter and use the filtrate.

(2) Dissolve a quantity of *paeoniflorin BPCRS* in *methanol* and dilute with solution A to produce a solution containing 0.05% w/v in 3 volumes of *methanol* and 7 volumes of solution A and mix.

(3) Dissolve a quantity of *4′-hydroxyacetophenone BPCRS* in solution (2) to produce a solution containing 0.05% w/v of 4′-hydroxyacetophenone.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Luna C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 ml per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 230 nm.

(f) Inject 10 µl of each solution.

MOBILE PHASE

A mixture of 30 volumes of *methanol* and 70 volumes of solution A.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the number of *theoretical plates* for the peak due to paeoniflorin is at least 3000, the *symmetry factor* for the peak due to paeoniflorin is not more than 1.3 and the *resolution factor* between the two peaks is not less than 1.7.

DETERMINATION OF CONTENT

Using the retention time and the peak area from the chromatograms obtained with solution (2) , locate and integrate the peak due to paeoniflorin in the chromatogram obtained with solution (1).

Calculate the content of $C_{23}H_{28}O_{11}$ in the sample, using the declared content of paeoniflorin ($C_{23}H_{28}O_{11}$) in *paeoniflorin BPCRS* and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100 - d}$$

A_1 = Area of the peak due to paeoniflorin in the chromatogram obtained with solution (1).

A_2 = Area of the peak due to paeoniflorin in the chromatogram obtained with solution (2).

m_1 = Weight of the drug being examined in mg.

m_2 = Weight of *paeoniflorin BPCRS* in mg.

V_1 = Dilution volume of solution (1) in ml.

V_2 = Dilution volume of solution (2) in ml.

p = Percentage content of $C_{23}H_{28}O_{11}$ in *paeoniflorin BPCRS.*

d = Percentage loss on drying of the herbal drug being examined.

STORAGE

White Peony Root for use in THM should be protected from moisture.

Wild Pansy

General Notices

(Wild Pansy (Flowering Aerial Parts), Ph Eur monograph 1855)

Ph Eur

DEFINITION

Dried flowering aerial parts of *Viola arvensis* Murray and/or *Viola Tricolor* L.

Content

Minimum 1.5 per cent of flavonoids, expressed as violanthin ($C_{27}H_{30}O_{14}$; M_r 578.5) (dried drug).

IDENTIFICATION

A. The stem is angular and hollow. The leaves are oval, petiolate, with a cordate base or elongated and obtuse, with lyrate stipules, divided in the middle. The flowers, with a long peduncle, are zygomorphic, with 5 oval, lanceolate sepals, an appendage pointed outwards and 5 petals of which the lower one bears a spur; in *Viola arvensis*, the petals are shorter than the calyx, the lower petal is cream coloured, with black lines, the 4 upper petals may be cream coloured or violet blue; in *Viola Tricolor*, the petals are longer than the calyx and violet coloured, more or less tinged with yellow. The androecium consisting of 5 stamens bears at the apex a membranous connective appendage with 2 spurs. The trilocular ovary shows a short style and globular stigmata. The fruit are navicular capsules, three-lobed, yellowish brown, 5 mm to 10 mm long. The pale yellow, pyriform seeds are about 1 mm long, bearing a caruncle.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greenish. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the epidermis of the leaves in surface view with wavy-walled cells and anomocytic stomata *(2.8.3)*; conical unicellular covering trichomes, widened at the base and sharply pointed at the apex, with a striated cuticle; glandular trichomes with a multicellular head, and a short, multicellular stalk in the indentations of the leaf margins; cluster crystals of calcium oxalate, sometimes included in parenchyma; fragments of the corolla with wavy-walled epidermal cells, those from the mid-region papillose and with some extended to form flask or bottle-shaped projections, those from the base of the petals with covering trichomes up to about 300 µm long with characteristic hump-like swellings along their length; spherical or polyhedral pollen grains, 60 µm to 80 µm in diameter, with finely pitted exines and 5 pores (*Viola arvensis*) or 4 pores (*Viola Tricolor*); occasional fragments of spiral and reticulate vessels and groups of fibres from the stem.

C. Thin-layer chromatography *(2.2.27)*.

Test solution Heat in a water-bath at 65 °C for 5 min, with frequent stirring, 2.0 g of the powdered drug (355) *(2.9.12)* in 10 ml of *alcohol (70 per cent V/V) R*. Cool and filter.

Reference solution Dissolve 2.5 mg of *rutin R*, 2.5 mg of *hyperoside R* and 1.0 mg of *caffeic* *acid R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate *TLC silica gel plate R.*

Mobile phase *anhydrous formic acid R*, *acetic acid R*, *water R*, *ethyl acetate R* (11:11:27:100 *V/V/V/V*).

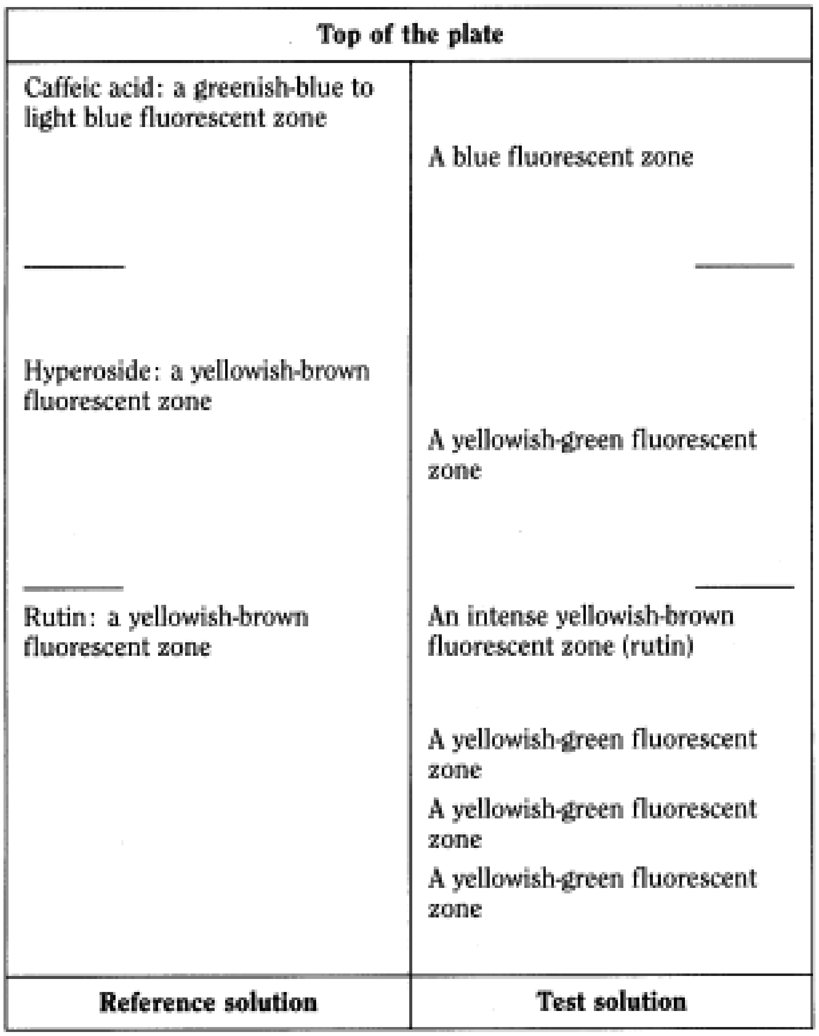
Application 10 µl, as bands.

Development Over a path of 12 cm.

Drying At 100-105 °C.

Detection Spray with a solution containing 10 g/l of *diphenylboric acid aminoethyl ester R* and 50 g/l of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for 30 min. Examine in ultraviolet light at 365 nm.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
Caffeic acid: a greenish-blue to light blue fluorescent zone	A blue fluorescent zone

	A yellowish-green fluorescent zone
Reference solution	**Test solution**

TESTS

Foreign matter *(2.8.2)*

Maximum 3 per cent.

Swelling index (*2.8.4*)

Minimum 9, determined on the powdered drug (355) *(2.9.12)*.

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*)

Maximum 15.0 per cent.

ASSAY

Stock solution In a 200 ml flask, introduce 0.300 g of the powdered drug (250) *(2.9.12)* and 40 ml of *alcohol (60 per cent V/V) R*. Heat in a water-bath at 60 °C for 10 min, shaking frequently. Allow to cool and filter through a plug of absorbent cotton into a 100 ml volumetric flask. Transfer the absorbent cotton with the drug residue back into the 200 ml flask, add 40 ml of *alcohol (60 per cent V/V) R* and heat again in a water-bath at 60 °C for 10 min, shaking frequently. Allow to cool and filter into the same 100 ml volumetric flask as used previously. Rinse the 200 ml flask with a further quantity of *alcohol (60 per cent V/V) R*, filter and transfer to the same 100 ml volumetric flask. Dilute to volume with *alcohol (60 per cent V/V) R* and filter.

Test solution Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the same 25 ml volumetric flask as used previously. Add 10.0 ml of a solution containing 25.0 g/l of *boric acid R* and 20.0 g/l of *oxalic acid R* in *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

Compensation liquid Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the same 25 ml volumetric flask as used previously. Add 10.0 ml of *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

Measure the absorbance *(2.2.25)* of the test solution at 405 nm after 30 min.

Calculate the percentage content of total flavonoids, expressed as violanthin from the expression:

$$\frac{A \times 1.25}{m}$$

taking the specific absorbance of violanthin to be 400.

A = measured absorbance at 405 nm

M = mass of the drug to be examined, in grams

Ph Eur

Wild Thyme

General Notices

(Ph Eur monograph 1891)

Ph Eur

DEFINITION

Whole or cut, dried, flowering aerial parts of *Thymus serpyllum* L.s.l.

Content

Minimum 3.0 ml/kg of essential oil (dried drug).

IDENTIFICATION

A. The stem is much branched, up to about 1.5 mm in diameter, cylindrical or indistinctly quadrangular, green, reddish or purplish, the older stems brown and woody, the younger stems pubescent. The leaves are opposite, 3 mm to 12 mm long and up to 4 mm wide, elliptical to ovate-lanceolate with an obtuse apex, cuneate and shortly petiolate at the base; the margin is entire and markedly ciliate, especially near the base; both surfaces are more or less glabrous but distinctly punctate. The inflorescence is composed of about 6 to 12 flowers in rounded to ovoid, terminal heads. The calyx is tubular, two-lipped with the upper lip dividing to form 3 teeth, the lower lip with 2 teeth, edged with long hairs; inner surfaces strongly pubescent, the hairs forming a closed tube after flowering. The corolla is purplish-violet to red, two-lipped, the lower lip with 3 lobes, upper lip notched, inner surface strongly pubescent; stamens 4, epipetalous, projecting from the corolla tube.

B. Reduce to a powder (355) *(2.9.12)*. The powder is greyish-green to brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the leaf epidermises with sinuous, slightly thickened anticlinical walls and stomata of the diacytic type *(2.8.3)*; numerous covering trichomes on both epidermises and along the leaf margins, the majority short, conical, unicellular, with thickened and warty walls, fewer long, uniseriate, composed of up to 8 cells, slightly swollen at the joints, with moderately thickened walls; abundant glandular trichomes, mostly multicellular with a small, rounded, unicellular stalk and a large globular head composed of a number of indistinct, radiating cells containing brown secretion, others smaller, capitate, with unicellular stalk and a unicellular, globoid or ovoid head; purplish-violet fragments of the corolla, the outer epidermis with numerous covering and glandular trichomes, inner epidermis papillose; pollen grains spherical to elliptical, 30 µm to 40 µm in diameter, with a finely grained exine and 6 germinal pores.

C. Thin-layer chromatography *(2.2.27)*.

Test solution To 1.0 g of the powdered drug (355) *(2.9.12)* add 5 ml of *methylene chloride R* and shake for 3 min. Filter through about 2 g of *anhydrous sodium sulphate R*.

Reference solution Dissolve 5 mg of *thymol R* and 10 µl of *carvacrol R* in 10 ml of *methylene chloride R.*

Plate *TLC silica gel F_{254} plate R*.

Mobile phase *methylene chloride R.*

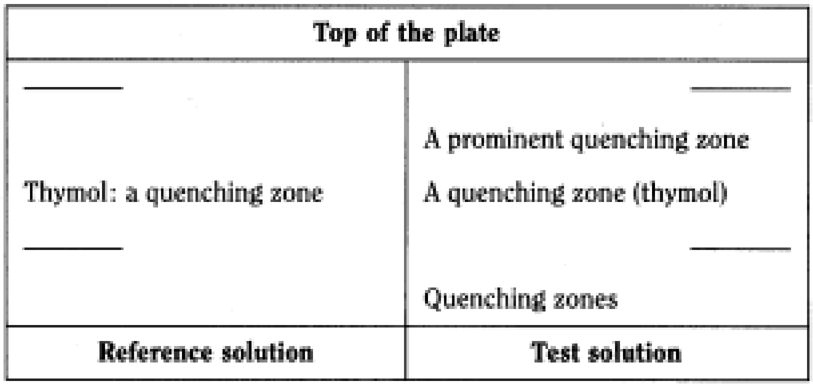
Application 20 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection A Examine in ultraviolet light at 254 nm.

Results A See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
———	———
	A prominent quenching zone
Thymol: a quenching zone	A quenching zone (thymol)

TESTS

Foreign matter ***(2.8.2)***

Maximum 3 per cent, determined on 30 g.

Foreign matter may also consist of acicular to linear-lanceolate leaves with a strongly bent

---

margin, the adaxial surface showing covering trichomes shaped as pointed teeth with warty walls, the abaxial surface showing many types of warty covering trichomes: unicellular, straight or slightly curved, bicellular or tricellular, often elbow-shaped, and bicellular or tricellular, more or less straight (*Thymus vulgaris, Thymus zygis*).

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16)*

Maximum 10.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 3.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs (2.8.12). Use 50.0 g of the cut drug, a 1000 ml round-bottomed flask and 500 ml of *water R* as the distillation liquid. Distil at a rate of 2-3 ml/min for 2 h without *xylene R* in the graduated tube.

Ph Eur

Willow Bark Dry Extract

General Notices

(Ph Eur monograph 2312)

Ph Eur

DEFINITION

Dry extract produced from *Willow bark (1583).*

Content

Minimum 5.0 per cent of total salicylic derivatives, expressed as salicin ($C_{13}H_{18}O_7$; M_r 286.3) (dried extract).

PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using either water or a hydroalcoholic solvent equivalent in strength to a maximum of 80 per cent *V/V* ethanol.

CHARACTERS

Appearance

Yellowish-brown amorphous powder.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)*.

Test solution (a) To 0.200 g of the extract to be examined add 5 ml of *methanol R*. Sonicate for 5 min, filter and dilute to 10 ml with *methanol R.*

Test solution (b) To 5.0 ml of test solution (a) add 1.0 ml of a 50 g/l solution of *anhydrous sodium carbonate R* and heat in a water-bath at about 60 °C for 10 min. Cool and filter if necessary.

Reference solution Dissolve 2.0 mg of *salicin R* and 2.0 mg of *chlorogenic acid R* in 1.0 ml of *methanol R.*

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *water R*, *methanol R*, *ethyl acetate R* (8:15:77 *V/V/V*).

Application 10 µl [or 2 µl] as bands.

Development Over a path of 15 cm [or 6 cm].

Drying In a current of warm air.

Detection Spray with a mixture of 5 volumes of *sulphuric acid R* and 95 volumes of *methanol*

R. Heat at 100-105 °C for 5 min and examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and test solutions (a) and (b). Furthermore, other zones may be present in the chromatogram obtained with test solutions (a) and (b).

Flow rate 1.0 ml/min.

Detection Spectrophotometer at 270 nm.

Injection 10 µl.

Retention time Salicin = about 6.4 min;

picein = about 7.7 min.

System suitability Reference solution:

— *resolution*: minimum 1.5 between the peaks due to salicin and picein.

Calculate the percentage content of total salicylic derivatives, expressed as salicin, from the following expression:

$$\frac{A_1 \times m_2 \times p \times 2}{A_2 \times m_1}$$

A_1 = area of the peak due to salicin in the chromatogram obtained with the test solution

A_2 = area of the peak due to salicin in the chromatogram obtained with the reference solution;

m_1 = mass of the extract to be examined used to prepare the test solution, in grams

m_2 = mass of *salicin CRS* used to prepare the reference solution, in grams

p = percentage content of salicin in *salicin CRS.*

Ph Eur

Willow Bark

General Notices

(Ph Eur monograph 1583)

Ph Eur

DEFINITION

Whole or fragmented dried bark of young branches or whole dried pieces of current-year twigs of various species of genus *Salix* including *S. purpurea* L., *S. daphnoides* Vill. and *S. fragilis* L.

Content

Minimum 1.5 per cent of total salicylic derivatives, expressed as salicin ($C_{13}H_{18}O_7$; M_r 286.3) (dried drug).

IDENTIFICATION

A. The bark is 1-2 mm thick and occurs in flexible, elongated, quilled or curved pieces. The outer surface is smooth or slightly wrinkled longitudinally and greenish-yellow or brownish-grey. The inner surface is smooth or finely striated longitudinally and white, pale yellow or reddish-brown, depending on the species. The fracture is short in the outer part and coarsely fibrous in the inner region. The diameter of current-year twigs is not greater than 10 mm. The wood is white or pale yellow.

B. Reduce to a powder (355) (*2.9.12*). The powder is pale yellow, greenish-yellow or light brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: bundles of narrow fibres, up to about 600 µm long, with very thick walls and surrounded by a crystal sheath containing prism crystals of calcium oxalate; parenchyma of the cortex with thick, pitted and deeply beaded walls, and containing large cluster crystals of calcium oxalate; uniseriate medullary rays; thickened cork cells. Groups of brownish collenchyma from the bud may be present. Twigs show, additionally, fragments of lignified fibres and vessels.

C. Thin-layer chromatography (*2.2.27*).

Test solution (a) To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *methanol R.* Heat in a water-bath at about 50 °C, with frequent shaking, for 10 min. Cool and filter.

Test solution (b) To 5.0 ml of test solution (a) add 1.0 ml of a 50 g/l solution of *anhydrous sodium carbonate R* and heat in a water-bath at about 60 °C for 10 min. Cool and filter if necessary.

Reference solution Dissolve 2 mg of *salicin R* and 2 mg of *chlorogenic acid R* in 1.0 ml of *methanol R.*

Plate *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase *water R*, *methanol R*, *ethyl acetate R* (8:15:77 *V/V/V*).

Application 10 µl [or 2 µl], as bands.

Development Over a path of 15 cm [or 6 cm].

Drying In a current of warm air.

Detection Spray with a mixture of 5 volumes of *sulphuric acid R* and 95 volumes of *methanol R*. Heat at 100-105 °C for 5 min and examine in daylight.

p = percentage content of salicin in *salicin CRS*.

Ph Eur

Withania Somnifera Root for use in THMP

General Notices

DEFINITION

Withania Somnifera Root for use in THMP consists of the dried mature roots of *Withania somnifera* (L.) Dunal.

It contains not less than 0.01% withaferin A ($C_{28}H_{38}O_6$) and not less than 0.01% withanolide A ($C_{29} H_{42}O_7$).

PRODUCTION

It is collected in winter, washed, dried and cut into short pieces.

IDENTIFICATION

A. The drug is cut into short lengths of up to 8 cm and varies in diameter from 2 mm to 1 cm. The outer surface is a pale greyish-brown to somewhat darker brown in larger specimens. The root breaks with a short fracture to show a whitish interior. It consists of a mixture of broader root and small portions of narrower rhizome, often at the transition zone. The cut surface of the root may show a distinction between the xylem and other tissues marked by a faint yellow-green cambial ring.

B. Reduce to a powder (355). Examine under a microscope using *chloral hydrate solution*. Cork cells in surface view polygonal, in sectional view rectangular, thin-walled, yellowish brown, rare, often broken. Parenchymatous cells in fragmented groups elongated, rectangular, or oval to round, filled with starch; occasionally pitted, lightly lignified, possibly alongside vascular fragments; square to round cells of medullary rays crossing xylem elements at right angles. Single or small groups of round or oval lignified, pitted parenchyma cells. Fragments of fibres, vessels and tracheids with surrounding parenchymatous cells. Occasional fragments of spiral, scalariform or pitted vessels with broad lumen. Other tracheids and vessels heavily lignified, reticulate or bordered pitted, single or in small groups. Fibres often accompanying vessels, thick walled, heavily pitted, and lignified; others less pitted and lignified, thin walled, in groups of two or three, or single. Medullary rays, one or two cells wide, of round cells between fibres or vascular elements. Microcrystals of calcium oxalate scattered or occasionally in idioblasts. Examine under a microscope using a 50% v/v solution of *glycerol*. Starch, abundant, of simple and 2 to 4 compound, round to oval granules, some with point, stellate or mainly cleft hila.

C. Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions.

(1) Shake 0.5 g of freshly powdered (355) drug with 1 ml of *dilute ammonia R4*, add 10 ml of *methanol*, sonicate for 10 seconds, heat on a water-bath for 3 minutes, cool, filter, evaporate the filtrate to dryness at 60° and dissolve the dried residue in 1 ml of *methanol*. Filter through a 0.45 µm filter.

(2) 0.1% w/v each of *withaferin A CRS, withanolide B CRS* and *β-sitosterol* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *silica gel F_{254}* precoated high performance plate (Merck silica gel F_{254} HPTLC plates are suitable).

(b) Use the mobile phase described below.

(c) Apply 2 µl of each of solution, as 6 mm bands.

(d) Develop the plate to 8 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm).* Immerse the plate in 5% v/v of *methanolic sulphuric acid* for 1 second, allow to dry in air, heat at 110° for 2 minutes and examine immediately in daylight. Examine the derivatised plate under *ultraviolet light* (*366 nm)*.

MOBILE PHASE

A mixture of 5 volumes of *anhydrous formic acid*, 15 volumes of *ethyl acetate* and 50 volumes of *toluene.*

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows three clearly separated bands.

CONFIRMATION

The bands with Rf values of approximately 0.1 (withaferin A), 0.26 (withanolide B) and 0.57 (β-sitosterol) in the chromatogram obtained with solution (1) correspond in colour and position to those in the chromatogram obtained with solution (2).

TESTS

Absence of *Withania coagulans*

In Identification test C the derivatised plate under *ultraviolet light* (*366 nm)* shows no orange band with an Rf of approximately 0.2 in the chromatogram obtained with solution (1).

Ash

Not more than 7.0%, Appendix XI J*.*

Acid-insoluble ash

Not more than 1.0%, Appendix XI K*.*

Loss on drying

When dried for 2 hours at 105°, loses not more than 12.0% of its weight. Use 1 g.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Extract 1.0 mg of the powdered drug with 3.0 ml of *methanol* with the aid of ultrasound for 10 minutes, centrifuge at 3000 rpm for 5 minutes and retain the supernatant extract. The extraction is repeated a further two times as described. Combine the three supernatant extracts. Adjust the total volume of the combined extracts to 10.0 ml, dilute to 20.0 ml with *methanol* and filter through a 0.45-µm filter.

(2) 0.02% w/v each of *withaferin A CRS* and *withanolide A CRS* and 0.01% w/v of

withanolide B CRS in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with dodecylsilyl silica gel for chromatography (4 µm) (Phenomenex Synergi Max-RP 80A is suitable).

(b) Use gradient elution and the mobile phases described below. Equilibrate the column with a mixture of 65% Mobile phase A and 35% Mobile phase B for at least 15 minutes.

(c) Use a flow rate of 1 ml per minute.

(d) Use a column temperature of 50º.

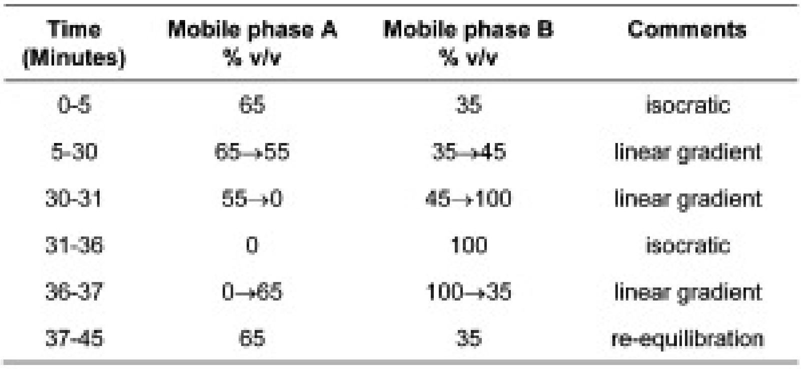
(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

Mobile phase A *water.*

Mobile phase B A mixture of *methanol* and *ethanol (96%)* in equal volumes.



Time (Minutes)	Mobile phase A % v/v	Mobile phase B % v/v	Comments
0-5	65	35	isocratic
5-30	65→55	35→45	linear gradient
30-31	55→0	45→100	linear gradient
31-36	0	100	isocratic
36-37	0→65	100→35	linear gradient
37-45	65	35	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the first two main peaks, of withaferin A and withanolide A is at least 5.0 and the *symmetry factor* for both peaks is less than 1.3.

DETERMINATION OF CONTENT

Withaferin A Using the retention time and peak area of the peak due to withaferin A in the chromatogram obtained with solution (2), locate and integrate the peak due to withaferin A in the chromatogram obtained with solution (1).

Calculate the content of withaferin A in the sample using the declared content withaferin A ($C_{28}H_{38}O_6$) in *withaferin A CRS* and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100 - d}$$

A_1 = Area of the peak due to withaferin A in the chromatogram obtained with solution (1).

A_2 = Area of the peak due to withaferin A in the chromatogram obtained with solution (2).

m_1 = Weight of the drug being examined in mg.

m_2 = Weight of *withaferin A CRS* in mg.

V_1 = Dilution volume of solution (1) in ml.

V_2 = Dilution volume of solution (2) in ml.

p = Percentage content withaferin A in *withaferin A CRS.*

d = Percentage loss on drying of the herbal drug being examined.

Withanolide A Using the retention time and peak area of the peak due to withanolide A in the chromatogram obtained with solution (2), locate and integrate the peak due to withanolide A in the chromatogram obtained with solution (1).

Calculate the content of withanolide A in the sample using the declared content withanolide A ($C_{29}H_{42}O_7$) in *withanolide A CRS* and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100 - d}$$

A_1 = Area of the peak due to withanolide A in the chromatogram obtained with solution (1).

A_2 = Area of the peak due to withanolide A in the chromatogram obtained with solution (2).

m_1 = Weight of the drug in mg.

m_2 = Weight of *withanolide A CRS* in mg.

V_1 = Dilution volume of solution (1) in ml.

V_2 = Dilution volume of solution (2) in ml.

p = Percentage content withanolide A in *withanolide A CRS*.

d = Percentage loss on drying of the herbal drug being examined.

In the chromatogram obtained with solution (2), locate and integrate the peak due to withanolide A in the chromatogram obtained with solution (1).

STORAGE

Withania Somnifera Root for use in THMP should be protected from moisture.

Wormwood

General Notices

(Ph Eur monograph 1380)

Ph Eur

DEFINITION

Basal leaves or slightly leafy, flowering tops, or mixture of these dried, whole or cut organs of *Artemisia absinthium* L.

Content

Minimum 2 ml/kg of essential oil (dried drug).

IDENTIFICATION

A. The leaves are greyish or greenish, densely tomentose on both surfaces. The basal leaves, with long petioles, have triangular or oval bipinnatisect or tripinnatisect lamina, with rounded or lanceolate segments. The cauline leaves are less segmented and the apical leaves are lanceolate. The stem of the flower-bearing region is greenish-grey, tomentose, up to 2.5 mm in diameter and usually with 5 flattened longitudinal grooves. The capitula are arranged as loose, axillary panicles, inserted at the level of the lanceolate to slightly pinnatisect leaves; they are spherical to flattened hemispherical, 2-4 mm in diameter and consist of a grey, tomentose involucre, the outer bracts linear, inner layer ovate, blunt at the apices with scarious margins, a receptacle with very long paleae up to 1 mm or more long, numerous yellow, tubular, hermaphroditic florets about 2 mm long and few yellow, ray florets.

B. Reduce to a powder (355) (*2.9.12)*. The powder is greenish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: many T-shaped trichomes with a short uniseriate stalk consisting of 1-5 small cells, perpendicularly capped by a very long, undulating terminal cell tapering at the ends; fragments of epidermises with sinuous or wavy walls, anomocytic stomata *(2.8.3)* and secretory trichomes each with a short, biseriate, 2 celled stalk and a biseriate head with 2-4 cells; fragments of the tubular and ray florets, some containing small cluster crystals of calcium oxalate; numerous paleae each composed of a small cell forming a stalk and a very long, cylindrical and thin-walled terminal cell about 1-1.5 mm long; spheroidal pollen grains, about 30 µm in diameter, with 3 pores and a finely warty exine; groups of fibres, small vessels with spiral and annular thickening, larger vessels with bordered pits and parenchyma with moderately thickened and pitted walls, from the stem.

C. Thin-layer chromatography *(2.2.27)*.

Test solution Place 2 g of the powdered drug (355) *(2.9.12)* in 50 ml of *boiling water R* and allow to stand for 5 min, shaking the flask several times. After cooling, add 5 ml of a 100 g/l solution of *lead acetate R*. Mix and filter. Rinse the flask and the residue on the filter with 20 ml of *water R*. Shake the filter with 50 ml of *methylene chloride R*. Separate the organic layer, dry over *anhydrous sodium sulphate R*, filter and evaporate the filtrate to dryness on a water-bath. Dissolve the residue in 0.5 ml of *ethanol (96 per cent) R*.

Reference solution Dissolve 2 mg of *methyl red R* and 2 mg of *resorcinol R* in 10.0 ml of *methanol R*.

Plate *TLC silica gel plate R.*

Mobile phase *acetone R, glacial acetic acid R, toluene R, methylene chloride R* (10:10:30:50 *V/V/V/V*).

Application 10 µl, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection A Spray with *acetic anhydride-sulphuric acid solution R* and examine in daylight.

Results A The chromatogram obtained with the test solution shows a blue zone due to artabsin shortly above a red zone due to methyl red in the chromatogram obtained with the reference solution.

Detection B Examine in daylight while heating at 100-105 °C for 5 min.

Results B The chromatogram obtained with the reference solution shows in the middle third a red zone due to methyl red and below it a light pink zone due to resorcinol. The chromatogram obtained with the test solution shows an intense red or brownish-red zone due to absinthin with a similar R_F value to that of the zone due to resorcinol in the chromatogram obtained with the reference solution. Other zones are visible, but less intense than that due to absinthin.

TESTS

Foreign matter *(2.8.2)*

Maximum 5 per cent of stems with a diameter greater than 4 mm and maximum 2 per cent of other foreign matter.

Bitterness value *(2.8.15)*

Minimum 10 000.

Loss on drying *(2.2.32)*

Maximum 10.0 per cent, determined on 1.000 g of powdered drug (355) *(2.9.12)* by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 12.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 1.0 per cent.

ASSAY

Carry out the determination of essential oil in herbal drugs *(2.8.12)*. Use 50.0 g of the cut drug, a 1000 ml round-bottomed flask and 500 ml of *water R* as the distillation liquid. Add 0.5 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for not less than 3 h.

Ph Eur

Yarrow

General Notices

(Ph Eur monograph 1382)

Ph Eur

DEFINITION

Whole or cut, dried flowering tops of *Achillea millefolium* L.

Content:

— *essential oil*: minimum 2 ml/kg (dried drug);

— *proazulenes, expressed as chamazulene* ($C_{14}H_{16}$; M_r 184.3): minimum 0.02 per cent (dried drug).

IDENTIFICATION

A. The leaves are green or greyish-green, faintly pubescent on the upper surface and more pubescent on the lower surface, 2-3 pinnately divided with linear lobes and a finely pointed whitish tip. The capitula are arranged in a corymb at the end of the stem. Each capitulum, 3-5 mm in diameter, consists of the receptacle, usually 4-5 ligulate ray-florets and 3-20 tubular disk-florets. The involucre consists of 3 rows of imbricate lanceolate, pubescent green bracts arranged with a brownish or whitish, membranous margin. The receptacle is slightly convex and, in the axillae of paleae, bears a ligulate ray floret with a three-lobed, whitish or reddish ligule and tubular disk-florets with a radial, five-lobed, yellowish or light brownish corolla. The pubescent green, partly brown or violet stems are longitudinally furrowed, up to 3 mm thick with a light-coloured medulla.

B. Reduce to a powder (355) *(2.9.12)*. The powder is green or greyish-green. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the stems, leaves and bracts bearing very rare glandular trichomes with a short stalk and a head formed of 2 rows of 3-5 cells enclosed in a bladder-like membrane and uniseriate covering trichomes consisting of 4-6 small, more or less isodiametric cells at the base and a thick-walled, often somewhat tortuous terminal cell, about 400 µm to greater than 1000 µm long; fragments of the ligulate corolla with papillary epidermal cells; small-celled parenchyma from the corolla tubes containing cluster crystals of calcium oxalate; groups of lignified and pitted cells from the bracts; spherical pollen grains, about 30 µm in diameter, with 3 germinal pores and spiny exine; groups of sclerenchymatous fibres and small vessels with spiral or annular thickening, from the stem.

C. To 2.0 g of the powdered drug (710) *(2.9.12)* add 25 ml of *ethyl acetate R*, shake for 5 min and filter. Evaporate to dryness on a water-bath and dissolve the residue in 0.5 ml of *toluene R* (solution A). To 0.1 ml of this solution add 2.5 ml of *dimethylaminobenzaldehyde solution R8* and heat on a water-bath for 2 min. Allow to cool. Add 5 ml of *light petroleum R* and shake the mixture vigorously. The aqueous layer shows a blue or greenish-blue colour.

D. Thin-layer chromatography *(2.2.27)*.

Test solution Use solution A prepared in identification test C.

Reference solution Dissolve 10 mg of *cineole R* and 10 mg of *guaiazulene R* in 20 ml of *toluene R*.

Plate *TLC silica gel plate R*.

Mobile phase *ethyl acetate R, toluene R* (5:95 *V/V*).

Application 20 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min and examine in daylight.

Results The chromatogram obtained with the reference solution shows in the upper part a red zone (guaiazulene) and in the middle part a blue or greyish-blue zone (cineole). The chromatogram obtained with the test solution shows a violet zone a little above the zone due to guaiazulene in the chromatogram obtained with the reference solution; below this zone a reddish-violet zone; below which, 1-2 not clearly separated greyish-violet or greyish zones (which changes to greenish-grey after a few hours) and a reddish-violet zone a little above the zone due to cineole in the chromatogram obtained with the reference solution. Further faint zones are present.

TESTS

Foreign matter *(2.8.2)*

Maximum 5 per cent of stems with a diameter greater than 3 mm and maximum 2 per cent of other foreign matter.

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 0.500 g of powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 10.0 per cent.

Ash insoluble in hydrochloric acid *(2.8.1)*

Maximum 2.5 per cent.

ASSAY

Essential oil

Carry out the determination of essential oils in herbal drugs *(2.8.12)*. Use 20.0 g of cut drug, a 1000 ml round-bottomed flask and 500 ml of a mixture of 1 volume of *water R* and 9 volumes of *ethylene glycol R* as the distillation liquid. Add 0.2 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

Stop cooling at the end of distillation and continue distilling until the blue, steam-volatile components have reached the lower end of the cooler. Immediately start cooling again, taking care to avoid warming the separation space. Stop the distillation after 5 min. Replace the 1000 ml round-bottomed flask by a 250 ml round-bottomed flask containing a mixture of 0.4 ml of *xylene R* and 50 ml of *water R*. Distil for 15 min. After 10 min read the total volume. To determine the blank value, use 0.2 ml of *xylene R* in the graduated tube and distil a mixture of 0.4 ml of *xylene R* and 50 ml of *water R* for 15 min.

Proazulenes

To ensure that as little water as possible is transferred, transfer the blue essential oil-xylene mixture obtained in the assay of essential oil into a 50 ml volumetric flask with the aid of small portions of *xylene R*, rinsing the graduated tube of the apparatus with *xylene R* and dilute to 50.0 ml with the same solvent. Measure the absorbance *(2.2.25)* at 608 nm using *xylene R* as the compensation liquid.

Calculate the percentage content of proazulenes, expressed as chamazulene, using the following expression:

$$\frac{A \times 2.1}{m}$$

i.e. taking the specific absorbance of chamazulene to be 23.8.

A = absorbance at 608 nm

m = mass of the drug to be examined, in grams.

Ph Eur

Apomorphine Hydrochloride for Homoeopathic Preparations

General Notices

Apomorphinum Muriaticum for Homoeopathic Preparations

DEFINITION

Apomorphine Hydrochloride for Homoeopathic Preparations contains Apomorphine Hydrochloride.

PRODUCTION OF STOCK

The first trituration of Apomorphine Hydrochloride for Homoeopathic Preparations is prepared using a suitable quantity of Lactose or Anhydrous Lactose as the vehicle and a validated trituration method that ensures homogeneity is achieved. The vehicle complies with the statement under Vehicles in the monograph for Homoeopathic Preparations.

Content of apomorphine hydrochloride, $C_{17}H_{17}NO_2$,HCl

The first decimal trituration contains 9.5% to 10.5% of $C_{17}H_{17}NO_2$,HCl (dried substance).

CHARACTERISTICS

The first decimal trituration is a white powder.

IDENTIFICATION

Dissolve 2.5 g of the substance being examined without heating in *water* and dilute to 25 ml with the same solvent (solution S).

A. To 5 ml of solution S add a few millitres of *sodium hydrogen carbonate solution* until a permanent, white precipitate is formed. The precipitate slowly becomes a greenish colour. Add 0.25 ml of *0.05M iodine* and shake. The precipitate becomes a greyish-green colour. Collect the precipitate. The precipitate dissolves in *ether* giving a purple solution, dissolves in *dichloromethane chloride* giving a violet-blue solution and dissolves in *alcohol* giving a blue solution.

B. To 2 ml of solution S add 0.1 ml of *nitric acid*, mix and filter. The filtrate yields reaction A characteristic of *chlorides,* Appendix VI.

C. Dissolve 0.25 g of the substance being examined in 5 ml of *water*. Add 5 ml of *ammonia* and heat in a water-bath at 80° for 10 minutes. A red colour develops.

ASSAY

Disperse 2.5 g of the substance being examined in a mixture of 5.0 ml of 0.01M *hydrochloric acid* and 50 ml of *ethanol (96%)*. Carry out the method for *potentiometric titration*, Appendix VIII B, using 0.1M *sodium hydroxide*. Measure the titrant between the first 2 points of inflexion. Each ml of 0.1M *sodium hydroxide* is equivalent to 30.38 mg of $C_{17}H_{17}NO_2$,HCl.

Arsenious Trioxide for Homoeopathic Preparations

General Notices

(Ph Eur monograph 1599)

As_2O_3 197.8 *1327-53-3*

Ph Eur

DEFINITION

Content

99.5 per cent to 100.5 per cent of As_2O_3.

CHARACTERS

Appearance

White or almost white powder.

Solubility

Practically insoluble to sparingly soluble in water. It dissolves in solutions of alkali hydroxides and carbonates.

IDENTIFICATION

A. Dissolve 20 mg in 1 ml of *dilute hydrochloric acid R*, add 4 ml of *water R* and 0.1 ml of *sodium sulphide solution R*. The resulting yellow precipitate is soluble in *dilute ammonia R1.*

B. Dissolve 20 mg in 1 ml of *hydrochloric acid R1*, add 5 ml of *hypophosphorous reagent R* and heat for 15 min on a water-bath. A black precipitate develops.

TESTS

Appearance of solution

A 100 g/l solution in *dilute ammonia R1* is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Sulphides

Dissolve 1.0 g in 10.0 ml of *dilute sodium hydroxide solution R*. Add 0.05 ml of *lead acetate solution R*. Any colour in the test solution is not more intense than that in a standard prepared at the same time and in the same manner using a mixture of 10.0 ml of a 0.015 g/l solution of *sodium sulphide R* in *dilute sodium hydroxide solution R* and 0.05 ml of *lead acetate solution R* (20 ppm).

ASSAY

Dissolve 40.0 mg in a mixture of 10 ml of *water R* and 10 ml of *dilute sodium hydroxide* *solution R*. Add 10 ml of *dilute hydrochloric acid R* and 3 g of *sodium hydrogen carbonate R* and mix. Add 1 ml of *starch solution R* and titrate with *0.05 M iodine*.

1 ml of *0.05 M iodine* is equivalent to 4.946 mg of As_2O_3.

Ph Eur

Artemisia Cina for Homoeopathic Preparations

General Notices

DEFINITION

The dried, unexpanded flower heads of *Artemisia cina* O.C.Berg et C.F. Schmidt.

IDENTIFICATION

A. The dried, unexpanded and slightly shiny capitula are 2 to 4 mm long and 0.5 to 1.5 mm wide, acuminate, yellow-green to slightly brownish with 3 to 6 small hermaphrodite disk flowers in various stages of development; these are enclosed by 12 to 20 bracts arranged like roof tiles. The outer, smaller bracts in the lower area of the cylindrically formed inflorescence base, are keel-shaped, broad elliptic with a keel-shaped midrib frequently appearing at the outer margin; the inner, superior bracts are tongue-shaped, linear elongated and flat; both are apically rounded.

B. Reduce to a powder and examine under a microscope using *chloral hydrate solution*. Abundant fragments of the involucral bracts in surface view. Fragments from the margins are usually only one or two cells thick and are composed of very thin-walled, elongated cells. Towards the central region the bracts become thicker and small, thin-walled palisade cells can be seen underlying the epidermis; on the inner epidermis in this region the cells become somewhat less elongated and the walls show slight beading. The cells of the outer epidermis near the central region are irregularly polygonal in outline and fairly numerous anomocytic stomata are present. Glandular trichomes occur on the bracts and are particularly abundant on the outer epidermis near the central region. Some of the fragments from near the base of the thicker region of the bracts show the presence of very small cluster crystals of calcium oxalate in the underlying tissues.

Very occasional fragments of the bracts occur in sectional view and these show the presence of a fairly thick cuticle and, in fragments from near the central region, a one- or two-layered palisade.

Groups of sclereids from the central region of the bracts whose individual cells vary in shape but are usually considerably elongated; the ends are square or bluntly tapering or, occasionally, somewhat enlarged; the walls are strongly thickened and have scattered pits. Small groups of these sclereids are occasionally found attached to fragments of the epidermis of the bracts.

The covering trichomes occur on the central region of the bracts but they are nearly always found detached; they are not very numerous; they are unicellular and usually very thin-walled although slight thickening may occur in the basal region; some of these trichomes are very long and they are frequently found in groups forming loosely felted, cottony masses. The glandular trichomes are very abundant; they occur on the bracts and are also frequently found detached; each has a short, biseriate stalk, usually composed of two cells and a biseriate head with two or four cells; around each head the cuticle is raised to form a bladder-like covering.

Abundant pollen grains, which are fairly small, spherical, with three pores and three furrows; the exine is finely warted. A large number of immature pollen grains are present, forming elongated, closely packed masses.

Fragments of the fibrous layer of the anthers composed of very thin-walled, rather indistinct cells; the rods of thickening on the walls are very thin and appear as small, elongated beads in surface view.

Fragments of the epidermis of the pedicel in surface view show small rectangular cells with slightly and unevenly thickened walls; the underlying palisade cells are small, thin-walled and closely packed.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 10 ml of *ethanol* (90%) to 1 g of the coarsely powdered drug, stir for one hour and filter.

(2) Dissolve 10 mg each of *santonin* and 10 mg of *cineole* in 10 ml of *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel H.*

(b) Mobile phase is a mixture of 5 volumes of *glacial acetic acid* and 45 volumes of *hexane* and 50 volumes *ethyl acetate*.

(c) Application volume 10 µl for each solution.

(d) Develop to 10 cm.

(e) Remove the plate, allow to dry in air, spray with *ethanolic phosphomolybdic acid solution*, heat at 100º to 105º for about 5 minutes and examine in daylight.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows the grey-blue santonin zone just between the lower third and middle third and the grey-blue cineole zone in the upper third.

VALIDITY

The chromatogram obtained with solution (1) shows a grey-blue zone below the santonin zone of solution (2), a strong grey-blue zone correlating with that of santonin in solution (2) and one or two grey-blue zones just above it; one or two grey-blue zones between santonin and cineole zones and a strong grey-blue zone at the height of the cineole zone.

TESTS

Foreign matter

Not more than 5% of sections of stem and pieces of narrow-linear hairy leaves; not more than 2% of other foreign matter, Appendix XI D.

Ash

Not more than 11.0%, Appendix XI J, Method II.

Loss on drying

Not more than 10.0%, Appendix IX D.

MOTHER TINCTURE

The mother tincture complies with the requirements stated under Mother Tinctures for Homoeopathic Preparations and with the following requirements.

PRODUCTION

The mother tincture of *Artemisia cina* O.C. Berg et C.F. Schmidt is prepared from the powdered drug using *Method 4a* described in the monograph for Methods of Preparation of Homoeopathic Stocks and Potentisation. Use 86% w/w (90% v/v) of *ethanol*.

CHARACTERISTICS

The mother tincture is a golden yellow to greenish liquid.

IDENTIFICATION

The mother tincture complies with Identification test C above using the mother tincture as solution (1).

TESTS

Ethanol

40% to 46% w/w (47% to 54% v/v), Appendix VIII F.

Dry residue

Not less than 1.8% w/w, Appendix XI P.

Relative density

0.835 to 0.855, Appendix V G.

Barium Chloride Dihydrate for Homoeopathic Preparations

General Notices

(Ph Eur monograph 2142)

$BaCl_2,2H_2O$ 244.3 *10326-27-9*

Ph Eur

DEFINITION

Content

99.0 per cent to 101.0 per cent of $BaCl_2,2H_2O$.

CHARACTERS

Appearance

White or almost white, crystalline powder or colourless crystals.

Solubility

Freely soluble in water, very slightly soluble or practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. Dissolve 0.1 g in 1 ml of *water R*. Add 0.3 ml of *dilute sulphuric acid R*. A white precipitate is formed; it is insoluble in *dilute hydrochloric acid R* and in *dilute nitric acid R*.

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S

Dissolve 10.0 g in *water R* and dilute to 100 ml with the same solvent.

Appearance of solution

Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity

To 10 ml of solution S add 0.1 ml of *phenolphthalein solution R*. Not more than 0.2 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Heavy metals (*2.4.8*)

Maximum 10 ppm.

12 ml of solution S complies with limit test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R.*

ASSAY

Dissolve 0.200 g in 100 ml of *water R*. Add 100 ml of *methanol R*, 10 ml of *concentrated ammonia R* and 2 mg of *phthalein purple R*. Titrate with *0.1 M sodium edetate* until the colour changes from violet to colourless.

1 ml of *0.1 M sodium edetate* is equivalent to 24.43 mg of $BaCl_2,2H_2O$.

Ph Eur

B. To 2 ml of solution S (see Tests) add 2 ml of *sodium sulphide solution R*. A yellow precipitate is formed.

TESTS

Solution S

Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution

Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity

To 10 ml of solution S add 0.3 ml of *methyl orange solution R*. Not more than 0.5 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Nitrates

Maximum 100 ppm.

Dissolve 1.0 g in *water R* and dilute to 20.0 ml with the same solvent. To 1.0 ml of this solution add 0.2 ml of a 10 g/l solution of *sulphanilic acid R* in *acetic acid R* and 0.2 ml of a recently prepared 3 g/l solution of *naphthylamine R* in *acetic acid R*. Add a turning of *zinc R*. A pink colour is produced within 5 min. It is not more intense than that of a mixture of 0.5 ml of *nitrate standard solution (10 ppm* NO_3*) R* and 0.5 ml of *water R*, prepared at the same time.

Zinc sulphate, alkaline-earth sulphates, rare-earth sulphates

Dissolve 1.0 g in 17 ml of *water R*. Add 0.5 ml of *hydrochloric acid R* and 1 g of *thioacetamide R.* Heat in a water-bath for 10 min. Dilute to 20.0 ml with *water R* and filter. Evaporate 10.0 ml of this solution to dryness in an oven. Ignite the residue at about 800 ± 50 °C to constant mass. The residue weighs a maximum of 2 mg.

Arsenic (*2.4.2, Method A*)

Maximum 2 ppm, determined on 5 ml of solution S.

Water (*2.5.12*)

16.0 per cent to 20.0 per cent, determined on 80 mg. Shake for 10 min before carrying out the determination.

ASSAY

Dissolve 0.200 g in 50 ml of *water R*. Add 10 ml of *ammonium chloride buffer solution pH 10.0 R* and 50 mg of *mordant black 11 triturate R1*. Titrate with *0.1 M sodium edetate* until the colour changes from red to green.

1 ml of *0.1 M sodium edetate* is equivalent to 20.85 mg of $CdSO_4$.

Ph Eur

Calcium Iodide Tetrahydrate for Homoeopathic Preparations

General Notices

(Ph Eur monograph 2144)

$CaI_2,4H_2O$ 366.0 *13640-62-5*

Ph Eur

DEFINITION

Content

97.0 per cent to 102.0 per cent of CaI_2 (anhydrous substance).

CHARACTERS

Appearance

White or almost white powder, very hygroscopic.

Solubility

Very soluble to freely soluble in water and in ethanol (96 per cent).

IDENTIFICATION

A. Solution S (see Tests) gives reaction (a) of calcium (*2.3.1*).

B. Solution S (see Tests) gives reaction (b) of iodides (*2.3.1*).

TESTS

Solution S

Dissolve 10.0 g in *distilled water R* and dilute to 100.0 ml with the same solvent.

Appearance of solution

Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution GY_5 (*2.2.2, Method II*).

Free iodine, iodates

To 5 ml of solution S add 2 ml of *methylene chloride R.* Shake and allow to stand. The organic layer is colourless (*2.2.2, Method I*) (free iodine). Add 0.2 ml of *dilute sulphuric acid R*. Shake and allow to stand. The organic layer remains colourless (*2.2.2, Method I*) (iodates).

Sulphates (*2.4.13*)

Maximum 150 ppm.

Dilute 10 ml of solution S to 15 ml with *distilled water R*.

Iron (*2.4.9*)

Maximum 10 ppm, determined on 10 ml of solution S.

Heavy metals (*2.4.8*)

Maximum 10 ppm.

12 ml of solution S complies with limit test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R.*

Water (*2.5.12*)

18.0 per cent to 22.0 per cent, determined on 0.100 g.

ASSAY

Dissolve 0.300 g in 50 ml of *water R*. Add 5 ml of *dilute nitric acid R* and 25.0 ml of *0.1 M silver nitrate*. Shake. Add 2 ml of *ferric ammonium sulphate solution R2* and titrate with *0.1 M ammonium thiocyanate* until the colour changes to reddish-yellow.

1 ml of *0.1 M silver nitrate* is equivalent to 14.70 mg of CaI_2.

STORAGE

In an airtight container .

Ph Eur

Calcium Phosphate for Homoeopathic Preparations

General Notices

Calcium Phosphoricum for Homoeopathic Preparations

DEFINITION

Calcium Phosphate for Homoeopathic Preparations contains Calcium Phosphate.

PRODUCTION OF STOCK

The first trituration of Calcium Phosphate for Homoeopathic Preparations is prepared using a suitable quantity of a vehicle, such as Lactose, Anhydrous Lactose or Sucrose, and a validated method for trituration that ensures homogeneity is achieved. The vehicle complies with the statement under Vehicles in the monograph for Homoeopathic Preparations.

Content of calcium Ca

The first decimal trituration contains 3.5% to 4.0% of Ca.

CHARACTERISTICS

The first decimal trituration is a white powder.

IDENTIFICATION

Wash 5 g of the first decimal trituration of the substance being examined with three 10-ml quantities of *water.* The dried residue complies with the following tests.

A. Dissolve 0.1 g of the dried residue in 5 ml of a 25% v/v solution of *nitric acid .* The resulting solution yields reaction B of *phosphates*, Appendix VI.

B. The dried residue yields reaction B characteristic of *calcium salts*, Appendix VI. Filter before adding *potassium ferrocyanide solution.*

C. The dried residue complies with the limits of the Assay.

D. If the preparation includes Lactose as the vehicle, it complies with the following test. Dissolve 0.25 g in 5 ml of *water*. Add 5 ml of *ammonia* and heat in a water-bath at 80º for 10 minutes. A red colour develops.

E. If the preparation includes Sucrose as the vehicle, it complies with the following test. Dissolve 5.0 g in *carbon dioxide-free water* and dilute to 10 ml with the same solvent. Dilute 1 ml of the solution to 100 ml with *water*. To 5 ml of the solution add 0.15 ml of freshly prepared *copper sulphate solution* and 2 ml of freshly prepared *dilute sodium hydroxide solution*. The solution is blue and clear and remains so after boiling. To the hot solution add 4 ml of *dilute hydrochloric acid* and boil for 1 minute. Add 4 ml of *dilute sodium hydroxide solution.* An orange precipitate is formed immediately.

ASSAY

Dissolve 0.2 g of the residue in a mixture of 1.0 ml of hydrochloric acid R1 and 5 ml of water. Add 25.0 ml of 0.1M disodium edetate and dilute to 200 ml with water. Adjust to about pH 10 with concentrated ammonia. Add 10 ml of ammonia buffer pH 10.0 and a few milligrams of mordant black 11 triturate. Titrate the excess disodium edetate with 0.1M zinc sulphate until the colour changes from blue to violet. Each ml of 0.1M sodium hydroxide is equivalent to 4.008 mg of Ca.

Common Stinging Nettle for Homoeopathic Preparations

General Notices

(Ph Eur monograph 2030)

Ph Eur

DEFINITION

Whole, fresh, flowering plant of *Urtica dioica* L.

CHARACTERS

The plant causes an itching, burning sensation on the skin.

IDENTIFICATION

A. Common stinging nettle is perennial. The taproot sends out creeping subterranean rhizomes, more or less 4-angled in transverse section, from which extend adventious secondary roots and very numerous brownish hairy rootlets. The stipes are erect, generally unbranched, 3-5 mm in diameter and 0.3-1.5 m high, rarely up to 2.5 m high, 4-angled, greyish-green and covered in short hairs and stinging hairs.

The decussate leaves are 30-150 mm long and 20-80 mm wide. The petiole is hispid and usually slightly less than one-third the length of the lamina. The leaf blade is ovate, acuminate, cordate or rounded at the base, and coarsely dentate; the apical tooth is distinctly larger than the lateral teeth. The upper side of the leaves is dark green and usually matt, both sides bear short serried hairs intermingled with long stinging hairs. The 2 stipules are linear-subulate and free. The inflorescences growing from the leaf axils are complex, the flowers unisexual, and, particularly in male plants, generally distinctly longer than the petiole. After shedding their pollen, male inflorescences are erect at an oblique angle or horizontal; female inflorescences are pendent when the fruit is ripe. All flowers have long stalks. The perianth of the male flowers is divided half-way down into equal green lobes, widest at their base, with short bristles and stinging hairs at the margins. The stamens are equal and opposite to the perianth segments, each with a long, whitish filament that curves inwards before pollen is shed and spreads out afterwards. The ovary is rudimentary, button or cup-shaped. The perianth of the female flowers is downy or bristly on the outside and consists of outer, and 2 inner segments; the inner segments are about twice the length of the outer ones. The hypogynous, ovate, unilocular ovary bears a large capitate stigma with a brush-like shock of hair. As the one-seeded fruit grows ripe, the 2 inner segments of the perianth fold around it like wings.

B. It complies with the test for *Urtica urens* (see Tests).

TESTS

Urtica urens

The margin of the lamina is not serrate with teeth twice as long as wide. The clusters of flowers in the axils are longer than the petiole of the leaf. Unisexual, apetalous flowers are not together on the same plant and in the same cluster.

Foreign matter *(2.8.2)*

Maximum 5 per cent.

Loss on drying *(2.2.32)*

Minimum 65.0 per cent, determined on 5.0 g of finely cut drug by drying in an oven at 105 °C for 2 h, if performed to demonstrate the freshness of the drug.

MOTHER TINCTURE

The mother tincture complies with the requirements of the general monograph on *Mother tinctures for homoeopathic preparations (2029).*

PRODUCTION

The mother tincture of *Urtica dioica* L. is prepared by maceration using alcohol of a suitable concentration.

CHARACTERS

Appearance

Greenish-brown or orange-brown liquid.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)*.

Test solution The mother tincture to be examined.

Reference solution Dissolve 10 mg of *phenylalanine R* and 10 mg of *serine R* in a mixture of equal volumes of *methanol R* and *water R* and dilute to 10 ml with the same mixture of solvents.

Plate *TLC silica gel plate R.*

Mobile phase *glacial acetic acid R*, *water R*, *acetone R*, *butanol R* (10:20:35:35 *V/V/V/V*).

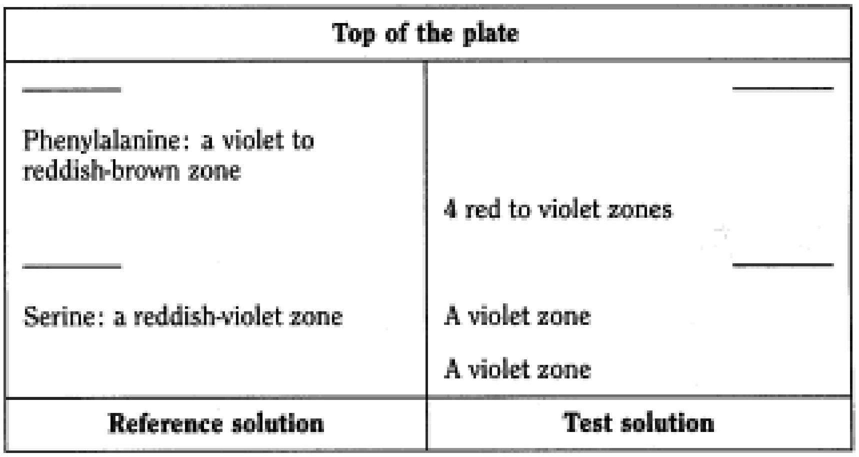
Application 20 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with a 1 g/l solution of *ninhydrin R* in *alcohol R*. Heat the plate at 105-110 °C for 5-10 min then examine in daylight within 10 min.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.



Top of the plate	
———	———
Phenylalanine: a violet to reddish-brown zone	
	4 red to violet zones
———	———
Serine: a reddish-violet zone	A violet zone
	A violet zone

Minimum 1.1 per cent.

Ph Eur

Copper Acetate Monohydrate for Homoeopathic Preparations

General Notices

(Ph Eur monograph 2146)

$Cu(C_2H_3O_2)_2,H_2O$ 199.7 *6046-93-1*

Ph Eur

DEFINITION

Content

99.0 per cent to 101.0 per cent of $Cu(C_2H_3O_2)_2,H_2O$.

CHARACTERS

Appearance

Geenish-blue crystals or green powder.

Solubility

Soluble in water, slightly soluble or very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

A. It gives reaction (a) of acetates (*2.3.1*).

B. Dissolve 0.1 g in 10 ml of *water R* and add *dilute ammonia R1* dropwise. A dark blue colour is produced.

TESTS

Solution S

Dissolve 3.0 g in a mixture of 40 ml of *distilled water R* and 0.6 ml of *glacial acetic acid R*, with heating at 70 °C. Cool and dilute to 45 ml with *distilled water R*.

Appearance of solution

Solution S is clear (*2.2.1*).

Impurities not precipitating with hydrogen sulphide: maximum 0.1 per cent, calculated as sulphates.

To 2.000 g add 92 ml of *water R* and 8.0 ml of *dilute sulphuric acid R*. Heat to 70 °C. Pass a current of *hydrogen sulphide R* until there is no longer precipitation of copper sulphide. Allow to cool and stand, then filter. Evaporate to dryness 50.0 ml of the filtrate in a crucible. Ignite the residue at about 600 ± 50 °C to constant mass.

Chlorides (*2.4.4*)

Maximum 50 ppm, determined on 15 ml of solution S.

Sulphates (*2.4.13*)

Maximum 150 ppm, determined on 15 ml of solution S.

Iron (*2.4.9*)

Maximum 20 ppm.

Dissolve 0.500 g in 10 ml of *water R*. Transfer to a separating funnel. Add 20 ml of *hydrochloric acid R1* and 10 ml of *methyl isobutyl ketone R*. Shake vigorously for 3 min. Allow to stand. Transfer the organic layer to a second separating funnel and add 10 ml of *water R.* Shake vigorously for 3 min. Allow to stand. The aqueous layer complies with the limit test for iron.

Nickel

Maximum 10 ppm.

To the residue obtained in the test for impurities not precipitating with hydrogen sulphide, add 2.0 ml of *hydrochloric acid R* and 1.0 ml of *sulphuric acid R*. Evaporate to dryness. Dissolve the residue in a mixture of 3.0 ml of *dilute sulphuric acid R* and 17.0 ml of *water R*. To 4.0 ml of this solution add 4.0 ml of *water R*, 5.0 ml of *bromine water R*, 7.0 ml of *dilute ammonia R1* and 3.0 ml of a 10 g/l solution of *dimethylglyoxime R* in *ethanol (90 per cent V/V) R*. This solution is not more intensely coloured within 1 min than a solution prepared as follows: mix 4.0 ml of a 1 ppm solution of nickel (Ni) prepared from *nickel standard solution (10 ppm Ni) R*, 4.0 ml of *water R* and 5.0 ml of *bromine water R*; carefully add 7.0 ml of *dilute ammonia R1* and 3.0 ml of a 10 g/l solution of *dimethylglyoxime R* in *ethanol (90 per cent V/V) R.*

ASSAY

Dissolve 0.400 g in *water R* and dilute to 50 ml with the same solvent. Add 6.0 ml of *glacial acetic acid R*, 10.0 g of *potassium iodide R* and 1 ml of *starch solution R*. Titrate with *0.1 M sodium thiosulphate.*

1 ml of *0.1 M sodium thiosulphate* is equivalent to 19.97 mg of $Cu(C_2H_3O_2)_2,H_2O$.

Ph Eur

Copper for Homoeopathic Preparations

General Notices

Copper for Homoeopathic Use

(Ph Eur monograph 1610)

Cu 63.5 *7440-50-8*

Ph Eur

DEFINITION

Content

99.0 per cent to 101.0 per cent of Cu.

CHARACTERS

Appearance

Reddish-brown powder.

Solubility

Practically insoluble in water, soluble in hydrochloric acid and in nitric acid, practically insoluble in alcohol.

IDENTIFICATION

A. To 2 ml of solution S (see Tests) add 0.5 ml of *potassium ferrocyanide solution R*. A reddish-brown precipitate is formed.

B. To 5 ml of solution S add 0.6 ml of *ammonia R*. A blue precipitate is formed. Add 2 ml of *ammonia R*. The precipitate disappears; the solution has an intense blue colour.

TESTS

Solution S

Dissolve 2.0 g in 10 ml of *nitric acid R*. After nitrous fumes are no longer evolved, dilute to 60 ml with *distilled water R*.

Acidity or alkalinity

To 5.0 g add 20 ml of *carbon dioxide-free water R*. Boil for 1 min. Cool. Filter and dilute to 25.0 ml with *carbon dioxide free water R*. To 10 ml of the solution add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Chlorides *(2.4.4)*

Maximum 100 ppm.

15 ml of solution S complies with the limit test for chlorides.

Sulphates *(2.4.13)*

Maximum 300 ppm.

15 ml of solution S complies with the limit test for sulphates.

Iron

Maximum 50.0 ppm.

Atomic absorption spectrometry *(2.2.23, Method I)*.

Test solution Dissolve 1.00 g in 5 ml of *nitric acid R* and dilute to 50.0 ml with *water R*.

Reference solutions Prepare the reference solutions using *iron standard solution (20 ppm Fe) R*, diluted as necessary with a 1 per cent *V/V* solution of *nitric acid R*.

Source Iron hollow-cathode lamp.

Wavelength 248.3 nm.

Flame Air-acetylene.

Lead

Maximum 1.00×10^2 ppm.

Atomic absorption spectrometry *(2.2.23, Method I)*.

Test solution Use the test solution prepared for the test for iron.

Reference solutions Prepare the reference solutions using *lead standard solution (0.1 per cent Pb) R*, diluted as necessary with a 1 per cent *V/V* solution of *nitric acid R*.

Source Lead hollow-cathode lamp.

Wavelength 283.3 nm.

Flame Air-acetylene.

Zinc

Maximum 50.0 ppm.

Atomic absorption spectrometry *(2.2.23, Method I)*.

Test solution Use the test solution prepared for the test for iron.

Reference solutions Prepare the reference solutions using *zinc standard solution (100 ppm Zn) R*, diluted as necessary with a 1 per cent *V/V* solution of *nitric acid R*.

Source Zinc hollow-cathode lamp.

Wavelength 213.9 nm.

Flame Air-acetylene.

ASSAY

Dissolve 0.100 g in 5 ml of *nitric acid R*. Heat to expel the nitrous fumes. Add 200 ml of *water*

R and neutralise *(2.2.3)* with *dilute ammonia R1*. Add 1 g of *ammonium chloride R* and 3 mg of *murexide R*. Titrate with *0.1 M sodium edetate* until the colour changes from green to violet.

1 ml of *0.1 M sodium edetate* is equivalent to 6.354 mg of Cu.

Ph Eur

Garlic for Homoeopathic Preparations

General Notices

(Ph Eur monograph 2023)

Ph Eur

DEFINITION

Fresh bulb of *Allium sativum* L.

CHARACTERS

It has a characteristic odour after cutting.

IDENTIFICATION

The bulb is generally 3 cm to 5 cm broad and almost spherical; the flat base bears the remnants of numerous short greyish-brown adventitious roots. The bulb consists of about 10 daughter bulbs (cloves) arranged roughly in a circle around a central axis. Individual daughter bulbs are 1 cm to 3 cm long, laterally compressed and convex on the dorsal side. Each daughter bulb has a tough, white or reddish skin around a fleshy tubular leaf, investing a more or less rounded elongated cone of leaf primordia and vegetative apex.

TESTS

Water *(2.2.13)*

Minimum 55.0 per cent, determined on 10.0 g of the finely cut drug, if performed to demonstrate the freshness of the drug.

MOTHER TINCTURE

The mother tincture complies with the requirements of the general monograph on *Mother tinctures for homoeopathic preparations (2029).*

PRODUCTION

The mother tincture of *Allium sativum* L. is prepared by maceration of the cut drug using alcohol of a suitable concentration.

CHARACTERS

Appearance

Brownish-yellow liquid.

It has a peculiar and unpleasant aromatic odour.

IDENTIFICATION

A. To 2 ml of the mother tincture to be examined, add 0.2 ml of *dilute sodium hydroxide solution R*. A yellowish-white precipitate develops.

B. Thin-layer chromatography *(2.2.27)*.

Test solution Extract 5 ml of the mother tincture to be examined with 2 quantities, each of 10 ml, of *ether R*. Combine the ether layers and dry over *anhydrous sodium sulphate R*. Filter and evaporate the filtrate in a water-bath at low temperature. Dissolve the residue in 0.4 ml of *methanol R*.

Reference solution Dissolve 10 mg of *resorcinol R*, 10 mg of *thymol R* and 30 mg of *gallic acid R* in 10 ml of *methanol R*.

Plate *TLC silica gel F_{254} plate R.*

Mobile phase *anhydrous formic acid R*, *toluene R*, *di-isopropyl ether R* (10:40:50 *V/V/V*).

Application 40 µl of the test solution and 10 µl of the reference solution.

Development Over a path of 10 cm.

Drying In air.

Detection Examine in ultraviolet light at 254 nm and identify gallic acid; spray with *anisaldehyde solution R*, heat to 105-110 °C for 5-10 min. Examine in daylight within 10 min.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Other zones may also be visible in the chromatogram obtained with the test solution.

Ph Eur

Hedera Helix for Homoeopathic Preparations

General Notices

(Ph Eur monograph 2092)

Ph Eur

DEFINITION

Fresh, young, fully developed but not yet lignified branch of *Hedera helix* L., harvested immediately before or at the beginning of flowering.

IDENTIFICATION

The fresh, young branches of *Hedera helix* L. are thin and flexible, climbing; they cling to their support by stem-roots. The leaves are alternate, simple and petiolate. The petiole shows a cylindrical section. The upper surface of the leaves is glabrous and shiny, darker than the lower surface. The lamina is usually divided into 3 to 5 more or less deeply cut lobes on sterile branches; it is oval, with a pointed apex on fertile branches. The inflorescences are arranged in a simple semi-globular corymb and grouped in terminal clusters. The pedicels of the umbel are covered in whitish hairs. Each flower shows 5 small teeth formed by the upper part of the sepals and 5 petals covered in very small inverted hairs.

TESTS

Foreign matter *(2.8.2)*

If required by the competent authority, maximum 5 per cent.

Loss on drying *(2.2.32)*

If required by the competent authority, minimum 50 per cent, determined on 5.0 g of the finely cut drug by drying in an oven at 105 °C for 2 h.

MOTHER TINCTURE

The mother tincture complies with the requirements of the general monograph on *Mother tinctures for homoeopathic preparations (2029).*

PRODUCTION

The mother tincture of *Hedera helix* L. is prepared by maceration using ethanol of a suitable concentration.

Content

Minimum 0.15 per cent *m/m* of hederacoside C ($C_{59}H_{96}O_{26}$; M_r 1221).

CHARACTERS

Appearance

Dark greenish-brown liquid.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)*.

Test solution The mother tincture to be examined.

Reference solution Dissolve 1 mg of α-*hederin R* and 1 mg of *hederacoside C R* in *methanol R* and dilute to 2 ml with the same solvent.

Plate TLC silica gel plate R.

Mobile phase glacial acetic acid R, *water R*, *butanol R* (1:1:4 *V/V/V*).

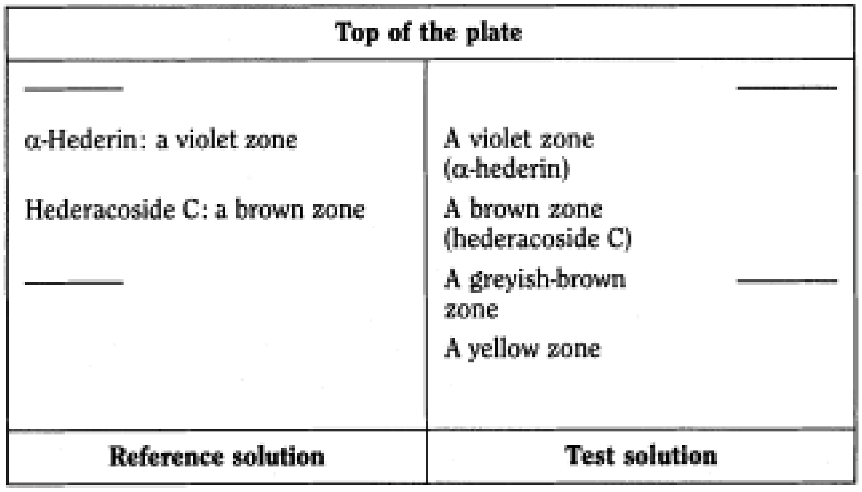
Application 20 µl, as bands.

Development Over half of the plate.

Drying In air.

Detection Spray with a 10 per cent *V/V* solution of *sulphuric acid R* in *methanol R* and heat at 100-105 °C for 10 min. Examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Other faint zones may also be present in the chromatogram obtained with the test solution.



Top of the plate	
———	———
α-Hederin: a violet zone	A violet zone (α-hederin)
Hederacoside C: a brown zone	A brown zone (hederacoside C)
———	A greyish-brown zone ———
	A yellow zone
Reference solution	**Test solution**

TESTS

Relative density *(2.2.5)*

0.890 to 0.925.

Ethanol *(2.9.10)*

60 per cent *V/V* to 70 per cent *V/V*.

Dry residue *(2.8.16)*

Minimum 2.0 per cent.

ASSAY

Liquid chromatography *(2.2.29)*.

Test solution In a 20.0 ml volumetric flask, dilute 3.000 g of the mother tincture to be examined to 20.0 ml with the mobile phase.

Reference solution In a 50.0 ml volumetric flask, dissolve 20.0 mg of *hederacoside C R* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Column:

— *size:* l = 0.25 m, Ø = 4 mm,

— *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase Mix 35 volumes of *water R* adjusted to pH 3 with *phosphoric acid R* and 65 volumes of *methanol R*.

Flow rate 1 ml/min.

Detection Spectrophotometer at 205 nm.

Injection 20 µl.

Retention time Hederacoside C = about 8 min.

Calculate the percentage content *m/m* of hederacoside C from the following expression:

$$\frac{A_1 \times m_2 \times C \times 40}{A_2 \times m_1}$$

A_1 = area of the peak due to hederacoside C in the chromatogram obtained with the test solution,

A_2 = area of the peak due to hederacoside C in the chromatogram obtained with the reference solution,

m_1 = mass of the mother tincture in the test solution, in grams,

m_2 = mass of *hederacoside C R* in the reference solution, in grams,

C = percentage content of *hederacoside C R*.

Ph Eur

Herbal Drugs for Homoeopathic Preparations

General Notices

Herbal Drugs for Homoeopathic Use

(Ph Eur monograph 2045)

Ph Eur

DEFINITION

Herbal drugs for homoeopathic preparations are mainly whole, fragmented or cut, plants, parts of plants including algae, fungi or lichens in an unprocessed state, usually in fresh form. The state, fresh or dried, in which the drug is used, is defined in the individual monograph of the European Pharmacopoeia or, in the absence, in the individual monograph of a national Pharmacopoeia. In the absence of such a monograph, the state in which the herbal drug is used has to be defined. Certain exudates that have not been subjected to a specific treatment are also considered to be herbal drugs for homoeopathic preparations. Herbal drugs for homoeopathic preparations are precisely defined by the botanical scientific name of the source species according to the binomial system (genus, species, variety and author).

PRODUCTION

Herbal drugs for homoeopathic preparations are obtained from cultivated or wild plants. Suitable cultivation, harvesting, collection, sorting, drying, fragmentation and storage conditions are essential to guarantee the quality of herbal drugs for homoeopathic preparations.

Herbal drugs for homoeopathic preparations are, as far as possible, free from impurities such as soil, dust, dirt and other contaminants such as fungal, insect and other animal contaminants. They do not present signs of decay.

If a decontaminating treatment has been used, it is necessary to demonstrate that the constituents of the plant are not affected and that no harmful residues remain. The use of ethylene oxide is prohibited for the decontamination of herbal drugs for homoeopathic preparations.

Fresh herbal drugs are processed as rapidly as possible after harvesting. Where justified and authorised for transportation or storage purposes, fresh plant material may be deep-frozen; it may also be kept in ethanol (96 per cent *V/V*) or in ethanol of a suitable concentration, provided the whole material including the storage medium is used for processing.

Adequate measures have to be taken in order to ensure that the microbiological quality of homoeopathic preparations containing 1 or more herbal drugs comply with the recommendations given in the text on *Microbiological quality of pharmaceutical preparations* (*5.1.4*).

IDENTIFICATION

Herbal drugs for homoeopathic preparations are identified using their macroscopic and, where necessary, microscopic descriptions and any further tests that may be required (for example, thin-layer chromatography).

TESTS

When a fresh plant is used as a starting material for the manufacture of homoeopathic preparations, the content of foreign matter is as low as possible; if necessary, the maximum content of foreign matter is indicated in the individual monographs. When a dried plant is used as a starting material for the manufacture of homoeopathic preparations, a test for foreign matter (*2.8.2*) is carried out, unless otherwise prescribed in the individual monographs.

A specific appropriate test may apply to herbal drugs for homoeopathic preparations liable to be falsified.

If appropriate, the herbal drugs for homoeopathic preparations comply with other tests, for example, total ash (*2.4.16*) and bitterness value (*2.8.15*).

The test for loss on drying (*2.2.32*) is carried out on dried herbal drugs for homoeopathic preparations. A determination of water (*2.2.13*) is carried out on herbal drugs for homoeopathic preparations with a high essential oil content. The water content of fresh herbal drugs for homoeopathic preparations may be determined by an appropriate method.

Herbal drugs for homoeopathic preparations comply with the requirements for pesticide residues (*2.8.13*). The requirements take into account the nature of the plant, where necessary the preparation in which the plant might be used, and where available the knowledge of the complete record of treatment of the batch of the plant. The content of pesticide residues may be determined by the method described in the annex to the general method.

The risk of contamination of herbal drugs for homoeopathic preparations by heavy metals must be considered. If an individual monograph does not prescribe limits for heavy metals or specific elements, such limits may be required if justified.

Limits for aflatoxins may be required.

In some specific circumstances, the risk of radioactive contamination is to be considered.

ASSAY

Where applicable, herbal drugs for homoeopathic preparations are assayed by an appropriate method.

STORAGE

Store dried herbal drugs protected from light.

Ph Eur

Homoeopathic Preparations

General Notices

(Ph Eur monograph 1038)

Ph Eur

DEFINITION

Homoeopathic preparations are prepared from substances, products or preparations called stocks, in accordance with a homoeopathic manufacturing procedure. A homoeopathic preparation is usually designated by the Latin name of the stock, followed by an indication of the degree of dilution.

Raw materials

Raw materials for the production of homoeopathic preparations may be of natural or synthetic origin.

For raw materials of zoological or human origin, adequate measures are taken to minimise the risk of agents of infection, including viruses *(5.1.7)*, in the homoeopathic preparations. For this purpose, it is demonstrated that:

— the method of production includes a step or steps that have been shown to remove or inactivate agents of infection;

— where applicable, raw materials of zoological origin comply with the monograph *Products with risk of transmitting agents of animal spongiform encephalopathies (1483)*;

— where applicable, the animals and the tissues used to obtain the raw materials comply with the health requirements of the competent authorities for animals for human consumption;

— for materials of human origin, the donor follows the recommendations applicable to human blood donors and to donated blood (see *Human plasma for fractionation (0853)*), unless otherwise justified and authorised.

A raw material of botanical, zoological or human origin may be used either in the fresh state or in the dried state. Where appropriate, fresh material may be kept deep-frozen. Raw materials of botanical origin comply with the requirements of the monograph *Herbal drugs for homoeopathic preparations (2045)*.

Where justified and authorised for transportation or storage purposes, fresh plant material may be kept in ethanol (96 per cent *V/V*) or in alcohol of a suitable concentration, provided the whole material including the storage medium is used for processing.

Raw materials comply with any requirements of the relevant monographs of the European Pharmacopoeia.

Vehicles

Vehicles are excipients used for the preparation of certain stocks or for the potentisation process. They may include, for example: purified water, alcohol of a suitable concentration, glycerol and lactose.

Vehicles comply with any requirements of the relevant monographs of the European Pharmacopoeia.

Stocks

Stocks are substances, products or preparations used as starting materials for the production of homoeopathic preparations. A stock is usually one of the following: a mother tincture or a glycerol macerate, for raw materials of botanical, zoological or human origin, or the substance itself, for raw materials of chemical or mineral origin.

Mother tinctures comply with the requirements of the monograph *Mother tinctures for homoeopathic preparations (2029)*.

Glycerol macerates are liquid preparations obtained from raw materials of botanical, zoological or human origin by using glycerol or a mixture of glycerol and either alcohol of a suitable concentration or a solution of sodium chloride of a suitable concentration.

Potentisation

Dilutions and triturations are obtained from stocks by a process of potentisation in accordance with a homoeopathic manufacturing procedure: this means successive dilutions and succussions, or successive appropriate triturations, or a combination of the 2 processes.

The potentisation steps are usually one of the following:

— 1 part of the stock plus 9 parts of the vehicle; they may be designated as 'D', 'DH' or 'X' (decimal);

— 1 part of the stock plus 99 parts of the vehicle; they may be designated as 'C' or 'CH' (centesimal).

The number of potentisation steps defines the degree of dilution; for example, 'D3', '3 DH' or '3X' means 3 decimal potentisation steps, and 'C3', '3 CH' or '3C' means 3 centesimal potentisation steps.

'LM-' (or 'Q-') potencies are manufactured according to a specific procedure.

Dosage forms

A dosage form of a homoeopathic preparation complies with any relevant dosage form monograph in the European Pharmacopoeia, and with the following:

— for the purpose of dosage forms for homoeopathic use, 'active substances' are considered to be 'dilutions or triturations of homoeopathic stocks';

— these dosage forms are prepared using appropriate excipients;

— the test for uniformity of content is normally not appropriate; however, in certain circumstances, it is required.

Homoeopathic dosage form pillule
Pillules for homoeopathic use are solid preparations obtained from sucrose, lactose or other suitable excipients. They may be prepared by impregnation of preformed pillules with a dilution or dilutions of homoeopathic stocks or by progressive addition of these excipients and the addition of a dilution or dilutions of homoeopathic stocks. They are intended for oral or sublingual use.

Homoeopathic dosage form tablet

Tablets for homoeopathic use are solid preparations obtained from sucrose, lactose or other suitable excipients according to the monograph *Tablets (0478)*. They may either be prepared by compressing one or more solid active substances with the excipients or by impregnating preformed tablets with a dilution or dilutions of homoeopathic stocks. The preformed tablets for impregnation are obtained from sucrose, lactose or other suitable excipients according to the monograph *Tablets (0478)*. They are intended for oral or sublingual use.

Ph Eur

Honey Bee for Homoeopathic Preparations

General Notices

(Ph Eur monograph 2024)

Ph Eur

DEFINITION

Live worker honey bee (*Apis mellifera* L.).

CHARACTERS

Characters described under Identification.

PRODUCTION

If the bee has been exposed to treatment to prevent or cure diseases, appropriate steps are taken to ensure that the levels of residues are as low as possible.

IDENTIFICATION

The body of a honey bee is about 15 mm long, black, with a silky sheen, and covered with red hairs with a touch of grey. The broad tibiae are without spines. The posterior margins of the segments and legs are brown, with gradual transition to orange-red. The claws are two-membered, the maxillary palps single-membered. On the hind legs are baskets or scoops invested with bristles. The wings have 3 complete cubital cells, with the radial cell twice as long as it is wide; the 3 cells on the lower margin and the 3 middle cells are closed. A duct connects the barbed sting with the poison sac.

MOTHER TINCTURE

The mother tincture complies with the requirements of the general monograph on *Mother tinctures for homoeopathic preparations (2029).*

PRODUCTION

The mother tincture of *Apis mellifera* L. is prepared by maceration using alcohol of a suitable concentration.

CHARACTERS

Pale yellow liquid that may darken on storage.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)*.

Test solution The mother tincture to be examined.

Reference solution Dissolve 12 mg of *4-aminobutanoic acid R*, 12 mg of *leucine R* and 12 mg of *proline R* in 5 ml of *water R* and dilute to 50 ml with *alcohol R.*

Plate *TLC silica gel plate R.*

Mobile phase *water R*, *ethanol R* (17:63 *V/V*).

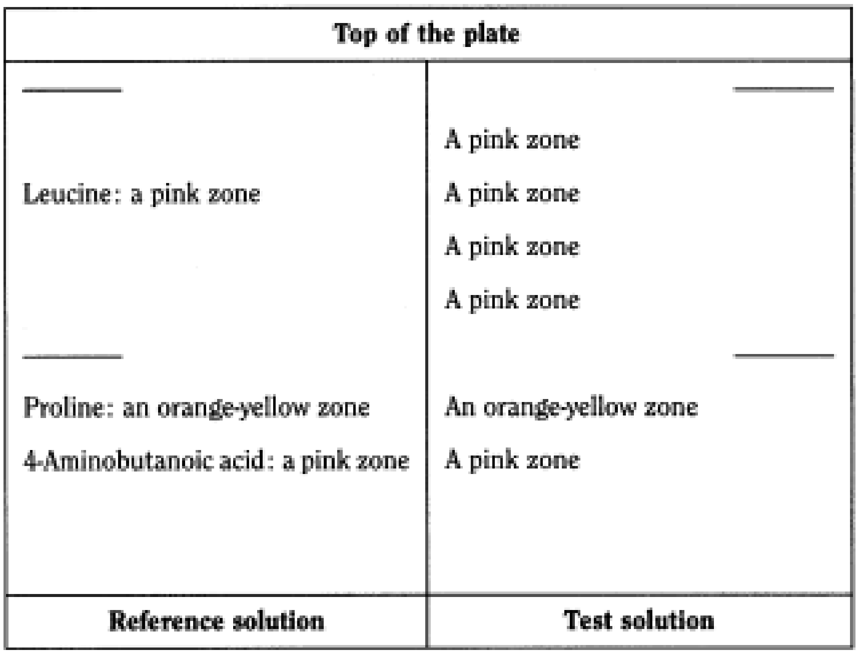
Application 20 µl, as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Spray with *ninhydrin solution R* and heat at 100-105 °C for 10 min; examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference and test solutions. Other zones may also be visible.



Top of the plate	
———	———
	A pink zone
Leucine: a pink zone	A pink zone
	A pink zone
	A pink zone

Proline: an orange-yellow zone	An orange-yellow zone
4-Aminobutanoic acid: a pink zone	A pink zone
Reference solution	**Test solution**

TESTS

Relative density *(2.2.5)*

0.890 to 0.910.

Ethanol *(2.9.10)*

60 per cent *V/V* to 70 per cent *V/V*.

Dry residue *(2.8.16)*

Minimum 0.30 per cent.

Ph Eur

Hydrated Iron(II) and Iron(III) Phosphate for Homoeopathic Preparations

General Notices

DEFINITION

Hydrated Iron(II) and Iron(III) Phosphate for Homoeopathic Preparations contains a mixture of hydrated iron(II) phosphate and iron(III) phosphate and some hydrated oxides of iron. It contains not less than 16.0% of Fe^{2+}, equivalent to not less than 47.9% of $Fe_3(PO_4)_{2,}8H_2O$.

CHARACTERISTICS

A slate blue amorphous powder.

Insoluble in *water;* soluble in *hydrochloric acid*.

IDENTIFICATION

Dissolve 0.5 g in 5 ml of *dilute hydrochloric acid* with warming. Dilute the resulting solution to 35 ml with *water* and filter if necessary (solution S).

A. Solution S yields the reactions characteristic of *iron and iron salts*, Appendix VI.

B. Solution S yields the reactions characteristic of *phosphates*, Appendix VI.

TESTS

Heavy metals

Dissolve 1.0 g of the substance being examined in 20 ml of *hydrochloric acid*. Extract the solution using five 20-ml quantities of a mixture of 100 ml of freshly distilled *methyl isobutyl ketone* with 1 ml of *hydrochloric acid R1*. Allow to stand, separate the aqueous layer and evaporate to half its volume, allow to cool and dilute to 35 ml with *water*. Neutralise 7.5 ml of this solution to *litmus paper* using *dilute ammonia R1* and dilute to 15 ml with *water*. 12 ml of the resulting solution complies with *limit test A for heavy metals*, Appendix VII (70 ppm). Use *lead standard solution (1 ppm Pb)* to prepare the standard.

Sulphates

Dissolve 0.25 g of the substance being examined in *water*. Add 3 ml of *dilute hydrochloric acid* and dilute to 15 ml with *water*. The resulting solution complies with the *limit test for sulphates*, Appendix VII.

ASSAY

Dissolve 0.3 g of the substance being examined in 3 ml of *orthophosphoric acid* and 10 ml of a 14% v/v solution of *sulphuric acid* in *water*. Add 100 ml of *water* and titrate with 0.1M *potassium permanganate*. Each ml of 0.1M *potassium permanganate VS* is equivalent to 27.925 mg of Fe^{2+}.

PRODUCTION OF STOCK

The first decimal trituration of Hydrated Iron(II) and Iron(III) Phosphate for Homoeopathic Preparations is prepared using a suitable quantity of Lactose or Anhydrous Lactose as the vehicle and a validated trituration method that ensures homogeneity is achieved. The vehicle complies with the statement under Vehicles in the monograph for Homoeopathic Preparations.

Content of hydrated iron(II) and iron(III) phosphate

The first decimal trituration contains 4.5% to 5.0% of $Fe_3(PO_4)_2, 8H_2O$.

CHARACTERISTICS

The first decimal trituration is a light grey powder.

IDENTIFICATION

A. Yields the reactions characteristic of *iron and iron salts*, Appendix VI.

B. Yields the reactions characteristic of *phosphates*, Appendix VI.

C. Dissolve 0.25 g in 5 ml of *water*. Add 5 ml of *ammonia* and heat in a water-bath at 80º for 10 minutes. A red colour develops.

ASSAY

Dissolve 3.0 g of the first decimal trituration in 3 ml of *orthophosphoric acid* and 10 ml of a 14% v/v solution of *sulphuric acid* in *water*. Add 100 ml of *water* and titrate with 0.1M *potassium permanganate*. Each ml of 0.1M *potassium permanganate VS* is equivalent to 27.925 mg of Fe^{2+}.

STORAGE

Hydrated Iron(II) and Iron(III) Phosphate for Homoeopathic Preparations should be protected from light.

Hydrated Iron(III) Phosphate for Homoeopathic Preparations

General Notices

222.8 *10045-86-0*

DEFINITION

Hydrated Iron(III) Phosphate for Homoeopathic Preparations contains hydrated iron(III) phosphate. It contains not less than 96.0% and not more than 106.5% of $FePO_4,4H_2O$.

CHARACTERISTICS

A yellow to pale ochre powder.

Insoluble in *water;* soluble in dilute mineral acids.

IDENTIFICATION

Dissolve 0.5 g of the substance being examined in 5 ml of *dilute hydrochloric acid*, with warming. Dilute the resulting solution to 35 ml with *water* and filter if necessary (solution S).

A. Solution S yields reactions B and C characteristic of *iron and iron salts*, Appendix VI.

B. Solution S yields reaction B characteristic of *phosphates*, Appendix VI.

TESTS

Clarity of solution

Solution S is *clear*, Appendix IV A, Method II.

Chloride

To 0.05 g of the substance being examined add 1 ml of *dilute nitric acid*. Heat, dilute with 14 ml of *water* and filter. The filtrate complies with the *limit test for chlorides*, Appendix VII (0.1%) .

Heavy metals

Dissolve 1.0 g of the substance being examined in 20 ml of *hydrochloric acid* if necessary with heating. Extract the solution using five 20-ml quantities of a mixture of 100 ml of freshly distilled *methyl isobutyl ketone* and 1 ml of *hydrochloric acid R1.* Allow to stand, separate the aqueous layer and evaporate to half its volume, allow to cool and dilute to 35 ml with *water*. Neutralise 7.5 ml of this solution to *litmus paper* using *dilute ammonia R1* and dilute to 15 ml with *water*. 12 ml of the resulting solution complies with *limit test heavy metals*, Appendix VII, Method A (70 ppm). Use *lead standard solution (1 ppm Pb)* to prepare the standard.

Loss on drying

When dried to constant weight at 200º, loses not less than 28% and not more than 33% of its weight, Appendix IX D. Use 1 g.

ASSAY

Dissolve 0.45 g in 3 ml of *hydrochloric acid R1* in an iodine flask, add 10 ml of *water* and 6.0 g of *potassium iodide,* close the flask and allow to stand protected from light for 30 minutes. Add 100 ml of *water* and 1 ml of *starch solution* and titrate with 0.1M *sodium thiosulphate VS*. Each ml of 0.1M *sodium thiosulphate VS* is equivalent to 22.29 mg of $FePO_4,4H_2O$.

PRODUCTION OF STOCK

The first decimal trituration of Hydrated Iron(III) Phosphate for Homoeopathic Preparations is prepared using a suitable quantity of Lactose or Anhydrous Lactose as the vehicle and a validated trituration method that ensures homogeneity is achieved. The vehicle complies with the statement under Vehicles in the monograph for Homoeopathic Preparations.

Content of hydrated iron(III) phosphate $FePO_4$, $4H_2O$

The first decimal trituration contains 9.0% to 11.0% of $FePO_4$, $4H_2O$.

CHARACTERISTICS

The first decimal trituration is a yellowish powder.

IDENTIFICATION

Dissolve, with warming, 1.5 g of the first decimal trituration in a mixture of 1.5 ml of *dilute hydrochloric acid* and 9 ml of *water* (solution S1).

A. Solution S1 yields reactions B and C characteristic of *iron and iron salts*, Appendix VI.

B. Solution S1 yields reaction B characteristic of *phosphates*, Appendix VI.

C. Dissolve 0.25 g of the substance being examined in 5 ml of *water*. Add 5 ml of *ammonia* and heat in a water-bath at 80º for 10 minutes. A red colour develops.

ASSAY

Dissolve 4.0 g of the first decimal trituration in 3 ml of *hydrochloric acid R1* in an iodine flask, add 10 ml of *water* and 8.0 g of *potassium iodide,* close the flask and allow to stand protected from light for 30 minutes. Add 100 ml of *water* and 1 ml of *starch solution* and titrate with 0.1M *sodium thiosulphate VS*. Each ml of 0.1M *sodium thiosulphate VS* is equivalent to 22.29 mg of $FePO_4,4H_2O$.

STORAGE

Hydrated Iron(III) Phosphate for Homoeopathic Preparations should be protected from light.

Hyoscyamus for Homoeopathic Preparations

General Notices

(Ph Eur monograph 2091)

Ph Eur

DEFINITION

Whole, fresh flowering plant of *Hyoscyamus niger* L.

IDENTIFICATION

Hyoscyamus is an annual or biennial plant, with a well developed taproot. The robust, erect stem is hollow and subcylindrical and up to 80 cm long. The soft, viscid, dull dark-green leaves are densely pubescent on both surfaces, especially on the veins. The lower leaves are petiolate and are arranged in a rosette; the lower cauline leaves are semi-amplexicaul and the upper ones are completely amplexicaul. The lamina, up to 25 cm long, is oblong to ovate with 2 to 5 broadly dentate lobes on each side. The midrib is well developed. The secondary veins arise at a wide angle from the midrib and terminate in the apices of the lobes. The flowering tops are densely pubescent and form a short drooping cluster. Each flower arises in the axils of a large bract. The gamosepalous calyx is covered with dense cotton-like hairs and has 5 triangular-ovate lobes, each ending in a short point that becomes spiny. The gamopetalous corolla, with 5 nearly equal lobes, is yellowish and with a delicate, brown to blackish-violet venation. The fruit, sometimes present at the base of the inflorescences, is a pyxis distinctly swollen at the base.

TESTS

Foreign matter *(2.8.2)*

If required by the competent authority, maximum 5 per cent.

Loss on drying *(2.2.32)*

If required by the competent authority, minimum 50 per cent, determined on 5.0 g of the finely cut drug by drying in an oven at 105 °C for 2 h.

Hyoscyamus albus L.

The presence of middle and upper leaves with a petiole and of fruits barely swollen at the base indicates adulteration by *Hyoscyamus albus* L.

MOTHER TINCTURE

The mother tincture complies with the requirements of the general monograph on *Mother tinctures for homoeopathic preparations (2029).*

PRODUCTION

The mother tincture of *Hyoscyamus niger* L. is prepared by maceration of the drug, using ethanol of a suitable concentration.

Content

0.002 per cent m/m to 0.01 per cent *m/m* of total alkaloids, expressed as hyoscyamine ($C_{17}H_{23}NO_3$; M_r 289.4).

CHARACTERS

Appearance

Dark greenish-brown liquid.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)*.

Test solution Evaporate 10 ml of the mother tincture to be examined in a water-bath at 40 °C, under reduced pressure. Take up the residue with 1 ml of *ammonia R*, and shake with 2 quantities, each of 10 ml, of *ether R*. Combine the ether layers, dry over *anhydrous sodium sulphate R* and filter. Evaporate on a water-bath and dissolve the residue in 0.50 ml of *methanol R.*

Reference solution (a) Dissolve 50 mg of *hyoscyamine sulphate R* in 10 ml of *methanol R* (solution A). Dissolve 15 mg of *hyoscine hydrobromide R* in 10 ml of *methanol R* (solution B). Mix 4 ml of solution A and 2 ml of solution B and dilute to 10 ml with *methanol R*.

Reference solution (b) Dissolve 20 mg of *atropine sulphate R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate TLC silica gel plate R.

Mobile phase concentrated ammonia R, *water R*, *acetone R* (3:7:90 *V/V/V*).

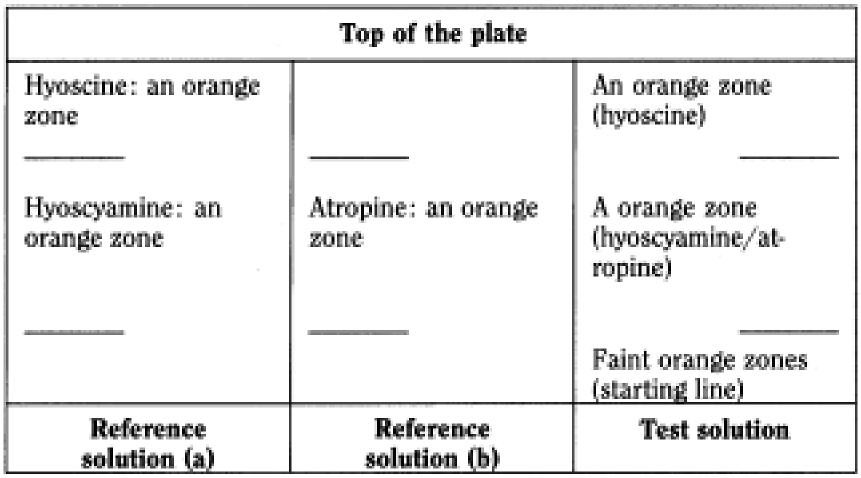
Application 20 µl, as bands.

Development Over a path of 10 cm.

Drying At 100-105 °C for 15 min.

Detection A Spray with *dilute potassium iodobismuthate solution R* until orange zones become visible. Examine in daylight.

Results A See below the sequence of the zones present in the chromatograms obtained with the reference solutions and the test solution. Other faint zones may be present in the chromatogram obtained with the test solution.



Top of the plate		
Hyoscine: an orange zone		An orange zone (hyoscine)
Hyoscyamine: an orange zone	Atropine: an orange zone	A orange zone (hyoscyamine/atropine)
		Faint orange zones (starting line)
Reference solution (a)	**Reference solution (b)**	**Test solution**

Detection B Subsequently spray with *sodium nitrite solution R* until the yellow background disappears. Examine in daylight after 15 min.

Results B See test for atropine.

TESTS

Relative density *(2.2.5)*

0.930 to 0.960.

Atropine

Examine the chromatograms obtained in the test for identification.

Results The zone due to hyoscyamine in the chromatogram obtained with the test solution changes from orange to reddish-brown but not to greyish-blue (atropine).

Ethanol *(2.9.10)*

40 per cent *V/V* to 50 per cent *V/V*.

Dry residue *(2.8.16)*

Minimum 1.2 per cent.

ASSAY

Evaporate 100.0 g of the mother tincture to be examined, at a low temperature under reduced pressure, until a residue of about 10 g is obtained. Quantitatively transfer the residue to a separating funnel using a few millilitres of *ethanol (70 per cent V/V) R*. Add 5 ml of *concentrated ammonia R* and 25 ml of *water R*. Extract with successive fractions of a mixture of 1 volume of *chloroform R* and 3 volumes of *peroxide-free ether R* until the alkaloids are completely extracted. Evaporate to dryness a few millilitres of the last organic fraction. Take up the residue in *0.25 M sulphuric acid* and verify the absence of alkaloids using *potassium tetraiodomercurate solution R*. Combine the organic layers and extract several times with *0.25 M sulphuric acid*. Separate the layers by centrifugation if necessary and transfer the acid layers to a second separating funnel. Make the acid layer alkaline with *ammonia R* and shake with at least 3 quantities, each of 30 ml, of *chloroform R*. Combine the chloroform layers, add 4 g of *anhydrous sodium sulphate R* and allow to stand for 30 min with occasional shaking. Decant the chloroform and wash the anhydrous sodium sulphate with 3 quantities, each of 10 ml, of *chloroform R*. Combine the chloroform fractions, evaporate to dryness on a water-bath and dry in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of *chloroform R,* add 10.0 ml of *0.005 M sulphuric acid* and remove the chloroform by evaporation on a water-bath. Titrate the excess of acid with *0.01 M sodium hydroxide* using *methyl red mixed solution R* as indicator.

Calculate the percentage content *m/m* of total alkaloids, expressed as hyoscyamine, from the expression:

$$\frac{0.2894\,(10 - n)}{m}$$

n = volume of *0.01 M sodium hydroxide* used, in millilitres,

m = mass of the mother tincture used, in grams.

Ph Eur

Hypericum for Homoeopathic Preparations

General Notices

(Ph Eur monograph 2028)

Ph Eur

DEFINITION

Whole, fresh plant of *Hypericum perforatum* L., at the beginning of the flowering period.

IDENTIFICATION

The perennial plant consists of a spindle-shaped root and a branched rhizome, giving rise to long, decumbent runners. The cylindrical, erect stem is woody at the base, 0.2 m to 1 m long, branched in the upper part, with 2 raised longitudinal lines.

The leaves are opposite, sessile, exstipulate, oblong-oval and 15 mm to 30 mm long. The leaf margins show black glandular dots, and many small translucent oil glands are present on the entire surface and are visible by transmitted light.

The flowers are regular and form corymbose clusters at the apex of the stem. They have 5 green, lanceolate sepals with acuminate apices, and black oil glands near the entire margins; 5 orange-yellow petals, much longer than the sepals, with black oil glands near the terminal margins only; 3 staminal blades, each divided into many orange-yellow stamens and 3 carpels surmounted by red styles. Each petal is asymmetrically linear-ovate in shape, with one of the margin entire and the other dentate.

TESTS

Foreign matter (*2.8.2*)

Maximum 4 per cent of fruits and maximum 1 per cent of other foreign matter.

Loss on drying (*2.2.32*)

If performed to demonstrate the freshness of the drug, minimum 55 per cent, determined on 5.0 g of finely cut drug by drying in an oven at 105 °C.

MOTHER TINCTURE

The mother tincture complies with the requirements of the general monograph on *Mother tinctures for homoeopathic preparations (2029).*

PRODUCTION

The mother tincture of *Hypericum perforatum* L. is prepared by maceration using alcohol of a suitable concentration.

CHARACTERS

Dark red to brownish red liquid.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)*.

Test solution The mother tincture to be examined.

Reference solution Dissolve 5 mg of *rutin R*, 1 mg of *hypericin R* and 5 mg of *hyperoside R* in *methanol R* and dilute to 5 ml with the same solvent.

Plate TLC silica gel plate R.

Mobile phase anhydrous formic acid R, *water R*, *ethyl acetate R* (6:9:90 *V/V/V*).

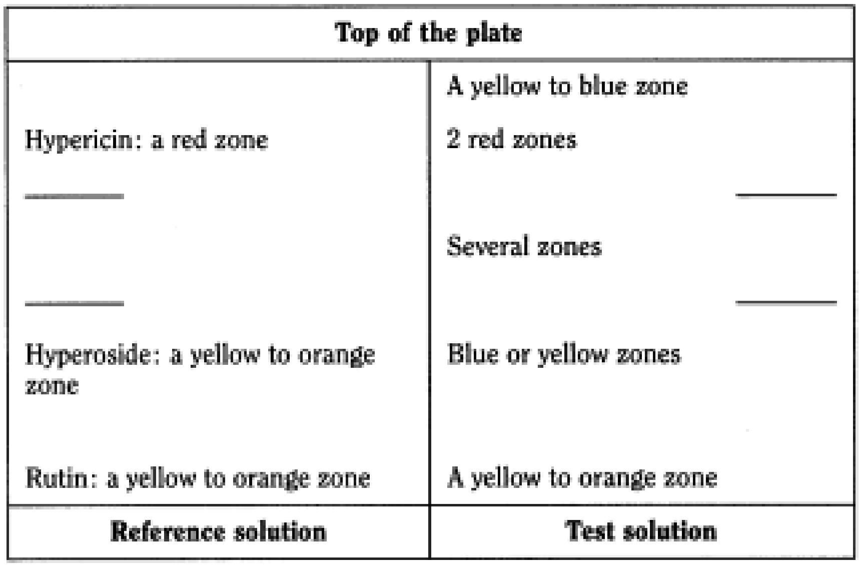
Application 10 µl of the test solution and 5 µl of the reference solution, as 10 mm bands.

Development Over a path of 10 cm.

Drying At 100-105 °C for 10 min.

Detection Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then a 50 g/l solution of *macrogol 400 R* in *methanol R*. Examine the plates after 30 min in ultraviolet light at 365 nm.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. In the chromatogram obtained with the test solution, the zone due to rutin may be weak or even absent. The chromatogram obtained with the test solution shows a group of zones that may be blue or yellow, with a R_F similar to that of the zone due to hyperoside in the chromatogram obtained with the reference solution. Other weak zones may also be visible.



Top of the plate	
	A yellow to blue zone
Hypericin: a red zone	2 red zones
_______	_______
	Several zones

Ph Eur

Iron for Homoeopathic Preparations

General Notices

Iron for Homoeopathic Use

(Ph Eur monograph 2026)

Fe 55.85 *7439-89-6*

Ph Eur

DEFINITION

Obtained by reduction or sublimation as a fine blackish-grey powder.

Content

97.5 per cent to 101.0 per cent.

CHARACTERS

Appearance

Fine, blackish-grey powder, without metallic lustre.

Solubility

Practically insoluble in water and in alcohol. It dissolves with heating in dilute mineral acids.

IDENTIFICATION

Dissolve 50 mg in 2 ml of *dilute sulphuric acid R* and dilute to 10 ml with *water R*. The solution gives reaction (a) of iron *(2.3.1)*.

TESTS

Solution S

To 10.0 g add 40 ml of *water R*. Boil for 1 min. Cool, filter and dilute to 50.0 ml with *water R*.

Alkalinity

To 10 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.1 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator to yellow.

Substances insoluble in hydrochloric acid

Dissolve 2.00 g in 40 ml of *hydrochloric acid R*. Heat on a water-bath. As soon as fumes are no longer evolved, filter through a sintered-glass filter (16) *(2.1.2)*. Rinse with *water R*. Dry the residue in an oven at 100-105 °C for 1 h. The residue weighs a maximum of 20 mg (1.0 per cent).

Substances soluble in water

Evaporate 10.0 ml of solution S on a water-bath and dry at 100-105 °C for 1 h. The residue weighs a maximum of 2 mg (0.1 per cent).

Chlorides ***(2.4.4)***

Maximum 50 ppm.

Dilute 5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides.

Sulphides and phosphides

In a 100 ml conical flask carefully mix 1.0 g with 10 ml of *dilute hydrochloric acid R*. Within 30 s *lead acetate paper R* moistened with *water R* and placed over the mouth of the flask is not coloured more intensely than light brown by the resulting fumes.

Arsenic ***(2.4.2)***

Maximum 5 ppm.

Boil 0.2 g in 25 ml of *dilute hydrochloric acid R* until completely dissolved. The solution complies with limit test A.

Copper

Maximum 50.0 ppm.

Atomic absorption spectrometry *(2.2.23, Method I)*.

Test solution Dissolve 1.00 g in a mixture of 60 ml of *dilute hydrochloric acid R* and 10 ml of *dilute hydrogen peroxide solution R*. Reduce to a volume of 5 ml and dilute to 50.0 ml with *water R*.

Reference solutions Prepare the reference solutions using *copper standard solution (0.1 per cent Cu) R*, diluted as necessary with a 1 per cent *V/V* solution of *hydrochloric acid R.*

Source Copper hollow-cathode lamp.

Wavelength 324.8 nm.

Flame Air-acetylene.

Lead

Maximum 50.0 ppm.

Atomic absorption spectrometry *(2.2.23, Method I)*.

Test solution In a separating funnel, place 20 ml of the test solution prepared for the test for copper. Add 25 ml of *lead-free hydrochloric acid R*. Stir with 3 quantities, each of 25 ml, of *di-isopropyl ether R*. Collect the aqueous layer. Add 0.10 g of *sodium sulphate decahydrate R*. Evaporate to dryness. Take up the residue with 1 ml of *lead-free nitric acid R* and dilute to 20 ml with *water R.*

Reference solutions Prepare the reference solutions using *lead standard solution (0.1 per cent Pb) R*, diluted as necessary with a 10 per cent *V/V* solution of *nitric acid R* containing 5 g/l of *sodium sulphate decahydrate R.*

Source Lead hollow-cathode lamp.

Wavelength 217 nm.

Flame Air-acetylene.

ASSAY

Stir for 10 min 0.100 g in a hot solution of 1.25 g of *copper sulphate R* in 20 ml of *water R* in a 100 ml conical flask with a ground-glass stopper. Filter rapidly and wash the filter. Combine the filtrate and the washings, acidify with *dilute sulphuric acid R* and titrate with *0.02 M potassium permanganate* until a pink colour is obtained.

1 ml of *0.02 M potassium permanganate* is equivalent to 5.585 mg of Fe.

LABELLING

The label indicates whether the iron for homoeopathic preparations is obtained by reduction or sublimation.

Ph Eur

Methods of Preparation of Homoeopathic Stocks and Potentisation

General Notices

(Ph Eur monograph 2371)

Ph Eur

Homoeopathic stocks are prepared, using suitable methods, from raw materials that comply with the requirements of the monograph *Homoeopathic preparations (1038)*. The methods described below, combined with established methods for potentisation, are examples of methods, but other methods described in an official national pharmacopoeia of a Member State may equally be used.

Where material of animal origin is to be used, particular reference is made to the requirements concerning the use of raw material of zoological or human origin in the monograph *Homoeopathic preparations (1038).*

In the preparation of liquid dilutions, the ethanol of the concentration prescribed in the method may, if necessary, be replaced by ethanol (30 per cent *m/m*) [ethanol (36 per cent *V/V*)] or ethanol (15 per cent *m/m*) [ethanol (18 per cent *V/V*)].

When the individual monograph allows that the mother tincture be prepared from more than one plant species, the mother tincture can be prepared from the specified parts of an individual plant species or from any mixture thereof.

Unless otherwise stated, mother tinctures are prepared by maceration. Maceration lasts not less than 10 days and not more than 30 days.

Maceration may be replaced by long maceration (maximum 60 days) or very long maceration (maximum 180 days), provided it is demonstrated that the quality of the resulting mother tincture is the same as that of the mother tincture prepared by maceration.

Unless otherwise stated in the individual monograph, the term 'part(s)' denotes 'mass part(s)'. Unless otherwise stated in the method, the maximum temperature for the preparation is 25 C.

METHOD 1A

Method 1a is used for fresh herbal drugs containing generally more than 70 per cent of expressed juice and no essential oil or resin or mucilage. Mother tinctures prepared according to Method 1a are mixtures of equal parts of expressed juices and ethanol (86 per cent *m/m*) [ethanol (90 per cent *V/V*)].

Express the comminuted herbal drug. Immediately mix the expressed juice with an equal mass of ethanol (86 per cent *m/m*) [ethanol (90 per cent *V/V*)]. Allow to stand in a closed container at a temperature not exceeding 20 °C for not less than 5 days, then filter.

Adjustment to any value specified in the individual monograph

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount (A_1), in kilograms, of ethanol

(43 per cent *m/m*) [ethanol (50 per cent *V/V*)] required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

m = mass of filtrate, in kilograms.

N_0 = percentage dry residue or percentage assay content as required in the individual monograph.

N_x = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)]. Allow to stand at a temperature not exceeding 20 °C for not less than 5 days, then filter if necessary.

Potentisation

The 1st 'decimal' dilution (D1) is made from:

— 2 parts of the mother tincture;

— 8 parts of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)].

The 2nd decimal dilution (D2) is made from:

— 1 part of the 1st 'decimal' dilution;

— 9 parts of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)].

Subsequent decimal dilutions are produced as stated for D2.

The 1st 'centesimal' dilution (C1) is made from:

— 2 parts of the mother tincture;

— 98 parts of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)].

The 2nd centesimal dilution (C2) is made from:

— 1 part of the 1st 'centesimal' dilution;

— 99 parts of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)].

Subsequent centesimal dilutions are produced as stated for C2.

METHOD 1B

Method 1b is used where the latex of a herbal drug is to be processed.

Mother tinctures prepared according to Method 1b are mixtures of fresh plant latex with ethanol (30 per cent *m/m*) [ethanol (36 per cent *V/V*)]. Mix the fresh latex with 2 parts by mass of ethanol (30 per cent *m/m*) [ethanol (36 per cent *V/V*)] and filter.

Adjustment to any value specified in the individual monograph

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount (A_1), in kilograms, of ethanol (30 per cent *m/m*) [ethanol (36 per cent *V/V*)] required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

m = mass of filtrate, in kilograms.

N_0 = percentage dry residue or percentage assay content as required in the individual monograph.

N_x = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (30 per cent *m/m*) [ethanol (36 per cent *V/V*)]. Allow to stand at a temperature not exceeding 20 °C for not less than 5 days, then filter if necessary.

Potentisation

The 1st 'decimal' dilution (D1) is made from:

— 3 parts of the mother tincture;

— 7 parts of ethanol (30 per cent *m/m*) [ethanol (36 per cent *V/V*)].

The 2nd decimal dilution (D2) is made from:

— 1 part of the 1st 'decimal' dilution;

— 9 parts of ethanol (15 per cent *m/m*) [ethanol (18 per cent *V/V*)].

Subsequent decimal dilutions are produced as stated for D2.

METHOD 2A

Method 2a is used for fresh herbal drugs containing generally less than 70 per cent of expressed juice and more than 60 per cent moisture (loss on drying) and no essential oil or resin.

Mother tinctures prepared according to Method 2a (ethanol content approximately 43 per cent *m/m* or 50 per cent *V/V*) are prepared by maceration as described below.

Comminute the herbal drug Take a sample and determine the loss on drying (*2.2.32*). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of comminuted raw material in a flat-bottomed tared vessel, 45-55 mm in diameter, that has been previously dried as indicated for the raw material. Dry the raw material at 100-105 °C for 2 h then allow to cool in a desiccator.

To the comminuted herbal drug immediately add not less than half the mass of ethanol (86 per cent *m/m*) [ethanol (90 per cent *V/V*)] and store in well-closed containers at a temperature not exceeding 20 °C.

Use the following expression to calculate the amount (A_2), in kilograms, of ethanol (86 per cent *m/m*) [ethanol (90 per cent *V/V*)] required for the mass (m) of raw material, then subtract the amount of ethanol (86 per cent *m/m*) [ethanol (90 per cent *V/V*)] already added and add the difference to the mixture.

$$\frac{m \times T}{100}$$

m = mass of raw material, in kilograms.

T = percentage loss on drying of the sample.

Allow to stand at a temperature not exceeding 20 °C for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

Adjustment to any value specified in the individual monograph

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount (A_1), in kilograms, of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)] required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

m = mass of filtrate, in kilograms.

N_0 = percentage dry residue or percentage assay content as required in the individual monograph.

N_x = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)]. Allow to stand at a temperature not exceeding 20 °C for not less than 5 days, then filter if necessary.

Potentisation

The 1st 'decimal' dilution (D1) is made from:

— 2 parts of the mother tincture;

— 8 parts of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)].

The 2nd decimal dilution (D2) is made from:

— 1 part of the 1st 'decimal' dilution;

— 9 parts of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)].

Subsequent decimal dilutions are produced as stated for D2.

The 1st 'centesimal' dilution (C1) is made from:

— 2 parts of the mother tincture;

— 98 parts of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)].

The 2nd centesimal dilution (C2) is made from:

— 1 part of the 1st 'centesimal' dilution;

— 99 parts of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)].

Subsequent centesimal dilutions are produced as stated for C2.

METHOD 2B

Method 2b is used for fresh herbal drugs containing generally less than 70 per cent of expressed juice and more than 60 per cent moisture (loss on drying) and no essential oil or resin.

Mother tinctures prepared according to Method 2b (ethanol content approximately 30 per cent *m/m* or 36 per cent *V/V*) are prepared by maceration as described below.

Comminute the herbal drug Take a sample and determine the loss on drying (*2.2.32*). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of comminuted raw material in a flat-bottomed tared vessel, 45-55 mm in diameter, that has been previously dried as indicated for the raw material. Dry the raw material at 100-105 °C for 2 h then allow to cool in a desiccator.

To the comminuted herbal drug immediately add not less than half the mass of ethanol (62 per cent *m/m*) [ethanol (70 per cent *V/V*)] and store in well-closed containers at a temperature not exceeding 20 °C.

Use the following expression to calculate the amount (A_2), in kilograms, of ethanol (62 per cent *m/m*) [ethanol (70 per cent *V/V*)] required for the mass (m) of raw material, then subtract the amount of ethanol (62 per cent *m/m*) [ethanol (70 per cent *V/V*)] already added and add the difference to the mixture.

$$\frac{m \times T}{100}$$

m = mass of raw material, in kilograms.

T = percentage loss on drying of the sample.

Allow to stand at a temperature not exceeding 20 °C for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

Adjustment to any value specified in the individual monograph

Determine the percentage dry residue (*2.8.16)* or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount (A_1), in kilograms, of ethanol (30 per cent *m/m*) [ethanol (36 per cent *V/V*)] required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

m = mass of filtrate, in kilograms.

N_0 = percentage dry residue or percentage assay content as required in the individual monograph.

N_x = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (30 per cent *m/m*) [ethanol (36 per cent *V/V*)]. Allow to stand at a temperature not exceeding 20 °C for not less than 5 days, then filter if necessary.

Potentisation

The 1st 'decimal' dilution (D1) is made from:

— 2 parts of the mother tincture;

— 8 parts of ethanol (30 per cent *m/m*) [ethanol (36 per cent *V/V*)].

The 2nd decimal dilution (D2) is made from:

— 1 part of the 1st 'decimal' dilution;

— 9 parts of ethanol 15 per cent (*m/m*) [ethanol (18 per cent *V/V*)].

Subsequent decimal dilutions are produced as stated for D2.

METHOD 3A

Method 3a is used for fresh herbal drugs containing essential oil or resin, or generally less than 60 per cent moisture (loss on drying).

Mother tinctures prepared according to Method 3a (ethanol content approximately 60 per cent *m/m* or 68 per cent *V/V*) are prepared by maceration as described below.

Comminute the herbal drug Take a sample and determine the loss on drying (*2.2.32*). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of comminuted raw material in a flat-bottomed tared vessel, 45-55 mm in diameter, that has been previously dried as indicated for the raw material. Dry the raw material at 100-105 °C for 2 h then allow to cool in a desiccator.

To the comminuted herbal drug immediately add not less than half the mass of ethanol (86 per cent *m/m*) [ethanol (90 per cent *V/V*)] and store in well-closed containers at a temperature not exceeding 20 °C.

Use the following expression to calculate the amount (A_3), in kilograms, of ethanol (86 per cent *m/m*) [ethanol (90 per cent *V/V*)] required for the mass (m) of raw material, then subtract the amount of ethanol (86 per cent *m/m*) [ethanol (90 per cent *V/V*)] already added and add the difference to the mixture.

$$\frac{2 \times m \times T}{100}$$

m = mass of raw material, in kilograms.

T = percentage loss on drying of the sample.

Allow to stand at a temperature not exceeding 20 °C for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

Adjustment to any value specified in the individual monograph

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount (A_1), in kilograms, of ethanol (62 per cent *m/m*) [ethanol (70 per cent *V/V*)] required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

m = mass of filtrate, in kilograms.

N_0 = percentage dry residue or percentage assay content as required in the individual monograph.

N_x = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (62 per cent *m/m*) [ethanol (70 per cent *V/V*)]. Allow to stand at a temperature not exceeding 20 °C for not less than 5 days, then filter if necessary.

Potentisation

The 1st 'decimal' dilution (D1) is made from:

— 3 parts of the mother tincture;

— 7 parts of ethanol (62 per cent *m/m*) [ethanol (70 per cent *V/V*)].

The 2nd decimal dilution (D2) is made from:

— 1 part of the 1st 'decimal' dilution;

— 9 parts of ethanol (62 per cent *m/m*) [ethanol (70 per cent *V/V*)].

Subsequent dilutions are produced as stated for D2. Use ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)] for dilutions from D4 onwards.

The 1st 'centesimal' dilution (C1) is made from:

— 3 parts of the mother tincture;

— 97 parts of ethanol (62 per cent *m/m*) [ethanol (70 per cent *V/V*)].

The 2nd 'centesimal' dilution (C2) is made from:

— 1 part of the 1st 'centesimal' dilution;

— 99 parts of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)].

Subsequent dilutions are produced as stated for C2.

METHOD 3B

Method 3b is used for fresh herbal drugs containing essential oils or resins or generally less than 60 per cent moisture (loss on drying).

Mother tinctures prepared according to Method 3b (ethanol content approximately 43 per cent *m/m* or 50 per cent *V/V*) are prepared by maceration as described below.

Comminute the herbal drug. Take a sample and determine the loss on drying (*2.2.32*). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of comminuted raw material in a flat-bottomed tared vessel, 45-55 mm in diameter, that has been previously dried as indicated for the raw material. Dry the raw material at 100-105 °C for 2 h then allow to cool in a desiccator.

To the comminuted herbal drug immediately add not less than half the mass of ethanol (73 per cent *m/m*) [ethanol (80 per cent *V/V*)] and store in well-closed containers at a temperature not exceeding 20 °C.

Use the following expression to calculate the amount (A_3), in kilograms, of ethanol (73 per cent *m/m*) [ethanol (80 per cent *V/V*)] required for the mass (m) of raw material, then subtract the amount of ethanol (73 per cent *m/m*) [ethanol (80 per cent *V/V*)] already added and add the difference to the mixture.

$$\frac{2 \times m \times T}{100}$$

m = mass of raw material, in kilograms.

T = percentage loss on drying of the sample.

Allow to stand at a temperature not exceeding 20 °C for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

Adjustment to any value specified in the individual monograph

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount (A_1), in kilograms, of ethanol (43 per cent *m/m*) [ethanol 50 per cent *V/V*)] required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

m = mass of filtrate, in kilograms.

N_0 = percentage dry residue or percentage assay content as required in the individual monograph.

N_x = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)]. Allow to stand at a temperature not exceeding 20 °C for not less than 5 days, then filter if necessary.

Potentisation

The 1st 'decimal' dilution (D1) is made from:

— 3 parts of the mother tincture;

— 7 parts of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)].

The 2nd decimal dilution (D2) is made from:

— 1 part of the 1st 'decimal' dilution;

— 9 parts of ethanol (30 per cent *m/m*) [ethanol (36 per cent *V/V*)].

The 3rd decimal dilution (D3) is made from:

— 1 part of the 2nd decimal dilution;

— 9 parts of ethanol (15 per cent *m/m*) [ethanol (19 per cent *V/V*)].

Subsequent decimal dilutions are produced as stated for D3.

METHOD 3C

Method 3c is used for fresh herbal drugs containing generally less than 60 per cent moisture (loss on drying).

Mother tinctures prepared according to Method 3c (ethanol content approximately 30 per cent *m/m* or 36 per cent *V/V*) are prepared by maceration as described below.

Comminute the herbal drug Take a sample and determine the loss on drying (*2.2.32*). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of comminuted raw material in a flat-bottomed tared vessel, 45-55 mm in diameter, that has been previously dried as indicated for the raw material. Dry the raw material at 100-105 °C for 2 h then allow to cool in a desiccator.

To the comminuted herbal drug immediately add not less than half the mass of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)] and store in well-closed containers at a temperature not exceeding 20 °C.

Use the following expression to calculate the amount (A_3), in kilograms, of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)] required for the mass (m) of raw material, then subtract the amount of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)] already added and add the difference to the mixture.

$$\frac{2 \times m \times T}{100}$$

m = mass of raw material, in kilograms.

T = percentage loss on drying of the sample.

Allow to stand at a temperature not exceeding 20 °C for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

Adjustment to any value specified in the individual monograph

Determine the percentage dry residue (*2.8.16*) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount (A_1), in kilograms, of ethanol (30 per cent *m/m*) [ethanol (36 per cent *V/V*)] required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

m = mass of filtrate, in kilograms.

N_0 = percentage dry residue or percentage assay content as required in the individual monograph.

N_x = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (30 per cent *m/m*) [ethanol (36 per cent *V/V*)]. Allow to stand at a temperature not exceeding 20 °C for not less than 5 days, then filter if necessary.

Potentisation

The 1st 'decimal' dilution (D1) is made from:

— 3 parts of the mother tincture;

— 7 parts of ethanol (30 per cent *m/m*) [ethanol (36 per cent *V/V*)].

The 2nd decimal dilution (D2) is made from:

— 1 part of the 1st 'decimal' dilution;

— 9 parts of ethanol (15 per cent *m/m*) [ethanol (18 per cent *V/V*)].

Subsequent decimal dilutions are produced as stated for D2.

METHOD 4A

Method 4a is generally used for dried herbal drugs.

Mother tinctures prepared according to Method 4a are prepared by maceration or percolation as described below, using 1 part of dried herbal drug and 10 parts of ethanol of the appropriate concentration (anhydrous, 94 per cent *m/m* - 96 per cent *V/V*, 86 per cent *m/m* - 90 per cent *V/V*, 73 per cent *m/m* - 80 per cent *V/V*, 62 per cent *m/m* - 70 per cent *V/V*, 43 per cent *m/m* - 50 per cent *V/V*, 30 per cent *m/m* - 36 per cent *V/V*, 15 per cent *m/m* - 18 per cent *V/V*), unless otherwise prescribed in the individual monograph.

Production by maceration Unless otherwise prescribed, comminute the herbal drug, mix thoroughly with ethanol of the appropriate concentration and allow to stand in a closed container for an appropriate time. Separate the residue from the ethanol and, if necessary, press out. In the latter case, combine the 2 liquids obtained.

Production by percolation If necessary, comminute the herbal drug. Mix thoroughly with a portion of ethanol of the appropriate concentration and allow to stand for an appropriate time.

Transfer to a percolator and allow the percolate to flow slowly, at room temperature, making sure that the herbal drug to be extracted is always covered with the remaining ethanol. The residue may be pressed out and the expressed liquid combined with the percolate.

If adjustment to a given concentration is necessary, calculate the amount (A_1), in kilograms, of ethanol of the appropriate concentration required to obtain the concentration specified or used for production, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

m = mass of percolate or macerate, in kilograms.

N_0 = percentage dry residue or percentage assay content as required in the individual monograph.

N_x = percentage dry residue or percentage assay content of the percolate or macerate.

Mix the macerate or percolate with the calculated amount of ethanol of the appropriate concentration. Allow to stand at a temperature not exceeding 20 °C for not less than 5 days, then filter if necessary.

Potentisation

The mother tincture corresponds to the 1st decimal solution (Ø = D1).

The 2nd decimal dilution (D2) is made from:

— 1 part of the mother tincture (D1);

— 9 parts of ethanol of the same concentration.

The 3rd decimal dilution (D3) is made from:

— 1 part of the 2nd decimal dilution;

— 9 parts of ethanol of the same concentration.

Unless a different ethanol concentration is specified, use ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)] for subsequent decimal dilutions from D4 onwards and proceed as stated for D3.

The 1st 'centesimal' dilution (C1) is made from:

— 10 parts of the mother tincture (D1);

— 90 parts of ethanol of the same concentration.

The 2nd centesimal dilution (C2) is made from:

— 1 part of the 1st 'centesimal' dilution;

— 99 parts of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)], unless a different ethanol concentration is specified.

Subsequent centesimal dilutions are produced as stated for C2.

METHOD 4B

Method 4b is generally used for animal matter.

Mother tinctures prepared according to Method 4b are prepared by maceration or percolation as described below, using 1 part of animal matter and 10 parts of ethanol of the appropriate concentration (anhydrous, 94 per cent *m/m* - 96 per cent *V/V*, 86 per cent *m/m* - 90 per cent *V/V*, 73 per cent *m/m* - 80 per cent *V/V*, 62 per cent *m/m* - 70 per cent *V/V*, 43 per cent *m/m* - 50 per cent *V/V*, 30 per cent *m/m* - 36 per cent *V/V*, 15 per cent *m/m* - 18 per cent *V/V*), unless otherwise prescribed in the individual monograph.

Production by maceration Unless otherwise prescribed, comminute the animal matter, mix thoroughly with ethanol of the appropriate concentration and allow to stand in a closed container for an appropriate time. Separate the residue from the ethanol and, if necessary, press out. In the latter case, combine the 2 liquids obtained.

Production by percolation If necessary, comminute the animal matter. Mix thoroughly with a portion of ethanol of the appropriate concentration and allow to stand for an appropriate time. Transfer to a percolator and allow the percolate to flow slowly at room temperature, making sure that the animal matter to be extracted is always covered with the remaining ethanol. The residue may be pressed out and the expressed liquid combined with the percolate.

If adjustment to a given concentration is necessary, calculate the amount (A_1), in kilograms, of ethanol of the appropriate concentration required to obtain the concentration specified or used for production, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

m = mass of percolate or macerate, in kilograms.

N_0 = percentage dry residue or percentage assay content as required in the individual monograph.

N_x = percentage dry residue or percentage assay content of the percolate or macerate.

Mix the macerate or percolate with the calculated amount of ethanol of the appropriate concentration. Allow to stand at a temperature not exceeding 20 °C for not less than 5 days, then filter if necessary.

Potentisation

The mother tincture corresponds to the 1st decimal solution (Ø = D1).

The 2nd decimal dilution (D2) is made from:

— 1 part of the mother tincture (D1);

— 9 parts of ethanol of the same concentration.

The 3rd decimal dilution (D3) is made from:

— 1 part of the 2nd decimal dilution;

— 9 parts of ethanol of the same concentration.

Unless a different ethanol concentration is specified, use ethanol (43 per cent *m/m*) [ethanol

(50 per cent *V/V*)] for subsequent decimal dilutions from D4 onwards and proceed as stated for D3.

The 1st 'centesimal' dilution (C1) is made from:

- — 10 parts of the mother tincture (D1);
- — 90 parts of ethanol of the same concentration.

The 2nd centesimal dilution (C2) is made from:

- — 1 part of the 1st 'centesimal' dilution;
- — 99 parts of ethanol (43 per cent *m/m*) [ethanol (50 per cent *V/V*)], unless a different ethanol concentration is specified.

Subsequent centesimal dilutions are produced as stated for C2.

METHOD 4C

Method 4c is generally used for herbal drugs. The state of the herbal drug, fresh or dried, is specified in the individual monograph.

Mother tinctures prepared according to Method 4c are prepared by maceration.

Comminute appropriately the herbal drug Take a sample and determine the loss on drying at 100-105 °C for 2 h (*2.2.32*) or the water content (*2.2.13*). Taking this value into account, calculate and add to the herbal drug the quantities of ethanol of the appropriate concentration required to produce, unless otherwise prescribed, a 1 in 10 mother tincture (1:10 mother tincture) with a suitable ethanol content. Allow to macerate for at least 10 days, with sufficient shaking.

Separate the residue from the ethanol and strain at a pressure of about 10^7 Pa. Allow the combined liquids to stand for 48 h and filter. For mother tinctures with a required assay content, adjustment may be carried out, if necessary, by adding ethanol of the same concentration as used for the preparation of the tincture.

Potentisation

The 1st decimal dilution (D1) is made from:

- — 1 part of the mother tincture;
- — 9 parts of ethanol of the appropriate concentration.

The 2nd decimal dilution (D2) is made from:

- — 1 part of the 1st decimal dilution;
- — 9 parts of ethanol of the appropriate concentration.

Subsequent decimal dilutions are produced as stated for D2, using ethanol of the appropriate concentration.

The 1st centesimal dilution (C1) is made from:

- — 1 part of the mother tincture;
- — 99 parts of ethanol of the appropriate concentration.

The 2nd centesimal dilution (C2) is made from:

- — 1 part of the 1st centesimal dilution;
- — 99 parts of ethanol of the appropriate concentration.

Subsequent centesimal dilutions are produced as stated for C2, using ethanol of the appropriate concentration.

METHOD 4D

Method 4d is generally used for animal matter.

Mother tinctures prepared according to Method 4d are prepared by maceration.

The mass ratio of raw material to mother tincture is usually 1 to 20. To the raw material, appropriately comminuted, add the quantity of ethanol of the appropriate concentration required to produce a 1 in 20 mother tincture. Allow to macerate for at least 10 days, with sufficient shaking. Decant and filter. Allow to stand for 48 h and filter again.

Potentisation

The 1st decimal dilution (D1) is made from:

— 1 part of the mother tincture;

— 9 parts of ethanol of the appropriate concentration.

The 2nd decimal dilution (D2) is made from:

— 1 part of the 1st decimal dilution;

— 9 parts of ethanol of the appropriate concentration.

Subsequent decimal dilutions are produced as stated for D2, using ethanol of the appropriate concentration.

The 1st centesimal dilution (C1) is made from:

— 1 part of the mother tincture;

— 99 parts of ethanol of the appropriate concentration.

The 2nd centesimal dilution (C2) is made from:

— 1 part of the 1st centesimal dilution;

— 99 parts of ethanol of the appropriate concentration.

Subsequent centesimal dilutions are produced as stated for C2, using ethanol of the appropriate concentration.

Ph Eur

Mother Tinctures for Homoeopathic Preparations

General Notices

(Ph Eur monograph 2029)

Ph Eur

DEFINITION

Mother tinctures for homoeopathic preparations are liquid preparations obtained by the solvent action of a suitable vehicle upon raw materials. The raw materials are usually in the fresh form but may be dried. Mother tinctures for homoeopathic preparations may also be obtained from plant juices, with, or without the addition of a vehicle. For some preparations, the matter to be extracted may undergo a preliminary treatment.

PRODUCTION

Mother tinctures for homoeopathic preparations are prepared by maceration, digestion, infusion, decoction, fermentation or as described in the individual monographs, usually using alcohol of suitable concentration.

Mother tinctures for homoeopathic preparations are obtained using a fixed proportion of raw material to solvent, taking the moisture content of the raw material into account, unless otherwise justified and authorised.

If fresh plants are used, suitable procedures are used to ensure freshness. The competent authorities may require that the freshness is demonstrated by means of a suitable test.

Mother tinctures for homoeopathic preparations are usually clear. A slight sediment may form on standing and that is acceptable as long as the composition of the tincture is not changed significantly.

The manufacturing process is defined so that it is reproducible.

Production by maceration

Unless otherwise prescribed, reduce the matter to be extracted to pieces of suitable size, mix thoroughly and extract according to the prescribed extraction method with the prescribed extraction solvent. Allow to stand in a closed vessel for the prescribed time. The residue is separated from the extraction solvent and, if necessary, pressed out. In the latter case, the 2 liquids obtained are combined.

Adjustment of the contents

Adjustment of the content of constituents may be carried out if necessary, either by adding the extraction solvent of suitable concentration, or by adding another mother tincture for homoeopathic preparations of the vegetable or animal matter used for the preparation.

IDENTIFICATION

Where applicable, at least 1 chromatographic identification test is carried out.

TESTS

The limits in an individual monograph are set to include official methods of production. Specific limits will apply to each defined method of production.

If the test for relative density is carried out, the test for ethanol need not be carried out, and vice versa.

Relative density (*2.2.5*)

The mother tincture for homoeopathic preparations complies with the limits prescribed in the monograph.

Ethanol (*2.9.10*)

The ethanol content complies with that prescribed in the monograph.

Methanol and 2-propanol (*2.9.11*)

Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol, unless otherwise prescribed.

Dry residue (*2.8.16*)

Where applicable, the mother tincture for homoeopathic preparations complies with the limits prescribed in the monograph.

Pesticides (*2.8.13*)

Where applicable, the mother tincture for homoeopathic preparations complies with the test. This requirement is met if the herbal drug has been shown to comply with the test.

ASSAY

Where applicable, an assay with quantitative limits is performed.

STORAGE

Protected from light. A maximum storage temperature may be specified.

LABELLING

The label states:

— that the product is a mother tincture for homoeopathic preparations (designated as ″TM″ or ″Ø″),

— the name of the raw material using the Latin title of the European Pharmacopoeia monograph where one exists,

— the method of preparation,

— the ethanol content or other solvent content, in per cent *V/V*, in the mother tincture,

— the ratio of raw material to mother tincture,

— where applicable, the storage conditions.

Ph Eur

Oriental Cashew for Homoeopathic Preparations

General Notices

(Ph Eur monograph 2094)

Ph Eur

DEFINITION

Dried fruit of *Semecarpus anacardium* L. (*Anacardium orientale* L.).

Content

Minimum 6.0 per cent *m/m* of total phenol derivatives expressed as eugenol ($C_{10}H_{12}O_2$; M_r 164.2) (dried drug).

IDENTIFICATION

A. The dried fruit is oval and more or less heart-shaped; about 2 cm long, nearly 2 cm wide and 0.5 cm thick. Its surface is smooth, shiny and blackish. A transverse section shows a rather well developed, tough pericarp riddled with rather wide lacunae containing an abundant thick reddish-brown juice. The pericarp covers a white kernel under a reddish skin. The fruit may include the blackish, fleshy, wrinkled, cupuliferous receptacle.

B. Thin-layer chromatography *(2.2.27)*.

Test solution To 1.0 g of suitably cut drug, add 10 ml of *ethanol (90 per cent V/V) R*. Heat under reflux on a water-bath at 60 °C for 15 min. Allow to cool and filter.

Reference solution Dissolve 5 mg of *gallic acid R* and 5 mg of *caffeic acid R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate TLC silica gel plate R.

Mobile phase *methanol R*, *toluene R* (15:85 *V/V*).

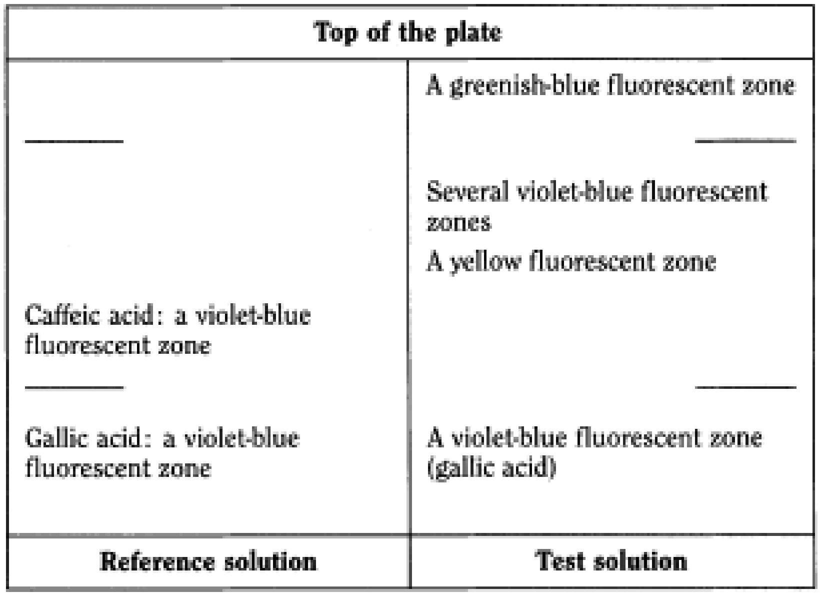
Application 20 µl of the test solution and 10 µl of the reference solution, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with a solution containing 10 g/l of *diphenylboric acid aminoethyl ester R* and 50 g/l of *macrogol 400 R* in *methanol R*. Examine in ultraviolet light at 365 nm.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fainter zones may be present in the chromatogram obtained with the test solution.



Top of the plate	
	A greenish-blue fluorescent zone
———	———
	Several violet-blue fluorescent zones A yellow fluorescent zone
Caffeic acid: a violet-blue fluorescent zone	
———	———
Gallic acid: a violet-blue fluorescent zone	A violet-blue fluorescent zone (gallic acid)
Reference solution	**Test solution**

TESTS

Anacardium occidentale L.

Fruits of *Anacardium occidentale* L. are not present. These are up to 35 mm long, 30 mm large, 20 mm thick, light brown and distinctly kidney-shaped. The pericarp is smooth or slightly crinkled with dark marbling in places.

Loss on drying *(2.2.32)*

Maximum 12.0 per cent, determined on 1.000 g of the finely divided drug by drying in an oven at 105 °C for 2 h.

Total ash *(2.4.16)*

Maximum 5.0 per cent.

ASSAY

Total phenol derivatives

Absorption spectrophotometry *(2.2.25)*.

Stock solution Place 4.500 g of the crushed drug in a flask. Add 200 ml of *ethanol (90 per cent V/V) R*. Boil in a water-bath under reflux for 4 h. Cool the flask. Quantitatively transfer into a volumetric flask. Dilute to 250.0 ml with *ethanol (90 per cent V/V) R*. Filter the liquid through a paper filter 125 mm in diameter. Discard the first 50 ml of the filtrate. Dilute 5.0 ml of filtrate to 50.0 ml with *ethanol (90 per cent V/V) R* and shake. Dilute 5.0 ml of this solution to 10.0 ml with *ethanol (90 per cent V/V) R* and shake.

Test solution To 2.0 ml of stock solution add 1.0 ml of *phosphomolybdotungstic reagent R* and 10 ml of *water R*, mix and dilute to 25.0 ml with a 290 g/l solution of *sodium carbonate R*. Wait exactly 3 min then filter the solution through a fibre-glass filter with a 1 µm mesh aperture, discarding the first 5 ml.

Reference solution Dissolve 80.0 mg of *eugenol R* in *ethanol (90 per cent V/V) R* and dilute to 250.0 ml with the same solvent. Dilute 5.0 ml of the solution to 25.0 ml with *ethanol (90 per cent V/V) R*. To 2.0 ml of this solution add 1.0 ml of *phosphomolybdotungstic reagent R* and 10 ml of *water R*, mix and dilute to 25.0 ml with a 290 g/l solution of *sodium carbonate R*. Wait exactly 3 min then filter the solution through a fibre-glass filter with a 1 µm mesh aperture, discarding the first 5 ml.

Measure the absorbance *(2.2.25)* of the test solution and the reference solution at 755 nm after 30 min using *water R* as compensation liquid.

Calculate the percentage content *m/m* of total phenol derivatives, expressed as eugenol, from the following expression:

$$\frac{A_1 \times m_2 \times 400}{A_2 \times m_1}$$

A_1 = absorbance of the test solution,

A_2 = absorbance of the reference solution,

m_1 = mass of the drug to be examined, in milligrams,

m_2 = mass of eugenol in the reference solution, in milligrams.

MOTHER TINCTURE

The mother tincture complies with the requirements of the general monograph on *Mother tinctures for homoeopathic preparations (2029).*

DEFINITION

The mother tincture of oriental cashew is prepared by maceration using ethanol of a suitable concentration from the dried fruit of *Semecarpus anacardium* L. (*Anacardium orientale* L.).

Content

0.5 per cent *m/m* to 1.0 per cent *m/m* of total phenol derivatives expressed as eugenol.

CHARACTERS

Appearance

Yellowish-brown or reddish-brown liquid.

IDENTIFICATION

Thin-layer chromatography *(2.2.27)* as described under Identification B of the drug with the following modification.

Test solution The tincture to be examined.

Results See identification B for the drug.

TESTS

Relative density ***(2.2.5)***

0.815 to 0.845.

Ethanol ***(2.9.10)***

85 per cent *V/V* to 95 per cent *V/V*.

Dry residue ***(2.8.16)***

Minimum 1.50 per cent *m/m*.

ASSAY

Total phenol derivatives

Absorption spectrophotometry *(2.2.25)* as described in the assay of the drug to be examined with the following modifications.

Stock solution Place 8.000 g of the mother tincture to be examined in a volumetric flask and dilute to 250.0 ml with *ethanol (90 per cent V/V) R*. Dilute 5.0 ml of this solution to 20.0 ml with *ethanol (90 per cent V/V) R*.

Test solution To 2.0 ml of stock solution add 1.0 ml of *phosphomolybdotungstic reagent R* and 10 ml of *water R*, mix and dilute to 25.0 ml with a 290 g/l solution of *sodium carbonate R*. Wait exactly 3 min then filter the solution through a fibre-glass filter with a 1 µm mesh aperture, discarding the first 5 ml.

Reference solution Dissolve 80.0 mg of *eugenol R* in *ethanol (90 per cent V/V) R* and dilute to 250.0 ml with the same solvent. Dilute 5.0 ml of the solution to 25.0 ml with *ethanol (90 per cent V/V) R*. To 2.0 ml of this solution add 1.0 ml of *phosphomolybdotungstic reagent R* and 10 ml of *water R*, mix and dilute to 25.0 ml with a 290 g/l solution of *sodium carbonate R*. Wait exactly 3 min then filter the solution through a fibre-glass filter with a 1 µm mesh aperture, discarding the first 5 ml.

Measure the absorbance *(2.2.25)* of the test solution and the reference solution at 755 nm after 30 min, using *water R* as compensation liquid.

Calculate the percentage content *m/m* of total phenol derivatives expressed as eugenol, using the following expression:

$$\frac{A_1 \times m_2 \times 80}{A_2 \times m_1}$$

A_1 = absorbance of the test solution,

A_2 = absorbance of the reference solution,

m_1 = mass of the mother tincture to be examined, in milligrams,

m_2 = mass of eugenol in the reference solution, in milligrams.

Ph Eur

Saffron for Homoeopathic Preparations

General Notices

Saffron for Homoeopathic Use
(Ph Eur monograph 1624)

Ph Eur

DEFINITION

Dried stigmas of *Crocus sativus* L. usually joined by the base to a short style.

CHARACTERS

Characteristic, aromatic odour.

IDENTIFICATION

A. The dark brick-red stigmas, when dry, are 20 mm to 40 mm long and after soaking with water, about 35 mm to 50 mm long. The tubes, gradually widening at the top, are incised on one side, the upper margin is open and finely crenated. The style connecting the 3 stigmas is pale yellow and not more than 5 mm long.

B. Examine under a microscope using *chloral hydrate solution R.* It shows the following diagnostic characters: elongated epidermal cells, frequently with a short, central papilla; in water they release a yellow colouring matter; the upper border of the stigma has finger-shaped papillae, up to 150 µm long; between them are single, globular pollen grains, about 100 µm wide, with a finely pitted exine, vascular bundles with small spirally thickened vessels and no fibres.

C. Carefully crush pieces of the drug to coarse particles and moisten with 0.2 ml of *phosphomolybdic acid solution R*. The particles turn blue within 1-2 min or they have a blue areole around them.

D. Examine by thin-layer chromatography (*2.2.27*).

Test solution Carefully crush 0.1 g of the drug with a glass rod and moisten with 0.2 ml of *water R*. After 3 min add 5 ml of *methanol R*, allow to stand for 20 min, protected from light, and filter through a plug of glass wool.

Reference solution Dissolve 5 mg of *naphthol yellow R* in 5 ml of *methanol R* and add a solution of 5 mg of *Sudan red G R* in 5 ml of *methylene chloride R*.

Plate *TLC silica gel* F_{254} *plate R.*

Mobile phase *water R*, *2-propanol R*, *ethyl acetate R* (10:25:65 *V/V/V*).

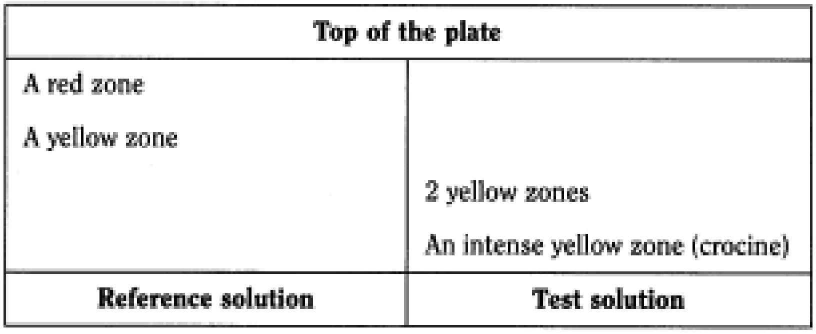
Application 10 µl of the test solution and 5 µl of the reference solution as bands.

Development Over a path of 10 cm.

Drying In air.

Detection Examine in daylight.

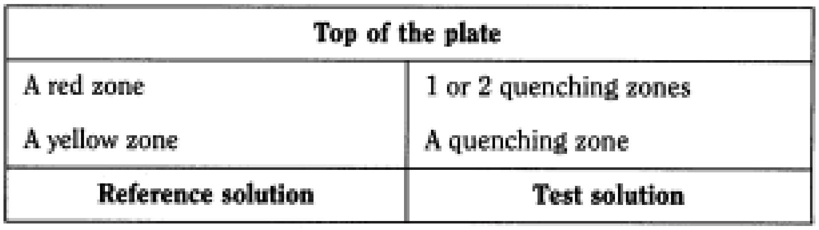
Results See below the sequence of the zones present in the chromatograms obtained with the reference and test solutions.



Top of the plate	
A red zone	
A yellow zone	
	2 yellow zones
	An intense yellow zone (crocine)
Reference solution	**Test solution**

Detection In ultraviolet light at 254 nm.

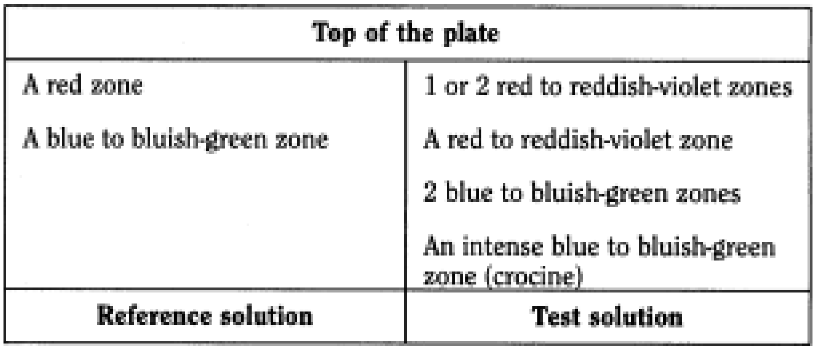
Results See below the sequence of the zones present in the chromatograms obtained with the reference and test solutions.



Top of the plate	
A red zone	1 or 2 quenching zones
A yellow zone	A quenching zone
Reference solution	**Test solution**

Detection Spray with *anisaldehyde solution R* and examine in daylight while heating at 100-105 °C for 5-10 min.

Results See below the sequence of the zones present in the chromatograms obtained with the reference and test solutions.



Top of the plate	
A red zone	1 or 2 red to reddish-violet zones
A blue to bluish-green zone	A red to reddish-violet zone
	2 blue to bluish-green zones
	An intense blue to bluish-green zone (crocine)
Reference solution	**Test solution**

E. Dilute 0.1 ml of the test solution (see Identification test D) with 1 ml of *methanol R*. Deposit 0.1 ml of this solution on a filter paper, allow to dry and spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Examine in ultraviolet light at 365 nm. The spot shows an intense orange-yellow fluorescence.

TESTS

Colouring intensity

Introduce 0.10 g into a 5 ml volumetric flask and add to 5.0 ml with *distilled water R.* Close the flask and shake every 30 min for 8 h. Then allow to stand for 16 h. Dilute 1.0 ml to 500.0 ml with *distilled water R*. The absorbance (*2.2.25*) measured at 440 nm using *distilled water R* as the compensation liquid, is not less than 0.44.

Foreign matter

Examine the drug microscopically. No parts with rough walls, no crystals and no pollen grains containing 3 germinal pores are present.

Loss on drying (*2.2.32*)

Maximum 10.0 per cent, determined on 0.200 g by drying in an oven at 105 °C.

Total ash (*2.4.16*)

Maximum 7.0 per cent, determined on the residue obtained in the test for loss on drying.

Ph Eur

Symphytum Officinale Root for Homoeopathic Preparations

General Notices

DEFINITION

Symphytum Officinale Root for Homoeopathic Preparations is the fresh root of *Symphytum officinale* L.

IDENTIFICATION

The strong, spirally-formed rootstock with a smooth, black-brown cortex, subdivides at the base. It is about 5 to 8 cm in diameter and 17 to 30 cm long, surmounted by several tops, close together, consisting of the black residues of the previous year's rosettes of leaves between the current year's new growths. A ring of 10 to 15 horizontally-running, secondary, glabrous smooth roots grows from the base of the rosettes, the roots often reaching a length of more than 50 cm and a diameter of approximately 1.5 cm. The middle portion of the rootstock, which is more or less glabrous, branches at the lower end into several clearly separated, straight downwards pointing, smooth roots, each about 1.5 cm thick and bearing a few secondary rootlets 1 to 2 cm long.

The rootstock and the thick secondary roots are non-lignified, succulent and break off easily. In the yellowish-white, glassy, slightly differentiated cross section, there is a very thin, black rhizodermis, and an easily detachable layer of cortex, 5-8 mm thick. Within this is a single dark pigmented vascular ring. The cut surface and particularly the richly exuding mucilagenous substance turn yellow to red-brown on exposure.

TESTS

Foreign matter

Not more than 2%, Appendix XI D.

MOTHER TINCTURE

The mother tincture complies with the requirements stated under Mother Tinctures for Homoeopathic Preparations and with the following requirements.

PRODUCTION

The mother tincture of *Symphytum officinale* L., is prepared from the herbal drug using *Method 2a* described in the monograph for Methods of Preparation of Homoeopathic Stocks and Potentisation. Use 86% w/w (90% v/v) of *ethanol* .

CHARACTERISTICS

The mother tincture is a brown liquid.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions

(1) The mother tincture.

(2) 0.1% w/v solution of *allantoin* in *ethanol (45%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating silica gel G.

(b) Mobile phase is a mixture of 10 volumes of *anhydrous formic acid*, 10 volumes of *water* and 80 volumes of *ethyl acetate.*

(c) Application volumes of 20 µl for solution (1) and 10 µl for solution (2); applied as bands.

(d) Develop to 10 cm.

(e) Remove the plate, allow it to dry in air and examine under *ultraviolet light (365 nm).*

(f) Spray the chromatograms with a 5% (w/v) solution of *dimethylaminobenzaldehyde* in *hydrochloric acid* and examine in daylight.

VALIDITY

Under *ultraviolet light (365 nm)* the chromatogram of solution (1) shows two bluish spots at Rf 0.25 and Rf 0.55 and one light-green spot at the solvent front.

After spraying, the chromatogram of solution (2) shows the yellow allantoin spot at Rf 0.35. The chromatogram of the solution (1) shows one yellow spot with the same Rf of 0.35 as that for allantoin.

TESTS

Ethanol

35% to 45% w/w (42% to 53% v/v), Appendix VIII F

Dry residue

Not less than 1.5% w/w, Appendix XI P.

Relative density

0.920 to 0.970, Appendix V G.

Symphytum Officinale Root, Ethanol. Decoctum for Homoeopathic Preparations

General Notices

DEFINITION

The fresh root of *Symphytum officinale* L.

IDENTIFICATION

The strong, spirally-formed rootstock with a smooth, black-brown cortex, subdivides at the base. It is about 5 to 8 cm in diameter and 17 to 30 cm long, surmounted by several tops, close together, consisting of the black residues of the previous year's rosettes of leaves between the current year's new growths. A ring of 10 to 15 horizontally-running, secondary, glabrous smooth roots, grows from the base of the rosettes, the roots often reaching a length of more than 50 cm and a diameter of approximately 1.5 cm. The middle portion of the rootstock, which is more or less glabrous, branches at the lower end into several clearly separated, straight downwards pointing, smooth roots, each about 1.5 cm thick and bearing a few secondary rootlets 1 to 2 cm long.

The rootstock and the thick secondary roots are non-lignified, succulent and break off easily. In the yellowish-white, glassy, slightly differentiated cross section, there is a very thin, black rhizodermis, and an easily detachable layer of cortex, 5-8 mm thick. Within this is a single dark pigmented vascular ring. The cut surface and particularly the richly exuding mucilagenous substance turn yellow to red-brown on exposure.

TESTS

Foreign matter

Not more than 2%, Appendix XI D.

MOTHER TINCTURE

The mother tincture complies with the requirements stated under Mother Tinctures for Homoeopathic Preparations and with the following requirements.

PRODUCTION

The mother tincture of *Symphytum officinale* L. is prepared by decoction of the herbal drug, using 43% w/w (50% v/v) of *ethanol* .

CHARACTERISTICS

The mother tincture is a brown liquid.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) The mother tincture.

(2) 0.1% w/v solution of *allantoin* in *ethanol (45%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G.*

(b) Mobile phase is a mixture of 10 volumes of *anhydrous formic acid ,* 10 volumes of *water* and 80 volumes of *ethyl acetate.*

(c) Application volumes of 20 µl for solution (1) and 10 µl for solution (2); applied as bands.

(d) Develop to 10 cm.

(e) Remove the plate, allow it to dry in air and examine under *ultraviolet light (365 nm).*

(f) Spray the plate with a 5% (w/v) solution of *dimethylaminobenzaldehyde* in *hydrochloric acid* and examine in daylight.

VALIDITY

Under *ultraviolet light (365 nm)*, the chromatogram obtained with solution (1) shows two bluish spots at Rf 0.25 and Rf 0.55 and one light-green spot at the solvent front.

After spraying, the chromatogram obtained with solution (2) shows a yellow spot at Rf 0.35 (allantoin). The chromatogram obtained with solution (1) shows one yellow spot with the same Rf of 0.35 as that for allantoin.

TESTS

Ethanol

25% to 35% w/w (31% to 42% v/v), Appendix VIII F

Dry residue

Not less than 3.0% w/w, Appendix XI P.

Relative density

0.973 to 0.982, Appendix V G.

Toxicodendron Quercifolium for Homoeopathic Preparations

General Notices

Rhus toxicodendron

DEFINITION

Toxicodendron Quercifolium for Homoeopathic Preparations is the fresh, young, not yet lignified shoots, with leaves, of *Toxicodendron quercifolium* (Michx.) Greene.

CAUTION *The shoots contain a yellowish-white milky sap that is a strong cutaneous irritant and darkens the skin. Contact with the skin and mucous membranes is to be avoided.*

IDENTIFICATION

The thin branches have a downy to cottony indumentum. At their ends and in the axils of the alternate leaves they may bear pointed buds covered in brown, woolly hairs. The tripinnate, fairly tough leaves have 15 to 20 cm long stems.The pinnatifid leaves are ovate to slightly rhombic and of varying size. The middle, larger lamina is long-stemmed, 7 to 20 cm long and 5 to 11 cm wide. The two smaller lateral pinnatifid leaves are short stemmed, up to 16 cm long and up to 9 cm wide. The pinnatifid laminae are sometimes asymetrical, entire or 3 to 7-lobate, indentate or broadly crenate. The laminae, particularly asymmetrical in the apical area, have a blunt end, are pointed or drawn out into a longer point. The base of the laminae are rounded or wedge shaped. The leaves are darker green on the upper side, light green on the underside, diffuse, but more hairy particularly on the veins. Flowers are absent.

MOTHER TINCTURE

The mother tincture complies with the requirements stated under Mother Tinctures for Homoeopathic Preparations and with the following requirements.

PRODUCTION

The mother tincture of *Toxicodendron quercifolium* (Michx.) Greene, is prepared from the herbal drug using *Method 2a* described in the monograph for Methods of Preparation of Homoeopathic Stocks and Potentisation. Use 86% w/w (90% v/v) of *ethanol*.

CHARACTERISTICS

The mother tincture is a yellowish-brown to reddish-brown liquid.

IDENTIFICATION

A. To 1 ml of the mother tincture add 1 granule of *zinc,* a few turnings of *magnesium* and 1 ml of *hydrochloric acid*. A dark red colour is produced which can be extracted with *tert-pentyl alcohol*.

B. Carry out the method for *thin-layer chromatography*, Appendix IIIA, using the following solutions.

(1) Mother tincture.

(2) Dissolve 20 mg of *arbutin* and 10 mg of *gallic acid* in 10 ml of *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Mobile phase is a mixture of 10 volumes of *anhydrous formic acid*, 10 volumes of *water* and 80 volumes of *ethyl acetate*.

(c) Develop to 10 cm.

(d) Application volume of 10 µl for each solution.

(e) Remove the plate, dry in air, spray with a 0.5% w/v solution of *fast blue B salt* in *water* and after brief intermediate drying spray with 0.1M *alcoholic sodium hydroxide*. Examine in daylight.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows two well separated zones.

VALIDITY

The chromatogram obtained with solution (1) shows the following reddish-brown zones: two or three zones, which lie close together at a position between those given by arbutin and gallic acid with solution (2) and two further pronounced zones at about the same level as that given by gallic acid with solution (2). Other zones may be present in the chromatogram obtained with solution (1).

TESTS

Ethanol

36% to 46% w/w (43% to 54% v/v), Appendix VIII F.

Dry residue

Not less than 3.5% w/w, Appendix XI P.

Relative density

0.945 to 0.965, Appendix V G.

Urtica Urens Herb for Homoeopathic Preparations

General Notices

Urtica urens, Herba

DEFINITION

Fresh leaves and flowers of *Urtica urens* L.

CHARACTERISTICS

The plant produces an itchy, burning sensation.

IDENTIFICATION

Plant Annual.

Leaves Decussate with diffusely haired petiole, which in the lower leaves is mostly as long as the lamina; ovate to elliptic, 1 to 5 cm long and 1 to 4 cm wide lamina with incised serrated leaf margin, blunt to wedge-shaped at the base, acuminate towards the tip. The leaves are dark-green above, slightly shiny, lighter on the underside; diffusely haired above, on the underside occasionally only the vein is covered with hairs apart. The leaves are covered solely with stinging hairs. The two stipules on each side are lance-shaped and smooth-edged.

Flowers The complicated inflorescences consist of numerous female and only a few male flowers; these grow from the leaf axils and are about 1.5 cm, occasionally 2 cm long and thus mostly shorter than the petiole of their leaf. The perigonium of the male flowers is split into four light green lacinula of equal size. Each one of the four stamens situated in front of the perigonium segments has one long, firstly incurved then widening filament before the disbursement of the anther. The perigonium of the female flowers consists of two outer, very short segments and two inner, long segments, ciliated at the edge, glabrous or with a few stiff hairs. The superior ovary is narrow, ovoid and has a stigma with a brushlike fascicle. The ripe fruits are monospermic and are enclosed by the two inner perigonium segments.

TESTS

Foreign matter

Not more than 2%, Appendix XI D.

MOTHER TINCTURE

The mother tincture complies with the requirements stated under Mother Tinctures for Homoeopathic Preparations and with the following requirements.

PRODUCTION

The mother tincture of *Urtica urens* L., is prepared from the herbal drug using *Method 2b* described in the monograph for Methods of Preparation of Homoeopathic Stocks and

Potentisation. Use 62% w/w (70% v/v) of *ethanol*.

CHARACTERISTICS

The mother tincture is a green to brownish-green liquid.

IDENTIFICATION

A. To 1 ml of *potassium hydroxide solution* add 1 ml of the mother tincture and heat to boiling. *Red litmus paper* held over the mouth of the test tube turns blue.

B. Add 1 ml of *hydrochloric acid* and a few crystals of *resorcinol* to 1 ml of the mother tincture. Heat to boiling. A red colour is produced.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Mother tincture.

(2) Dissolve 10 mg of *leucine* and 10 mg of *threonine* in 10 ml of *ethanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Mobile phase is a mixture of 10 volumes of *glacial acetic acid*, 20 volumes of *water*, 35 volumes of *acetone*, and 35 volumes of *butan-1-ol*.

(c) Application volume of 20 µl for each solution.

(d) Develop to 15 cm.

(e) Remove the plate, dry in a current of warm air or in an oven at 100º to 105º. Spray the chromatogram with a 0.5% w/v solution of *ninhydrin* in *butan-1-ol*. Heat for 10 minutes at 100º to 105º and examine in daylight.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with the solution (2) shows two clearly separated coloured zones due to threonine (reddish pink) in the lower region and leucine (pink) in the middle region.

VALIDITY

The chromatogram obtained with solution (1) shows a pink spot (which may be separated into two spots) corresponding to leucine. A reddish pink spot occurs in the lower region corresponding to threonine. Between the spots corresponding to threonine and leucine there is an orange pink spot and a pink spot present, in order of increasing Rf value. Several spots are present below the spot corresponding to threonine.

TESTS

Ethanol

25% to 35% w/w (30% to 42% v/v), Appendix VIII F.

Dry residue

Not less than 1.0% w/w, Appendix XI P.

Relative density

0.956 to 0.968, Appendix V G.

Anti-T Lymphocyte Immunoglobulin for Human Use, Animal

General Notices

(Ph Eur monograph 1928)

Ph Eur

DEFINITION

Animal anti-T lymphocyte immunoglobulin for human use is a liquid or freeze-dried preparation containing immunoglobulins, obtained from serum or plasma of animals, mainly rabbits or horses, immunised with human lymphocytic antigens.

The immunoglobulin has the property of diminishing the number and function of immunocompetent cells, in particular T-lymphocytes. The preparation contains principally immunoglobulin G. It may contain antibodies against other lymphocyte subpopulations and against other cells. The preparation is intended for intravenous administration, after dilution with a suitable diluent where applicable.

Applicable provisions of the monograph on *Immunosera for human use, animal (0084)* are stated below.

PRODUCTION

GENERAL PROVISIONS

The production method has been shown to yield consistently immunoglobulins of acceptable safety, potency in man and stability.

Any reagent of biological origin used in production shall be free of contamination with bacteria, fungi and viruses. The method of preparation includes a step or steps that have been shown to remove or inactivate known agents of infection.

During development studies, it shall be demonstrated that the production method yields a product that:

— does not transmit infectious agents,

— is characterised by a defined pattern of immunological activity, notably: antigen binding, complement-dependent and independent cytotoxicity, cytokine release, induction of T-cell activation, cell death,

— does not contain antibodies that cross-react with human tissues to a degree that would impair clinical safety,

— has a defined maximum content of anti-thrombocyte antibody activity,

— has a defined maximum content of haemoglobin.

The product has been shown, by suitable tests in animals and evaluation during clinical trials, to be well tolerated.

Reference preparation A batch shown to be suitable for checking the validity of the assay and whose efficacy has been demonstrated in clinical trials, or a batch representative thereof.

ANIMALS

The animals used are of a species approved by the competent authority, are healthy and exclusively reserved for production of anti-T lymphocyte immunoglobulin. They are tested and shown to be free from a defined list of infectious agents. The introduction of animals into a closed herd follows specified procedures, including definition of quarantine measures. Where appropriate, tests for additional specific agents are considered depending on the geographical localisation of the establishment used for the breeding and production of the animals. The feed originates from a controlled source and no animal proteins are added. The suppliers of animals are certified by the competent authority.

If the animals are treated with antibiotics, a suitable withdrawal period is allowed before collection of blood or plasma. The animals are not treated with penicillin antibiotics. If a live vaccine is administered, a suitable waiting period is imposed between vaccination and collection of serum or plasma for immunoglobulin production.

The species, origin and identification number of the animals are specified.

IMMUNISATION

The antigens used are identified and characterised, where appropriate. They are identified by their names and a batch number; information on the source and preparation are recorded.

The selected animals are isolated for at least 1 week before being immunised according to a defined schedule with booster injections at suitable intervals. Adjuvants may be used.

Animals are kept under general health surveillance and specific antibody production is controlled at each cycle of immunisation.

Animals are thoroughly examined before collection of blood or plasma. If an animal shows any pathological lesion not related to the immunisation process, it is not used, nor are any other of the animals in the group concerned, unless it is evident that their use will not impair the safety of the product.

Human antigens such as continuously growing T-lymphocyte cell lines or thymocytes are used to immunise the animals. Cells may be subjected to a sorting procedure. The immunising antigens are shown to be free from infectious agents by validated methods for relevant blood-borne pathogens, notably hepatitis B virus (HBV), hepatitis C virus (HCV) and human immunodeficiency virus (HIV) and other relevant adventitious agents originating from the preparation of the antigen. The cells used comply with defined requirements for purity of the cell population and freedom from adventitious agents.

COLLECTION OF BLOOD OR PLASMA

Collection of blood is made by venepuncture or plasmapheresis. The puncture area is shaved, cleaned and disinfected. The animals may be anaesthetised under conditions that do not influence the quality of the product.

No antimicrobial preservative is added to the plasma and serum samples. The blood or plasma is collected in such a manner as to maintain sterility of the product. The blood or plasma collection is conducted at a site separate from the area where the animals are kept or bred and the area where the immunoglobulin is purified. If the serum or plasma is stored before further processing, precautions are taken to avoid microbial contamination.

Several single plasma or serum samples may be pooled before purification. The single or pooled samples are tested before purification for the following tests.

Tests for contaminating viruses

Each pool is tested for contaminating viruses by suitable in vitro tests including inoculation to cell cultures capable of detecting a wide range of viruses relevant for the particular product. Where applicable, in vitro tests for contaminating viruses are carried out on the adsorbed pool, after the last production stage that may introduce viral contaminants.

PURIFICATION AND VIRAL INACTIVATION

The immunoglobulins are concentrated and purified by fractional precipitation, chromatography, immuno-adsorption or by other suitable chemical or physical methods. The methods are selected and validated to avoid contamination at all steps of processing and to avoid formation of protein aggregates that effect immunobiological characteristics of the product.

Unless otherwise justified and authorised, validated procedures are applied for removal and/ or inactivation of viruses.

After purification and treatment for removal and/or inactivation of viruses, a stabiliser may be added to the intermediate product, which may be stored for a period defined in the light of stability data.

Only an intermediate product that complies with the following requirements may be used in the preparation of the final bulk.

If the method of preparation includes a step for adsorption of cross-reacting anti-human antibodies using material from human tissues and/or red blood cells, the human materials are submitted to a validated procedure for inactivation of infectious agents, unless otherwise justified and authorised. If erythrocytes are used for adsorption, the donors for such materials comply with the requirements for donors of blood and plasma of the monograph on *Human plasma for fractionation (0853).* If other human material is used, it is shown by validated methods to be free from relevant blood-borne pathogens, notably HBV, HCV and HIV. If substances are used for inactivation or removal of viruses, it shall have been shown that any residues present in the final product have no adverse effects on the patients treated with the anti-T lymphocyte immunoglobulin.

FINAL BULK

The final bulk is prepared from a single intermediate product or from a pool of intermediate products obtained from animals of the same species. A stabiliser may be added. No antimicrobial preservative is added either during the manufacturing procedure or for preparation of the final bulk solution. During manufacturing, the solution is passed through a bacteria-retentive filter.

FINAL LOT

The final bulk of anti-T-lymphocyte immunoglobulin is distributed aseptically into sterile, tamper-proof containers. The containers are closed as to prevent contamination.

Only a final lot that complies with the requirements prescribed below under Identification, Tests and Assay may be released for use.

CHARACTERS

The liquid preparation is clear or slightly opalescent and colourless or pale yellow. The freeze-dried preparation is a white or slightly yellow powder or solid friable mass, which after reconstitution gives a liquid preparation corresponding to the description above.

IDENTIFICATION

A. Using a suitable range of species-specific antisera, carry out precipitation tests on the preparation to be examined. It is recommended that the test be carried out using antisera specific to the plasma proteins of each species of domestic animal commonly used in the preparation of materials of biological origin in the country concerned and antisera specific to human plasma proteins. The preparation is shown to contain proteins originating from the animal used for the anti-T lymphocyte immunoglobulin production.

B. Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal serum of the animal used for production, compare this serum and the preparation to be examined, both diluted to a concentration that will allow a clear gammaglobulin precipitation arc to be obtained on the gel. The main component of the preparation to be examined corresponds to the IgG component of normal serum of the animal used for production.

C. The preparation complies with the assay.

TESTS

Solubility

To a container of the preparation to be examined, add the volume of the liquid for reconstitution stated on the label. The preparation dissolves completely within the time stated on the label.

Extractable volume *(2.9.17)*

It complies with the requirement for extractable volume.

pH *(2.2.3)*

The pH is within the limits approved for the particular product.

Osmolality *(2.2.35)*

Minimum 240 mosmol/kg after dilution, where applicable.

Proteins *(2.5.33)*

90 per cent to 110 per cent of the amount stated on the label.

Stabiliser

Determine the amount of stabiliser by a suitable physico-chemical method. The preparation contains not less than 80 per cent and not more than 120 per cent of the quantity stated on the label.

Distribution of molecular size

Size exclusion chromatography *(2.2.30)*.

Test solution Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to a concentration suitable for the chromatographic system used. A concentration in the range 2-20 g/l is usually suitable.

Reference solution Dilute *human immunoglobulin (molecular size) BRP* with a 9 g/l solution of *sodium chloride R* to the same protein concentration as the test solution.

Column:

— *size:* *l* = 0.6 m, Ø = 7.5 mm,

— *stationary phase*: *silica gel for size-exclusion chromatography R*, a grade suitable for fractionation of globular proteins in the molecular mass range of 20 000 to 200 000.

Mobile phase Dissolve 4.873 g of *disodium hydrogen phosphate dihydrate R,* 1.741 g of *sodium dihydrogen phosphate monohydrate R* and 11.688 g of *sodium chloride R* in 1 litre of *water R.*

Flow rate 0.5 ml/min.

Detection Spectrophotometer at 280 nm.

Injection 50-600 µg of protein.

Retention time Identify the peaks in the chromatogram obtained with the test solution by comparison with the chromatogram obtained with the reference solution; any peak with a retention time shorter than that of dimer corresponds to polymers and aggregates.

System suitability:

— *reference solution*: the principal peak corresponds to IgG monomer and there is a peak corresponding to dimer with a retention time relative to monomer of 0.85 ± 0.05,

— *test solution*: the relative retentions of monomer and dimer are 1 ± 0.05 with reference to the corresponding peaks in the chromatogram obtained with the reference solution.

Limits:

— *total monomer and dimer*: at least 95 per cent of the total area of the peaks,

— *total polymers and aggregates*: maximum 5 per cent of the total area of the peaks.

Purity

Polyacrylamide gel electrophoresis *(2.2.31)*, under non-reducing and reducing conditions.

Resolving gel Non-reducing conditions: 8 per cent acrylamide; reducing conditions: 12 per cent acrylamide.

Test solution Dilute the preparation to be examined to a protein concentration of 0.5-2 mg/ml.

Reference solution Dilute the reference preparation to the same protein concentration as the test solution.

Application 10 µl.

Detection Coomassie staining.

Results Compared with the electropherogram of the reference solution, no additional bands are found in the electropherogram of the test solution.

Anti-A and anti-B haemagglutinins *(2.6.20)*

The 1 to 64 dilution does not show agglutination.

Where applicable, dilute the preparation to be examined as prescribed for use before preparing the dilutions for the test.

Haemolysins

Prepare a 1 to 64 dilution of the preparation to be examined, diluted if necessary as stated on the label. Take 6 aliquots of the 1 to 64 dilution. To 1 volume of 3 of the aliquots, add 1 volume of a 10 per cent *V/V* suspension of group A1, group B and group O erythrocytes in a 9 g/l solution of *sodium chloride R*, respectively. To 1 volume of the remaining 3 aliquots, add 1 volume of a 10 per cent *V/V* suspension of group A1, group B and group O erythrocytes in a 9 g/l solution of *sodium chloride R*, respectively, and to each aliquot 1 volume of fresh group AB serum (as a source of complement). Mix and incubate at 37 °C for 1 h. Examine the supernatant liquids for haemolysis. No signs of haemolysis are present.

Thrombocyte antibodies

Examined by a suitable method, the level of thrombocyte antibodies is shown to be below that approved for the specific product.

Water *(2.5.12)*

Maximum 3 per cent.

Sterility *(2.6.1)*

It complies with the test for sterility.

Pyrogens *(2.6.8)*

Unless otherwise justified and authorised, it complies with the test for pyrogens. Unless otherwise prescribed, inject 1 ml per kilogram of the rabbit's body mass.

ASSAY

The biological activity is determined by measuring the complement-dependent cytotoxicity on target cells. Flow cytometry is performed with read-out of dead cells stained using propidium iodide. The activity is expressed as the concentration of anti-T lymphocyte immunoglobulin in milligrams per millilitre which mediates 50 per cent cytotoxicity.

Lymphocyte separation medium Commercial separation media with low viscosity and a density of 1.077 g/ml.

Complement Commercial complement is suitable.

Buffered salt solution pH 7.2 Dissolve 8.0 g of *sodium chloride R*, 0.2 g of *potassium chloride R*, 3.18 g of *disodium hydrogen phosphate R* and 0.2 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 1000.0 ml with the same solvent.

Buffer solution for flow cytometry Add 40 ml of 0.1 per cent *V/V sodium azide R* and 10 ml of foetal calf serum to 440 ml of buffered salt solution pH 7.2. The foetal calf serum is inactivated at 56 °C for 30 min prior to use. Store at 4 °C.

Propidium iodide solution Dissolve *propidium iodide R* in buffered salt solution pH 7.2, to a concentration of 1 mg/ml. Store this stock solution at 2-8 °C and use within 1 month. For the assay, dilute this solution with buffer solution for flow cytometry, to obtain a concentration of 5 µg/ml. Store at 2-8 °C and use within 3 h.

Microtitre plates Plates used to prepare immunoglobulin dilutions are U- or V-bottomed polystyrene or poly(vinyl chloride) plates without surface treatment.

Micronic tubes Suitable for flow cytometry measurement.

Cell suspension Collect blood in anticoagulant from at least one healthy donor. Immediately isolate the peripheral blood mononuclear cells (PBMC) by gradient centrifugation in lymphocyte separation medium so that the PBMC form a visible clean interface between the plasma and the separation medium. Collect the layer containing the cells and dispense into centrifuge tubes containing buffered salt solution pH 7.2. Centrifuge at 400 g at 2-8 °C for 10 min. Discard the supernatant. Suspend the cell pellet in buffer solution for flow cytometry. Repeat the centrifugation and resuspension procedure of the cells twice. After the third centrifugation, resuspend the cell pellet in 1 ml of buffer solution for flow cytometry. Determine the number and vitality of the cells using a haemocytometer. Cell viability of at least 90 per cent is required. Adjust the cell number to 7 × 10^6/ml by adding buffer solution for flow cytometry. Store the cell suspension at 4 °C and use within 12 h.

If necessary, the first PBMC pellet may be resuspended in buffered salt solution pH 7.2 containing 20 per cent fœtal calf serum and stored overnight at 2 °C. Centrifuge at 400 g at 2-8 °C for 10 min. Discard the supernatant. Suspend the cell pellet in buffer solution for flow cytometry. Determine the number and vitality of the cells using a haemocytometer. Cell viability of at least 90 per cent is required. Adjust the cell number to 7 × 10^6/ml by adding buffer solution for flow cytometry.

It is also possible for cells to be immediately frozen and stored in nitrogen using the following method.

Buffer solution for freezing To 20 ml of cell culture medium, add 25 ml of fœtal calf serum and 5 ml of dimethyl sulphoxide (DMSO). Store this solution at 2-8 °C and use within 3 h.

20 × 10^6 cells per ampoule are frozen. These ampoules are stored in liquid nitrogen.

Buffer solution for thawing To 450 ml of cell culture medium, add 50 ml of foetal calf serum. Store this solution at 2-8 °C and use within 3 h.

Each ampoule is thawed in a water-bath at 37 °C with shaking. Cell suspension is repeated in a buffer solution for thawing. Centrifuge at 200 g at 2-8 °C for 10 min. Discard the supernatant. Suspend the cell pellet in buffer solution for flow cytometry. Repeat the procedure for centrifugation and resuspension of cells once. After the second centrifugation, resuspend the cells pellet in 1 ml of buffer solution for flow cytometry. Determine the number and vitality of the cells using a haemocytometer. Cell viability of at least 90 per cent is required. Adjust the cell number to 7 × 10^6/ml by adding buffer solution for flow cytometry. Store the cell suspension at 4 °C and use within 3 h.

Test solutions For freeze-dried preparations, reconstitute as stated on the label. Prepare 3 independent series of not fewer than 7 dilutions using buffer solution for flow cytometry as diluent.

Reference solutions For freeze-dried preparations, reconstitute according to the instructions for use. Prepare 3 independent dilution series of not fewer than 7 dilutions using buffer solution for flow cytometry as diluent.

Distribute 75 µl of each of the dilutions of the test solution or reference solution to each of a series of wells of a microtitre plate. Add 25 µl of the cell suspension of PBMC into each well. Add 25 µl of rabbit complement to each of the wells. Incubate at 37 °C for 30 min.

Centrifuge the plates at 200 g at 4 °C for 8 min, discard the supernatant and keep the plate on ice. Preparation for flow cytometry measurement is done step-wise by using a certain number of wells in order to allow labelling with *propidium iodide R* solution and measurement within a defined time period. Resuspend carefully the cell pellet of a certain number of wells with 200 µl of propidium iodide solution. Transfer the suspension into tubes. Incubate at 25 °C for 10 min then place immediately on ice.

Proceed with fluorescence measurement in a flow cytometer. Define a region including all propidium iodide-positive cells on the basis of Forward-Scattered, light (FSC) and flourescence (FL2 or FL3 for propidium iodide). Measure the percentage of propidium iodide-positive cells, without gating but excluding debris. Analyse at least 3000 cells for each of the test and reference solutions.

Use the percentages of dead cells to estimate the potency as the concentration in milligrams per millilitre of the preparation to be examined necessary to induce 50 per cent of cytotoxicity by fitting a sigmoidal dose response curve to the data obtained with the test and the reference preparations and by using a 4-parameter logistic model (see, for example, chapter *5.3*) and suitable software. The test is not valid unless the percentage of propidium iodide-positive cells at the lower asymptote of the curve is less then 15 per cent and the percentage of propidium iodide-positive cells at the upper asymptote of the curve is at least 80 per cent.

The estimated activity is 70 per cent to 130 per cent of the activity approved for the particular product.

The confidence limits ($P = 0.95$) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

STORAGE

Protected from light at the temperature stated on the label.

Expiry date The expiry date is calculated from the beginning of the assay.

LABELLING

The label states:

— for liquid preparations, the volume of the preparation in the container and the protein content,

— for freeze-dried preparations:
  — the name and the volume of the reconstitution liquid to be added,
  — the quantity of protein in the container,
  — that the immunoserum is to be used immediately after reconstitution,
  — the time required for complete dissolution,

— the animal species of origin,

— the name and amount of stabiliser, where applicable,

— the dilution to be made before use of the product.

Ph Eur

Botulinum Antitoxin

General Notices

(Ph Eur monograph 0085)

The label may state 'Bot/Ser' followed by a letter or letters indicating the type or types present.

When Mixed Botulinum Antitoxin or Botulinum Antitoxin is prescribed or demanded and the types to be present are not stated, Botulinum Antitoxin prepared from types A, B and E shall be dispensed or supplied.

Ph Eur

DEFINITION

Botulinum antitoxin is a preparation containing antitoxic globulins that have the power of specifically neutralising the toxins formed by *Clostridium botulinum* type A, type B or type E, or any mixture of these types.

PRODUCTION

It is obtained by fractionation from the serum of horses, or other mammals, that have been immunised against *Cl. botulinum* type A, type B and type E toxins.

IDENTIFICATION

It specifically neutralises the types of *Cl. botulinum* toxins stated on the label, rendering them harmless to susceptible animals.

POTENCY

Not less than 500 IU of antitoxin per millilitre for each of types A and B and not less than 50 IU of antitoxin per millilitre for type E.

The potency of botulinum antitoxin is determined by comparing the dose necessary to protect mice against the lethal effects of a fixed dose of botulinum toxin with the quantity of the standard preparation of botulinum antitoxin necessary to give the same protection. For this comparison a reference preparation of each type of botulinum antitoxin, calibrated in International Units, and suitable preparations of botulinum toxins, for use as test toxins, are required. The potency of each test toxin is determined in relation to the specific reference preparation; the potency of the botulinum antitoxin to be examined is determined in relation to the potency of the test toxins by the same method.

International Units of the antitoxin are the specific neutralising activity for botulinum toxin type A, type B and type E contained in stated amounts of the International Standards which consist of dried immune horse sera of types A, B and E. The equivalence in International Units of the International Standard is stated from time to time by the World Health Organisation.

Selection of animals Use mice having body masses such that the difference between the lightest and the heaviest does not exceed 5 g.

Preparation of test toxins CAUTION: Botulinum toxin is extremely toxic: exceptional care must be taken in any procedure in which it is employed. Prepare type A, B and E toxins from sterile filtrates of approximately 7-day cultures in liquid medium of *Cl. botulinum* types A, B and E. To the filtrates, add 2 volumes of glycerol, concentrate, if necessary, by dialysis against glycerol and store at or slightly below 0 °C.

Selection of test toxins Select toxins of each type for use as test toxins by determining for mice the L+/10 dose and the LD_{50}, the observation period being 96 h. The test toxins contain at least 1000 LD_{50} in an L+/10 dose.

Determination of test doses of the toxins (L+/10 dose) Prepare solutions of the reference preparations in a suitable liquid such that each contains 0.25 IU of antitoxin per millilitre. Using each solution in turn, determine the test dose of the corresponding test toxin.

Prepare mixtures of the solution of the reference preparation and the test toxin such that each contains 2.0 ml of the solution of the reference preparation, one of a graded series of volumes of the test toxin and sufficient of a suitable liquid to bring the total volume to 5.0 ml. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using four mice for each mixture, inject a dose of 1.0 ml intraperitoneally into each mouse. Observe the mice for 96 h.

The test dose of toxin is the quantity in 1.0 ml of the mixture made with the smallest amount of toxin capable of causing, despite partial neutralisation by the reference preparation, the death of all four mice injected with the mixture within the observation period.

Determination of potency of the antitoxin Prepare solutions of each reference preparation in a suitable liquid such that each contains 0.25 IU of antitoxin per millilitre.

Prepare solutions of each test toxin in a suitable liquid such that each contains 2.5 test doses per millilitre.

Using each toxin solution and the corresponding reference preparation in turn, determine the potency of the antitoxin. Prepare mixtures of the solution of the test toxin and the antitoxin to be examined such that each contains 2.0 ml of the solution of the test toxin, one of a graded series of volumes of the antitoxin to be examined, and sufficient of a suitable liquid to bring the total volume to 5.0 ml. Also prepare mixtures of the solution of the test toxin and the solution of the reference preparation such that each contains 2.0 ml of the solution of the test toxin, one of a graded series of volumes of the solution of the reference preparation centred on that volume (2.0 ml) that contains 0.5 IU, and sufficient of a suitable liquid to bring the total volume to 5.0 ml. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using four mice for each mixture, inject a dose of 1.0 ml intraperitoneally into each mouse. Observe the mice for 96 h.

The mixture that contains the largest volume of antitoxin that fails to protect the mice from death contains 0.5 IU. This quantity is used to calculate the potency of the antitoxin in International Units per millilitre.

The test is not valid unless all the mice injected with mixtures containing 2.0 ml or less of the solution of the reference preparation die and all those injected with mixtures containing more survive.

LABELLING

The label states the types of *Cl. botulinum* toxin neutralised by the preparation.

Ph Eur

Diphtheria Antitoxin

General Notices

(Ph Eur monograph 0086)

The label may state 'Dip/Ser'.

Ph Eur

DEFINITION

Diphtheria antitoxin is a preparation containing antitoxic globulins that have the power of specifically neutralising the toxin formed by *Corynebacterium diphtheriae.*

PRODUCTION

It is obtained by fractionation from the serum of horses, or other mammals, that have been immunised against diphtheria toxin.

IDENTIFICATION

It specifically neutralises the toxin formed by *C. diphtheriae*, rendering it harmless to susceptible animals.

ASSAY

Not less than 1000 IU of antitoxin per millilitre for antitoxin obtained from horse serum. Not less than 500 IU of antitoxin per millilitre for antitoxin obtained from the serum of other mammals.

The potency of diphtheria antitoxin is determined by comparing the dose necessary to protect guinea-pigs or rabbits against the erythrogenic effects of a fixed dose of diphtheria toxin with the quantity of the standard preparation of diphtheria antitoxin necessary to give the same protection. For this comparison a reference preparation of diphtheria antitoxin, calibrated in International Units, and a suitable preparation of diphtheria toxin, for use as a test toxin, are required. The potency of the test toxin is determined in relation to the reference preparation; the potency of the diphtheria antitoxin to be examined is determined in relation to the potency of the test toxin by the same method.

The International Unit of antitoxin is the specific neutralising activity for diphtheria toxin contained in a stated amount of the International Standard, which consists of a quantity of dried immune horse serum. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Preparation of test toxin Prepare diphtheria toxin from cultures of *C. diphtheriae* in a liquid medium. Filter the culture to obtain a sterile toxic filtrate and store at 4 °C.

Selection of test toxin Select a toxin for use as a test toxin by determining for guinea-pigs or rabbits the lr/100 dose and the minimal reacting dose, the observation period being 48 h. The test toxin has at least 200 minimal reacting doses in the lr/100 dose.

Minimal reacting dose This is the smallest quantity of toxin which, when injected intracutaneously into guinea-pigs or rabbits, causes a small, characteristic reaction at the site of injection within 48 h.

The test toxin is allowed to stand for some months before being used for the assay of antitoxin. During this time its toxicity declines and the lr/100 dose may be increased. Determine the minimal reacting dose and the lr/100 dose at frequent intervals. When experiment shows that the lr/100 dose is constant, the test toxin is ready for use and may be used for a long period. Store the test toxin in the dark at 0 °C to 5 °C. Maintain its sterility by the addition of toluene or other antimicrobial preservative that does not cause a rapid decline in specific toxicity.

Determination of test dose of toxin (lr/100 dose) Prepare a solution of the reference preparation in a suitable liquid such that it contains 0.1 IU of antitoxin per millilitre.

Prepare mixtures of the solution of the reference preparation and of the test toxin such that each contains 1.0 ml of the solution of the reference preparation, one of a graded series of volumes of the test toxin and sufficient of a suitable liquid to bring the total volume to 2.0 ml. Allow the mixtures to stand at room temperature, protected from light, for 15 min to 60 min. Using two animals for each mixture, inject a dose of 0.2 ml intracutaneously into the shaven or depilated flanks of each animal. Observe the animals for 48 h.

The test dose of toxin is the quantity in 0.2 ml of the mixture made with the smallest amount of toxin capable of causing, despite partial neutralisation by the reference preparation, a small but characteristic erythematous lesion at the site of injection.

Determination of potency of the antitoxin Prepare a solution of the reference preparation in a suitable liquid such that it contains 0.125 IU of antitoxin per millilitre.

Prepare a solution of the test toxin in a suitable liquid such that it contains 12.5 test doses per millilitre.

Prepare mixtures of the solution of the test toxin and of the antitoxin to be examined such that each contains 0.8 ml of the solution of the test toxin, one of a graded series of volumes of the antitoxin to be examined and sufficient of a suitable liquid to bring the total volume to 2.0 ml. Also prepare mixtures of the solution of the test toxin and the solution of the reference preparation such that each contains 0.8 ml of the solution of the test toxin, one of a graded series of volumes of the solution of the reference preparation centred on that volume (0.8 ml) that contains 0.1 IU and sufficient of a suitable liquid to bring the total volume to 2.0 ml. Allow the mixtures to stand at room temperature, protected from light, for 15 min to 60 min. Using two animals for each mixture, inject a dose of 0.2 ml intracutaneously into the shaven or depilated flanks of each animal. Observe the animals for 48 h.

The mixture that contains the largest volume of antitoxin that fails to protect the guinea-pigs from the erythematous effects of the toxin contains 0.1 IU. This quantity is used to calculate the potency of the antitoxin in International Units per millilitre.

The test is not valid unless all the sites injected with mixtures containing 0.8 ml or less of the solution of the reference preparation show erythematous lesions and at all those injected with mixtures containing more there are no lesions.

Ph Eur

European Viper Venom Antiserum

General Notices

(Ph Eur monograph 0145)

The only poisonous snake native to the British Isles is the adder or common viper, *Vipera berus*. In a geographical region where other species of snake (including elapids) are found, antisera able to neutralise the venoms of the species of snake indigenous to the region should be used. When the preparation is intended to neutralise the venom or venoms of one or more snakes other than vipers, the title Snake Venom Antiserum is used.

Ph Eur

DEFINITION

European viper venom antiserum is a preparation containing antitoxic globulins that have the power of neutralising the venom of one or more species of viper. The globulins are obtained by fractionation of the serum of animals that have been immunised against the venom or venoms.

IDENTIFICATION

It neutralises the venom of *Vipera ammodytes*, or *Vipera aspis,* or *Vipera berus*, or *Vipera ursinii* or the mixture of these venoms stated on the label, rendering them harmless to susceptible animals.

ASSAY

Each millilitre of the preparation to be examined contains sufficient antitoxic globulins to neutralise not less than 100 mouse LD_{50} of *Vipera ammodytes* venom or *Vipera aspis* venom and not less than 50 mouse LD_{50} of the venoms of other species of viper. The potency of European viper venom antiserum is determined by estimating the dose necessary to protect mice against the lethal effects of a fixed dose of venom of the relevant species of viper.

Selection of test venoms Use venoms which have the normal physicochemical, toxicological and immunological characteristics of venoms from the particular species of vipers. They are preferably freeze-dried and stored in the dark at 5 ± 3 °C.

Select a venom for use as a test venom by determining the LD_{50} for mice, the observation period being 48 h.

Determination of the test dose of venom Prepare graded dilutions of the reconstituted venom in a 9 g/l solution of *sodium chloride R* or other isotonic diluent in such a manner that the middle dilution contains in 0.25 ml the dose expected to be the LD_{50}. Dilute with an equal volume of the same diluent. Using at least four mice, each weighing 18 g to 20 g, for each dilution, inject 0.5 ml intravenously into each mouse. Observe the mice for 48 h and record the number of deaths. Calculate the LD_{50} using the usual statistical methods.

Determination of the potency of the antiserum to be examined Dilute the reconstituted test venom so that 0.25 ml contains the test dose of 5 LD_{50} (test venom solution).

Prepare serial dilutions of the antiserum to be examined in a 9 g/l solution of *sodium chloride R* or other isotonic diluent, the dilution factor being 1.5 to 2.5. Use a sufficient number and range of dilutions to enable a mortality curve between 20 per cent and 80 per cent mortality to be established and to permit an estimation of the statistical variation.

Prepare mixtures such that 5 ml of each mixture contains 2.5 ml of one of the dilutions of the antiserum to be examined and 2.5 ml of the test venom solution. Allow the mixtures to stand in a water-bath at 37 °C for 30 min. Using not fewer than six mice, each weighing 18 g to 20 g, for each mixture, inject 0.5 ml intravenously into each mouse. Observe the mice for 48 h and record the number of deaths. Calculate the PD_{50}, using the usual statistical methods. At the same time verify the number of LD_{50} in the test dose of venom, using the method described above. Calculate the potency of the antiserum from the expression:

$$\frac{(T_v - 1)}{\mathrm{PD}_{50}}$$

T_v = number of LD_{50} in the test dose of venom.

In each mouse dose of the venom-antiserum mixture at the end point there is one LD_{50} of venom remaining unneutralised by the antiserum and it is this unneutralised venom that is responsible for the deaths of 50 per cent of the mice inoculated with the mixture. The amount of venom neutralised by the antiserum is thus one LD_{50} less than the total amount contained in each mouse dose. Therefore, as the potency of the antiserum is defined in terms of the number of LD_{50} of venom that are neutralised, rather than the number of LD_{50} in each mouse dose, the expression required in the calculation of potency is T_v - 1 rather than T_v.

Alternatively, the quantity of test venom in milligrams that is neutralised by 1 ml or some other defined volume of the antiserum to be examined may be calculated.

LABELLING

The label states the venom or venoms against which the antiserum is effective.

Warning: Because of the allergenic properties of viper venoms, inhalation of venom dust should be avoided by suitable precautions.

Ph Eur

Gas-gangrene Antitoxin (Novyi)

General Notices

Gas-gangrene Antitoxin (Oedematiens)
(Ph Eur monograph 0087)

The label may state 'Nov/Ser'.

Preparation

Mixed Gas-gangrene Antitoxin

Ph Eur

DEFINITION

Gas-gangrene antitoxin (novyi) is a preparation containing antitoxic globulins that have the power of neutralising the alpha toxin formed by *Clostridium novyi* (Former nomenclature: *Clostridium oedematiens*). It is obtained by fractionation from the serum of horses, or other mammals, that have been immunised against *Cl. novyi* alpha toxin.

IDENTIFICATION

It specifically neutralises the alpha toxin formed by *Cl. novyi,* rendering it harmless to susceptible animals.

ASSAY

Not less than 3750 IU of antitoxin per millilitre.

The potency of gas-gangrene antitoxin (novyi) is determined by comparing the dose necessary to protect mice or other suitable animals against the lethal effects of a fixed dose of *Cl. novyi* toxin with the quantity of the standard preparation of gas-gangrene antitoxin (novyi) necessary to give the same protection. For this comparison a reference preparation of gas-gangrene antitoxin (novyi), calibrated in International Units, and a suitable preparation of *Cl. novyi* toxin for use as a test toxin are required. The potency of the test toxin is determined in relation to the reference preparation; the potency of the gas-gangrene antitoxin (novyi) to be examined is determined in relation to the potency of the test toxin by the same method.

The International Unit of antitoxin is the specific neutralising activity for *Cl. novyi* toxin contained in a stated amount of the International Standard, which consists of a quantity of dried immune horse serum. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Selection of animals Use mice having body masses such that the difference between the lightest and the heaviest does not exceed 5 g.

Preparation of test toxin Prepare the test toxin from a sterile filtrate of an approximately 5-day culture in liquid medium of *Cl. novyi.* Treat the filtrate with *ammonium sulphate R*, collect the precipitate, which contains the toxin, dry *in vacuo* over *diphosphorus pentoxide R,* powder and store dry.

Selection of test toxin Select a toxin for use as a test toxin by determining for mice the L+ dose and the LD_{50}, the observation period being 72 h. The test toxin has an L+ dose of 0.5 mg or less and contains not less than 25 LD_{50} in each L+ dose.

Determination of test dose of toxin (L+ dose) Prepare a solution of the reference preparation in a suitable liquid such that it contains 12.5 IU of antitoxin per millilitre.

Prepare a solution of the test toxin in a suitable liquid such that 1 ml contains a precisely known amount such as 10 mg.

Prepare mixtures of the solution of the reference preparation and the solution of the test toxin such that each contains 0.8 ml of the solution of the reference preparation, one of a graded series of volumes of the solution of the test toxin and sufficient of a suitable liquid to bring the total volume to 2.0 ml. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using six mice for each mixture, inject a dose of 0.2 ml intramuscularly into each mouse. Observe the mice for 72 h.

The test dose of toxin is the quantity in 0.2 ml of the mixture made with the smallest amount of toxin capable of causing, despite partial neutralisation by the reference preparation, the death of all six mice injected with the mixture within the observation period.

Determination of potency of the antitoxin Prepare a solution of the reference preparation in a suitable liquid such that it contains 12.5 IU of antitoxin per millilitre.

Prepare a solution of the test toxin in a suitable liquid such that it contains 12.5 test doses per millilitre.

Prepare mixtures of the solution of the test toxin and the antitoxin to be examined such that each contains 0.8 ml of the solution of the test toxin, one of a graded series of volumes of the antitoxin to be examined and sufficient of a suitable liquid to bring the total volume to 2.0 ml. Also prepare mixtures of the solution of the test toxin and the solution of the reference preparation such that each contains 0.8 ml of the solution of the test toxin, one of a graded series of volumes of the solution of the reference preparation centred on that volume (0.8 ml) that contains 10 IU and sufficient of a suitable liquid to bring the total volume to 2.0 ml. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using six mice for each mixture, inject a dose of 0.2 ml intramuscularly into each mouse. Observe the mice for 72 h.

The mixture that contains the largest volume of antitoxin that fails to protect the mice from death contains 10 IU. This quantity is used to calculate the potency of the antitoxin in International Units per millilitre.

The test is not valid unless all the mice injected with mixtures containing 0.8 ml or less of the solution of the reference preparation die and all those injected with mixtures containing a larger volume survive.

Ph Eur

Gas-gangrene Antitoxin (Perfringens)

General Notices

(Ph Eur monograph 0088)

The label may state 'Perf/Ser'.

Preparation

Mixed Gas-gangrene Antitoxin

Ph Eur

DEFINITION

Gas-gangrene antitoxin (perfringens) is a preparation containing antitoxic globulins that have the power of specifically neutralising the alpha toxin formed by *Clostridium perfringens*. It is obtained by fractionation from the serum of horses, or other mammals, that have been immunised against *Cl. perfringens* alpha toxin.

IDENTIFICATION

It specifically neutralises the alpha toxin formed by *Cl. perfringens*, rendering it harmless to susceptible animals.

ASSAY

Not less than 1500 IU of antitoxin per millilitre.

The potency of gas-gangrene antitoxin (perfringens) is determined by comparing the dose necessary to protect mice or other suitable animals against the lethal effects of a fixed dose of *Cl. perfringens* toxin with the quantity of the standard preparation of gas-gangrene antitoxin (perfringens) necessary to give the same protection. For this comparison a reference preparation of gas-gangrene antitoxin (perfringens), calibrated in International Units, and a suitable preparation of *Cl. perfringens* toxin for use as a test toxin are required. The potency of the test toxin is determined in relation to the reference preparation; the potency of the gas-gangrene antitoxin (perfringens) to be examined is determined in relation to the potency of the test toxin by the same method.

The International Unit of antitoxin is the specific neutralising activity for *Cl. perfringens* toxin contained in a stated amount of the International Standard, which consists of a quantity of dried immune horse serum. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Selection of animals Use mice having body masses such that the difference between the lightest and the heaviest does not exceed 5 g.

Preparation of test toxin Prepare the test toxin from a sterile filtrate of an approximately 5-day culture in liquid medium of *Cl. perfringens*. Treat the filtrate with *ammonium sulphate R,* collect the precipitate, which contains the toxin, dry *in vacuo* over *diphosphorus pentoxide R*, powder and store dry.

Selection of test toxin Select a toxin for use as a test toxin by determining for mice the L+ dose and the LD_{50}, the observation period being 48 h. The test toxin has an L+ dose of 4 mg or less and contains not less than 20 LD_{50} in each L+ dose.

Determination of test dose of toxin (L+ dose) Prepare a solution of the reference preparation in a suitable liquid such that it contains 5 IU of antitoxin per millilitre.

Prepare a solution of the test toxin in a suitable liquid such that 1 ml contains a precisely known amount such as 10 mg.

Prepare mixtures of the solution of the reference preparation and the solution of the test toxin such that each contains 2.0 ml of the solution of the reference preparation, one of a graded series of volumes of the solution of the test toxin and sufficient of a suitable liquid to bring the total volume to 5.0 ml. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using six mice for each mixture, inject a dose of 0.5 ml intravenously into each mouse. Observe the mice for 48 h.

The test dose of toxin is the quantity in 0.5 ml of the mixture made with the smallest amount of toxin capable of causing, despite partial neutralisation by the reference preparation, the death of all six mice injected with the mixture within the observation period.

Determination of potency of the antitoxin Prepare a solution of the reference preparation in a suitable liquid such that it contains 5 IU of antitoxin per millilitre.

Prepare a solution of the test toxin in a suitable liquid such that it contains five test doses per millilitre.

Prepare mixtures of the solution of the test toxin and the antitoxin to be examined such that each contains 2.0 ml of the solution of the test toxin, one of a graded series of volumes of the antitoxin to be examined and sufficient of a suitable liquid to bring the total volume to 5.0 ml. Also prepare mixtures of the solution of the test toxin and the solution of the reference preparation such that each contains 2.0 ml of the solution of the test toxin, one of a graded series of volumes of the solution of the reference preparation centred on that volume (2.0 ml) that contains 10 IU and sufficient of a suitable liquid to bring the total volume to 5.0 ml. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using six mice for each mixture, inject a dose of 0.5 ml intravenously into each mouse. Observe the mice for 48 h.

The mixture that contains the largest volume of antitoxin that fails to protect the mice from death contains 10 IU. This quantity is used to calculate the potency of the antitoxin in International Units per millilitre.

The test is not valid unless all the mice injected with mixtures containing 2.0 ml or less of the solution of the reference preparation die and all those injected with mixtures containing a larger volume survive.

Ph Eur

Gas-gangrene Antitoxin (Septicum)

General Notices

(Ph Eur monograph 0089)

The label may state 'Sep/Ser'.

Preparation

Mixed Gas-gangrene Antitoxin

Ph Eur

DEFINITION

Gas-gangrene antitoxin (septicum) is a preparation containing antitoxic globulins that have the power of specifically neutralising the alpha toxin formed by *Clostridium septicum*. It is obtained by fractionation from the serum of horses, or other mammals, that have been immunised against *Cl. septicum* alpha toxin.

IDENTIFICATION

It specifically neutralises the alpha toxin formed by *Cl. septicum*, rendering it harmless to susceptible animals.

ASSAY

Not less than 1500 IU of antitoxin per millilitre.

The potency of gas-gangrene antitoxin (septicum) is determined by comparing the dose necessary to protect mice or other suitable animals against the lethal effects of a fixed dose of *Cl. septicum* toxin with the quantity of the standard preparation of gas-gangrene antitoxin (septicum) necessary to give the same protection. For this comparison a reference preparation of gas-gangrene antitoxin (septicum), calibrated in International Units, and a suitable preparation of *Cl. septicum* toxin for use as a test toxin are required. The potency of the test toxin is determined in relation to the reference preparation; the potency of the gas-gangrene antitoxin (septicum) to be examined is determined in relation to the potency of the test toxin by the same method.

The International Unit of antitoxin is the specific neutralising activity for *Cl. septicum* toxin contained in a stated amount of the International Standard, which consists of a quantity of dried immune horse serum. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Selection of animals Use mice having body masses such that the difference between the lightest and the heaviest does not exceed 5 g.

Preparation of test toxin Prepare the test toxin from a sterile filtrate of an approximately 5-day culture in liquid medium of *Cl. septicum*. Treat the filtrate with *ammonium sulphate R*, collect the precipitate, which contains the toxin, dry *in vacuo* over *diphosphorus pentoxide R*, powder and store dry.

Selection of test toxin Select a toxin for use as a test toxin by determining for mice the L+ dose and the LD_{50}, the observation period being 72 h. The test toxin has an L+ dose of 0.5 mg or less and contains not less than 25 LD_{50} in each L+ dose.

Determination of test dose of toxin (L+ dose) Prepare a solution of the reference preparation in a suitable liquid such that it contains 5 IU of antitoxin per millilitre.

Prepare a solution of the test toxin in a suitable liquid such that 1 ml contains a precisely known amount such as 20 mg.

Prepare mixtures of the solution of the reference preparation and the solution of the test toxin such that each contains 2.0 ml of the solution of the reference preparation, one of a graded series of volumes of the solution of the test toxin and sufficient of a suitable liquid to bring the total volume to 5.0 ml. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using six mice for each mixture, inject a dose of 0.5 ml intravenously into each mouse. Observe the mice for 72 h.

The test dose of toxin is the quantity in 0.5 ml of the mixture made with the smallest amount of toxin capable of causing, despite partial neutralisation by the reference preparation, the death of all six mice injected with the mixture within the observation period.

Determination of potency of the antitoxin Prepare a solution of the reference preparation in a suitable liquid such that it contains 5 IU of antitoxin per millilitre.

Prepare a solution of the test toxin in a suitable liquid such that it contains five test doses per millilitre.

Prepare mixtures of the solution of the test toxin and the antitoxin to be examined such that each contains 2.0 ml of the solution of the test toxin, one of a graded series of volumes of the antitoxin to be examined and sufficient of a suitable liquid to bring the total volume to 5.0 ml. Also prepare mixtures of the solution of the test toxin and the solution of the reference preparation such that each contains 2.0 ml of the solution of the test toxin, one of a graded series of volumes of the solution of the reference preparation centred on that volume (2.0 ml) that contains 10 IU and sufficient of a suitable liquid to bring the total volume to 5.0 ml. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using six mice for each mixture, inject a dose of 0.5 ml intravenously into each mouse. Observe the mice for 72 h.

The mixture that contains the largest volume of antitoxin that fails to protect the mice from death contains 10 IU. This quantity is used to calculate the potency of the antitoxin in International Units per millilitre.

The test is not valid unless all the mice injected with mixtures containing 2.0 ml or less of the solution of the reference preparation die and all those injected with mixtures containing more survive.

Ph Eur

Immunosera

General Notices

Antisera

(Immunosera for Human Use, Animal, Ph Eur monograph 0084)

Immunosera comply with the requirements of the European Pharmacopoeia monograph for Immunosera for Human Use, Animal. These requirements are reproduced below.

Ph Eur

DEFINITION

Animal immunosera for human use are liquid or freeze-dried preparations containing purified immunoglobulins or immunoglobulin fragments obtained from serum or plasma of immunised animals of different species.

The immunoglobulins or immunoglobulin fragments have the power of specifically neutralising or binding to the antigen used for immunisation. The antigens include microbial or other toxins, human antigens, suspensions of bacterial and viral antigens and venoms of snakes, scorpions and spiders. The preparation is intended for intravenous or intramuscular administration, after dilution where applicable.

PRODUCTION

GENERAL PROVISIONS

The production method shall have been shown to yield consistently immunosera of acceptable safety, potency in man and stability.

Any reagent of biological origin used in the production of immunosera shall be free of contamination with bacteria, fungi and viruses. The general requirements of chapter *5.1.7. Viral safety* apply to the manufacture of animal immunosera for human use, in conjunction with the more specific requirements relating to viral safety in this monograph. The method of preparation includes a step or steps that have been shown to remove or inactivate known agents of infection.

Methods used for production are validated, effective, reproducible and do not impair the biological activity of the product.

The production method is validated to demonstrate that the product, if tested, would comply with the test for abnormal toxicity for immunosera and vaccines for human use *(2.6.9)*.

Reference preparation A batch shown to be suitable in clinical trials, or a batch representative thereof, is used as the reference preparation for the tests for high molecular mass proteins and purity.

ANIMALS

The animals used are of a species approved by the competent authority, are healthy and are exclusively reserved for production of immunoserum. They are tested and shown to be free from a defined list of infectious agents. The introduction of animals into a closed herd follows specified procedures, including definition of quarantine measures. Where appropriate, additional specific agents are considered depending on the geographical localisation of the establishment used for the breeding and production of the animals. The feed originates from a controlled source and no animal proteins are added. The suppliers of animals are certified by the competent authority.

If the animals are treated with antibiotics, a suitable withdrawal period is allowed before collection of blood or plasma. The animals are not treated with penicillin antibiotics. If a live vaccine is administered, a suitable waiting period is imposed between vaccination and collection of serum or plasma for immunoserum production.

IMMUNISATION

The antigens used are identified and characterised, where appropriate; where relevant, they are shown to be free from extraneous infectious agents. They are identified by their names and a batch number; information on the source and preparation are recorded.

The selected animals are isolated for at least 1 week before being immunised according to a defined schedule, with booster injections at suitable intervals. Adjuvants may be used.

Animals are kept under general health surveillance and specific antibody production is controlled at each cycle of immunisation.

Animals are thoroughly examined before collection of blood or plasma. If an animal shows any pathological lesion not related to the immunisation process, it is not used, nor are any other of the animals in the group concerned, unless it is evident that their use will not impair the safety of the product.

COLLECTION OF BLOOD OR PLASMA

Collection of blood is made by venepuncture or plasmapheresis. The puncture area is shaved, cleaned and disinfected. The animals may be anaesthetised under conditions that do not influence the quality of the product. Unless otherwise prescribed, an antimicrobial preservative may be added. The blood or plasma is collected in such a manner as to maintain sterility of the product. The blood or plasma collection is conducted at a site separate from the area where the animals are kept or bred and the area where the immunoserum is purified. If the serum or plasma is stored before further processing, precautions are taken to avoid microbial contamination.

Several single plasma or serum samples may be pooled before purification. The single or pooled samples are tested before purification for the following tests.

Tests for contaminating viruses

If an antimicrobial preservative is added, it must be neutralised before carrying out the tests, or the tests are carried out on a sample taken before addition of the antimicrobial preservative. Each pool is tested for contaminating viruses by suitable *in vitro* tests.

Each pool is tested for viruses by inoculation to cell cultures capable of detecting a wide range of viruses relevant for the particular product.

Potency

Carry out a biological assay as indicated in the monograph and express the result in International Units per millilitre, where applicable. A validated in vitro method may also be used.

Protein content

Dilute the product to be examined with a 9 g/l solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 ml. To 2 ml of this solution in a round-bottomed centrifuge tube add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion *(2.5.9)* and calculate the content of protein by multiplying by 6.25. The protein content is within approved limits.

PURIFICATION AND VIRAL INACTIVATION

The immunoglobulins are concentrated and purified by fractional precipitation, chromatography, immunoadsorption or by other chemical or physical methods. They may be processed further by enzyme treatment. The methods are selected and validated to avoid contamination at all steps of processing and to avoid formation of protein aggregates that affect the immunobiological characteristics of the product. For products intended to consist of immunoglobulin fragments, the methods are validated to guarantee total fragmentation. The methods of purification used are such that they do not generate additional components that compromise the quality and the safety of the product.

Unless otherwise justified and authorised, validated procedures are applied for removal and/ or inactivation of viruses. The procedures are selected to avoid the formation of polymers or aggregates and, unless the product is intended to consist of Fab′ fragments, to minimise the splitting of F(ab′)2 into Fab′ fragments.

After purification and treatment for removal and/or inactivation of viruses, a stabiliser may be added to the intermediate product, which may be stored for a period defined in light of stability data.

Only an intermediate product that complies with the following requirements may be used in the preparation of the final bulk.

Purity

Examine by non-reducing polyacrylamide gel electrophoresis *(2.2.31)*, by comparison with the reference preparation. The bands are compared in intensity and no additional bands are found.

FINAL BULK

The final bulk is prepared from a single intermediate product or from a pool of intermediate products obtained from animals of the same species. Intermediate products with different specificities may be pooled.

An antimicrobial preservative and a stabiliser may be added. If an antimicrobial preservative has been added to the blood or plasma, the same substance is used as the antimicrobial preservative in the final bulk.

Only a final bulk that complies with the following requirements may be used in the preparation of the final lot.

Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable physico-chemical method. It contains not less than 85 per cent and not more than 115 per cent of the amount stated on the label.

Sterility *(2.6.1)*

It complies with the test for sterility.

FINAL LOT

The final bulk of immunoserum is distributed aseptically into sterile, tamper-proof containers. The containers are closed so as to prevent contamination.

Only a final lot that complies with the requirements prescribed below under Identification, Tests and Assay may be released for use. Provided that the tests for osmolality, protein content, molecular-size distribution, antimicrobial preservative, stabiliser, purity, foreign proteins and albumin and the assay have been carried out with satisfactory results on the final bulk, they may be omitted on the final lot.

Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.

IDENTIFICATION

The identity is established by immunological tests and, where necessary, by determination of biological activity. The assay may also serve for identification.

CHARACTERS

Immunosera are clear to opalescent and colourless to very faintly yellow liquids. They are free from turbidity. Freeze-dried products are white or slightly yellow powders or solid friable masses. After reconstitution they show the same characteristics as liquid preparations.

TESTS

Solubility

To a container of the preparation to be examined, add the volume of the liquid for reconstitution stated on the label. The preparation dissolves completely within the time stated on the label.

Extractable volume *(2.9.17)*

It complies with the requirement for extractable volume.

pH *(2.2.3)*

The pH is within the limits approved for the particular product.

Osmolality *(2.2.35)*

Minimum 240 mosmol/kg after dilution, where applicable.

Protein content

90 per cent to 110 per cent of the amount stated on the label, and, unless otherwise justified and authorised, not more than 100 g/l.

Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 ml. To 2 ml of this solution in a round-bottomed centrifuge tube add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R.* Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion *(2.5.9)* and calculate the content of protein by multiplying by 6.25.

Molecular-size distribution

Examine by liquid chromatography *(2.2.29 or 2.2.30)*. It complies with the specification approved for the particular product.

Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable physicochemical method. The amount is not less than the minimum amount shown to be effective and is not greater than 115 per cent of that stated on the label.

Phenol *(2.5.15)*

Maximum 2.5 g/l for preparations containing phenol.

Stabiliser

Determine the amount of stabiliser by a suitable physico-chemical method. The preparation contains not less than 80 per cent and not more than 120 per cent of the quantity stated on the label.

Purity

Examine by non-reducing polyacrylamide gel electrophoresis *(2.2.31)*, by comparison with the reference preparation. No additional bands are found for the preparation to be examined.

Foreign proteins

When examined by precipitation tests with specific antisera, only protein from the declared animal species is shown to be present, unless otherwise prescribed, for example where material of human origin is used during production.

Albumin

Unless otherwise prescribed in the monograph, when examined electrophoretically, the content of albumin is not greater than the limit approved for the particular product and, in any case, is not greater than 3 per cent.

Water *(2.5.12)*

Maximum 3 per cent.

Sterility *(2.6.1)*

It complies with the test for sterility.

Pyrogens *(2.6.8)*

Unless otherwise justified and authorised, it complies with the test for pyrogens. Unless otherwise prescribed, inject 1 ml per kilogram of the rabbit's body mass.

ASSAY

Carry out a biological assay as indicated in the monograph and express the result in International Units per millilitre, where appropriate. A validated in vitro method may also be used.

STORAGE

Protected from light, at the temperature stated on the label. Do not allow liquid preparations to freeze.

Expiry date The expiry date is calculated from the beginning of the assay.

LABELLING

The label states:

— the number of International Units per millilitre, where applicable;

— the amount of protein per container;

— for freeze-dried preparations:

— the name and volume of the reconstituting liquid to be added;

— that the immunoserum is to be used immediately after reconstitution;

— the time required for complete dissolution;

— the route of administration;

— the storage conditions;

— the expiry date, except for containers of less than 1 ml which are individually packed; the expiry date may be omitted from the label on the container, provided it is shown on the package and the label on the package states that the container must be kept in the package until required for use;

— the animal species of origin;

— the name and amount of any antimicrobial preservative, any stabiliser and any other substance added to the immunoserum.

Ph Eur

Mixed Gas-gangrene Antitoxin

General Notices

(Ph Eur monograph 0090)

The label may state 'Gas/Ser'.

Ph Eur

DEFINITION

Mixed gas-gangrene antitoxin is prepared by mixing gas-gangrene antitoxin (novyi), gas-gangrene antitoxin (perfringens) and gas-gangrene antitoxin (septicum) in appropriate quantities.

IDENTIFICATION

It specifically neutralises the alpha toxins formed by *Clostridium novyi* (former nomenclature: *Clostridium oedematiens*), *Clostridium perfringens* and *Clostridium septicum*, rendering them harmless to susceptible animals.

ASSAY

Gas-gangrene antitoxin (novyi), not less than 1000 IU of antitoxin per millilitre; gas-gangrene antitoxin (perfringens), not less than 1000 IU of antitoxin per millilitre; gas-gangrene antitoxin (septicum) not less than 500 IU of antitoxin per millilitre.

Carry out the assay for each component, as prescribed in the monographs on *Gas-gangrene antitoxin (novyi) (0087)*, *Gas-gangrene antitoxin (perfringens) (0088)* and *Gas-gangrene antitoxin (septicum) (0089)*.

Ph Eur

Monoclonal Antibodies for Human Use

General Notices

(Ph Eur monograph 2031)

The requirements of the monograph for Immunosera do not necessarily apply to the monograph for Monoclonal Antibodies for Human Use.

Ph Eur

DEFINITION

Monoclonal antibodies for human use are preparations of an immunoglobulin or a fragment of an immunoglobulin, for example, F(ab′)2, with defined specificity, produced by a single clone of cells. They may be conjugated to other substances, including for radiolabelling.

They can be obtained from immortalised B lymphocytes that are cloned and expanded as continuous cell lines or from rDNA-engineered cell lines.

Currently available rDNA-engineered antibodies include the following antibodies.

Chimeric monoclonal antibodies The variable heavy and light chain domains of a human antibody are replaced by those of a non-human species, which possess the desired antigen specificity.

Humanised monoclonal antibodies The 3 short hypervariable sequences (the complementarity determining regions) of non-human variable domains for each chain are engineered into the variable domain framework of a human antibody; other sequence changes may be made to improve antigen binding.

Recombinant human monoclonal antibodies The variable heavy and light chain domain of a human antibody are combined with the constant region of a human antibody.

Monoclonal antibodies obtained from cell lines modified by recombinant DNA technology also comply with the requirements of the monograph *Products of recombinant DNA technology (0784).*

This monograph applies to monoclonal antibodies for therapeutic and prophylactic use and for use as *in vivo* diagnostics. It does not apply to monoclonal antibodies used as reagents in the manufacture of medicinal products. Nor does it apply to monoclonal antibodies produced in ascites, for which requirements are decided by the competent authority.

PRODUCTION

GENERAL PROVISIONS

Production is based on a seed-lot system using a master cell bank and, if applicable, a working cell bank derived from the cloned cells. The production method is validated during development studies in order to prevent transmission of infectious agents by the final product. All biological materials and cells used in the production are characterised and are in compliance with chapter *5.2.8. Minimising the risk of transmitting animal spongiform encephalopathy agents via human and veterinary medicinal products*. Where monoclonal antibodies for human use are manufactured using materials of human or animal origin, the requirements of chapter *5.1.7. Viral safety* also apply. Where an immunogen is used it is characterised and the method of immunisation is documented.

Process validation

During development studies, the production method is validated for the following aspects:

— consistency of the production process including fermentation, purification and, where applicable, fragmentation method;

— removal or inactivation of infectious agents;

— adequate removal of product- and process-related impurities (for example, host-cell protein and DNA, protein A, antibiotics, cell-culture components);

— specificity and specific activity of the monoclonal antibody;

— absence of non-endotoxin pyrogens;

— reusability of purification components (for example, column material), limits or acceptance criteria being set as a function of the validation;

— methods used for conjugation, where applicable.

Product characterisation

The product is characterised to obtain adequate information including: structural integrity, isotype, amino-acid sequence, secondary structure, carbohydrate moiety, disulphide bridges, conformation, specificity, affinity, specific biological activity and heterogeneity (characterisation of isoforms).

A battery of suitable analytical techniques is used including chemical, physical, immunochemical and biological tests (for example, peptide mapping, N- and C-terminal amino-acid sequencing, mass spectrometry, chromatographic, electrophoretic and spectroscopic techniques). Additional tests are performed to obtain information on cross-reactivity with human tissues.

For those products that are modified by fragmentation or conjugation, the influence of the methods used on the antibody is characterised.

Process intermediates

Where process intermediates are stored, an expiry date or a storage period justified by stability data is established for each.

Biological assay

The biological assay is chosen in terms of its correlation with the intended mode of action of the monoclonal antibody.

Reference preparation

A batch shown to be stable and shown to be suitable in clinical trials, or a batch representative thereof, is used as a reference preparation for the identification, tests and assay. The reference preparation is appropriately characterised as defined under Product characterisation, except that it is not necessary to examine cross-reactivity for each batch of reference preparation.

Definition of a batch

Definition of a batch (including batch size) is required throughout the process.

SOURCE CELLS

Source cells include fusion partners, lymphocytes, myeloma cells, feeder cells and host cells for the expression of the recombinant monoclonal antibody.

The origin and characteristics of the parental cell are documented, including information on the health of the donors, and on the fusion partner used (for example, myeloma cell line, human lymphoblastoid B-cell line).

Wherever possible, source cells undergo suitable screening for extraneous agents and endogenous agents. The choice of viruses for the tests is dependent on the species and tissue of origin.

CELL LINE PRODUCING THE MONOCLONAL ANTIBODY

The suitability of the cell line producing the monoclonal antibody is demonstrated by:

— documentation on the history of the cell line including description of the cell fusion, immortalisation or transfection and cloning procedure;

— characterisation of the cell line (for example, phenotype, isoenzyme analysis, immunochemical markers and cytogenetic markers);

— characterisation of relevant features of the antibody;

— stability of antibody secretion with respect to the characteristics of the antibody and level of expression and glycosylation up to or beyond the population doubling level or generation number used for routine production;

— for recombinant DNA products, stability of the host/vector genetic and phenotypic characteristics up to or beyond the population doubling level or generation number used for routine production.

CELL BANKS

The master cell bank is a homogeneous suspension of the cell line producing the monoclonal antibody, distributed in equal volumes in a single operation into individual containers for storage.

A working cell bank is a homogeneous suspension of the cell material derived from the master cell bank at a finite passage level, distributed in equal volumes in a single operation into individual containers for storage.

Post-production cells are cells cultured up to or beyond the population doubling level or generation number used for routine production.

The following tests are performed on the master cell bank: viability, identity, sterility (bacteria, fungi, mycoplasmas), characterisation of the monoclonal antibody produced. Non-endogenous viral contamination is tested with a suitable range of *in vivo* and *in vitro* tests. Retrovirus and other endogenous viral contamination is tested using a suitable range of in vitro tests.

The following tests are performed on the working cell bank: viability, identity, sterility (bacteria, fungi, mycoplasmas). Adventitious viral contamination is tested with a suitable range of *in vivo* and *in vitro* tests. For the first working cell bank, these tests are performed on post-production cells, generated from that working cell bank; for working cell banks subsequent to the first working cell bank, a single *in vitro* and *in vivo* test can be done either directly on the working cell bank or on post-production cells.

For the master cell bank and working cell bank, tests for specific viruses are carried out when potentially contaminated biological material has been used during preparation of the cell banks, taking into account the species of origin of this material. This may not be necessary when this material is inactivated using validated procedures.

The following tests are performed on the post-production cells: sterility (bacteria, fungi, mycoplasmas). Virus tests are performed on cells or cell culture supernatants. For this, non-endogenous viral contamination is tested with a suitable range of *in vivo* and *in vitro* tests. Retrovirus and other endogenous viral contamination is tested using a suitable range of in vitro tests.

CULTURE AND HARVEST

Production at finite passage level (single harvest)

Cells are cultivated up to a defined maximum number of passages or population doublings (in accordance with the stability of the cell line). Product is harvested in a single operation.

Continuous-culture production (multiple harvest)

Cells are continuously cultivated for a defined period (in accordance with the stability of the system and production consistency). Monitoring is necessary throughout the life of the culture; the required frequency and type of monitoring will depend on the nature of the production system.

Each harvest is tested for antibody content, bioburden, endotoxin and mycoplasmas. Routine general or specific tests for adventitious viruses are carried out at a suitable stage depending on the nature of the manufacturing process and the materials used. For processes using production at finite passage level (single harvest), at least 3 harvests are tested for adventitious viruses using a suitable range of *in vitro* methods.

The acceptance criteria for harvests for further processing are clearly defined and linked to the schedule of monitoring applied. If any adventitious viruses are detected, the process is carefully investigated to determine the cause of the contamination and the harvest is not further processed. Harvests in which an endogenous virus has been detected are not used for purification unless an appropriate action plan has been defined to prevent transmission of infectious agents by the final product.

PURIFICATION

Harvests may be pooled before further processing. The purification process includes steps that remove and/or inactivate non-enveloped and enveloped viruses. A validated purification process, for which removal and/or inactivation of infectious agents and removal of product- and process-related impurities has been demonstrated is used. Defined steps of the process lead to a purified antibody of constant quality and biological activity.

The test programme on the purified monoclonal antibody depends on the validation of the process, on demonstration of consistency and on the expected level of product- and process-related impurities. The purified monoclonal antibody is tested for bioburden and bacterial endotoxins, purity, integrity and potency by suitable analytical methods, comparing with the reference preparation where necessary.

If storage of intermediates is intended, adequate stability of these preparations and its impact on quality or shelf-life of the finished product are evaluated.

FINAL BULK

The final bulk is prepared from one or more batches of purified monoclonal antibody. Suitable stabilisers and other excipients may be added during preparation of the final bulk.

Only a final bulk that complies with the following requirements may be used in the preparation of the final lot.

Sterility *(2.6.1)*

Carry out the test using 10 ml for each medium.

Bacterial endotoxins *(2.6.14)*

It complies with the limit approved for the particular product.

Process-related impurities

Suitable tests for host-cell-derived proteins, host-cell- and vector-derived DNA and other process-related impurities are carried out on a suitable number of final bulks or batches of purified monoclonal antibodies. The final bulk complies with the limits approved for the particular product. When consistency of the purification process has been demonstrated, the tests may subsequently be omitted.

FINAL LOT

The final bulk is distributed aseptically into sterile containers, which are then closed so as to prevent contamination.

CHARACTERS

Liquid preparations are clear or slightly opalescent, colourless or slightly yellow liquids, without visible particles. Freeze-dried products are white or slightly yellow powders or solid friable masses. After reconstitution they show the same characteristics as liquid preparations.

IDENTIFICATION

The identity is established by suitable validated methods comparing the product with the reference preparation. The assay also contributes to identification.

TESTS

Appearance

Liquid or reconstituted freeze-dried preparations are clear or slightly opalescent and colourless or slightly yellow, without visible particles.

Solubility

Freeze-dried preparations dissolve completely in the prescribed volume of reconstituting liquid, within a defined time, giving a clear or slightly opalescent solution without visible particles.

pH *(2.2.3)*

It complies with the limits approved for the particular product.

Osmolality *(2.2.35)*

Minimum 240 mosmol/kg, diluted for use where applicable.

Extractable volume *(2.9.17)*

It complies with the test for extractable volume.

Total protein *(2.5.33)*

It complies with the limits approved for the particular product.

Molecular-size distribution

Molecular-size distribution is determined by a suitable method, for example, size-exclusion chromatography *(2.2.30)*. It complies with the limits approved for the particular product.

Molecular identity and structural integrity

Depending on the nature of the monoclonal antibody, its microheterogeneity and isoforms, a number of different tests can be used to demonstrate molecular identity and structural integrity. These tests may include peptide mapping, isoelectric focusing, ion-exchange chromatography, hydrophobic interaction chromatography, oligosaccharide mapping, monosaccharide content and mass spectrometry.

Purity

Examine by a suitable validated method, such as SDS-polyacrylamide gel electrophoresis *(2.2.31)* under non-reducing and reducing conditions or capillary electrophoresis *(2.2.47)*. Suitable tests for process-related and product-related impurities are carried out.

Stabiliser

Where applicable, it complies with the limits approved for the particular product.

Water *(2.5.12)*

Freeze-dried products comply with the limits approved for the particular product.

Sterility *(2.6.1)*

It complies with the test for sterility.

Bacterial endotoxins *(2.6.14)*

It complies with the limits approved for the particular product.

Tests applied to modified antibodies

Suitable tests are carried out depending on the type of modification.

ASSAY

Carry out a suitable assay against the reference preparation. Design of the assay and calculation of the results are made according to the usual principles *(for example, 5.3)*.

STORAGE

As stated on the label.

Expiry date The expiry date is calculated from the date of sterile filtration, the date of filling (for liquid preparations) or the date of freeze-drying (where applicable).

LABEL

The label states:

— the number of International Units per millilitre, where applicable;

— the quantity of protein per container;

— the quantity of monoclonal antibody in the container;

— for liquid preparations, the volume of the preparation in the container;

— for freeze-dried preparations:
  — the name and the volume of the reconstitution liquid to be added;
  — the period of time within which the monoclonal antibody is to be used after reconstitution;

— the dilution to be made before use of the product, where applicable.

Ph Eur

Tetanus Antitoxin

General Notices

(Tetanus Antitoxin for Human Use, Ph Eur monograph 0091)

The label may state 'Tet/Ser'.

Ph Eur

DEFINITION

Tetanus antitoxin for veterinary use is a preparation containing principally the globulins that have the power of specifically neutralising the neurotoxin formed by *Clostridium tetani*.

PRODUCTION

It is obtained by fractionation from the serum of horses, or other mammals, that have been immunised against tetaunus toxin.

IDENTIFICATION

It specifically neutralises the toxin formed by *Cl. Tetani*, rendering it harmless to susceptible animals.

POTENCY

Not less than 1000 IU of antitoxin per millilitre when intended for prophylactic use. Not less than 3000 IU if antitoxin per millilitre when intended for therapeutic use.

The potency of tetanus antitoxin is determined by comparing the dose necessary to protect guinea-pigs or mice against the paralytic effects of a fixed dose of tetanus toxin with the quantity of the standard preparation of tetanus antitoxin necessary to give the same protection. In countries where the paralysis method is not obligatory the lethal method may be used. For this method the number of animals and the procedure are identical with those described for the paralysis method but the end-point is the death of the animal rather than the onset of paralysis and the L+/10 dose is used instead of the Lp/10 dose. For this comparison a reference preparation of tetanus antitoxin, calibrated in International Units, and a suitable preparation of tetanus toxin, for use as a test toxin, are required. The potency of the test toxin is determined in relation to the reference preparation; the potency of the tetanus antitoxin to be examined is determined in relation to the potency of the test toxin by the same method.

The International Unit of antitoxin is the specific neutralising activity for tetanus toxin contained in a stated amount of the International Standard which consists of a quantity of dried immune horse serum. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Selection of animals If mice are used, the body masses should be such that the difference between the lightest and the heaviest dose does not exceed 5 g.

Preparation of test toxin Prepare the text toxin from a sterile filtrate of an approximately 9-day culture in liquid medium of *Cl. tetani*. To the filtrate add 1 to 2 volumes of glycerol and store slightly below 0 °C. Alternatively, treat the filtrate with *ammonium sulphate R*, collect the precipitate, which contains the toxin, dry *in vacuo* over *diphosphorus pentoxide R*, powder and store and dry, either in sealed ampoules or *in vacuo* over *diphosphorous pentoxide R*.

Determination of test dose of toxin (Lp/10 dose) Prepare a solution of the reference preparation in a suitable liquid such that it contains 0.5 IU of antitoxin per millilitre.

If the test toxin is stored dry, reconstitute it using a suitable liquid.

Prepare the mixtures of the solution of the reference preparation and the test toxin such that each contains 2.0 ml of the solution of the reference preparation, one of a graded series of volumes of the test toxin and a sufficient of a suitable liquid to bring the volume to 5.0 ml. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using six mice for each mixture, inject a dose of 0.5 ml subcutaneously into each mouse. Observe the mice for 96 h. Mice that become paralysed may be euthanised.

The test dose of toxin is the quantity in 0.5 ml of the mixture made with the smallest amount of toxin capable of causing, despite partial neutralisation by the reference preparation, paralysis in all six mice injected with the mixture within the observation period.

Determination of potency of the antitoxin Prepare a solution of the reference preparation in a suitable liquid such that it contains 0.5 IU of antitoxin per millilitre.

Prepare a solution of the test toxin in a suitable liquid such that it contains five test doses per millilitre.

Prepare the mixtures of the solution of the test toxin and the antitoxin to be examined such that each contains 2.0 ml of the solution of the test toxin, one of a graded series of volumes of the antitoxin to be examined and sufficient of a suitable liquid to bring the total volume to 5.0 ml. Also prepare mixtures of the solution of the test toxin and the solution of the reference preparation such that each contains 2.0 ml of the solution of the test toxin, one of a graded series of volumes of the solution of the reference preparation centred on that volume (2.0 ml) that contains 1 IU and sufficient of a suitable liquid to bring the total volume to 5.0 ml. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using six mice for each mixture, inject into each mouse subcutaneously a dose of 0.5 ml. Observe the mice for 96 h. Mice that become paralysed may be euthanised.

The mixture that contains the largest volume of antitoxin that fails to protect the mice from paralysis contains 1 IU. This quantity is used to calculate the potency of the antitoxin in International Units per millilitre.

The test is not valid unless all the mice injected with mixtures containing 2.0 or less of the solution of the reference preparation show paralysis and all those injected with mixtures containing more do not.

Ph Eur

Ammonia [^{13} N] Injection

General Notices

(Ph Eur monograph 1492)

Ph Eur

DEFINITION

Ammonia (^{13}N) injection is a sterile solution of [^{13}N]ammonia for diagnostic use. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared nitrogen-13 radioactivity at the date and time stated on the label. Not less than 99 per cent of the total radioactivity corresponds to nitrogen-13 in the form of [^{13}N]ammonia. Not less than 99.0 per cent of the total radioactivity corresponds to nitrogen-13.

PRODUCTION

RADIONUCLIDE PRODUCTION

Nitrogen-13 is a radioactive isotope of nitrogen which may be produced by various nuclear reactions, such as proton irradiation of carbon-13 or oxygen-16, or deuteron irradiation of carbon-12.

RADIOCHEMICAL SYNTHESIS

[^{13}N]Ammonia may be prepared by proton irradiation of water followed by the reduction of the resulting [^{13}N]nitrates/nitrites mixture with a reducing agent. The [^{13}N]ammonia formed is distilled from the reaction mixture and trapped in a slightly acidic solution.

Other methods may produce [^{13}N]ammonia "in-target" by proton irradiation of water containing a small amount of ethanol or acetic acid, or by proton irradiation of a slurry of [^{13}C]carbon powder in water. The resulting solution can be purified, to remove radionuclidic and radiochemical impurities, using anion and cation exchange columns.

CHARACTERS

A clear, colourless solution.

Nitrogen-13 has a half-life of 9.96 min and emits positrons with a maximum energy of 1.198 MeV, followed by annihilation gamma radiation of 0.511 MeV.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. It complies with test (a) for radionuclidic purity (see Tests).

C. Examine the chromatograms obtained in the test for radiochemical purity. The principal peak in the radiochromatogram obtained with the test solution has approximately the same retention time as the principal peak in the radiochromatogram obtained with the reference solution.

TESTS

pH (*2.2.3*)

The pH of the injection is 5.5 to 8.5.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The injection may be released for use before completion of the test.

Bacterial endotoxins (*2.6.14*)

Less than 175/V IU/ml, *V* being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

CHEMICAL PURITY

Aluminium In a test-tube about 12 mm in internal diameter, mix 1 ml of *acetate buffer solution pH 4.6 R* and 2 ml of a 1 in 20 dilution of the preparation to be examined in *water R*. Add 0.05 ml of a 10 g/l solution of *chromazurol S R*. After 3 min, the colour of the solution is not more intense than that of a standard prepared at the same time and in the same manner using 2 ml of a 1 in 20 dilution of *aluminium standard solution (2 ppm Al) R* (2 ppm).

The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

(a) Half-life The half-life is between 9 min and 11 min.

(b) Gamma emitting impurities Retain a sample of the preparation to be examined for 2 h. Examine the gamma-ray spectrum of the decayed material for the presence of radionuclidic impurities, which should, where possible, be identified and quantified. The total gamma radioactivity due to these impurities does not exceed 1.0 per cent of the total radioactivity.

The injection may be released for use before completion of tests (a) and (b).

RADIOCHEMICAL PURITY

Examine by liquid chromatography (*2.2.29*).

Test solution The preparation to be examined.

Reference solution Dilute 1.0 ml of *dilute ammonia R2* to 10.0 ml with *water R*.

The chromatographic procedure may be carried out using:

— a column 0.04 m long and 4.0 mm in internal diameter packed with *cation exchange resin R* (10 µm);

— as mobile phase at a flow rate of 2 ml/min *0.002 M nitric acid* ;

— a suitable radioactivity detector;

— a conductivity detector;

— a loop injector;

maintaining the column at a constant temperature between 20 °C and 30 °C.

Inject separately the test solution and the reference solution. The chromatogram obtained with the radioactivity detector and the test solution shows a principal peak with approximately the same retention time as the peak in the chromatogram obtained with the reference solution and the conductivity detector. Not less than 99 per cent of the total radioactivity corresponds to nitrogen-13 in the form of ammonia.

The injection may be released for use before completion of the test.

RADIOACTIVITY

Measure the radioactivity using suitable equipment by comparison with a standardised fluorine-18 solution or by using an instrument calibrated with the aid of such a solution. Standardised fluorine-18 solutions are available from laboratories recognised by the competent authority.

IMPURITIES

A. $[^{13}N]O_2$-;

B. $[^{13}N]O_3$-;

C. [18F-];

D. $H_2[^{15}O]$.

Ph Eur

Carbon Monoxide [^{15} O]

General Notices

(Ph Eur monograph 1607)

Ph Eur

DEFINITION

Mixture of carbon [^{15}O]monoxide in the gaseous phase and a suitable vehicle such as *Medicinal air (1238),* for diagnostic use.

Purity:

— minimum 99 per cent of the total radioactivity corresponds to oxygen-15;

— minimum 97 per cent of the total radioactivity corresponds to oxygen-15 in the form of carbon monoxide (CO).

PRODUCTION

RADIONUCLIDE PRODUCTION

Oxygen-15 is a radioactive isotope of oxygen which may be produced by various nuclear reactions such as proton irradiation of nitrogen-15 or deuteron irradiation of nitrogen-14.

RADIOCHEMICAL SYNTHESIS

In order to recover oxygen-15 as molecular oxygen from the nitrogen target gas, carrier oxygen is added at concentrations generally ranging from 0.2 per cent *V/V* to 1.0 per cent *V/V*. After irradiation, the target gas is usually reacted with activated charcoal at a temperature of about 950 °C. The activated charcoal is preconditioned before use by flushing an inert gas at the production flow rate at a temperature of about 950 °C for not less than 1 h. The carbon [^{15}O]monoxide obtained is purified by passage through a carbon dioxide scavenger, such as soda lime, before mixing with the vehicle.

CHARACTERS

Appearance

Colourless gas.

HALF-LIFE AND NATURE OF RADIATION OF OXYGEN-15

See general chapter 5.7. Table of physical characteristics of radionuclides.

IDENTIFICATION

A. Gamma spectrometry.

Results The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. It complies with the test for radionuclidic purity (see Tests).

C. Examine the chromatograms obtained in the test for radiochemical purity.

Results The principal peaks in the chromatogram obtained with the test gas using the radioactivity detector are similar in retention times to the principal peaks corresponding to carbon monoxide in the chromatogram obtained with reference gas (a) using the thermal conductivity detector.

TESTS

The following tests are performed on carbon [^{15}O]monoxide as described under radiochemical synthesis before mixing with the vehicle.

Carbon monoxide

Gas chromatography (*2.2.28*) as described in the test for radiochemical purity.

The concentration of carbon monoxide in the test sample is determined before administration and is used to calculate the amount of carbon monoxide to be administered to the patient.

Injection Test sample, reference gas (b).

Examine the chromatogram obtained with the thermal conductivity detector and calculate the content of carbon monoxide.

RADIONUCLIDE PURITY

Oxygen-15: minimum 99 per cent of the total radioactivity.

A. Gamma spectrometry.

Comparison Standardised fluorine-18 solution, or by using an instrument calibrated with the aid of such a solution. Standardised fluorine-18 solutions and/or standardisation services are available from the competent authority.

Results The spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised fluorine-18 solution.

B. Half-life: 1.9 min to 2.2 min.

The preparation may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Carbon [^{15}O]monoxide

Gas chromatography (*2.2.28*): use the normalisation procedure.

Test sample Carbon [^{15}O]monoxide as described under radiochemical synthesis.

Reference gas (a) *Nitrogen gas mixture R.*

Reference gas (b) *Nitrogen R*, containing 2.0 per cent *V/V* of *carbon monoxide R1*.

Column:
- *size:* *l* = 1.8 m, Ø1 = 6.3 mm and Ø2 = 3.2 mm;
- *stationary phase*: *GC concentrical column R.*

Carrier gas *helium for chromatography R.*

Flow rate 65 ml/min.

Temperature:
- *column*: 40 °C;
- *injection port*: 40 °C;
- *thermal conductivity detector*: 70 °C.

Detection Thermal conductivity detector and radioactivity detector connected in series.

Injection Loop injector.

Run time 10 min.

Retention times Oxygen, nitrogen and carbon monoxide eluting from the inner column = about 0.4 min; carbon dioxide eluting from the inner column = about 0.8 min; oxygen eluting from the outer column = about 2.1 min; nitrogen eluting from the outer column = about 3.1 min; carbon monoxide eluting from the outer column = about 6.2 min.

System suitability Reference gas (a):

- 5 clearly separated principal peaks are observed in the chromatogram obtained using the thermal conductivity detector,
- *resolution*: minimum of 1.5 between the peaks due to carbon dioxide eluting from the inner column and oxygen eluting from the outer column, in the chromatogram obtained using the thermal conductivity detector.

Limits Examine the chromatogram obtained with the radioactivity detector and calculate the percentage content of oxygen-15 substances from the peak areas.

- carbon [^{15}O]monoxide: minimum 97 per cent of the total radioactivity.
- disregard the first peak corresponding to components co-eluting from the inner column.

RADIOACTIVITY

The radioactive concentration is determined before administration.

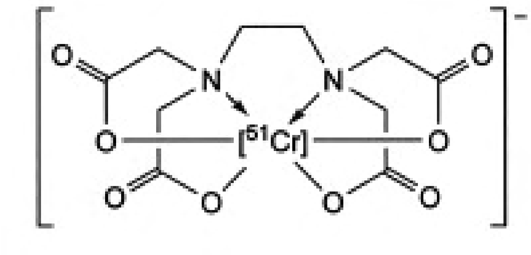
Measure the radioactivity using suitable equipment by comparison with a standardised fluorine-18 solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

Chromium [^{51} Cr] Edetate Injection

General Notices

(Ph Eur monograph 0266)



Ph Eur

DEFINITION

Sterile solution containing chromium-51 in the form of a complex of chromium(III) with (ethylenedinitrilo)tetraacetic acid, the latter being present in excess. It may be made isotonic by the addition of sodium chloride and may contain a suitable antimicrobial preservative such as benzyl alcohol.

Content:

— *chromium-51*: 90.0 per cent to 110.0 per cent of the declared chromium-51 radioactivity at the date and time stated on the label;

— *chromium*: maximum 1 mg/ml.

PRODUCTION

Chromium-51 is a radioactive isotope of chromium and may be prepared by neutron irradiation of chromium, either of natural isotopic composition or enriched in chromium-50.

CHARACTERS

Appearance

Clear, violet solution.

Half-life and nature of radiation of chromium-51

See general chapter *5.7 . Table of physical characteristics of radionuclides*.

IDENTIFICATION

A. Radionuclidic purity (see Tests).

B. Examine the chromatograms obtained in the test for radiochemical purity.

Results The principal peak in the radiochromatogram obtained with the test solution is similar in retardation factor to the principal peak in the chromatogram obtained with the reference solution.

TESTS

pH *(2.2.3)*

3.5 to 6.5.

Chromium

Ultraviolet and visible absorption spectrophotometry *(2.2.25)* .

Test solution The preparation to be examined.

Reference solution Dissolve 0.96 g of *chromic potassium sulphate R* and 2.87 g of *sodium edetate R* in 50 ml of *water R* , boil for 10 min, cool, adjust to pH 3.5-6.5 with *dilute sodium hydroxide solution R* and dilute to 100.0 ml with *water R* .

Measure the absorbance of the test solution and the reference solution at the absorption maximum at 560 nm. The absorbance of the test solution is not greater than that of the reference solution (1 mg/ml).

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)* . The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Chromium-51

Minimum 99.9 per cent of the total radioactivity.

Gamma-ray spectrometry.

Results The only gamma photons have an energy of 0.320 MeV.

RADIOCHEMICAL PURITY

[^{51}Cr]Chromium edetate

Descending paper chromatography *(2.2.26)* .

Test solution The preparation to be examined.

Reference solution Use the reference solution from the test for chromium.

Chromate carrier solution Dissolve 0.1 g of *potassium chromate R* in 1 ml of *concentrated ammonia R1* and dilute to 100 ml with *water R* .

Paper *paper for chromatography R.*

Mobile phase *concentrated ammonia R1, ethanol (96 per cent) R, water R* (1:2:5 *V/V/V*).

Application Apply a band of a 50 g/l solution of *lead acetate R* to the paper at about 4 cm from the origin and dry in hot air. Apply 10 µl of the chromate carrier solution at the origin, followed by 10 µl of the test solution on the same spot. On a separate sheet, repeat the above procedure, applying 10 µl of the reference solution instead of the test solution.

Development Immediately, over a path of 14 cm.

Drying In air.

Detection Determine the distribution of radioactivity using a suitable radioactivity detector.

Retardation factors Impurity A = 0; impurity B = 0.2 to 0.4; [^{51}Cr]chromium edentate = 0.8 to 0.9.

System suitability The band of lead acetate turns yellow due to reaction with the chromate carrier solution. The retardation factor of the radioactive spot due to [^{51}Cr]chromium edetate in the radiochromatogram obtained with the test solution is similar to that of the violet spot in the chromatogram obtained with the reference solution.

Limit:

- *[^{51} Cr]chromium edetate*: minimum 97.0 per cent of the total radioactivity due to chromium-51.

RADIOACTIVITY

Measure the radioactivity using a calibrated instrument.

IMPURITIES

A. [^{51}Cr]chromium(III) ion,

B. [^{51}Cr]chromate ion.

Ph Eur

Cyanocobalamin [^{57} Co] Capsules

General Notices

Ph Eur

DEFINITION

Cyanocobalamin (^{57}Co) capsules contain [^{57}Co]-α-(5,6-dimethylbenzimidazol-1-yl)cobamide cyanide and may contain suitable auxiliary substances. Cobalt-57 is a radioactive isotope of cobalt and may be produced by proton irradiation of nickel. Cyanocobalamin (^{57}Co) may be prepared by the growth of suitable micro-organisms on a medium containing (^{57}Co) cobaltous ion. Not less than 90 per cent of the cobalt-57 is in the form of cyanocobalamin. The capsules comply with the requirements for hard capsules in the monograph on *Capsules (0016),* unless otherwise justified and authorised.

CHARACTERS

Hard gelatin capsules.

Cobalt-57 has a half-life of 271 days and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised cobalt-57 solution. Standardised cobalt-57 and cobalt-58 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of cobalt-57 has an energy of 0.122 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity. The principal peak in the radio-chromatogram obtained with the test solution has a retention time similar to that of the peak in the chromatogram obtained with the reference solution.

TESTS

Disintegration

The capsules comply with the test for disintegration of tablets and capsules (*2.9.1*) except that one capsule is used in the test instead of six.

Uniformity of content

Determine by measurement in a suitable counting assembly and under identical geometrical conditions the radioactivity of each of not less than ten capsules. Calculate the average radioactivity per capsule. The radioactivity of no capsule differs by more than 10 per cent from the average. The relative standard deviation is less than 3.5 per cent.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument calibrated with the aid of standardised cobalt-57 and cobalt-58 solutions. The spectrum does not differ significantly from that of the stan-dardised cobalt-57 solution. Determine the relative amounts of cobalt-57, cobalt-56 and cobalt-58 present. Cobalt-56 has a half-life of 78 days and its presence is shown by gamma photons of energy 0.847 MeV. Cobalt-58 has a half-life of 70.8 days and its presence is shown by gamma photons of energy 0.811 MeV. Not more than 0.1 per cent of the total radioactivity is due to cobalt-56, cobalt-58 and other radionuclidic impurities.

RADIOCHEMICAL PURITY

Examine by liquid chromatography (*2.2.29*).

Test solution Dissolve the contents of a capsule in 1.0 ml of *water R* and allow to stand for 10 min. Centrifuge at 2000 r/min for 10 min. Use the supernatant.

Reference solution Dissolve 10 mg of *cyanocobalamin CRS* in the mobile phase and dilute to 100 ml with the mobile phase. Dilute 2 ml of the solution to 100 ml with the mobile phase. Use within 1 h.

The chromatographic procedure may be carried out using:

- — a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- — as mobile phase at a flow rate of 1.0 ml/min a mixture prepared as follows: mix 26.5 volumes of *methanol R* and 73.5 volumes of a 10 g/l solution of *disodium hydrogen phosphate R* adjusted to pH 3.5 using *phosphoric acid R* and use within 2 days,
- — a radioactivity detector adjusted for cobalt-57,
- — as detector a spectrophotometer set at 361 nm,
- — a loop injector.

Inject 100 µl of the test solution and record the chromatogram for three times the retention time of cyanocobalamin. Determine the peak areas and calculate the percentage of cobalt-57 present as cyanocobalamin. Inject 100 µl of the reference solution and record the chromatogram for 30 min.

RADIOACTIVITY

The average radioactivity determined in the test for uniformity of content is not less than 90.0 per cent and not more than 110.0 per cent of the declared cobalt-57 radioactivity, at the date stated on the label.

STORAGE

Store in an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

Ph Eur

Cyanocobalamin [^{57} Co] Solution

General Notices

(Ph Eur monograph 0269)

Ph Eur

DEFINITION

Cyanocobalamin (^{57}Co) solution is a solution of [^{57}Co]-α-(5,6-dimethylbenzimidazol-1-yl) cobamide cyanide and may contain a stabiliser and an antimicrobial preservative. Cobalt-57 is a radioactive isotope of cobalt and may be produced by the irradiation of nickel with protons of suitable energy. Cyanocobalamin (^{57}Co) may be prepared by the growth of suitable micro-organisms on a medium containing (^{57}Co) cobaltous ion. The solution contains not less than 90.0 per cent and not more than 110.0 per cent of the declared cobalt-57 radioactivity at the date stated on the label. Not less than 90 per cent of the cobalt-57 is in the form of cyanocobalamin.

CHARACTERS

A clear, colourless or slightly pink solution. Cobalt-57 has a half-life of 271 days and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised cobalt-57 solution. Standardised cobalt-57 and cobalt-58 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of cobalt-57 has an energy of 0.122 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity. The principal peak in the radiochromatogram obtained with the solution to be examined has a retention time similar to that of the peak in the chromatogram obtained with the reference solution.

TESTS

pH (*2.2.3*)

The pH of the solution is 4.0 to 6.0.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument calibrated with the aid of standardised cobalt-57 and cobalt-58 solutions. The spectrum does not differ significantly from that of the standardised cobalt-57 solution. Determine the relative amounts of cobalt-57, cobalt-56 and cobalt-58 present. Cobalt-56 has a half-life of 78 days and its presence is shown by gamma photons of energy 0.847 MeV. Cobalt-58 has a half-life of 70.8 days and its presence is shown by gamma photons of energy 0.811 MeV. Not more than 0.1 per cent of the total radioactivity is due to cobalt-56, cobalt-58 and other radionuclidic impurities.

RADIOCHEMICAL PURITY

Examine by liquid chromatography (*2.2.29*).

Reference solution Dissolve 10 mg of *cyanocobalamin CRS* in the mobile phase and dilute to 100 ml with the mobile phase. Dilute 2 ml of the solution to 100 ml with the mobile phase. Use within 1 h.

The chromatographic procedure may be carried out using:

— a stainless steel column 0.25 m long and 4 mm in internal diameter packed with octylsilyl silica gel for chromatography R (5 µm),

— as mobile phase at a flow rate of 1.0 ml/min a mixture prepared as follows: mix 26.5 volumes of *methanol R* and 73.5 volumes of a 10 g/l solution of *disodium hydrogen phosphate R* adjusted to pH 3.5 using *phosphoric acid R* and use within 2 days,

— a radioactivity detector adjusted for cobalt-57,

Determine the peak areas and calculate the percentage of cobalt-57 present as cyanocobalamin. Inject 100 µl of the reference solution and record the chromatogram for 30 min.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised cobalt-57 solution.

STORAGE

Store protected from light at a temperature of 2 °C to 8 °C.

Ph Eur

Cyanocobalamin [^{58} Co] Capsules

General Notices

(Ph Eur monograph 1505)

Ph Eur

DEFINITION

Cyanocobalamin (^{58}Co) capsules contain [^{58}Co]-α-(5,6-dimethylbenzimidazol-1-yl)cobamide cyanide and may contain suitable auxiliary substances. Cobalt-58 is a radioactive isotope of cobalt and may be produced by neutron irradiation of nickel. Cyanocobalamin (^{58}Co) may be prepared by the growth of suitable micro-organisms on a medium containing (^{58}Co) cobaltous ion. Not less than 84 per cent of the cobalt-58 is in the form of cyanocobalamin. The capsules comply with the requirements for hard capsules in the monograph on *Capsules (0016),* unless otherwise justified and authorised. The average radioactivity is not less than 90.0 per cent and not more than 110.0 per cent of the declared cobalt-58 radioactivity at the date stated on the label.

CHARACTERS

Hard gelatin capsules.

Cobalt-58 has a half-life of 70.9 days and emits beta (β^+) radiation and gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised cobalt-58 solution. Standardised cobalt-58 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photons of cobalt-58 have energies of 0.511 MeV (annihilation radiation) and 0.811 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity. The principal peak in the radiochromatogram obtained with the test solution has a retention time similar to that of the peak in the chromatogram obtained with the reference solution.

TESTS

Disintegration

The capsules comply with the test for disintegration of tablets and capsules (*2.9.1*) except that one capsule is used in the test instead of six.

Uniformity of content

Determine by measurement in a suitable counting assembly and under identical geometrical conditions the radioactivity of each of not less than ten capsules. Calculate the average radioactivity per capsule. The radioactivity of no capsule differs by more than 10 per cent from the average. The relative standard deviation is less than 3.5 per cent.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument calibrated with the aid of standardised cobalt-58, cobalt-57 and cobalt-60 solutions. The spectrum does not differ significantly from that of the standardised cobalt-58 solution. Standardised cobalt-58, cobalt-57 and cobalt-60 solutions are available from laboratories recognised by the competent authority. Determine the relative amounts of cobalt-58, cobalt-57 and cobalt-60 present. Cobalt-57 has a half-life of 272 days and its presence is shown by gamma photons of energy 0.122 MeV. Cobalt-60 has a half-life of 5.27 years and its presence is shown by gamma photons of energies 1.173 MeV and 1.333 MeV. Not more than 1 per cent of the total radioactivity is due to cobalt-60 and not more than 2 per cent of the total radioactivity is due to cobalt-57, cobalt-60 and other radionuclidic impurities.

RADIOCHEMICAL PURITY

Examine by liquid chromatography (*2.2.29*).

Test solution Dissolve the contents of a capsule in 1.0 ml of *water R* and allow to stand for 10 min. Centrifuge at 2000 r/min for 10 min. Use the supernatant.

Reference solution Dissolve 10 mg of *cyanocobalamin CRS* in the mobile phase and dilute to 100 ml with the mobile phase. Dilute 2 ml of the solution to 100 ml with the mobile phase. Use within 1 h of preparation.

The chromatographic procedure may be carried out using:

— a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),

— as mobile phase at a flow rate of 1.0 ml/min a mixture prepared as follows: mix 26.5 volumes of *methanol R* and 73.5 volumes of a 10 g/l solution of *disodium hydrogen phosphate R* , adjusted to pH 3.5 with *phosphoric acid R* and use within 2 days,

— a radioactivity detector adjusted for cobalt-58,

— as detector a spectrophotometer set at 361 nm,

— a loop injector.

Inject 100 µl of the test solution and record the chromatogram for three times the retention time of cyanocobalamin. Determine the peak areas and calculate the percentage of cobalt-58 present as cyanocobalamin. Inject 100 µl of the reference solution and record the chromatogram for 30 min.

RADIOACTIVITY

The average radioactivity determined in the test for uniformity of content is not less than 90.0 per cent and not more than 110.0 per cent of the declared cobalt-58 radioactivity, at the date stated on the label.

STORAGE

Store in an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

Ph Eur

Cyanocobalamin [^{58} Co] Solution

General Notices

(Ph Eur monograph 0270)

Ph Eur

DEFINITION

Cyanocobalamin (^{58}Co) solution is a solution of [^{58}Co]-α-(5,6-dimethylbenzimidazol-1-yl) cobamide cyanide and may contain a stabiliser and an antimicrobial preservative. Cobalt-58 is a radioactive isotope of cobalt and may be produced by neutron irradiation of nickel. Cyanocobalamin (^{58}Co) may be prepared by the growth of suitable micro-organisms on a medium containing (^{58}Co) cobaltous ion. The solution contains not less than 90.0 per cent and not more than 110.0 per cent of the declared cobalt-58 radioactivity at the date stated on the label. Not less than 90 per cent of the cobalt-58 is in the form of cyanocobalamin.

CHARACTERS

A clear, colourless or slightly pink solution.

Cobalt-58 has a half-life of 70.8 days and emits beta (β^+) radiation and gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised cobalt-58 solution. Standardised cobalt-58, cobalt-57 and cobalt-60 solutions are available from laboratories recognised by the competent authority. TESTS

pH (*2.2.3*)

The pH of the solution is 4.0 to 6.0.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument having adequate resolution and calibrated with the aid of standardised cobalt-58, cobalt-57 and cobalt-60 solutions. The spectrum does not differ significantly from that of the standardised cobalt-58 solution. Determine the relative amounts of cobalt-58, cobalt-57 and cobalt-60 present. Cobalt-57 has a half-life of 271 days and its presence is shown by gamma photons of energy 0.122 MeV. Cobalt-60 has a half-life of 5.27 years and its presence is shown by gamma photons of energies 1.173 MeV and 1.332 MeV. Not more than 1 per cent of the total radioactivity is due to cobalt-60 and not more than 2 per cent of the total radioactivity is due to cobalt-57, cobalt-60 and other radionuclidic impurities.

RADIOCHEMICAL PURITY

Examine by liquid chromatography (*2.2.29*).

Reference solution Dissolve 10 mg of *cyanocobalamin CRS* in the mobile phase and dilute to 100 ml with the mobile phase. Dilute 2 ml of the solution to 100 ml with the mobile phase. Use within 1 h.

The chromatographic procedure may be carried out using:

— a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),

— as mobile phase at a flow rate of 1.0 ml/min a mixture prepared as follows: mix 26.5 volumes of *methanol R* and 73.5 volumes of a 10 g/l solution of *disodium hydrogen phosphate R* adjusted to pH 3.5 using *phosphoric acid R* and use within 2 days,

— a radioactivity detector adjusted for cobalt-58,

— as detector a spectrophotometer set at 361 nm,

— a loop injector.

Inject 100 µl of the solution to be examined and record the chromatogram for three times the retention time of cyanocobalamin. Determine the peak areas and calculate the percentage of cobalt-58 present as cyanocobalamin. Inject 100 µl of the reference solution and record the chromatogram for 30 min.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised cobalt-58 solution or by measurement in an instrument calibrated with the aid of such a solution.

STORAGE

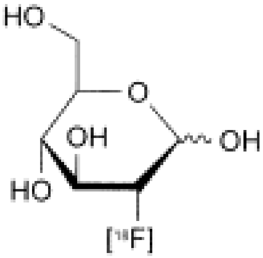
Store protected from light at a temperature of 2 °C to 8 °C.

Ph Eur

Fludeoxyglucose [^{18} F] Injection

General Notices

(Ph Eur monograph 1325)



Ph Eur

DEFINITION

Sterile solution containing 2-[^{18}F]fluoro-2-deoxy-D-glucopyranose (2-[^{18}F]fluoro-2-deoxy-D-glucose) prepared by nucleophilic substitution. It may also contain 2-[^{18}F]fluoro-2-deoxy-D-mannose.

Content:

— *fluorine-18*: 90 per cent to 110 per cent of the declared fluorine-18 radioactivity at the date and time stated on the label;

— *fluorine-18 in the form of 2-[^{18} F]fluoro-2-deoxy- D -glucose and 2-[^{18} F]fluoro-2-deoxy- D -mannose* : minimum 95 per cent of the total radioactivity;

— *2-[^{18} F]fluoro-2-deoxy- D -mannose* : maximum 10 per cent of the total radioactivity due to 2-[^{18}F]fluoro-2-deoxy-D-glucose and 2-[^{18}F]fluoro-2-deoxy-D-mannose;

— *2-fluoro-2-deoxy-d-glucose* : maximum 0.5 mg per maximum recommended dose, in millilitres.

PRODUCTION

RADIONUCLIDE PRODUCTION

The radionuclide fluorine-18 is most commonly produced by proton irradiation of water enriched in oxygen-18.

RADIOCHEMICAL SYNTHESIS

2-[^{18}F]Fluoro-2-deoxy-D-glucose is mostly prepared by phase transfer catalysed nucleophilic substitution of 1,3,4,6-tetra-*O*-acetyl-2-*O*-trifluoromethanesulphonyl-β-D-mannopyranose (tetraacetylmannose triflate) with [^{18}F]fluoride. Generally, [^{18}F]fluoride is adsorbed on an anion-exchange resin and eluted with a solution of potassium carbonate, which is then evaporated to dryness. Addition of a phase-transfer catalyst, such as an aminopolyether or a tetra-alkyl ammonium salt in dry acetonitrile, may be used to enhance the nucleophilicity of the [^{18}F]fluoride so that it reacts easily with the tetraacetylmannose triflate at elevated temperature. A variation of the method uses solid-phase-catalysed nucleophilic substitution on derivatised anion-exchange resin, for example, derivatised with 4-(4-methylpiperidin-1-yl) pyridine.

Hydrolysis under either alkaline or acidic conditions yields 2-[^{18}F]fluoro-2-deoxy-D-glucose. Depending on the conditions of hydrolysis, variable amounts of 2-chloro-2-deoxy-D-glucose and/or 2-[^{18}F]fluoro-2-deoxy-D-mannose may be formed as a by-product.

The preparation can be purified by serial chromatography on combinations of ion-retardation resin, ion-exchange resin, alumina and octadecylsilyl derivatised silica gel.

CHARACTERS

Appearance

Clear, colourless or slightly yellow solution.

Half-life and nature of radiation of fluorine-18: see general chapter *5.7. Table of physical characteristics of radionuclides.*

IDENTIFICATION

A. Test A for radionuclidic purity (see Tests).

B. Determine the approximate half-life by no fewer than 3 measurements of the activity of a sample in the same geometrical conditions within a suitable period of time (for example, 30 min).

Result 105 to 115 min.

C. Examine the chromatograms obtained in test A for radiochemical purity (see Tests).

Result The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Particular tests for chemical impurities may be omitted if the substances mentioned are not used or cannot be formed in the production process.

pH *(2.2.3)*

4.5 to 8.5.

2-Fluoro-2-deoxy-D-glucose and impurity A

Liquid chromatography *(2.2.29)* .

Test solution The preparation to be examined.

Reference solution (a) Dissolve 1.0 mg of *2-fluoro-2-deoxy- D -glucose R* in *water R* and dilute to 2.0 ml with the same solvent. Dilute 1.0 ml of the solution to *V* with *water R* , *V* being the maximum recommended dose in millilitres.

Reference solution (b) Dissolve 1.0 mg of *2-chloro-2-deoxy- D -glucose R* (impurity A) in *water R* and dilute to 2.0 ml with the same solvent. Dilute 1.0 ml of the solution to *V* with *water R* , V being the maximum recommended dose in millilitres.

Reference solution (c) Dissolve 1.0 mg of *2-fluoro-2-deoxy- D -mannose R* in *water R* and dilute to 2.0 ml with the same solvent. Mix 0.5 ml of this solution with 0.5 ml of reference solution (a).

Column:

— *size*: *l* = 0.25 m, Ø = 4.0 mm;

— *stationary phase*: *strongly basic anion exchange resin for chromatography R* (10 µm);

— *temperature*: constant, between 20 °C and 25 °C.

Mobile phase 4 g/l solution of *sodium hydroxide R* in *carbon dioxide-free water R* .

Flow rate 1 ml/min.

Detection Detector suitable for carbohydrates in the required concentration range, such as pulse amperometric detector and radioactivity detector connected in series.

Injection 20 µl.

Run time Twice the retention time of 2-fluoro-2-deoxy-D-glucose.

Relative retention With reference to 2-fluoro-2-deoxy-D-glucose (retention time = about 12 min): 2-fluoro-2-deoxy-D-mannose = about 0.9; impurity A = about 1.1.

System suitability Reference solution (c) using the carbohydrate detector:

— *resolution*: minimum 1.5 between the peaks due to 2-fluoro-2-deoxy-D-mannose and 2-fluoro-2-deoxy-D-glucose,

— *signal-to-noise ratio* : minimum 10 for the peak due to 2-fluoro-2-deoxy-D-glucose.

Limits In the chromatogram obtained with the carbohydrate detector:

— *2-fluoro-2-deoxy- D -glucose* : not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.5 mg/*V*);

— *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.5 mg/*V*).

Impurity B

Spot test.

Test solution The preparation to be examined.

Reference solution (a) *water R.*

Reference solution (b) Dissolve 11.0 mg of *aminopolyether R* (impurity B) in *water R* and dilute to 5.0 ml with the same solvent. Dilute 1 ml of the solution to *V* with *water R*, *V* being the maximum recommended dose in millilitres.

Plate *TLC silica gel plate for aminopolyether test R.*

Application 2.5 µl; in addition, apply 2.5 µl of the test solution and then 2.5 µl of reference solution (b) at the same place.

Detection Visually compare the spots 1 min after application.

System suitability:

- the spot due to the successive application of the test solution and reference solution (b) is similar in appearance to the spot due to reference solution (b), which is characterised by a number of concentric circles; the darker innermost circle (of intensity proportional to the concentration of impurity B) may be surrounded by a bluish-black ring, outside of which is a lighter circle surrounded by a peripheral dark edge;
- the spot due to reference solution (a) has a more diffuse inner circle, which is brownish-pink and without a distinct margin between it and the surrounding lighter zone;
- the spot due to reference solution (b) is clearly different from the spot due to reference solution (a).

Limit:

- the central portion of the spot due to the test solution is less intense than that of the spot due to reference solution (b) (2.2 mg/*V*).

Impurity C

Liquid chromatography *(2.2.29)*.

Test solution The preparation to be examined.

Reference solution (a) Dilute 2.1 ml of a 25.95 g/l solution of *tetrabutylammonium hydroxide R* (impurity C) to 20.0 ml with *water R*. Dilute 1.0 ml of this solution to *V* with *water R*, *V* being the maximum recommended dose in millilitres.

Reference solution (b) Dilute 1 ml of a 25.95 g/l solution of *tetrabutylammonium hydroxide R* to 10 ml with *water R*. Dilute 1 ml of this solution to 25 ml with *water R*.

Column:

- *size*: l = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: constant, between 20 °C and 25 °C.

Mobile phase 25 volumes of a 0.95 g/l solution of *toluenesulphonic acid R* and 75 volumes of *acetonitrile R*.

Flow rate 0.6 ml/min.

Detection Spectrophotometer at 254 nm.

Injection 20 µl.

Run time Twice the retention time of tetrabutylammonium ions.

Retention time Tetrabutylammonium hydroxide = about 3.3 min.

System suitability Reference solution (b):

- *signal-to-noise ratio* : minimum 10 for the principal peak;
- *symmetry factor* : maximum 1.8 for the principal peak.

Limit:

— *impurity C*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (2.75 mg/*V*).

Impurity D

Ultraviolet and visible absorption spectrophotometry *(2.2.25)* .

Test solution The preparation to be examined.

Reference solution Dissolve 20.0 mg of *4-(4-methylpiperidin-1-yl)pyridine R* (impurity D) in *water R* and dilute to 100.0 ml with the same solvent. Dilute 0.1 ml of the solution to *V* with *water R* , *V* being the maximum recommended dose in millilitres.

Measure the absorbance of the test solution and the reference solution at the absorption maximum of 263 nm.

Limit The absorbance of the test solution is not greater than that of the reference solution (0.02 mg/*V*).

Residual solvents

Limited according to the principles defined in general chapter *5.4*. The preparation may be released for use before completion of the test.

Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)* . The injection may be released for use before completion of the test.

Bacterial endotoxins *(2.6.14)*

Less than 175/*V* IU/ml, *V* being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

The preparation may be released for use before completion of test B.

A. Gamma-ray spectrometry.

Results The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. Gamma-ray spectrometry.

Determine the amount of fluorine-18 and radionuclidic impurities with a half-life longer than 2 h. For the detection and quantification of impurities, retain the preparation to be examined for at least 24 h to allow the fluorine-18 to decay to a level that permits the detection of impurities.

Results The total radioactivity due to radionuclidic impurities is not more than 0.1 per cent.

RADIOCHEMICAL PURITY

A. Liquid chromatography *(2.2.29)* as described in the test for 2-fluoro-2-deoxy-D-glucose and impurity A. If necessary, dilute the test solution with *water R* to obtain a radioactivity concentration suitable for the radioactivity detector.

Injection Test solution and reference solutions (a) and (c).

Relative retention With reference to 2-[^{18}F]fluoro-2-deoxy-D-glucose (retention time = about 12 min): 2-[^{18}F]fluoro-2-deoxy-D-mannose = about 0.9. Partially and fully acetylated derivatives of both compounds hydrolyse under the chromatographic conditions and therefore elute as 2-[^{18}F]fluoro-2-deoxy-D-glucose and 2-[^{18}F]fluoro-2-deoxy-D-mannose.

Locate the peaks due to 2-[^{18}F]fluoro-2-deoxy-D-glucose and 2-[^{18}F]fluoro-2-deoxy-D-mannose using the chromatograms obtained with the carbohydrate detector and reference solutions (a) and (c).

Limits:

— *fluorine-18 in the form of 2-[^{18}F]fluoro-2-deoxy-D-glucose and 2-[^{18}F]fluoro-2-deoxy-D-mannose*: minimum 95 per cent of the total radioactivity;

— *2-[^{18}F]fluoro-2-deoxy-D-mannose*: maximum 10 per cent of the total radioactivity due to 2-[^{18}F]fluoro-2-deoxy-D-glucose and 2-[^{18}F]fluoro-2-deoxy-D-mannose.

B. Thin-layer chromatography *(2.2.27)*.

Test solution The preparation to be examined.

Reference solution Dissolve, with gentle heating, 30 mg of *1,2,3,4-tetra-O-acetyl-β-D-glucopyranose R* and 20 mg of *glucose R* in 1 ml of *water R*.

Plate *TLC silica gel plate R.*

Mobile phase *water R, acetonitrile R* (5:95 *V/V*).

Application About 2 µl.

Development Over a path of 8 cm.

Drying In air for 15 min.

Detection Determine the distribution of radioactivity using a suitable detector, then immerse the plate in a 75 g/l solution of *sulphuric acid R* in *methanol R* and dry with a heat gun or at 150 °C until the appearance of dark spots in the chromatogram obtained with the reference solution.

Retardation factors [^{18}F]fluoride = about 0; 2-[^{18}F]fluoro-2-deoxy-D-glucose and 2-[^{18}F]fluoro-2-deoxy-D-mannose = about 0.45; partially or fully acetylated derivatives of 2-[^{18}F]fluoro-2-deoxy-D-glucose and 2-[^{18}F]fluoro-2-deoxy-D-mannose = about 0.8 to 0.95.

System suitability Reference solution:

— the chromatogram shows 2 clearly separated spots.

Limits:

— *fluorine-18 in the form of 2-[^{18}F]fluoro-2-deoxy-D-glucose and 2-[^{18}F]fluoro-2-deoxy-D-mannose*: minimum 95 per cent of the total radioactivity;

— *fluorine-18 in the form of fluoride and partially or fully acetylated derivatives of 2-[^{18} F] fluoro-2-deoxy- D -glucose and 2-[^{18} F]fluoro-2-deoxy- D -mannose* : maximum 5 per cent of the total radioactivity.

RADIOACTIVITY

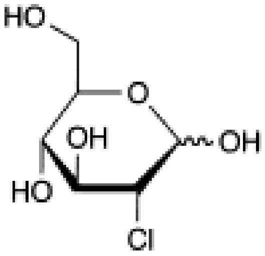
Measure the radioactivity using a calibrated instrument.

LABELLING

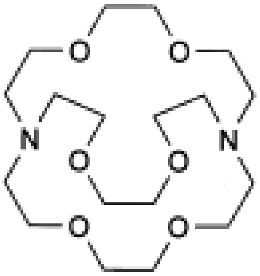
The label states the maximum recommended dose, in millilitres.

IMPURITIES

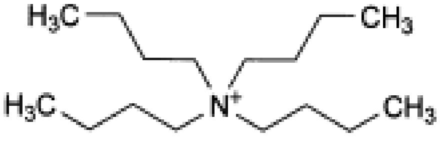
Specified impurities A, B, C, D, E.



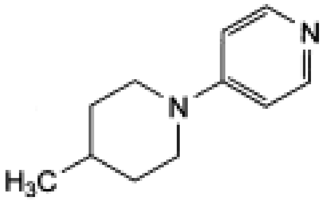
A. 2-chloro-2-deoxy-D-glucopyranose (2-chloro-2-deoxy-D-glucose),



B. 4,7,13,16,21,24-hexaoxa-1,10-diazabicyclo[8.8.8]hexacosane (aminopolyether),



C. *N,N,N*-tributylbutan-1-aminium (tetrabutylammonium),



D. 4-(4-methylpiperidin-1-yl)pyridine,

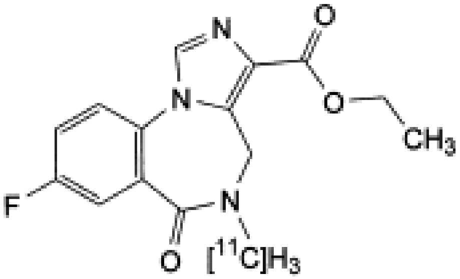
E. [^{18}F]fluoride.

Ph Eur

Flumazenil (*N*-[^{11} C]methyl) Injection

General Notices

(Ph Eur monograph 1917)



Ph Eur

DEFINITION

Sterile solution of ethyl 8-fluoro-5-[^{11}C]methyl-6-oxo-5,6-dihydro-4*H*-imidazo[1,5-*a*][1,4] benzodiazepine-3-carboxylate which may contain a stabiliser such as ascorbic acid.

Content

90 per cent to 110 per cent of the declared carbon-11 radioactivity at the date and time stated on the label.

Content of flumazenil

Maximum 50 µg in the maximum recommended dose in millilitres.

PRODUCTION

RADIONUCLIDE PRODUCTION

Carbon-11 is a radioactive isotope of carbon which is most commonly produced by proton irradiation of nitrogen. Depending on the addition of either trace amounts of oxygen or small amounts of hydrogen, the radioactivity is obtained as [^{11}C]carbon dioxide or [$_{11}$C]methane, respectively.

RADIOCHEMICAL SYNTHESIS

[5-Methyl-^{11}C]flumazenil may be prepared by *N*-alkylation of ethyl 8-fluoro-6-oxo-5,6-dihydro-

4*H*-imidazo[1,5-*a*][1,4]benzodiazepine-3-carboxylate (demethylflumazenil) with iodo[^{11}C]methane or [^{11}C]methyl trifluoromethanesulphonate.

Synthesis of iodo[^{11}C]methane

Iodo[^{11}C]methane may be produced from [^{11}C]carbon dioxide or from [^{11}C]methane. The most frequently used method is reduction of [^{11}C]carbon dioxide with lithium aluminium hydride. The [^{11}C]methanolate formed is reacted with hydriodic acid. Alternatively [^{11}C]methane, either obtained directly in the target or by on-line processes from [^{11}C]carbon dioxide, is reacted with iodine.

Synthesis of [^{11}C]methyl trifluoromethanesulphonate

[^{11}C]methyl trifluoromethanesulphonate may be prepared from iodo[^{11}C]methane using a solid support such as graphitised carbon, impregnated with silver trifluoromethanesulphonate.

Synthesis of [5-methyl-^{11}C]flumazenil

The most widely used method to obtain [5-methyl-^{11}C]flumazenil is the N-alkylation of demethylflumazenil with iodo[^{11}C]methane in alkaline conditions in a solvent such as dimethylformamide or acetone. The resulting [5-methyl-^{11}C]flumazenil can be purified by semi-preparative liquid chromatography. For example, a column packed with octadecylsilyl silica gel for chromatography eluted with a mixture of ethanol and water is suitable.

PRECURSOR FOR SYNTHESIS

Demethylflumazenil

Melting point (2.2.14) 286 °C to 289 °C.

Infrared absorption spectrophotometry (*2.2.24*).

Comparison Ph. Eur. reference spectrum of demethylflumazenil.

CHARACTERS

Appearance

Clear, colourless solution.

Half-life and nature of radiation of carbon-11

See general chapter *5.7. Table of physical characteristics of radionuclides.*

IDENTIFICATION

A. Gamma-ray spectrometry.

Results The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. It complies with test B for radionuclidic purity (see Tests).

C. Examine the chromatograms obtained in the test for radiochemical purity.

Results The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

pH (*2.2.3*)

6.0 to 8.0.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The injection may be released for use before completion of the test.

Bacterial endotoxins (*2.6.14*)

Less than 175/V IU/ml, V being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

Flumazenil and impurity A

Liquid chromatography (*2.2.29*).

Test solution The preparation to be examined.

Reference solution (a) Dissolve 2.5 mg of *flumazenil R* in 5 ml of *methanol R* .

Reference solution (b) Dissolve 2.5 mg of *demethylflumazenil R* in 50 ml of *methanol R.*

Reference solution (c) To 0.1 ml of reference solution (a) add 0.1 ml of reference solution (b) and dilute to *V* with a 0.9 g/l solution of *sodium chloride R* , *V* being the maximum recommended dose in millilitres.

Reference solution (d) Dilute 0.1 ml of reference solution (a) to 50 ml with *methanol R* . Dilute 1.0 ml of this solution to *V* with a 0.9 g/l solution of *sodium chloride R* , *V* being the maximum recommended dose in millilitres.

Column:

— *size: l* = 0.15 m, Ø = 3.9 mm,

— *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 440 m^2/g, a pore size of 100 nm and a carbon loading of 19 per cent,

— *temperature*: maintain at a constant temperature between 20-30 °C.

Mobile phase *methanol R* , *water R* (45:55 *V/V*).

Flow rate 1 ml/min.

Detection Spectrophotometer at 260 nm and radioactivity detector connected in series.

Injection 100 µl.

Run time 10 min.

Relative retention with reference to flumazenil: impurity A = about 0.74.

System suitability Reference solution (c):

— *resolution*: minimum 2.5 between the peaks due to flumazenil and impurity A.

Limits Examine the chromatogram obtained with the spectrophotometer:

— *flumazenil* : not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (50 µg/*V*),

— *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (5 µg/*V*),

— *any other impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (1 µg/*V*).

Residual solvents

are limited according to the principles defined in the general chapter (*5.4*), using the general method (*2.4.24*). The preparation may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Carbon-11

Minimum 99 per cent of the total radioactivity.

The preparation may be released for use before completion of the test.

A. Gamma-ray spectrometry.

Results The spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised fluorine-18 solution.

B. Half-life: 19.9 min to 20.9 min.

RADIOCHEMICAL PURITY

Liquid chromatography (*2.2.29*) as described in the test for flumazenil and impurity A, with the following modifications.

Injection Test solution and reference solution (a); if necessary, dilute the test solution to a radioactivity concentration suitable for the detector.

Limit Examine the chromatogram obtained with the radioactivity detector:

— *[5-methyl-^{11}C]flumazenil* : minimum 95 per cent of the total radioactivity.

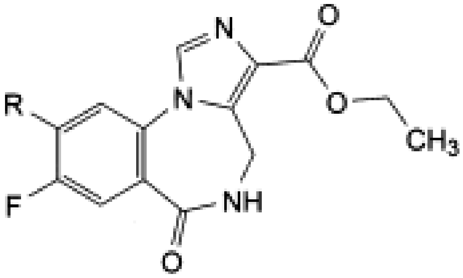
RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

LABELLING

The label states the maximum recommended dose in millilitres.

IMPURITIES



A. R = H: ethyl 8-fluoro-6-oxo-5,6-dihydro-4*H*-imidazo[1,5-*a*][1,4]benzodiazepine-3-carboxylate (demethylflumazenil),

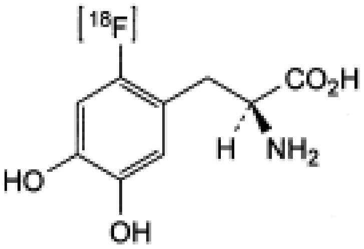
B. R = CH_2-CO-CH_3: ethyl 8-fluoro-6-oxo-9-(2-oxopropyl)-5,6-dihydro-4*H*-imidazo[1,5-*a*][1,4] benzodiazepine-3-carboxylate (acetone addition compound of demethylflumazenil).

Ph Eur

Fluorodopa [^{18} F] Injection

General Notices

(Fluorodopa (18F) (Prepared By Electrophilic Substitution) Injection, Ph Eur monograph 1918)



Ph Eur

DEFINITION

Sterile solution of (2*S*)-2-amino-3-(2-([^{18}F]fluoro)-4,5-dihydroxyphenyl)propanoic acid (6-[^{18}F] fluorolevodopa). It may contain stabilisers such as ascorbic acid and edetic acid.

This monograph applies to an injection containing 6-[^{18}F]fluorolevodopa produced by electrophilic substitution.

Content:

— *fluorine-18*: 90 per cent to 110 per cent of the declared fluorine-18 radioactivity at the date and time stated on the label;

— *dopa*: maximum 1 mg per maximum recommended dose in millilitres;

— *6-fluorolevodopa*: maximum 15 mg per maximum recommended dose in millilitres.

PRODUCTION

RADIONUCLIDE PRODUCTION

Fluorine-18 is a radioactive isotope of fluorine that may be produced by various nuclear reactions induced by proton irradiation of oxygen-18, deuteron irradiation of neon-20, or helium-3 or helium-4 irradiation of oxygen-16.

In order to obtain fluorine-18 in a chemical form suitable for electrophilic substitution reactions, such as fluorine gas or gaseous acetylhypofluorite, a small amount of non-radioactive fluorine gas (0.3-0.8 per cent of the target gas volume) must be added as a carrier at some step in the production process.

RADIOCHEMICAL SYNTHESIS

6-[^{18}F]Fluorolevodopa may be prepared by various radiochemical synthetic pathways, which lead to different products in terms of yield, specific radioactivity, by-products and possible impurities. Electrophilic pathways for production of 6-[^{18}F]fluorolevodopa may proceed by fluorodemetallation of a stannylated derivative of levodopa, with molecular [^{18}F]fluorine or [^{18}F]acetylhypofluorite, followed by hydrolysis of protecting groups and final purification by semipreparative liquid chromatography. Pathways using demercuration or dethallation must not be used.

CHARACTERS

Appearance

Clear, colourless solution.

Half-life and nature of radiation of fluorine-18

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

IDENTIFICATION

A. Test A for radionuclidic purity (see Tests).

B. Determine the approximate half-life by at least 3 measurements of the activity of a sample in the same geometrical conditions over a suitable period of time, for example 30 min.

Results 105 min to 115 min.

C. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

Results The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the peak due to 6-fluorolevodopa in the chromatogram obtained with reference solution (a).

D. Examine the chromatograms obtained in the test for impurities C and D (see Tests).

Results The principal peak in the radiochromatogram obtained with the test solution is similar in retardation factor to the peak due to 6-fluorolevodopa in the chromatogram obtained with reference solution (b).

TESTS

pH *(2.2.3)*

4.0 to 5.5.

Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical* *preparations (0125)* . The injection may be released for use before completion of the test.

Bacterial endotoxins *(2.6.14)*

Less than 175/V IU/ml, V being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

6-Fluorolevodopa, dopa, impurity A and impurity B

Liquid chromatography *(2.2.29)* . *Prepare the reference solutions immediately before use.*

Test solution The preparation to be examined.

Reference solution (a) Dissolve 18.0 mg of *6-fluorolevodopa hydrochloride R* in 5.0 ml of the mobile phase and dilute to V with the mobile phase, V being the maximum recommended dose in millilitres.

Reference solution (b). Dissolve 1.0 mg of *levodopa R* in 5 ml of the mobile phase and dilute to *V* with the mobile phase, *V* being the maximum recommended dose in millilitres.

Reference solution (c) Dissolve 1.0 mg of *trimethyltin chloride R* (impurity A) in 2.0 ml of the mobile phase. Dilute 1.0 ml of this solution to *V* with the mobile phase, V being the maximum recommended dose in millilitres.

Reference solution (d) Mix equal volumes of reference solutions (b) and (c).

Reference solution (e) Dissolve 2.0 mg of *6-hydroxydopa R* (impurity B) in 20.0 ml of the mobile phase. Dilute 0.25 ml of this solution to *V* with the mobile phase, *V* being the maximum recommended dose in millilitres.

Column:

— *size:* *l* = 0.25 m, Ø = 4.0 mm;

— *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* ;

— *temperature*: maintain at a constant temperature between 20 °C and 30 °C.

Mobile phase 6.9 g/l solution of *sodium dihydrogen phosphate R* adjusted to pH 2.4 with a 4.8 g/l solution of *phosphoric acid R* .

Flow rate 1 ml/min.

Detection Spectrophotometer at 200 nm and radioactivity detector connected in series.

Injection 20 µl.

Run time 15 min.

Relative retention With reference to 6-fluorolevodopa (retention time = about 6 min): impurity A and impurity B = about 0.7; dopa = about 0.8.

System suitability Reference solution (d):

— *resolution*: minimum 1.5 between the peaks due to dopa and impurity A.

Limits Examine the chromatograms obtained with the spectrophotometer:

— *6-fluorolevodopa*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (15 mg/*V*);

— *dopa*: not more than the area of the peak due to levodopa in the chromatogram obtained with reference solution (b) (1.0 mg/*V*);

— *sum of impurities A and B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (e) (corresponding to a limit of 0.5 mg/*V* of impurity A or a limit of 0.025 mg/*V* of impurity B, or to lower limits of each if both impurities are present).

Residual solvents

Limited according to the principles defined in general chapter 5.4. The preparation may be released for use before completion of the test.

RADIONUCLIDE PURITY

Fluorine-18

Minimum 99.9 per cent of the total radioactivity. The preparation may be released for use before completion of test B.

A. Gamma-ray spectrometry

Results The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. Gamma-ray spectrometry

Determine the amount of fluorine-18 and radionuclidic impurities with a half-life longer than 2 h. For the detection and quantification of impurities, retain the preparation to be examined for a sufficient time to allow the fluorine-18 to decay to a level that permits the detection of impurities.

Results The spectrum obtained with the preparation to be examined does not differ significantly from a background spectrum.

RADIOCHEMICAL PURITY

Liquid chromatography *(2.2.29)* as described in the test for 6-fluorolevodopa, dopa, impurity A and impurity B.

Examine the chromatogram recorded using the radioactivity detector and locate the peak due to 6-[^{18}F]fluorolevodopa by comparison with the chromatogram obtained with reference solution (a) and the spectrophotometer.

Limit:

— *6-[18F]fluorolevodopa*: minimum 95 per cent of the total radioactivity due to fluorine-18.

Impurities C and D

Thin-layer chromatography *(2.2.27)* .

Test solution The preparation to be examined.

Reference solution (a) Dissolve 2 mg of *DL -6-fluorodopa hydrochloride R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b) Dissolve 2 mg of *6-fluorolevodopa hydrochloride R* in *water R* and dilute to 10 ml with the same solvent.

Plate *octadecylsilyl TLC silica gel plate for chiral separations R*.

Mobile phase *methanol R* , *water R* (50:50 *V/V*).

Application 2 µl.

Development Over a path of 10 cm.

Drying In air for 5 min.

Detection Spray with a 2 g/l solution of *ninhydrin R* in *anhydrous ethanol R* and heat at 60 °C for 10 min; determine the distribution of radioactivity using a suitable detector.

Retardation factors impurity D = about 0; 6-[^{18}F]fluorolevodopa = about 0.3; impurity C = about 0.5.

System suitability Reference solution (a):

— the chromatogram shows 2 clearly separated spots.

Limits:

— *impurity C*: maximum 2 per cent of the total radioactivity due to fluorine-18;

— *impurity D*: maximum 4 per cent of the total radioactivity due to fluorine-18.

RADIOACTIVITY

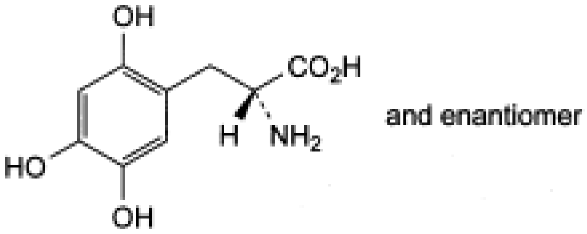
Measure the radioactivity using a calibrated instrument.

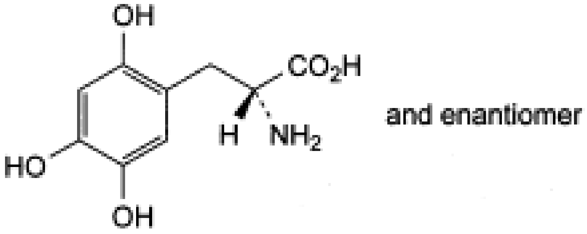
LABELLING

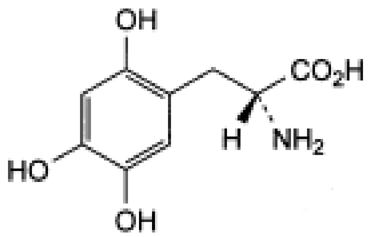
The label states the maximum recommended dose in millilitres.

IMPURITIES

A. Cl-Sn$(CH_3)_3$: chlorotrimethylstannane (trimethyltin chloride),

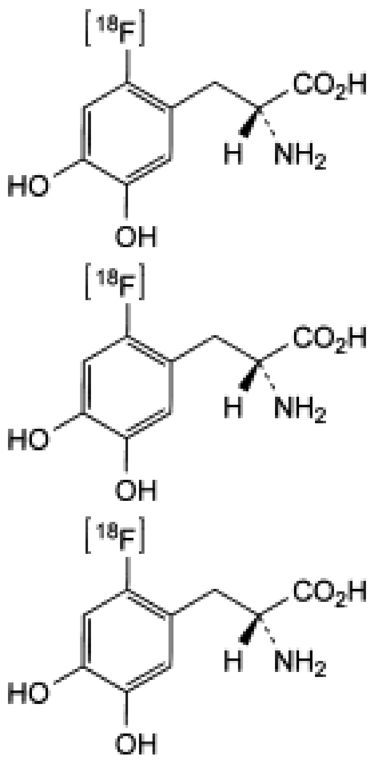






and enantiomer

B. (2*RS*)-2-amino-3-(2,4,5-trihydroxyphenyl)propanoic acid (6-hydroxydopa),



C. (2*R*)-2-amino-3-(2-[^{18}F]fluoro-4,5-dihydroxyphenyl)propanoic acid (6-[^{18}F]fluorodextrodopa),

D. [^{18}F]fluoride.

Ph Eur

Gallium [^{67} Ga] Citrate Injection

General Notices

(Ph Eur monograph 0555)

Ph Eur

DEFINITION

Gallium (^{67}Ga) citrate injection is a sterile solution of gallium-67 in the form of gallium citrate. It may be made isotonic by the addition of sodium chloride and sodium citrate and may contain a suitable antimicrobial preservative such as benzyl alcohol. Gallium-67 is a radioactive isotope of gallium and may be obtained by the irradiation, with protons of suitable energy, of zinc which may be enriched in zinc-68. Gallium-67 may be separated from zinc by solvent extraction or column chromatography. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared gallium-67 radioactivity at the date and hour stated on the label. Not more than 0.2 per cent of the total radioactivity is due to gallium-66.

CHARACTERS

A clear, colourless solution.

Gallium-67 has a half-life of 3.26 days and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised gallium-67 solution when measured either by direct comparison or by use of an instrument calibrated with the aid of such a solution. Standardised gallium-67 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photons have energies of 0.093 MeV, 0.185 MeV and 0.300 MeV.

B. To 0.2 ml of the injection to be examined add 0.2 ml of a solution containing 1 g/l of *ferric chloride R* and 0.1 per cent *V/V* of *hydrochloric acid R* and mix. Compare the colour with that of a solution containing 9 g/l of *benzyl alcohol R* and 7 g/l of *sodium chloride R* treated in the same manner. A yellow colour develops in the test solution only.

TESTS

pH (*2.2.3*)

The pH of the injection is 5.0 to 8.0.

Zinc

To 0.1 ml of the injection to be examined add 0.9 ml of *water R* , 5 ml of *acetate buffer solution pH 4.7 R* , 1 ml of a 250 g/l solution of *sodium thiosulphate R* and 5.0 ml of a dithizone solution prepared as follows: dissolve 10 mg of *dithizone R* in 100 ml of *methyl ethyl ketone R* allow to stand for 5 min, filter and immediately before use dilute the solution to ten times its volume with *methyl ethyl ketone R* . Shake vigorously for 2 min and separate the organic layer. Measure the absorbance (*2.2.25*) of the organic layer at 530 nm, using the organic layer of a blank solution as the compensation liquid. The absorbance is not greater than that of the organic layer obtained with 0.1 ml of *zinc standard solution (5 ppm Zn) R* treated in the same manner.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised gallium-67 solution, apart from any differences attributable to the presence of gallium-66. Gallium-66 has a half-life of 9.4 h and its most prominent gamma photon has an energy of 1.039 MeV. Not more than 0.2 per cent of the total radioactivity is due to gallium-66.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised gallium-67 solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

Indium [^{111} In] Chloride Solution

General Notices

(Ph Eur monograph 1227)

Ph Eur

DEFINITION

Indium (^{111}In) chloride solution is a sterile solution of indium-111 as the chloride in aqueous hydrochloric acid containing no additives. Indium-111 is a radioactive isotope of indium and may be produced by the irradiation of cadmium with protons of suitable energy. The solution contains not less than 90.0 per cent and not more than 110.0 per cent of the declared indium-111 radioactivity at the date and hour stated on the label. Not more than 0.25 per cent of the total radioactivity is due to radionuclides other than indium-111. Not less than 95 per cent of the radioactivity corresponds to indium-111 in the form of ionic indium(III). The method of preparation is such that no carrier is added and the specific radioactivity is not less than 1.85 GBq of indium-111 per microgram of indium.

CHARACTERS

A clear, colourless solution.

Indium-111 has a half-life of 2.8 days and emits gamma radiation and X-rays.

IDENTIFICATION

A. *Carry out the test after allowing sufficient time for short-lived impurities such as indium-110m to decay*. Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised indium-111 solution apart from any differences due to the presence of indium-114m, when measured either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised indium-111 and indium-114m solutions are available from laboratories recognised by the competent authority. The most prominent gamma photons of indium-111 have energies of 0.171 MeV and 0.245 MeV.

B. To 100 µl of *silver nitrate solution R2* add 50 µl of the solution. A white precipitate is formed.

C. It complies with the test for pH (see Tests).

D. Examine the chromatogram obtained in the test for radiochemical purity. The principal peak has an R_F value of 0.5 to 0.8.

TESTS

pH (*2.2.3*)

The pH of the solution is 1.0 to 2.0.

Cadmium

Not more than 0.40 µg/ml, determined by electrothermal atomic absorption spectrometry (*2.2.23, Method I*).

Test solution Dilute 0.05 ml of the solution to be examined to a suitable volume with a suitable concentration of *hydrochloric acid R*.

Reference solutions Prepare the reference solutions using *cadmium standard solution (0.1 per cent Cd) R,* diluted as necessary with the same concentration of *hydrochloric acid R* as in the solution to be examined.

Measure the absorbance at 228.8 nm using a cadmium hollow-cathode lamp as source of radiation.

Copper

Not more than 0.15 µg/ml, determined by electrothermal atomic absorption spectrometry (*2.2.23, Method I*).

Test solution Dilute 0.1 ml the solution to be examined to a suitable volume with a suitable concentration of *hydrochloric acid R.*

Reference solutions Prepare the reference solutions using *copper standard solution (0.1 per cent) R* diluted as necessary with the same concentration of *hydrochloric acid R* as the solution to be examined.

Measure the absorbance at 324.8 nm using a copper hollow-cathode lamp as source of radiation.

Iron

Not more than 0.60 µg/ml, determined by electrothermal atomic absorption spectrometry (*2.2.23, Method I*).

Test solution Dilute 0.1 ml of the solution to be examined to a suitable volume with a suitable concentration of *hydrochloric acid R.*

Reference solutions Prepare the reference solutions using *iron standard solution (0.1 per cent Fe) R* diluted as necessary with the same concentration of *hydrochloric acid R* as the solution to be examined.

Measure the absorbance at 248.3 nm using an iron hollow-cathode lamp as source of radiation.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The solution may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised solution of indium-111 apart from any differences due to the presence of indium-114m.

Indium-114m

Carry out the test after allowing sufficient time for short-lived impurities such as indium-110m to decay. Take a volume equivalent to 30 MBq and record the gamma-ray spectrum using a suitable detector with a shield of lead, 6 mm thick, placed between the sample and the detector. The response in the region corresponding to the 0.558 MeV photon and the 0.725 MeV photon of indium-114m does not exceed that obtained using 75 kBq of a standardised solution of indium-114m (0.25 per cent) measured under the same conditions, when all measurements are calculated with reference to the date and hour of administration. Standardised indium-111 and indium-114m solutions are available from laboratories recognised by the competent authority.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (*2.2.27*) using silica gel as the coating substance on a glass-fibre sheet.

Apply to the plate 5 µl of the solution to be examined. Develop immediately over a path of 15 cm using a 9.0 g/l solution of *sodium chloride R* adjusted to pH 2.3 ± 0.05 with *dilute hydrochloric acid R*. Allow the plate to dry in a current of cold air. Determine the distribution of radioactivity using a suitable detector. Indium-111 chloride migrates with an R_F value of 0.5 to 0.8. Not less than 95 per cent of the total radioactivity of the chromatogram corresponds to indium-111 chloride.

RADIOACTIVITY

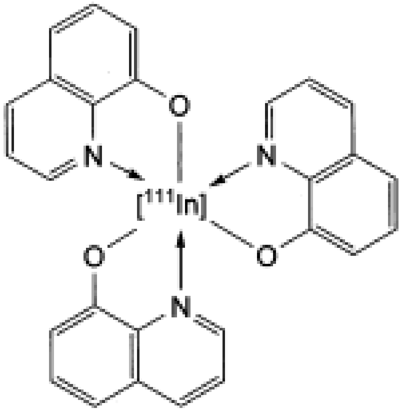
Measure the radioactivity using suitable counting equipment by comparison with a standardised indium-111 solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

Indium [^{111} In] Oxine Solution

General Notices

(Ph Eur monograph 1109)



$C_{27}H_{18}[^{111}In]N_3O_3$ 547.2

Ph Eur

DEFINITION

Indium (^{111}In) oxine solution is a sterile solution of indium-111 in the form of a complex with 8-hydroxyquinoline. It may contain suitable surface active agents and may be made iso-tonic by the addition of sodium chloride and a suitable buffer. Indium-111 is a radioactive isotope of indium and may be produced by the irradiation of cadmium with protons of suitable energy. The solution contains not less than 90.0 per cent and not more than 110.0 per cent of the declared indium-111 radioactivity at the date and hour stated on the label. Not more than 0.25 per cent of the total radioactivity is due to radionuclides other than indium-111. Not less than 90 per cent of the radioactivity corresponds to indium-111 complexed with oxine. The method of preparation is such that no carrier is added and the specific radioactivity is not less than 1.85 GBq of indium-111 per microgram of indium.

CHARACTERS

A clear, colourless solution.

Indium-111 has a half-life of 2.8 days and emits gamma radiation and X-rays.

IDENTIFICATION

A. *Carry out the test after allowing sufficient time for short-lived impurities such as indium-*

110m to decay. Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised indium-111 solution apart from any differences due to the presence of indium-114m, when measured either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised indium-111 and indium-114m solutions are available from laboratories recognised by the competent authority. The most prominent gamma photons of indium-111 have energies of 0.171 MeV and 0.245 MeV.

B. Place 5 mg to 10 mg of *magnesium oxide R* in a glass container of approximately 20 mm in internal diameter. Add 20 µl of the solution to be examined. Examine in ultraviolet light at 365 nm. Bright yellow fluorescence is produced.

C. The distribution of radioactivity between the organic and aqueous phases in the test for radiochemical purity contributes to the identification of the preparation.

TESTS

pH (*2.2.3*)

The pH of the solution is 6.0 to 7.5.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The solution may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised solution of indium-111, apart from any differences due to the presence of indium-114m.

Indium-114m

Carry out the test after allowing sufficient time for short-lived impurities such as indium-110m to decay. Take a volume equivalent to 30 MBq and record the gamma-ray spectrum using a suitable detector with a shield of lead, 6 mm thick, placed between the sample and the detector. The response in the region corresponding to the 0.558 MeV photon and the 0.725 MeV photon of indium-114m does not exceed that obtained using 75 kBq of a standardised solution of indium-114m (0.25 per cent) measured under the same conditions, when all measurements are calculated with reference to the date and hour of administration. (It should be noted that indium (^{111}In) oxine solution is a precursor used in the *in vitro* labelling of white blood cells or platelets prior to their re-injection into the patient. It is not intended for direct administration). Standardised indium-111 and indium-114m solutions are available from laboratories recognised by the competent authority.

RADIOCHEMICAL PURITY

To a silanised separating funnel containing 3 ml of a 9 g/l solution of *sodium chloride R* add 100 µl of the solution to be examined and mix. Add 6 ml of *octanol R* and shake vigorously. Allow the phases to separate and then run the lower layer into a suitable vial for counting. Allow the upper layer to drain completely into a similar vial. Add 1 ml of *octanol R* to the funnel, shake vigorously and drain into the vial containing the organic fraction. Add 5 ml of *dilute hydrochloric acid R* to the funnel, shake vigorously and drain these rinsings into a third vial. Seal each vial and, using a suitable instrument, measure the radioactivity in each. Calculate the radiochemical purity by expressing the radioactivity of the indium-111 oxine complex, found in the organic phase, as a percentage of the radioactivity measured in the three solutions. Not less than 90 per cent of the radioactivity corresponds to indium-111 complexed with oxine.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised indium-111 solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

Indium [^{111} In] Pentetate Injection

General Notices

(Ph Eur monograph 0670)

Ph Eur

DEFINITION

Indium (^{111}In) pentetate injection is a sterile and apyrogenic solution containing indium-111 in the form of indium diethylenetriaminepenta-acetate. It may contain calcium and may be made isotonic by the addition of sodium chloride and a suitable buffer. Indium-111 is a radioactive isotope of indium which may be obtained by proton irradiation, of appropriate energy, of cadmium which may be enriched with cadmium-111 or cadmium-112. The injection contains not less than 90 per cent and not more than 110 per cent of the declared indium-111 radioactivity at the date and hour stated on the label. The radioactivity due to indium-114m is not greater than 0.2 per cent of the total radioactivity at the date and hour of administration. Not less than 95 per cent of the radioactivity corresponds to indium-111 complexed with pentetate.

CHARACTERS

A clear, colourless solution.

Indium-111 has a half-life of 2.8 days and emits gamma radiation and X-rays.

IDENTIFICATION

A. Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised indium-111 solution apart from any differences due to the presence of indium-114m, when measured either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised indium-111 and indium-114m solutions are available from laboratories recognised by the competent authority. The most prominent gamma photons of indium-111 have energies of 0.171 MeV and 0.245 MeV.

B. Examine the chromatogram obtained in the test for radiochemical purity. The distribution of radioactivity contributes to the identification of the preparation.

TESTS

pH (*2.2.3*)

The pH of the injection is 7.0 to 8.0.

Cadmium

Not more than 5.0 µg of Cd per millilitre, determined by atomic absorption spectrometry (*2.2.23, Method II*).

Test solution Mix 0.1 ml of the injection to be examined with 0.9 ml of a mixture of 1 volume of *hydrochloric acid R* and 99 volumes of *water R* .

Reference solutions Prepare the reference solutions using *cadmium standard solution (0.1 per cent Cd) R* and diluting with a mixture of 1 volume of *hydrochloric acid R* and 99 volumes of *water R* .

Measure the absorbance at 228.8 nm using a cadmium hollow-cathode lamp as source of radiation and an air-acetylene flame.

Uncomplexed diethylenetriaminepenta-acetic acid

In a micro test-tube, mix 100 µl of the injection to be examined with 100 µl of a freshly prepared 1 g/l solution of *hydroxynaphthol blue*, *sodium salt R* in *1 M sodium hydroxide* . Add 50 µl of a 0.15 g/l solution of *calcium chloride R* . The solution remains pinkish-violet or changes from blue to pinkish-violet (0.4 mg/ml).

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The injection may be released for use before completion of the test.

Bacterial endotoxins (*2.6.14*)

Less than 14/V IU/ml, V being the maximum recommended dose in millilitres.

RADIONUCLIDIC PURITY

Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised solution of indium-111 apart from any differences due to the presence of indium-114m.

Indium-114m

Retain a sample of the injection to be examined for a sufficient time to allow the indium-111 radioactivity to decay to a sufficiently low level to permit the detection of radionuclidic impurities. Record the gamma-ray spectrum of the decayed material in a suitable instrument calibrated with the aid of a standardised indium-114m solution. Indium-114m has a half-life of 49.5 days and its most prominent gamma photon has an energy of 0.190 MeV. The radioactivity due to indium-114m is not greater than 0.2 per cent of the total radioactivity at the date and hour of administration.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (*2.2.27*) using silica gel as the coating substance on a glass-fibre sheet. Heat the plate at 110 °C for 10 min. Use a plate such that during development the mobile phase migrates over a distance of 10 cm to 15 cm in about 10 min.

Apply to the plate 5 µl to 10 µl of the injection to be examined and allow to dry. Develop over a path of 10 cm to 15 cm using a 9 g/l solution of *sodium chloride R* . Allow the plate to dry in air. Determine the distribution of radioactivity using a suitable detector. Indium pentetate complex migrates near to the solvent front. The radioactivity of the spot corresponding to indium pentetate complex represents not less than 95 per cent of the total radioactivity of the chromatogram.

RADIOACTIVITY

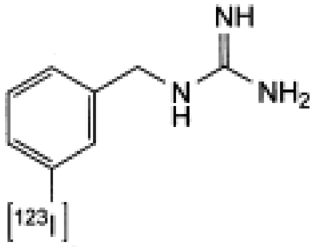
Measure the radioactivity using suitable counting equipment by comparison with a standardised indium-111 solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

Iobenguane [^{123} I] Injection

General Notices

(Ph Eur monograph 1113)



$C_8H_{10}[^{123}I]N_3$

Ph Eur

DEFINITION

Iobenguane (^{123}I) injection is a sterile, bacterial endotoxin-free solution of 1-(3-[^{123}I]iodobenzyl) guanidine or its salts. It may contain a suitable buffer, a suitable labelling catalyst such as ionic copper, a suitable labelling stabiliser such as ascorbic acid and antimicrobial preservatives. Iodine-123 is a radioactive isotope of iodine and may be obtained by proton irradiation of xenon enriched in xenon-124 (not less than 98 per cent) followed by the decay of caesium-123 formed via xenon-123. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared iodine-123 radioactivity at the date and hour stated on the label. Not less than 95 per cent of the radioactivity corresponds to iodine-123 in the form of iobenguane. The specific radioactivity is not less than 10 GBq of iodine-123 per gram of iobenguane base. Not more than 0.35 per cent of the total radioactivity is due to radionuclides other than iodine-123.

CHARACTERS

A clear, colourless or slightly yellow solution.

Iodine-123 has a half-life of 13.2 h and emits gamma radiation and X-rays.

IDENTIFICATION

A. Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-123 solution apart from any differences attributable to the presence of iodine-125, tellurium-121 and other radionuclidic impurities. The most prominent gamma photon of iodine-123 has an energy of 0.159 MeV.

Iodine-125 has a half-life of 59.4 days and emits an X-ray of 0.027 MeV and a photon of 0.035 MeV. Tellurium-121 has a half-life of 19.2 days and the most prominent photons have energies of 0.507 MeV and 0.573 MeV. Standardised iodine-123, iodine-125 and tellurium-121 solutions are available from laboratories recognised by the competent authority.

B. Examine the chromatogram obtained in the test for radiochemical purity. The distribution of the radioactivity contributes to the identification of the preparation.

TESTS

pH (*2.2.3*)

The pH of the solution is 3.5 to 8.0.

Specific radioactivity

The specific radioactivity is calculated from the results obtained in the test for radiochemical purity. Determine the content of iobenguane sulphate from the areas of the peaks corresponding to iobenguane in the chromatograms obtained with the test solution and reference solution (b). Calculate the concentration as iobenguane base by multiplying the result obtained in the assay by 0.85.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The injection may be released for use before completion of the test.

Bacterial endotoxins (*2.6.14*)

Less than 175/V IU/ml, V being the maximum recommended dose in millilitres.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument. Determine the relative amounts of iodine-125, tellurium-121 and other radionuclidic impurities present. No radionuclides with a longer half-life than iodine-125 are detected. For the determination of iodine-125, tellurium-121 and other radionuclidic impurities, retain the solution to be examined for a sufficient time to allow the radioactivity of iodine-123 to decrease to a level that permits the detection of radionuclidic impurities. Record the gamma-ray spectrum and the X-ray spectrum of the decayed material using a suitable instrument. Not more than 0.35 per cent of the total radioactivity is due to radionuclides other than iodine-123. The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by liquid chromatography (*2.2.29*).

Test solution The injection to be examined.

Reference solution (a) Dissolve 0.100 g of *sodium iodide R* in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution (b) Dissolve 10.0 mg of *iobenguane sulphate CRS* in 25 ml of the mobile phase and dilute to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

— a stainless steel column 0.25 m long and 4.0 mm in internal diameter packed with *silica gel for chromatography R* (5 µm),

— as mobile phase at a flow rate of 1.0 ml/min a mixture of 1 volume of an 80 g/l solution of *ammonium nitrate R*, 2 volumes of *dilute ammonia R2* and 27 volumes of *methanol R*,

— a suitable radioactivity detector,

— a spectrophotometer set at 254 nm and provided with a flow-cell,

— a 10 µl loop injector.

Inject the test solution and the reference solutions. Not less than 95 per cent of the radioactivity of the chromatogram is found in the peak corresponding to iobenguane. Not more than 4 per cent of the radioactivity is found in the peak corresponding to iodide and not more than 1 per cent of the radioactivity is found in other peaks.

RADIOACTIVITY

Measure the radioactivity using a suitable counting apparatus by comparison with a standardised iodine-123 solution or by measurement in an instrument calibrated with the aid of such a solution.

STORAGE

Store protected from light.

LABELLING

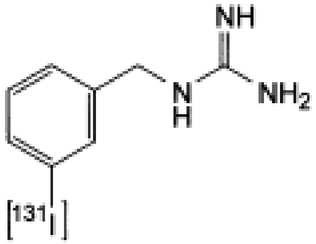
The label states the specific radioactivity expressed in GBq of iodine-123 per gram of iobenguane base.

Ph Eur

Iobenguane [^{131} I] Injection for Diagnostic Use

General Notices

(Ph Eur monograph 1111)



$C_8H_{10}[^{131}I]N_3$

Ph Eur

DEFINITION

Iobenguane (^{131}I) injection for diagnostic use is a sterile, bacterial endotoxin-free solution of 1-(3-[^{131}I]iodobenzyl)guanidine or its salts. It may contain a suitable buffer. It may also contain a suitable labelling catalyst such as ionic copper and a suitable labelling stabiliser such as ascorbic acid. It may contain antimicrobial preservatives. Iodine-131 is a radioactive isotope of iodine and may be obtained by neutron irradiation of tellurium or by extraction of uranium fission products. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared iodine-131 radioactivity at the date and hour stated on the label. Not less than 94 per cent of the radioactivity corresponds to iodine-131 in the form of iobenguane. The specific radioactivity is not less than 20 GBq of iodine-131 per gram of iobenguane base.

CHARACTERS

A clear, colourless or slightly yellow solution.

Iodine-131 has a half-life of 8.04 days and emits beta and gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-131 solution by direct comparison with such a solution. Standardised iodine-131 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of iodine-131 has an energy of 0.365 MeV.

B. Examine the chromatogram obtained in the test for radiochemical purity. The distribution of the radioactivity contributes to the identification of the preparation.

TESTS

pH (*2.2.3*)

The pH of the solution is 3.5 to 8.0.

Specific radioactivity

The specific radioactivity is calculated from the results obtained in the test for radiochemical purity. Determine the content of iobenguane sulphate from the areas of the peaks corresponding to iobenguane in the chromatograms obtained with the test solution and reference solution (b). Calculate the concentration as iobenguane base by multiplying the result obtained in the assay by 0.85.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

Bacterial endotoxins (*2.6.14*)

Less than 175/V IU/ml, V being the maximum recommended dose in millilitres.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-131 solution. Determine the relative amounts of iodine-131, iod-ine-133, iodine-135 and other radionuclidic impurities present. Iodine-133 has a half-life of 20.8 h and its most prominent gamma photons have energies of 0.530 MeV and 0.875 MeV. Iodine-135 has a half-life of 6.55 h and its most prominent gamma photons have energies of 0.527 MeV, 1.132 MeV and 1.260 MeV. Not less than 99.9 per cent of the total radioactivity is due to iodine-131.

RADIOCHEMICAL PURITY

Examine by liquid chromatography (*2.2.29*).

Test solution The injection to be examined.

Reference solution (a) Dissolve 0.100 g of *sodium iodide R* in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution (b) Dissolve 10.0 mg of *iobenguane sulphate CRS* in 25 ml of the mobile phase and dilute to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

— a stainless steel column 0.25 m long and 4.0 mm in internal diameter packed with *silica gel for chromatography R* (5 µm),

— as mobile phase at a flow rate of 1.0 ml/min a mixture of 1 volume of an 80 g/l solution of *ammonium nitrate R*, 2 volumes of *dilute ammonia R2* and 27 volumes of *methanol R*,

— a suitable radioactivity detector,

— a spectrophotometer set at 254 nm and provided with a flow-cell,

— a 10 µl loop injector.

Inject the test solution and the reference solutions. Not less than 94 per cent of the radioactivity of the chromatogram is found in the peak corresponding to iobenguane. Not more than 5 per cent of the radioactivity is found in the peak corresponding to iodide and not more than 1 per cent of the radioactivity is found in other peaks.

RADIOACTIVITY

Measure the radioactivity using a suitable counting apparatus by comparison with a standardised iodine-131 solution or by measurement in an instrument calibrated with the aid of such a solution.

STORAGE

Store protected from light.

LABELLING

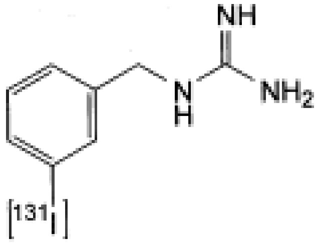
The label states the specific radioactivity expressed in gigabecquerels of iodine-131 per gram of iobenguane base.

Ph Eur

Iobenguane [^{131} I]) Injection for Therapeutic Use

General Notices

(Ph Eur monograph 1112)



$C_8H_{10}[^{131}I]N_3$

Ph Eur

DEFINITION

Iobenguane (^{131}I) injection for therapeutic use is a sterile, bacterial endotoxin-free solution of 1-(3-[^{131}I]iodobenzyl)guanidine or its salts. It may contain a suitable buffer, a suitable labelling catalyst such as ionic copper, a suitable labelling stabiliser such as ascorbic acid and antimicrobial preservatives. Iodine-131 is a radioactive isotope of iodine and may be obtained by neutron irradiation of tellurium or by extraction of uranium fission products. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared iodine-131 radioactivity at the date and hour stated on the label. Not less than 92 per cent of the radioactivity corresponds to iodine-131 in the form of iobenguane. The specific radioactivity is not less than 400 GBq of iodine-131 per gram of iobenguane base.

CHARACTERS

A clear, colourless or slightly yellow solution.

Iodine-131 has a half-life of 8.04 days and emits beta and gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-131 solution by direct comparison with such a solution. Standardised iodine-131 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of iodine-131 has an energy of 0.365 MeV.

B. Examine the chromatogram obtained in the test for radio-chemical purity. The distribution of the radioactivity contributes to the identification of the preparation.

TESTS

pH (*2.2.3*)

The pH of the solution is 3.5 to 8.0.

Specific radioactivity

The specific radioactivity is calculated from the results obtained in the test for radiochemical purity. Iobenguane Sulphate for Radiopharmaceutical Preparations

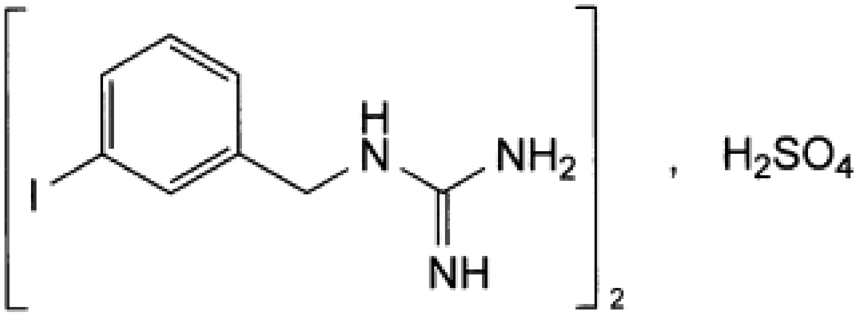
General Notices

(Ph Eur monograph 2351)



$C_{16}H_{20}I_2N_6,H_2SO_4$ 648 *87862-25-7*

Ph Eur

DEFINITION

Bis[(3-iodobenzyl)guanidine] sulphate.

Content

98.0 per cent to 102.0 per cent.

CHARACTERS

Appearance

White or almost white crystals.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison Ph. Eur. reference spectrum of iobenguane sulphate.

B. Dissolve about 10 mg in 1 ml of *water R* with gentle heating. The solution gives reaction (a) of sulphates (*2.3.1*).

TESTS

Related substances

Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use*.

Test solution Dissolve 10.0 mg of the substance to be examined in 1 ml of *ethanol (96 per cent) R* with gentle heating and dilute to 5.0 ml with the same solvent.

Reference solution (a) Dissolve 10.0 mg of *iobenguane sulphate CRS* in 1 ml of *ethanol (96 per cent) R* with gentle heating and dilute to 5.0 ml with the same solvent.

Reference solution (b) Dissolve 23.1 mg of *3-iodobenzylammonium chloride R* (salt of impurity A) in 1 ml of *ethanol (96 per cent) R* with gentle heating and dilute to 10.0 ml with the same solvent.

Reference solution (c) Mix 1 ml of reference solution (a) and 1 ml of reference solution (b).

Reference solution (d) Dilute 0.1 ml of reference solution (b) to 10.0 ml with *ethanol (96 per cent) R.*

Column:

- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *silica gel for chromatography R* (5 µm);
- *temperature*: maintain at a constant temperature between 20 °C and 30 °C.

Mobile phase Mix 40 ml of an 80 g/l solution of *ammonium nitrate R* , 80 ml of *dilute ammonia R2* and 1080 ml *of methanol R* .

Flow rate 1 ml/min.

Detection Spectrophotometer at 254 nm.

Injection 20 µl of the test solution and reference solutions (c) and (d).

Run time 15 min.

Relative retention With reference to iobenguane (retention time = about 7 min): impurity A = about 0.2.

System suitability Reference solution (c):

- *resolution*: minimum 4.0 between the peaks due to iobenguane and impurity A.

Limit:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (1.0 per cent).

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection Test solution and reference solution (a).

Calculate the percentage content of $C_{16}H_{22}I_2N_6O_4S$ from the declared content of *iobenguane sulphate CRS.*

STORAGE

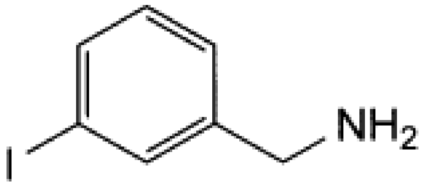
Protected from light, at a temperature below 25 °C.

LABELLING

The label recommends testing the substance in a production test before its use for the manufacture of radiopharmaceutical preparations. This ensures that, under specified production conditions, the substance yields the radiopharmaceutical preparation in the desired quantity and quality specified.

IMPURITIES

Specified impurities A.



A. 1-(3-iodophenyl)methanamine.

Ph Eur

Iodinated [^{125} I] Albumin Injection

General Notices

(Iodinated (^{125}I) Human Albumin Injection, Ph Eur monograph 1922)

Ph Eur

DEFINITION

Sterile, endotoxin-free solution of human albumin labelled with iodine-125. It may contain a suitable buffer and an antimicrobial preservative. The human albumin used complies with the requirements of the monograph on *Human albumin solution (0255).*

Content

90 per cent to 110 per cent of the declared iodine-125 radioactivity at the date stated on the label.

Purity:

— minimum of 99.0 per cent of the total radioactivity corresponds to iodine-125,

— minimum of 80 per cent of the total radioactivity is associated with the albumin fractions II to V,

— maximum of 5 per cent of the total radioactivity corresponds to unbound iodide.

Content of albumin

95 per cent to 105 per cent of the declared albumin content stated on the label.

CHARACTERS

Appearance

Clear, colourless to yellowish solution.

Half-life and nature of radiation of iodine-125

See general chapter *5.7 . Table of physical characteristics of radionuclides*.

IDENTIFICATION

A. Gamma-ray and X-ray spectrometry.

Comparison Standardised iodine-125 solution, or by using a calibrated instrument. Standardised iodine-125 solutions and/or standardisation services are available from the competent authority.

Results The spectrum obtained with the preparation to be examined does not differ significantly from that obtained with a standardised iodine-125 solution, apart from any differences attributable to the presence of iodine-126. The most prominent photon has an energy of 0.027 MeV, corresponding to the characteristic X-ray of tellurium, gamma photons of an energy of 0.035 MeV are also present. Iodine-126 has a half-life of 13.11 days and its most prominent gamma photons have energies of 0.388 MeV and 0.666 MeV.

B. Examine by a suitable immunoelectrophoresis technique (*2.7.1*). Using antiserum to normal human serum, compare normal human serum and the preparation to be examined, both diluted if necessary. The main component of the preparation to be examined corresponds to the main component of the normal human serum. The diluted solution may show the presence of small quantities of other plasma proteins.

TESTS

pH (*2.2.3*)

5.0 to 9.0.

Albumin

Reference solution Dilute *human albumin solution R* with a 9 g/l solution of *sodium chloride R* to a concentration of 5 mg of albumin per millilitre.

To 1.0 ml of the preparation to be examined and to 1.0 ml of the reference solution add 4.0 ml of *biuret reagent R* and mix. After exactly 30 min, measure the absorbance (*2.2.25*) of each solution at 540 nm, using as the compensation liquid a 9 g/l solution of *sodium chloride R* treated in the same manner. From the absorbances measured, calculate the content of albumin in the injection to be examined in milligrams per millilitre.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).*

Bacterial endotoxins (*2.6.14*)

Less than 175/V IU/ml, V being the maximum recommended dose in millilitres.

RADIONUCLIDIC PURITY

Iodine-125

Minimum 99.0 per cent of the total radioactivity.

Gamma-ray and X-ray spectroscopy.

Comparison Standardised solution of iodine-125.

Determine the relative amounts of iodine-125 and iodine-126 present.

RADIOCHEMICAL PURITY

Iodine-125 in albumin fractions II to V, iodine-125 corresponding to unbound iodide

Size-exclusion chromatography (*2.2.30*).

Test solution Mix 0.25 ml of the preparation to be examined with 0.25 ml of the mobile phase. Use immediately after mixing.

Reference solution *Human albumin solution R* or another appropriate human albumin standard diluted with the mobile phase to a suitable albumin concentration.

Column:
- *size: l* = 0.6 m, Ø = 7.5 mm,
- *stationary phase*: *silica gel for size-exclusion chromatography R* ,
- *temperature*: 25 °C.

Mobile phase Dissolve 11.24 g of *potassium dihydrogen phosphate R* , 42.0 g of *disodium hydrogen phosphate R* , 11.70 g of *sodium chloride R* in 2000 ml of *water R* .

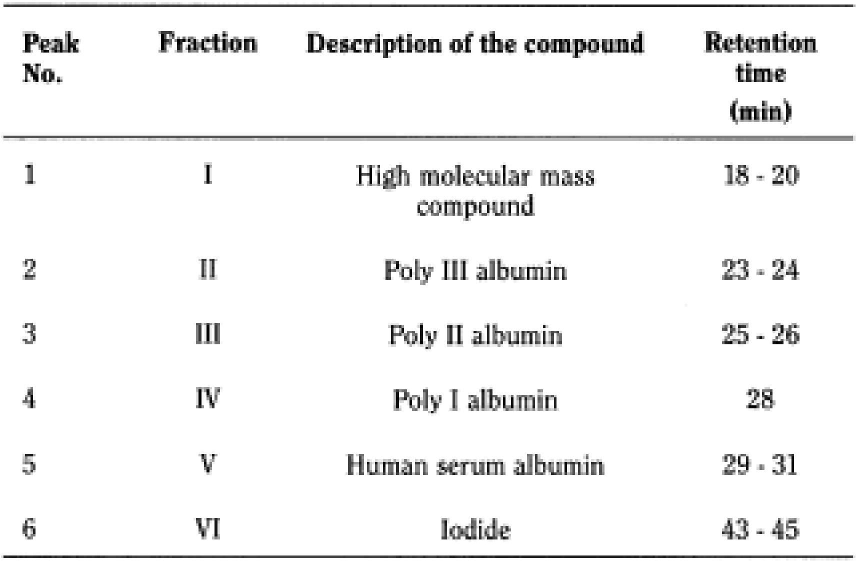
Flow rate 0.6 ml/min.

Detection Spectrophotometer at 280 nm and radioactivity detector set for iodine-125 connected in series.

Injection Loop injector.

Run time 85 min.

Retention times:



Peak No.	Fraction	Description of the compound	Retention time (min)
1	I	High molecular mass compound	18 - 20
2	II	Poly III albumin	23 - 24
3	III	Poly II albumin	25 - 26
4	IV	Poly I albumin	28
5	V	Human serum albumin	29 - 31
6	VI	Iodide	43 - 45

The main peak in the chromatogram obtained with the reference solution corresponds to fraction V.

Limits:
- *radioactivity in fractions II to V*: minimum 80 per cent of the total radioactivity applied to the column,
- *iodine-125 in fraction VI*: maximum 5 per cent of the total radioactivity.

RADIOACTIVITY

Measure the radioactivity using suitable equipment by comparison with a standardised iodine-125 solution or by measurement with a calibrated instrument.

LABELLING

The label states:

— the amount of albumin,

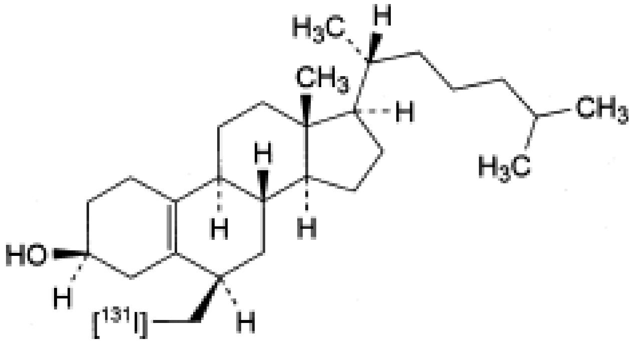
the maximum volume to be injected.

Ph Eur

Iodinated [^{131} I] Norcholesterol Injection

General Notices

(Ph Eur monograph 0939)



Ph Eur

DEFINITION

Iodinated (^{131}I) norcholesterol injection is a sterile, bacterial endotoxin-free solution of 6β-[^{131}I]iodomethyl-19-norcholest-5(10)-en-3β-ol. It may contain a suitable emulsifier such as polysorbate 80 and a suitable antimicrobial preservative such as benzyl alcohol. Iodine-131 is a radioactive isotope of iodine and may be obtained by neutron irradiation of tellurium or by extraction from uranium fission products. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared iodine-131 radioactivity at the date and hour stated on the label. Not less than 85 per cent of the radioactivity corresponds to iodine-131 in the form of 6β-[^{131}I]iodomethyl-19-norcholest-5(10)-en-3β-ol. Not more than 5 per cent of the radioactivity corresponds to iodine-131 in the form of iodide. The specific radioactivity is 3.7 GBq to 37 GBq per gram of 6β-iodomethylnorcholesterol.

CHARACTERS

A clear or slightly turbid, colourless or pale yellow solution.

Iodine-131 has a half-life of 8.04 days and emits beta and gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-131 solution by direct comparison with such a solution. The most prominent photon of iodine-131 has an energy of 0.365 MeV.

Standardised iodine-131 solutions are available from laboratories recognised by the competent authority.

B. Examine the chromatogram obtained in test (a) for radiochemical purity. The distribution of radioactivity contributes to the identification of the preparation.

TESTS

pH (*2.2.3*)

The pH of the solution is between 3.5 and 8.5.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

Bacterial endotoxins (*2.6.14*)

Less than 175/V IU/ml, V being the maximum recommended dose in millilitres.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-131 solution. Determine the relative amounts of iodine-131, iodine-133, iodine-135 and other radionuclidic impurities present. Iodine-133 has a half-life of 20.8 h and its most prominent gamma photons have energies of 0.530 MeV and 0.875 MeV. Iodine-135 has a half-life of 6.55 h and its most prominent gamma photons have energies of 0.527 MeV, 1.132 MeV and 1.260 MeV. Not less than 99.9 per cent of the total radioactivity is due to iodine-131.

RADIOCHEMICAL PURITY

a) Examine by thin-layer chromatography (*2.2.27*) using *silica gel GF* $_{254}$ *R* as the coating substance.

Test solution The injection to be examined.

Carrier solution Dissolve 10 mg of *potassium iodide R*, 20 mg of *potassium iodate R* and 0.1 g of *sodium hydrogen carbonate R* in *distilled water R* and dilute to 10 ml with the same solvent.

Apply to the plate up to 5 µl of the test solution and 10 µl of the carrier solution on the same spot. Develop over a path of 15 cm (about 60 min) using chloroform R. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Determine the distribution of radioactivity using a suitable detector. In the chromatogram obtained, not less than 85 per cent of the total radioactivity is found in the spot corresponding to 6β-iodomethyl-19-norcholest-5(10)-en-3β-ol at an R_F value of about 0.5. Iodide ion remains near the starting-line.

b) Examine by thin-layer chromatography (*2.2.27*) using *silica gel GF* $_{254}$ *R* as the coating substance.

Test solution The injection to be examined.

Carrier solution Dissolve 10 mg *potassium iodide R*, 20 mg of *potassium iodate R* and 0.1 g of *sodium hydrogen carbonate R* in *distilled water R* and dilute to 10 ml with the same solvent.

Apply to the plate 10 µl of the carrier solution and then up to 5 µl of the test solution on the same spot. Develop over a path of 15 cm (about 90 min) using a mixture of equal volumes of *chloroform R* and *ethanol R*. Allow the plate to dry in air. Expose the plate to ultraviolet light at 254 nm for 5 min. A yellow spot corresponding to iodide develops at an R_F value of about 0.5. Determine the distribution of radio- activity using a suitable detector. The main peak of radio-activity is near to the solvent front. Other iodocholesterols migrate near the solvent front. In the chromatogram obtained, not more than 5 per cent of the total radioactivity is found in the spot corresponding to iodide.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised iodine-131 solution or by measurement in an instrument calibrated with the aid of such a solution.

STORAGE

Store protected from light at a temperature not exceeding - 18 °C.

Ph Eur

Krypton [^{81m} Kr] Inhalation Gas

General Notices

(Ph Eur monograph 1533)

Ph Eur

DEFINITION

Krypton (^{81m}Kr) inhalation gas is a mixture of krypton-81m and a suitable vehicle such as air.

Krypton-81m is formed by decay of its parent radionuclide rubidium-81. Rubidium-81 has a half-life of 4.58 h.

The krypton-81m formed is separated from the rubidium-81 with a flow of a suitable gas in a rubidium/krypton generator. Rubidium-81 is produced by proton irradiation of krypton isotopes or by helium-3 or helium-4 irradiation of bromine. After separation of rubidium-81 from the target, it is retained by a suitable support.

Krypton-81m is eluted at a suitable flow rate with a vehicle such as air. The level of moisture required in the eluent depends on the type of generator used. The transport tube for administration has a defined length and inner diameter. The radioactivity concentration is determined before administration.

The radioactivity due to radionuclides other than krypton-81m is not greater than 0.1 per cent, expressed as a percentage of the total radioactivity in the preparation and calculated with reference to the date and time of administration.

CHARACTERS

A clear, colourless gas.

Krypton-81m has a half-life of 13.1 s and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray and X-ray spectrum using a suitable instrument. The gamma photon of krypton-81m has an energy of 0.190 MeV.

B. The half-life is 11.8 s to 14.4 s.

TESTS

RADIONUCLIDIC PURITY

Elute the generator as prescribed. Pass a sufficient amount (2 litres to 10 litres) of eluate at a suitable flow rate through a suitable absorber such as water. Determine the amount of radioactivity eluted. Allow the krypton-81m to decay for 5 min and record the gamma and X-ray spectrum of the residual radioactivity on the absorber using a suitable instrument. Examine the gamma-ray and X-ray spectrum of the absorber for the presence of radioactive impurities, which must be identified and quantified. The absorbed radioactivity is not more than 0.1 per cent of the radioactivity passed through the absorber, calculated with reference to the date and time of administration.

RADIOACTIVITY

Determine the radioactive concentration of the preparation using suitable equipment such as an ionisation chamber or a gamma ray spectrometer. The measurement equipment may be calibrated by reference to a primary calibrated instrument at a laboratory recognised by the competent authority. The radioactivity is measured under defined operating conditions, such as gas flow rate and measurement geometry, that are identical to those used for the calibration of the instrument.

STORAGE

The storage conditions apply to the generator.

LABELLING

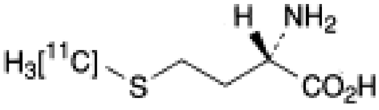
The labelling conditions apply to the generator.

Ph Eur

L-Methionine([^{11} C]-Methyl) Injection

General Notices

(Ph Eur monograph 1617)



Ph Eur

DEFINITION

Sterile solution of (2*S*)-2-amino-4-([^{11}C]methylsulphanyl)butanoic acid for diagnostic use.

Content

90 per cent to 110 per cent of the declared carbon-11 radioactivity at the date and time stated on the label.

Purity:

— minimum of 99 per cent of the total radioactivity corresponds to carbon-11,

— minimum of 95 per cent of the total radioactivity corresponds to carbon-11 in the form of L-[*methyl*-^{11}C]methionine and D-[*methyl*-^{11}C]methionine,

— maximum of 10 per cent of the total radioactivity corresponds to carbon-11 in the form of D-[*methyl*-^{11}C]methionine.

Content of methionine

Maximum of 2 mg per maximum recommended dose in millilitres.

PRODUCTION

RADIONUCLIDE PRODUCTION

Carbon-11 is a radioactive isotope of carbon which is most commonly produced by proton irradiation of nitrogen. Depending on the addition of either trace amounts of oxygen or small amounts of hydrogen, the radioactivity is obtained as [^{11}C]carbon dioxide or [^{11}C]methane.

RADIOCHEMICAL SYNTHESIS

L-[*Methyl*-^{11}C]methionine can be prepared by various chemical synthetic pathways. All methods rely on the alkylation of the sulphide anion of L-homocysteine with [^{11}C]methyl iodide or [^{11}C]methyl triflate. Variations in the procedures used to generate the sulphide anion of L-homocysteine and methods to obtain [^{11}C]methyl iodide lead to negligible differences with respect to quality in terms of specific radioactivity, enantiomeric purity and possible chemical and radiochemical impurities.

Synthesis of [^{11}C]methyl iodide

[^{11}C]Methyl iodide can be obtained either starting from [^{11}C]carbon dioxide or from [^{11}C]methane. The most frequently used method is the reduction of [^{11}C]carbon dioxide with lithium aluminium hydride. The formed [^{11}C]methanol is reacted with hydroiodic acid. Alternatively [^{11}C]methane, either obtained directly in the target or by on-line processes from [^{11}C]carbon dioxide, is reacted with iodine.

Synthesis of [^{11}C]methyl triflate

[^{11}C]methyl triflate can be prepared from [^{11}C]methyl iodide using a silver triflate-impregnated solid support such as graphitised carbon.

Synthesis of L-[*methyl*-^{11}C]methionine

The most widely used method to obtain L-[*methyl*-^{11}C]methionine is the alkylation of the sulphide anion, generated from L-homocysteine thiolactone, with [^{11}C]methyl iodide or [^{11}C]methyl triflate in alkaline conditions in a solvent such as acetone. The L-[*methyl*-^{11}C]methionine obtained can be purified by semi-preparative liquid chromatography. For example, a column packed with octadecylsilyl silica gel for chromatography eluted with a 9 g/l solution of sodium chloride is suitable.

L-Homocysteine thiolactone hydrochloride

Specific optical rotation *(2.2.7)* : + 20.5 to + 21.5, determined on a 10 g/l solution at 25 °C.

Infrared absorption spectrophotometry *(2.2.24)* .

Comparison Ph. Eur. reference spectrum of L -homocysteine thiolactone hydrochloride.

CHARACTERS

Appearance

Clear, colourless solution.

Half-life and nature of radiation of carbon-11

See general chapter *5.7 . Table of physical characteristics of radionuclides.*

IDENTIFICATION

A. Gamma-ray spectrometry.

Results The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. It complies with the test for radionuclidic purity (see Tests).

C. Examine the chromatograms obtained in the test for radiochemical purity.

Results The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (b).

TESTS

pH *(2.2.3)*

4.5 to 8.5.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The injection may be released for use before completion of the test.

Bacterial endotoxins *(2.6.14)*

Less than 175/V IU/ml, *V* being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

CHEMICAL PURITY

Impurity A, impurity B and methionine

Liquid chromatography (2.2.29).

Test solution The preparation to be examined.

Reference solution (a) Dissolve 0.6 mg of *L -homocysteine thiolactone hydrochloride R* , 2 mg of *DL -homocysteine R* and 2 mg of *DL -methionine R* in *water R* and dilute to *V*, *V* being the maximum recommended dose in millilitres.

Reference solution (b) Dissolve 2 mg of *L -methionine R* in the same solvent as used in the test solution and dilute to 10 ml with the same solvent.

Column:

— *size:* *l* = 0.25 m, Ø = 4.6 mm,

— *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm) with a specific surface of 220 m2/g, a pore size of 8 nm and a carbon loading of 6.2 per cent,

— *temperature*: 25 °C.

Mobile phase 1.4 g/l solution of *potassium dihydrogen phosphate R.*

Flow rate 1 ml/min.

Detection Spectrophotometer at 225 nm and radioactivity detector connected in series.

Injection Loop injector.

Run time 10 min.

Relative retention With reference to methionine (retention time = about 2.6 min): impurity B = about 0.8, impurity A = about 2.7.

System suitability Reference solution (a):

— *resolution*: minimum of 2.5 between the peaks due to methionine and impurity B.

Limits Examine the chromatogram obtained with the spectrophotometer:

— *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.6 mg/ *V*),

— *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (2 mg/ *V*),

— *methionine*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (2 mg/ *V*).

Residual solvents *(2.4.24)*

Maximum 50 mg/V for the concentration of acetone, V being the maximum recommended dose in millilitres. The preparation may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Carbon-11

Minimum 99 per cent of the total radioactivity.

A. Gamma-ray spectroscopy.

Comparison Standardised fluorine-18 solution, or by using an instrument calibrated with the aid of such a solution. Standardised fluorine-18 solutions and/or standardisation services are available from the competent authority.

Results The spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised fluorine-18 solution.

B. Half-life: 19.9 min to 20.9 min.

The preparation may be released for use before completion of the test.

RADIOCHEMICAL PURITY

L-[Methyl-^{11}C]methionine and impurity E

Liquid chromatography *(2.2.29)* as described in the test for impurity A, impurity B and methionine.

Injection Test solution and reference solution (b).

Limits Examine the chromatogram obtained with the radioactivity detector:

— *total of* L *-[methyl-* ^{11} *C]methionine and impurity E*: minimum of 95 per cent of the total radioactivity,

— other peaks in the chromatogram may be due to impurity C, impurity D and impurity F.

ENANTIOMERIC PURITY

Impurity E

Thin-layer chromatography *(2.2.27)* .

Test solution The preparation to be examined.

Reference solution (a) Dissolve 2 mg of *L -methionine R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b) Dissolve 4 mg of *DL -methionine R* in *water R* and dilute to 10 ml with the same solvent.

Plate *TLC octadecysilyl silica gel plate for chiral separations R.*

Mobile phase *methanol R* , *water R* (50:50 *V/V*).

Application 2-10 µl.

Development Over a path of 8 cm.

Drying In air for 5 min.

Detection Spray with a 2 g/l solution of *ninhydrin R* in *ethanol R* and heat at 60 °C for 10 min. Determine the distribution of radioactivity using a suitable detector.

Retardation factors L-[*methyl*-^{11}C]methionine = about 0.58; impurity E = about 0.51.

System suitability The chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Limits:

— *total of L -[methyl- ^{11} C]methionine and impurity E*: minimum 95 per cent of the total radioactivity,

— *impurity E*: maximum 10 per cent of the total radioactivity.

The preparation may be released for use before completion of the test.

RADIOACTIVITY

Oxygen [^{15} O]

General Notices

(Ph Eur monograph 1620)

Ph Eur

DEFINITION

Mixture of [^{15}O]oxygen in the gaseous phase and a suitable vehicle such as *Medicinal ai (1238),* for diagnostic use.

Purity:

— minimum 99 per cent of the total radioactivity corresponds to oxygen-15,

— minimum 97 per cent of the total radioactivity corresponds to oxygen-15 in the form of oxygen (O_2).

PRODUCTION

RADIONUCLIDIC PRODUCTION

Oxygen-15 is a radioactive isotope of oxygen which may be produced by various nuclear reactions such as proton irradiation of nitrogen-15 or deuteron irradiation of nitrogen-14.

RADIOCHEMICAL SYNTHESIS

In order to recover oxygen-15 as molecular oxygen from the nitrogen target gas, carrier oxygen is added at concentrations generally ranging from 0.2 per cent *V/V* to 1.0 per cent *V/V*. After irradiation, the target gas is usually passed through activated charcoal and a carbon dioxide scavenger, such as soda lime, before mixing with the vehicle.

CHARACTERS

Appearance

Colourless gas.

Half-life and nature of radiation of oxygen-15

See general chapter *5.7*. Table of physical characteristics of radionuclides.

IDENTIFICATION

A. Gamma spectrometry.

Results The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. It complies with the test for radionuclidic purity (see Tests).

C. Examine the chromatograms obtained in the test for radiochemical purity.

Results The retention times of the principal peaks in the chromatogram obtained with the test gas using the radioactivity detector are similar to those of the principal peaks corresponding to oxygen in the chromatogram obtained with the reference gas using the thermal conductivity detector.

TESTS

The following tests are performed on [^{15}O]oxygen as described under radiochemical synthesis before mixing with the vehicle.

RADIONUCLIDIC PURITY

Oxygen-15

Minimum 99 per cent of the total radioactivity.

A. Gamma spectrometry.

Comparison Standardised fluorine-18 solution, or by using an instrument calibrated with the aid of such a solution. Standardised fluorine-18 solutions and/or standardisation services are available from the competent authority.

Results The spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised fluorine-18 solution.

B. Half-life: 1.9 min to 2.2 min.

The preparation may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Oxygen-15 in the form of O_2

Gas chromatography (*2.2.28*): use the normalisation procedure.

Test sample [^{15}O]oxygen as described under radiochemical synthesis.

Reference gas *nitrogen gas mixture R.*

Column:

— *size:* l = 1.8 m, Ø1 = 6.3 mm and Ø2 = 3.2 mm,

— *stationary phase*: *GC concentrical column R.*

Carrier gas *helium for chromatography R.*

Flow rate 65 ml/min.

Temperature:

- — *column*: 40 °C,
- — *injection port*: 40 °C,
- — *thermal conductivity detector*: 70 °C.

Detection Thermal conductivity detector and radioactivity detector connected in series.

Injection Loop injector.

Run time 10 min.

Retention times Oxygen, nitrogen and carbon monoxide eluting from the inner column = about 0.4 min; carbon dioxide eluting from the inner column = about 0.8 min; oxygen eluting from the outer column = about 2.1 min; nitrogen eluting from the outer column = about 3.1 min; carbon monoxide eluting from the outer column = about 6.2 min.

System suitability Reference gas:

- — 5 clearly separated principal peaks are observed in the chromatogram obtained using the thermal conductivity detector,
- — *resolution*: minimum of 1.5 between the peaks due to carbon dioxide eluting from the inner column and oxygen eluting from the outer column, in the chromatogram obtained using the thermal conductivity detector.

Limits Examine the chromatogram obtained with the radioactivity detector and calculate the percentage content of oxygen-15 substances from the peak areas.

- — *oxygen-15 gas in the form of* O_2: minimum 97 per cent of the total radioactivity,
- — disregard the first peak corresponding to components co-eluting from the inner column.

RADIOACTIVITY

The radioactive concentration is determined before administration.

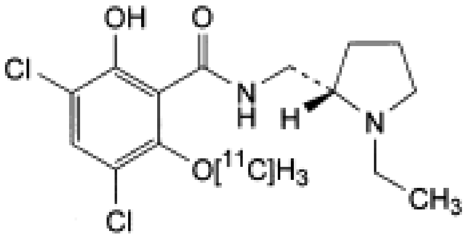
Measure the radioactivity using suitable equipment by comparison with a standardised fluorine-18 solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

Raclopride ([^{11} C]Methoxy) Injection

General Notices

(Ph Eur monograph 1924)



Ph Eur

DEFINITION

Sterile solution of 3,5-dichloro-*N*-[[(2*S*)-1-ethylpyrrolidin-2-yl]methyl]-2-hydroxy-6-([^{11}C] methoxy)benzamide.

Content

90 per cent to 110 per cent of the declared carbon-11 radioactivity at the date and time stated on the label.

Purity:

- — minimum of 99 per cent of the total radioactivity corresponds to carbon-11,
- — minimum of 95 per cent of the total radioactivity corresponds to carbon-11 in the form of [*methoxy*-^{11}C]raclopride.

Content of raclopride

Maximum of 10 µg per maximum recommended dose in millilitres.

PRODUCTION

RADIONUCLIDE PRODUCTION

Carbon-11 is a radioactive isotope of carbon most commonly produced by proton irradiation of nitrogen. Depending on the addition of either trace amounts of oxygen or small amounts of hydrogen, the radioactivity is obtained as [^{11}C]carbon dioxide or [^{11}C]methane, respectively.

RADIOCHEMICAL SYNTHESIS

[*Methoxy*-^{11}C]raclopride may be prepared by *O*-alkylation of the corresponding phenolate anion (*S*)-3,5-dichloro-2,6-dihydroxy-*N*-[(1-ethylpyrrolidin-2-yl)methyl]benzamide with iodo [^{11}C]methane or [^{11}C]methyl trifluoromethanesulphonate.

Synthesis of iodo[^{11}C]methane

Iodo[^{11}C]methane may be produced from [^{11}C]carbon dioxide or from [^{11}C]methane. The most frequently used method is reduction of [^{11}C]carbon dioxide with lithium aluminium hydride. The lithium aluminium [^{11}C]methanolate formed is reacted with hydroiodic acid to iodo[^{11}C] methane via [^{11}C]methanol. Alternatively [^{11}C]methane, either obtained directly in the target or by on-line processes from [^{11}C]carbon dioxide, is reacted with iodine.

Synthesis of [^{11}C]methyl trifluoromethanesulphonate

[^{11}C]Methyl trifluoromethanesulphonate may be prepared from iodo[^{11}C]methane using a solid support such as graphitised carbon impregnated with silver trifluoromethanesulphonate.

Synthesis of [*methoxy*-^{11}C]raclopride

Methylation with iodo[^{11}C]methane is performed under alkaline conditions in a solvent such as dimethyl sulphoxide. The methylation with [^{11}C]methyl trifluoromethanesulphonate is performed in a solvent such as dimethylformamide or acetone. The resulting [*methoxy*-^{11}C] raclopride may be purified by semi-preparative liquid chromatography using, for example, a column packed with octadecylsilyl silica gel for chromatography eluted with a mixture of 25 volumes of acetonitrile and 75 volumes of *0.01 M phosphoric acid*.

PRECURSOR FOR SYNTHESIS

(*S*)-3,5-Dichloro-2,6-dihydroxy-*N*-[(1-ethylpyrrolidin-2-yl)methyl]benzamide hydrobromide

Melting point (*2.2.14*): 211 °C to 213 °C.

Specific optical rotation (*2.2.7*): + 11.3 to + 11.5, determined on a 15.0 g/l solution in *ethanol R* at 22 °C.

CHARACTERS

Appearance

Clear, colourless solution.

Half-life and nature of radiation of carbon-11

See general chapter *5.7. Table of physical characteristics of radionuclides.*

IDENTIFICATION

A. Gamma-ray spectrometry.

Results The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. It complies with test B for radionuclidic purity (see Tests).

C. Examine the chromatograms obtained in the test for radiochemical purity.

Results The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (d).

TESTS

pH (*2.2.3*)

4.5 to 8.5.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

Bacterial endotoxins (*2.6.14*)

Less than 175/V IU/ml, V being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

CHEMICAL PURITY

Raclopride and impurity A

Liquid chromatography (*2.2.29*).

Test solution The preparation to be examined.

Reference solution (a) Dissolve 7.2 mg of *raclopride tartrate R* in *water R* and dilute to 50 ml with the same solvent.

Reference solution (b) Dissolve 1.2 mg of *(S)-3,5-dichloro-2,6-dihydroxy-N-[(1-ethylpyrrolidin-2-yl)methyl]benzamide hydrobromide R* in *methanol R* and dilute to 100 ml with the same solvent.

Reference solution (c) To 0.1 ml of reference solution (a) add 0.1 ml of reference solution (b) and dilute to *V* with *water R*, *V* being the maximum recommended dose in millilitres.

Reference solution (d) Dilute 1.0 ml of reference solution (a) to 10.0 ml with *water R*.

Column:

— *size:* *l* = 0.05 m, Ø = 4.6 mm,

— *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (3.5 µm) with a specific surface area of 175 m^2/g, a pore size of 12.5 nm, a pore volume of 0.7 cm^3/g and a carbon loading of 15 per cent,

— *temperature*: 30 °C.

Mobile phase Dissolve 2 g of *sodium heptanesulphonate R* in 700 ml of *water R,* adjust to pH 3.9 with *phosphoric acid R* and dilute to 1000 ml with *acetonitrile R*.

Flow rate 1 ml/min.

Detection Spectrophotometer at 220 nm and radioactivity detector connected in series.

Injection Loop injector; inject the test solution and reference solutions (b) and (c).

Run time 10 min.

Relative retention With reference to raclopride: impurity A = about 0.46.

System suitability Reference solution (c):

— *resolution*: minimum of 5 between the peaks due to raclopride and to impurity A.

Limits Examine the chromatogram obtained with the spectrophotometer:

— *raclopride*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (10 µg/*V)*,

— *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (1 µg/*V*).

Residual solvents

are limited according to the principles defined in the general chapter (*5.4*), using the general method (*2.4.24*). The preparation may be released for use before completion of the test.

RADIONUCLIDID PURITY

Carbon-11

Minimum 99 per cent of the total radioactivity.

The preparation may be released for use before completion of the test.

A. Gamma-ray spectrometry.

Comparison Standardised fluorine-18 solution, or by using a calibrated instrument. Standardised fluorine-18 solutions and/or standardisation services are available from the competent authority.

Results The spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised fluorine-18 solution.

B. Half-life. 19.9 min to 20.9 min.

RADIOCHEMICAL PURITY

Liquid chromatography (*2.2.29*) as described in the test for raclopride and impurity A with the following modifications.

Injection Test solution and reference solution (d).

Limits Examine the chromatogram obtained with the radioactivity detector:

— *[Methoxy-^{11}C] raclopride*: minimum of 95 per cent of the total radioactivity.

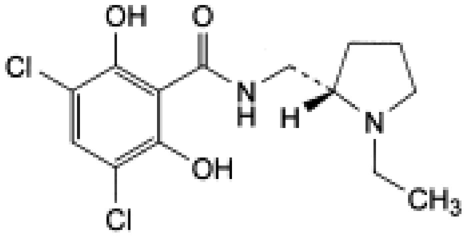
RADIOACTIVITY

Mesure the radioactivity using suitable equipment by comparison with a standardised fluorine-18 solution or by using a calibrated instrument.

LABELLING

The accompanying information specifies the maximum recommended dose in millilitres.

IMPURITIES



A. 3,5-dichloro-*N*-[[(2*S*)-1-ethylpyrrolidin-2-yl]methyl]-2,6-dihydroxybenzamide.

Ph Eur

Radiopharmaceutical Preparations

General Notices

(Ph Eur monograph 0125)

Radiopharmaceutical Preparations comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

DEFINITION

For the purposes of this general monograph, radiopharmaceutical preparations cover:

— radiopharmaceutical: any medicinal product which, when ready for use, contains one or more radionuclides (radioactive isotopes) included for a medicinal purpose,

— radionuclide generator: any system incorporating a fixed parent radionuclide from which is produced a daughter radionuclide which is to be removed by elution or by any other method and used in a radiopharmaceutical preparation,

— kit for radiopharmaceutical preparation: any preparation to be reconstituted and/or combined with radionuclides in the final radiopharmaceutical preparation, usually prior to its administration,

— radiopharmaceutical precursor: any other radionuclide produced for the radio-labelling of another substance prior to administration.

A nuclide is a species of atom characterised by the number of protons and neutrons in its nucleus (and hence by its atomic number Z, and mass number A) and also by its nuclear energy state. Isotopes of an element are nuclides with the same atomic number but different mass numbers. Nuclides containing an unstable arrangement of protons and neutrons will transform spontaneously to either a stable or another unstable combination of protons and neutrons with a constant statistical probability. Such nuclides are said to be radioactive and are called radionuclides. The initial unstable nuclide is referred to as the parent radionuclide and the resulting nuclide as the daughter nuclide.

The radioactive decay or transformation may involve the emission of charged particles, electron capture (EC) or isomeric transition (IT). The charged particles emitted from the nucleus may be alpha particles (helium nucleus of mass number 4) or beta particles (negatively charged, generally called electrons or positively charged, generally called positrons). The emission of charged particles from the nucleus may be accompanied by the emission of gamma rays. Gamma rays are also emitted in the process of isomeric transition. These emissions of gamma rays may be partly replaced by the ejection of electrons known as internal conversion electrons. This phenomenon, like the process of electron capture, causes a secondary emission of X-rays (due to the reorganisation of the electrons in the atom). This secondary emission may itself be partly replaced by the ejection of electrons known as Auger electrons. Radionuclides with a deficit of neutrons may decay by emitting positrons. These radionuclides are called positron emitters. Positrons are annihilated on contact with electrons, the process being accompanied by the emission of usually two gamma photons, each with an energy of 511 keV, generally emitted at 180° to each other, termed annihilation radiation.

The decay of a radionuclide is governed by the laws of probability with a characteristic decay constant and follows an exponential law. The time in which a given quantity of a radionuclide decays to half its initial value is termed the half-life ($T_{1/2}$).

The penetrating power of each radiation varies considerably according to its nature and its energy. Alpha particles are completely absorbed in a thickness of a few micrometers to some tens of micrometers of matter. Beta particles are completely absorbed in a thickness of several millimetres to several centimetres of matter. Gamma rays are not completely absorbed but only attenuated and a tenfold reduction may require, for example, several centimetres of lead. For most absorbents, the denser the absorbent, the shorter the range of alpha and beta particles and the greater the attenuation of gamma rays.

Each radionuclide is characterised by an invariable half-life, expressed in units of time and by the nature and energy of its radiation or radiations. The energy is expressed in electronvolts (eV), kilo-electronvolts (keV) or mega-electronvolts (MeV).

Generally the term "radioactivity" is used to describe the phenomenon of radioactive decay and to express the physical quantity (activity) of this phenomenon. The radioactivity of a preparation is the number of nuclear disintegrations or transformations per unit time.

In the International System (SI), radioactivity is expressed in becquerel (Bq) which is one nuclear transformation per second. Absolute radioactivity measurements require a specialised laboratory but identification and measurement of radiation can be carried out relatively by comparing with standardised preparations provided by laboratories recognised by the competent authority.

Radionuclidic purity

The ratio, expressed as a percentage, of the radioactivity of the radionuclide concerned to the total radioactivity of the radiopharmaceutical preparation. The relevant radionuclidic impurities are listed with their limits in the individual monographs.

Radiochemical purity

The ratio, expressed as a percentage, of the radioactivity of the radionuclide concerned which is present in the radiopharmaceutical preparation in the stated chemical form, to the total radioactivity of that radionuclide present in the radiopharmaceutical preparation. The relevant radiochemical impurities are listed with their limits in the individual monographs.

Chemical purity

In monographs on radiopharmaceutical preparations chemical purity is controlled by specifying limits on chemical impurities.

Isotopic carrier

A stable isotope of the element concerned either present or added to the radioactive preparation in the same chemical form as that in which the radionuclide is present.

Specific radioactivity

The radioactivity of a radionuclide per unit mass of the element or of the chemical form concerned.

Radioactive concentration

The radioactivity of a radionuclide per unit volume.

Total radioactivity

The radioactivity of the radionuclide, expressed per unit (vial, capsule, ampoule, generator, etc).

Starting materials

All the constituents which make up the radiopharmaceutical preparations.

Period of validity

The time during which specifications described in the monograph must be fulfilled. Expiry date and, if necessary, time must be clearly stated.

PRODUCTION

A radiopharmaceutical preparation monograph describes as precisely as possible the method of production of the radionuclide. A radiopharmaceutical preparation contains its radionuclide:

— as an element in atomic or molecular form, e.g. [^{133}Xe], [^{15}O]O_2,

— as an ion, e.g. [^{131}I]iodide, [^{99m}Tc]pertechnetate,

— included in or attached to organic molecules by chelation, e.g. [^{111}In]oxine or by covalent bonding, e.g. 2-[^{18}F]fluoro-2-deoxy-D-glucose.

The practical ways of producing radionuclides for use in, or as radiopharmaceutical preparations are:

— neutron bombardment of target materials (generally in nuclear reactors),

— charged particles bombardment of target materials (in accelerators such as cyclotrons),

— nuclear fission of heavy nuclides of target materials (generally after neutron or particle bombardment),

— from a radionuclide generator.

NEUTRON OR CHARGED PARTICLE BOMBARDMENT

The nuclear reaction and the probability of its occurrence in unit time are dependent on the nature and physical properties of the target material and the nature, energy and quantity of the incident particles.

The nuclear transformation occurring through particle bombardment may be written in the form:

target nucleus (bombarding particle, emitted particle or radiation) produced nucleus.

Examples: $^{58}\text{Fe}(n,\gamma)^{59}\text{Fe}$

$^{18}O(p,n)^{18}F$

In addition to the desired nuclear reaction adventitious transformations may occur. These will be influenced by the energy of the incident particle and the purity of the target material. Such adventitious transformations may give rise to radionuclidic impurities.

NUCLEAR FISSION

A small number of nuclides with a high atomic number are fissionable and the most frequently used reaction is the fission of uranium-235 by neutrons in a nuclear reactor. Iodine-131, molybdenum-99 and xenon-133 may be produced by nuclear fission of uranium-235. Their extraction from a mixture of more than 200 other radionuclides must be carefully controlled in order to minimise the radionuclidic impurities.

RADIONUCLIDE GENERATORS

Radionuclide generator systems use a relatively long-lived parent radionuclide which decays to a daughter radionuclide, usually with a shorter half-life.

By separating the daughter radionuclide from the parent radionuclide by a chemical or physical process, it is possible to use the daughter at a considerable distance from the production site of the generators despite its short half-life.

TARGET MATERIALS

The isotopic composition and purity of the target material will determine the relative percentages of the principal radionuclide and radionuclidic impurities. The use of isotopically enriched target material in which the abundance of the required target nuclide has been artificially increased, can improve the production yield and the purity of the desired radionuclide.

The chemical form, the purity, the physical state and the chemical additives, as well as the bombardment conditions and the direct physical and chemical environment will determine the chemical state and chemical purity of the radionuclides which are produced.

In the production of radionuclides and particularly of short-lived radionuclides it may not be possible to determine any of these quality criteria before further processing and manufacture of radiopharmaceutical preparations. Therefore each batch of target material must be tested in test production runs before its use in routine radionuclide production and manufacture of the radiopharmaceutical preparations, to ensure that under specified conditions, the target yields the radionuclide in the desired quantity and quality specified.

The target material is contained in a holder in gaseous, liquid or solid state, in order to be irradiated by a beam of particles. For neutron bombardment, the target material is commonly contained in quartz ampoules or high purity aluminium or titanium containers. It is necessary to ascertain that no interaction can occur between the container and its contents under the irradiation conditions (temperature, pressure, time).

For charged particle bombardment, the holder for target material is usually built of aluminium or another appropriate metal, with inlet and outlet ports, a surrounding cooling system and usually a thin metal foil target window. The nature and thickness of the target window have a particular influence on the yield of the nuclear reaction and may also affect the radionuclidic purity.

The production procedure clearly describes:

- — target material,
- — construction of the holder for target material,
- — loading of target material into the irradiation system,
- — method of irradiation (bombardment),
- — separation of the desired radionuclide,

and evaluates all effects on the efficiency of the production in terms of quality and quantity of the produced radionuclide.

The chemical state of the isolated radionuclide may play a major role in all further processing.

PRECURSORS FOR SYNTHESIS

Generally, these precursors are not produced on a large scale. Some precursors are synthesised by the radiopharmaceutical production laboratory, others are supplied by specialised producers or laboratories.

Tests for identity, for chemical purity and the assay must be performed by validated procedures.

When batches of precursors are accepted using data from the certificates of analysis, suitable evidence has to be established to demonstrate the consistent reliability of the supplier's analyses and at least one identity test must be conducted. It is recommended to test precursor materials in production runs before their use for the manufacture of radiopharmaceutical preparations, to ensure that under specified production conditions, the precursor yields the radiopharmaceutical preparation in the desired quantity and quality specified.

Performance of the production system

All operations, from the preparation of the target to the dispensing of the final radiopharmaceutical preparation, must be clearly documented including their impact on the purity of the final product and the efficiency of the procedure. Where possible, in-process controls are performed and the results recorded at each production step to identify at which level a possible discrepancy from the normal production pathway may have occurred.

a) The production of radiopharmaceutical preparations may make use of mechanical and automated processes that are used in the pharmaceutical industry, subject to adapting these to the specificity of the radioactive starting material and to the requirements of radioprotection.

b) For radiopharmaceutical preparations containing shortlived radionuclides, such as certain positron emitters, remotely controlled production and automated radiosynthesis are generally used. For radionuclides with a very short half-life (less than 20 min) the control of the performance of the production system is an important measure to assure the quality of the radiopharmaceutical preparation before its release.

c) Any production procedure must be validated in test production runs before its use in routine manufacture of radiopharmaceutical preparations, to ensure that under specified production conditions, the production system yields the radiopharmaceutical preparation in the desired quantity and specified quality.

d) The preparation of the dosage form of the final radiopharmaceutical preparation in the practice of nuclear medicine generally involves limited radioactivity starting from ready-to-use radiopharmaceutical preparations, generators, kits and radioactive precursors. All conditions which may affect the quality of the product (e.g. radiochemical purity and sterility) must be clearly defined and must include appropriate measures for radiation protection.

IDENTIFICATION

Radioactive decay

Radioactivity decays at an exponential rate with a decay constant characteristic of each radionuclide.

The curve of exponential decay (decay curve) is described by the equation:

$$A_t = A_o e^{-\lambda t}$$

A_t = the radioactivity at time t,

A_o = the radioactivity at time $t = 0$,

λ = the decay constant characteristic of each radionuclide,

e = the base of Napierian logarithms.

The half-life ($T_{1/2}$) is related to the decay constant (λ) by the equation:

$$T_{1/2} = \frac{\ln 2}{\lambda} \qquad (\ln 2 \approx 0.693)$$

The radionuclide is generally identified by its half-life or by the nature and energy of its radiation or radiations or by both, as prescribed in the monograph.

Measurement of half-life

The half-life is measured with a suitable detection apparatus such as an ionisation chamber, a Geiger-Müller counter, a scintillation counter (solid crystal, liquid) or a semiconductor detector. The preparation to be tested is used as such or diluted or dried in a capsule after appropriate dilution. The radioactivity chosen, having regard to experimental conditions, must be of a sufficiently high level to allow detection during several estimated half-lives, but not too high to minimise count rate losses, for example due to dead time.

The radioactive source is prepared in a manner that will avoid loss of material during handling. If it is a liquid (solution), it is contained in bottles or sealed tubes. If it is a solid (residue from drying in a capsule), it is protected by a cover consisting of a sheet of adhesive cellulose acetate or of some other material.

The same source is measured in the same geometrical conditions and at intervals usually corresponding to half of the estimated half-life throughout a time equal to about three half-lives. The correct functioning of the apparatus is checked using a source of long half-life and, if necessary, corrections for any changes of the count rate have to be applied (see Measurement of Radioactivity).

A graph can be drawn with time as the abscissa and the logarithm of the relative instrument reading (e.g. count rate) as the ordinate. The calculated half-life differs by not more than 5 per cent from the half-life stated in the Pharmacopoeia, unless otherwise stated.

Determination of the nature and energy of the radiation

The nature and energy of the radiation emitted may be determined by several procedures including the construction of an attenuation curve and the use of spectrometry. The attenuation curve can be used for analysis of electron radiation; spectrometry is mostly used for identification of gamma rays and detectable X-rays.

The *attenuation curve* is drawn for pure electron emitters when no spectrometer for beta rays is available or for beta/gamma emitters when no spectrometer for gamma rays is available. This method of estimating the maximum energy of beta radiation gives only an approximate value. The source, suitably mounted to give constant geometrical conditions, is placed in front of the thin window of a Geiger-Müller counter or a proportional counter. The source is protected as described above. The count rate of the source is then measured. Between the source and the counter are placed, in succession, at least six aluminium screens of increasing mass per unit area within such limits that with a pure beta emitter this count rate is not affected by the addition of further screens. The screens are inserted in such a manner that constant geometrical conditions are maintained. A graph is drawn showing, as the abscissa, the mass per unit area of the screen expressed in milligrams per square centimetre and, as the ordinate, the logarithm of the count rate for each screen examined. A graph is drawn in the same manner for a standardised preparation. The mass attenuation coefficients are calculated from the median parts of the curves, which are practically rectilinear.

The *mass attenuation coefficient* μ_m, expressed in square centimetres per milligram, depends on the energy spectrum of the beta radiation and on the nature and the physical properties of the screen. It therefore allows beta emitters to be identified. It is calculated using the equation:

$$\mu_m = \frac{\ln A_1 - \ln A_2}{m_2 - m_1}$$

m_1 = mass per unit area of the lightest screen,

m_2 = mass per unit area of the heaviest screen, m_1 and m_2 being within the rectilinear part of the curve,

A_1 = count rate for mass per unit area m_1,

A_2 = count rate for mass per unit area m_2.

The mass attenuation coefficient μ_m thus calculated does not differ by more than 10 per cent from the coefficient obtained under identical conditions using a standardised preparation of the same radionuclide.

The range of beta particles is a further parameter which can be used for the determination of the beta energy. It is obtained from the graph described above as the mass per unit area corresponding to the intersection of the extrapolations of the descending rectilinear part of the attenuation curve and the horizontal line of background radioactivity.

Liquid scintillation counting may be used to obtain spectra of α and β^- emitters (see measurement of radioactivity).

Gamma spectrometry is used to identify radionuclides by the energy and intensity of their gamma rays and X-rays.

The preferred detector for gamma and X-ray spectrometry is a germanium semiconductor detector. A thallium-activated sodium iodide scintillation detector is also used but this has a much lower energy resolution.

The gamma detector has to be calibrated using standard sources because the detection efficiency is a function of the energy of the gamma and X-rays as well as the form of the source and the source-to-detector distance. The detection efficiency may be measured using a calibrated source of the radionuclide to be measured or, for more general work, a graph of efficiency against gamma and X-ray energy may be constructed from a series of calibrated sources of various radionuclides.

The gamma and X-ray spectrum of a radionuclide which emits gamma and X-rays is unique to that nuclide and is characterised by the energies and the number of photons of particular energies emitted per transformation from one energy level to another energy level. This property contributes to the identification of radionuclides present in a source and to their quantification. It allows the estimation of the degree of radionuclidic impurity by detecting peaks other than those expected.

It is possible to establish the rate of the decay of radioactivity using gamma spectrometry since the peaks diminish in amplitude as a function of the half-life. If, in such a source, a radioactive impurity with a different half-life is present, it is possible to detect the latter by identification of the characteristic peak or peaks whose amplitudes decrease at a different rate from that expected for the particular radionuclide. A determination of the half-life of the additional peaks by repeated measurements of the sample will help to identify the impurity.

The *Table of physical characteristics of radionuclides mentioned in the European Pharmacopoeia* (*5.7*) summarises the most commonly accepted physical characteristics of radionuclides used in preparations which are the subject of monographs in the European Pharmacopoeia. In addition, the Table states the physical characteristics of the main potential impurities of the radionuclides mentioned in the monographs.

By "transition probability" is meant the probability of the transformation of a nucleus in a given energy state, via the transition concerned. Instead of "probability" the terms "intensity" and "abundance" are frequently used.

By "emission probability" is meant the probability of an atom of a radionuclide giving rise to the emission of the particles or radiation concerned.

Irrespective of whether the one or the other meaning is intended, probability is usually measured in terms of 100 disintegrations.

MEASUREMENT OF RADIOACTIVITY

The radioactivity of a preparation is stated at a given date and, if necessary, time.

The absolute measurement of the radioactivity of a given sample may be carried out if the decay scheme of the radionuclide is known, but in practice many corrections are required to obtain accurate results. For this reason it is common to carry out the measurement with the aid of a primary standard source. Primary standards may not be available for short-lived radionuclides e.g. positron emitters. Measuring instruments are calibrated using suitable standards for the particular radionuclides. Standards are available from the laboratories recognised by the competent authority. Ionisation chambers and Geiger-Müller counters may be used to measure beta and beta/gamma emitters; scintillation or semiconductor counters or ionisation chambers may be used for measuring gamma emitters; low-energy beta emitters require a liquid-scintillation counter. For the detection and measurement of alpha emitters, specialised equipment and techniques are required. For an accurate comparison of radioactive sources, it is essential for samples and standards to be measured under similar conditions.

Low-energy beta emitters may be measured by liquid-scintillation counting. The sample is dissolved in a solution containing one or more often two organic fluorescent substances (primary and secondary scintillators), which convert part of the energy of disintegration into photons of light, which are detected by a photomultiplier and converted into electrical impulses. When using a liquid-scintillation counter, comparative measurements are corrected for light-quenching effects. Direct measurements are made, wherever possible, under similar conditions, (e.g. volumes and type of solutions) for the source to be examined and the standard source.

All measurements of radioactivity must be corrected by subtracting the background due to radioactivity in the environment and to spurious signals generated in the equipment itself.

With some equipment, when measurements are made at high levels of radioactivity, it may be necessary to correct for loss by coincidence due to the finite resolving time of the detector and its associated electronic equipment. For a counting system with a fixed dead time τ following each count, the correction is:

$$N = \frac{N_{obs}}{1 - N_{obs}\tau}$$

N = the true count rate per second,

N_{obs} = the observed count rate per second,

τ = the dead time, in seconds.

With some equipment this correction is made automatically. Corrections for loss by coincidence must be made before the correction for background radiation.

If the time of an individual measurement, t_m is not negligible short compared with the half-life, $T_{1/2}$, the decay during this measurement time must be taken into account. After having corrected the instrument reading (count rate, ionisation current, etc.) for background and, if necessary, for losses due to electronic effects, the decay correction during measurement time is:

$$R_{corr} = \frac{R\dfrac{t_m \ln 2}{T_{1/2}}}{1 - \exp\left(-\dfrac{t_m \ln 2}{T_{1/2}}\right)}$$

R_{corr} = instrument reading corrected to the beginning of the individual measurement,

R = instrument reading before decay correction, but already corrected for background, etc.

The results of determinations of radioactivity show variations which derive mainly from the random nature of nuclear transformation. A sufficient number of counts must be registered in order to compensate for variations in the number of transformations per unit of time. The standard deviation is the square root of the counts, so at least 10 000 counts are necessary to obtain a relative standard deviation of not more than 1 per cent (confidence interval: 1 sigma).

All statements of radioactive content are accompanied by a statement of the date and, if necessary, the time at which the measurement was made. This statement of the radioactive content must be made with reference to a time zone (GMT, CET). The radioactivity at other times may be calculated from the exponential equation or from tables.

The radioactivity of a solution is expressed per unit volume to give the radioactive concentration.

RADIONUCLIDIC PURITY

In most of the cases, to state the radionuclidic purity of a radiopharmaceutical preparation, the identity of every radionuclide present and their radioactivity must be known. The most generally useful method for examination of radionuclidic purity is that of gamma spectrometry. It is not a completely reliable method because alpha- and beta-emitting impurities are not usually easily detectable and, when sodium iodide detectors are employed, the peaks due to gamma emitting impurities are often obscured by the spectrum of the principal radionuclide.

The individual monographs prescribe the radionuclidic purity required (for example, the gamma-ray spectrum does not significantly differ from that of a standardised preparation) and may set limits for specific radionuclidic impurities (for example, cobalt-60 in cobalt-57). While these requirements are necessary, they are not in themselves sufficient to ensure that the radionuclidic purity of a preparation is sufficient for human use. The manufacturer must examine the product in detail and especially must examine preparations of radionuclides of short half-life for impurities of long half-life after a suitable period of decay. In this way, information on the suitability of the manufacturing processes and the adequacy of the testing procedures may be obtained. In cases where two or more positron emitting radionuclides need to be identified and/or differentiated, as e.g. 18F-impurities in 13N-preparations, half-life determinations need to be carried out in addition to gamma spectrometry.

Due to differences in the half-lives of the different radionuclides present in a radiopharmaceutical preparation, the radionuclidic purity changes with time. The requirement of the radionuclidic purity must be fulfilled throughout the period of validity. It is sometimes difficult to carry out these tests before authorising the release for use of the batch when the half-life of the radionuclide in the preparation is short. The test then constitutes a control of the quality of production.

RADIOCHEMICAL PURITY

The determination of radiochemical purity requires separation of the different chemical substances containing the radionuclide and estimating the percentage of radioactivity associated with the declared chemical substance. Radiochemical impurities may originate from:

- radionuclide production,
- subsequent chemical procedures,
- incomplete preparative separation,
- chemical changes during storage.

The requirement of the radiochemical purity must be fulfilled throughout the period of validity.

In principle, any method of analytical separation may be used in the determination of radiochemical purity. For example, the monographs for radiopharmaceutical products may include paper chromatography (*2.2.26*), thin-layer chromatography (*2.2.27*), electrophoresis (*2.2.31*), size-exclusion chromatography (*2.2.30*), gas chromatography (*2.2.28*) and liquid chromatography (*2.2.29*). The technical description of these analytical methods is set out in the monographs. Moreover certain precautions special to radioactivity must also be taken for radiation protection.

In a hospital environment thin-layer and paper chromatography are mostly used. In paper and thin-layer chromatography, a volume equal to that described in the monograph is deposited on the starting-line as prescribed in the general methods for chromatography. It is preferable not to dilute the preparation to be examined but it is important to avoid depositing such a quantity of radioactivity that counting losses by coincidence occur during measurement of the radioactivity. On account of the very small quantities of the radioactive material applied, a carrier may be added when specified in a particular monograph. After development, the support is dried and the positions of the radioactive areas are detected by autoradiography or by measurement of radioactivity over the length of the chromatogram, using suitable collimated counters or by cutting the strips and counting each portion. The positions of the spots or areas permit chemical identification by comparison with solutions of the same chemical substances (non-radioactive) using a suitable detection method.

Radioactivity may be measured by integration using an automatic-plotting instrument or a digital counter. The ratios of the areas under the peaks give the ratios of the radioactive concentration of the chemical substances. When the strips are cut into portions, the ratios of the quantities of radioactivity measured give the ratio of concentrations of the radioactive chemical species.

SPECIFIC RADIOACTIVITY

Specific radioactivity is usually calculated taking into account the radioactive concentration (radioactivity per unit volume) and the concentration of the chemical substance being studied, after verification that the radioactivity is attributable only to the radionuclide (radionuclidic purity) and the chemical species (radiochemical purity) concerned.

Specific radioactivity changes with time. The statement of the specific radioactivity therefore includes reference to a date and, if necessary, time. The requirement of the specific radioactivity must be fulfilled throughout the period of validity.

CHEMICAL PURITY

The determination of chemical purity requires quantification of the individual chemical impurities specified in the monograph.

ENANTIOMERIC PURITY

Where appropriate, the stereoisomeric purity has to be verified.

PHYSIOLOGICAL DISTRIBUTION

A physiological distribution test is prescribed, if necessary, for certain radiopharmaceutical preparations. The distribution pattern of radioactivity observed in specified organs, tissues or other body compartments of an appropriate animal species (usually rats or mice) can be a reliable indication of the expected distribution in humans and thus of the suitability for the intended purpose.

The individual monograph prescribes the details concerning the performance of the test and the physiological distribution requirements which must be met for the radiopharmaceutical preparation. A physiological distribution conforming to the requirements will assure appropriate distribution of the radioactive compounds to the intended biological target in humans and limits its distribution to non-target areas.

In general, the test is performed as follows.

Each of three animals is injected intravenously with the preparation to be tested. If relevant, the species, sex, strain and weight and/or age of the animals is specified in the monograph. The test injection is the radiopharmaceutical preparation as it is intended for human use. Where applicable, products are reconstituted according to the manufacturer's instructions. In some cases, dilution immediately before injection may be necessary.

The administration will normally be made via the intravenous route for which purpose the caudal vein is used. Other veins such as the saphenous, femoral, jugular or penile veins may be used in special cases. Animals showing evidence of extravasation of the injection (observed at the time of injection or revealed by subsequent assay of tissue radioactivity) are rejected from the test.

Immediately after injection each animal is placed in a separate cage which will allow collection of excreta and prevent contamination of the body surface of the animal.

At the specified time after injection, the animals are euthanised by an appropriate method and dissected. Selected organs and tissues are assayed for their radioactivity using a suitable instrument as described elsewhere in this monograph. The physiological distribution is then calculated and expressed in terms of the percentage of the radioactivity which is found in each of the selected organs or tissues. For this purpose the radioactivity in an organ may be related to the injected radioactivity calculated from the radioactive content of the syringe measured before and after injection. For some radiopharmaceutical preparations it may be appropriate to determine the ratio of the radioactivity in weighed samples of selected tissues (radioactivity/mass).

For a preparation to meet the requirements of the test, the distribution of radioactivity in at least two of the three animals must comply with all the specified criteria.

STERILITY

Radiopharmaceutical preparations for parenteral administration must be prepared using precautions designed to exclude microbial contamination and to ensure sterility. The test for sterility is carried out as described in the general method for sterility (*2.6.1*). Special difficulties arise with radiopharmaceutical preparations because of the short half-life of some radionuclides small size of batches and the radiation hazards. It is not always possible to await the results of the test for sterility before authorisation of the release for use of the batch concerned. Parametric release (*5.1.1*) of the product manufactured by a fully validated process is the method of choice in such cases. When aseptic manufacturing is used, the test for sterility has to be executed as a control of the quality of production.

When the size of a batch of the radiopharmaceutical preparation is limited to one or a few samples (e.g. therapeutic or very short-lived radiopharmaceutical preparation), sampling the batch for sterility testing may not be applicable. If the radiopharmaceutical preparation is sterilised by filtration and/or aseptically processed (*5.1.1*) process validation is critical.

When the half-life of the radionuclide is very short (e.g. less than 20 min), the administration of the radiopharmaceutical preparation to the patient is generally on-line with a validated production system.

For safety reasons (high level of radioactivity) it is not possible to use the quantity of the radiopharmaceutical preparations as required in the test for sterility (*2.6.1*). The method by membrane filtration is to be preferred to limit irradiation of personnel.

Notwithstanding the requirements concerning the use of antimicrobial preservatives in *Parenteral preparations (0520)*, their addition to radiopharmaceutical preparations in multidose containers is not obligatory, unless prescribed in the monograph.

BACTERIAL ENDOTOXINS - PYROGENS

For certain radiopharmaceutical preparations a test for bacterial endotoxins is prescribed. The test is carried out as described in the general method (*2.6.14*), taking the necessary precautions to limit irradiation of the personnel carrying out the test.

The limit for bacterial endotoxins is indicated in the individual monograph.

When the nature of the radiopharmaceutical preparation results in an interference by inhibition or activation and it is not possible to eliminate the interfering factor(s), the test for pyrogens (*2.6.8*) may be specifically prescribed.

It is sometimes difficult to carry out these tests before releasing the batch for use when the half-life of the radionuclide in the preparation is short. The test then constitutes a control of the quality of production.

STORAGE

Store in an airtight container in a place that is sufficiently shielded to protect personnel from irradiation by primary or secondary emissions and that complies with national and international regulations concerning the storage of radioactive substances. During storage, containers may darken due to irradiation. Such darkening does not necessarily involve deterioration of the preparations.

Radiopharmaceutical preparations are intended for use within a short time and the end of the period of validity must be clearly stated.

LABELLING

The labelling of radiopharmaceutical preparations complies with the relevant national and European legislation.

The label on the direct container states:

— the name of the preparation and/or its reference,

— the name of the manufacturer,

— an identification number,

— for liquid and gaseous preparations: the total radioactivity in the container, or the radioactive concentration per millilitre at a stated date and, if necessary, time, and the volume of liquid in the container,

— for solid preparations (such as freeze-dried preparations): the total radioactivity at a stated date and, if necessary, time. After reconstitution with the appropriate solution, the preparation is considered as a liquid preparation,

— for capsules: the radioactivity per capsule at a stated date and, if necessary, time and the number of capsules in the container.

The labelling can be adapted in certain cases (e.g. radiopharmaceutical preparations containing short-lived radionuclides).

In addition, the label on the outer package states:

— the route of administration,

— the period of validity or the expiry date,

— the name and concentration of any added antimicrobial preservative,

— where applicable, any special storage conditions.

Ph Eur

Sodium Acetate ([1-^{11} C]) Injection

General Notices

(Ph Eur monograph 1920)

$CH_3{}^{11}COONa$

Ph Eur

DEFINITION

Sterile solution of sodium [1-^{11}C]acetate, in equilibrium with [1-^{11}C]acetic acid.

Content

90 per cent to 110 per cent of the declared carbon-11 radioactivity at the date and time stated on the label.

PRODUCTION

RADIONUCLIDE PRODUCTION

Carbon-11 is a radioactive isotope of carbon which is most commonly produced by proton irradiation of nitrogen. By the addition of trace amounts of oxygen, the radioactivity is obtained as [^{11}C]carbon dioxide.

RADIOCHEMICAL SYNTHESIS

[^{11}C]Carbon dioxide may be separated from the target gas mixture by cryogenic trapping or by trapping on a molecular sieve at room temperature. [^{11}C]Carbon dioxide is then released from the trap using an inert gas such as nitrogen at a temperature higher than the trapping temperature.

[1-^{11}C]Acetate is usually prepared by reaction of [^{11}C]carbon dioxide with methylmagnesium bromide in organic solvents such as ether or tetrahydrofuran.

Hydrolysis of the product yields [1-^{11}C]acetic acid. It is purified by chromatographic procedures. The eluate is diluted with sodium chloride solution.

PRECURSOR FOR SYNTHESIS

Methylmagnesium bromide

The reactivity of methylmagnesium bromide is tested by decomposition of a defined amount with water. The amount of methane released during this reaction is not less than 90 per cent of the theoretical value.

CHARACTERS

Appearance

Clear, colourless solution.

Half-life and nature of radiation of carbon-11

See general chapter *5.7. Table of physical characteristics of radionuclides.*

IDENTIFICATION

A. Gamma-ray spectrometry.

Results The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. It complies with test B for radionuclidic purity (see Tests).

C. Examine the chromatograms obtained in the test for radiochemical purity.

Results The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

TESTS

pH (*2.2.3*)

4.5 to 8.5.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The injection may be released for use before completion of the test.

Bacterial endotoxins (*2.6.14*)

Less than 175/*V* IU/ml, V being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

CHEMICAL PURITY

Acetate

Liquid chromatography (*2.2.29*).

Test solution The preparation to be examined.

Reference solution Dissolve 28 mg of *sodium acetate R* in *water R* and dilute to *V*, *V* being the maximum recommended dose in millilitres.

Column:

- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *strongly basic anion exchange resin for chromatography R* (10 µm);
- *temperature*: 25 °C.

Mobile phase *0.1 M sodium hydroxide* protected from atmospheric carbon dioxide.

Flow rate 1 ml/min.

Detection Spectrophotometer at 220 nm and radioactivity detector connected in series.

Injection Loop injector.

Run time 10 min.

System suitability Reference solution:

- *resolution*: minimum 4.0 between the peaks due to hold-up volume and acetate.

Limit Examine the chromatograms obtained with the spectrophotometer:

- *acetate*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (20 mg per *V*).

Residual solvents

are limited according to the principles defined in the general chapter (*5.4*), using the general method (*2.4.24*). The preparation may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Carbon-11

Minimum 99 per cent of the total radioactivity.

The preparation may be released for use before completion of the tests.

A. Gamma-ray spectrometry.

Comparison Standardised fluorine-18 solution, or by using a calibrated instrument. Standardised fluorine-18 solutions and/or standardisation services are available from laboratories recognised by the competent authority.

Results The spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised fluorine-18 solution.

B. Half-life: 19.9 min to 20.9 min.

RADIOCHEMICAL PURITY

[1-^{11}C]Acetate

Liquid chromatography (*2.2.29*) as described in the test for acetate.

Limit Examine the chromatograms obtained with the spectrophotometer and the radioactivity detector:

- *total of [1-^{11}C]acetate*: minimum 95 per cent of the total radioactivity.

RADIOACTIVITY

Measure the radioactivity using suitable equipment by comparison with a standardised fluorine-18 solution or by measurement with a calibrated instrument.

LABELLING

The accompanying information specifies the maximum recommended dose in millilitres.

Ph Eur

Sodium Chromate [^{51} Cr] Sterile Solution

General Notices

(Ph Eur monograph 0279)

Ph Eur

DEFINITION

Sodium chromate (^{51}Cr) sterile solution is a sterile solution of sodium [^{51}Cr]chromate made isotonic by the addition of sodium chloride. Chromium-51 is a radioactive isotope of chromium and may be prepared by neutron irradiation of chromium, either of natural isotopic composition or enriched in chromium-50. The solution contains not less than 90.0 per cent and not more than 110.0 per cent of the declared chromium-51 radioactivity at the date and hour stated on the label. Not less than 90 per cent of the radioactivity corresponds to chromium-51 in the form of chromate. The specific radioactivity is not less than 370 MBq of chromium-51 per milligram of chromate ion.

CHARACTERS

A clear, colourless or slightly yellow solution.

Chromium-51 has a half-life of 27.7 days and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised chromium-51 solution. Standardised chromium-51 solution are available from laboratories recognised by the competent authority. The gamma photon has an energy of 0.320 MeV.

B. Examine the chromatogram obtained in the test for radiochemical purity. The distribution of radioactivity contributes to the identification of the preparation.

TESTS

pH (*2.2.3*)

The pH of the solution is 6.0 to 8.5.

Total chromate

Not more than 2.7 µg of chromate ion (CrO_4^{2-}) per megabecquerel. Measure the absorbance of the solution (*2.2.25*) at the absorption maximum at 370 nm. Calculate the content of chromate using the absorbance of a standard consisting of a 1.7 mg/l solution of *potassium chromate R* . If necessary, adjust the solution to be examined and the standard to pH 8.0 by adding *sodium hydrogen carbonate solution R.*

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The solution may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised chromium-51 solution.

RADIOCHEMICAL PURITY

Examine by ascending paper chromatography (*2.2.26*).

Apply to the paper a quantity of the solution sufficient for the detection method. Begin the development immediately and develop for 2.5 h using a mixture of 25 volumes of *ammonia R*, 50 volumes of *alcohol R* and 125 volumes of *water R*. Chromic ions remain on the starting line. Determine the distribution of the radioactivity using a suitable detector. Not less than 90 per cent of the total radioactivity of the chromatogram is found in the spot with an R_F value of about 0.9, corresponding to sodium chromate.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised chromium-51 solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

Sodium Fluoride [^{18} F] Injection

General Notices

(Ph Eur monograph 2100)

Ph Eur

DEFINITION

Sterile solution containing fluorine-18 in the form of sodium fluoride. It may contain carrier fluoride and a suitable buffer.

Content

— *fluorine-18*: 90 per cent to 110 per cent of the declared fluorine-18 radioactivity at the date and hour stated on the label,

— *fluoride*: maximum 4.52 mg per maximum recommended dose in millilitres.

PRODUCTION

The radionuclide fluorine-18 is most commonly produced by proton irradiation of water enriched in oxygen-18. Fluorine-18 in the form of fluoride is recovered from the target water, generally by adsorption and desorption from anion-exchange resins or electrochemical deposition and redissolution.

CHARACTERS

Appearance

Clear, colourless solution.

Half-life and nature of radiation of fluorine-18

See *Table of physical characteristics of radionuclides (5.7)*.

IDENTIFICATION

A. Gamma-ray spectrometry.

Results The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. It complies with test B for radionuclidic purity (see Tests).

C. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

Results The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution. In the chromatogram obtained with the reference solution, the peak due to fluoride is negative.

TESTS

pH *(2.2.3)*

5.0 to 8.5.

Fluoride

Liquid chromatography *(2.2.29)* .

Test solution The preparation to be examined.

Reference solution Dissolve 10 mg of *sodium fluoride R* in *water R* and dilute to *V* with the same solvent, *V* being the maximum recommended dose in millilitres.

Column:

— *size*: *l* = 0.25 m, Ø = 4 mm,

— *stationary phase*: *strongly basic anion-exchange resin for chromatography R* (10 µm),

— *temperature*: constant, between 20 °C and 30 °C.

Mobile phase 4 g/l solution of *sodium hydroxide R*, protected from atmospheric carbon dioxide.

Flow rate 1 ml/min.

Detection Spectrophotometer at 220 nm and a radioactivity detector connected in series.

Injection 20 µl.

Run time 15 min.

System suitability Examine the chromatogram obtained with the reference solution using the spectrophotometer:

— *signal-to-noise ratio* : minimum 10 for the principal peak,

— *retention time of fluoride*: minimum 3 times the hold-up time.

Limit Examine the chromatogram obtained with the spectrophotometer:

— *fluoride*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (4.52 mg/*V*).

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)* . The injection may be released for use before completion of the test.

Bacterial endotoxins *(2.6.14)*

Less than 175/*V* IU/ml, *V* being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Fluorine-18

Minimum 99.9 per cent of the total radioactivity.

The preparation may be released for use before completion of the tests.

A. Gamma-ray spectrometry.

Determine the amount of fluorine-18 and radionuclidic impurities with a half-life longer than 2 h. For the detection and quantification of impurities, retain the preparation to be examined for a sufficient time to allow the fluorine-18 to decay to a level which permits the detection of impurities.

Results The spectrum obtained with the preparation to be examined does not differ significantly from that of a background spectrum.

B. Half-life: 105 min to 115 min.

RADIOCHEMICAL PURITY

[^{18}F]fluoride

Liquid chromatography *(2.2.29)* as described in the test for fluoride. If necessary, dilute the test solution with *water R* to obtain a radioactivity concentration suitable for the radioactivity detector.

Limit Examine the chromatogram obtained with the radioactivity detector:

— *[^{18}F]fluoride*: minimum 98.5 per cent of the total radioactivity.

RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

LABELLING

The label states the maximum recommended dose in millilitres.

Ph Eur

Sodium Iodide [^{123} I] Injection

General Notices

(Ph Eur monograph 0563)

Ph Eur

DEFINITION

Sterile solution containing iodine-123 in the form of sodium iodide; it may contain sodium thiosulphate or some other suitable reducing agent and a suitable buffer.

Content

90 per cent to 110 per cent of the declared iodine-123 radioactivity at the date and hour stated on the label.

PRODUCTION

Iodine-123 is obtained by proton irradiation of xenon enriched in xenon-124 (minimum 98 per cent) followed by the decay of xenon-123 which is formed directly and by the decay of caesium-123. No carrier iodide is added.

CHARACTERS

Appearance

Clear, colourless solution.

Half-life and nature of radiation of iodine-123

See general chapter *5.7. Table of physical characteristics of radionuclides.*

IDENTIFICATION

A. Gamma-ray spectrometry.

Results The spectrum obtained with the preparation to be examined does not differ significantly from that of a standardised iodine-123 solution. The most prominent gamma photon has an energy of 0.159 MeV and is accompanied by the principal X-ray of 0.027 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity.

Results The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference

solution (a).

TESTS

pH (*2.2.3*)

7.0 to 10.0.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The preparation may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Iodine-123

Minimum 99.65 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of iodine-123, iodine-125, tellurium-121 and other radionuclidic impurities present. For the detection of tellurium-121 and iodine-125, retain the preparation to be examined for a sufficient time to allow iodine-123 to decay to a level which permits the detection of radionuclidic impurities. No radionuclides with a half-life longer than that of iodine-125 are detected.

The preparation may be released for use before completion of the test.

RADIOCHEMICAL PURITY

[^{123}I]IODIDE

Liquid chromatography (2.2.29).

Test solution Dilute the preparation to be examined with a 2 g/l solution of *sodium hydroxide R* to a radioactive concentration suitable for the detector. Add an equal volume of a solution containing 1 g/l of *potassium iodide R* , 2 g/l of *potassium iodate R* and 10 g/l of *sodium hydrogen carbonate R* and mix.

Reference solution (a) Dilute 1 ml of a 26.2 mg/l solution of *potassium iodide R* to 10 ml with *water R* .

Reference solution (b) Dilute 1 ml of a 24.5 mg/l solution of *potassium iodate R* to 10 ml with *water R* . Mix equal volumes of this solution and reference solution (a).

Column:

— *size:* *l* = 0.25 m, Ø = 4.0 mm,

— *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),

— *temperature*: constant between 20 °C and 30 °C.

Mobile phase Dissolve 5.85 g of *sodium chloride R* in 1000 ml of *water R* , add 0.65 ml of *octylamine R* and adjust to pH 7.0 with *dilute phosphoric acid R* ; add 50 ml of *acetonitrile R* and mix.

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 220 nm and a radioactivity detector connected in series.

Injection 20 µl.

Run time 12 min.

Relative retention With reference to iodide (retention time = about 5 min): iodate = 0.2 to 0.3.

System suitability Reference solution (b):

— *resolution*: minimum 2 between the peaks due to iodide and iodate in the chromatogram recorded with the spectrophotometer.

Limit Examine the chromatogram obtained with the test solution using the radioactivity detector and locate the peak due to iodide by comparison with the chromatogram obtained with reference solution (a) using the spectrophotometer:

— *[^{123}I]iodide*: minimum 95 per cent of the total radioactivity.

RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

LABELLING

The label states any substance added.

IMPURITIES

A. [^{123}I]iodate ion.

Ph Eur

Sodium Iodide [^{123} I] Solution for Radiolabelling

General Notices

(Ph Eur monograph 2314)

Ph Eur

DEFINITION

Strongly alkaline solution containing iodine-123 in the form of sodium iodide.

Content

90 per cent to 110 per cent of the declared iodine-123 radioactivity at the date and hour stated on the label.

PRODUCTION

Iodine-123 is obtained by proton irradiation of xenon highly enriched in xenon-124 followed by the decay of directly formed xenon-123 and by the decay of caesium-123. No carrier iodide or reducing agents are added.

CHARACTERS

Appearance

Clear, colourless solution.

Half-life and nature of radiation of iodine-123

See general chapter *5.7*. *Table of physical characteristics of radionuclides.*

IDENTIFICATION

A. Gamma-ray spectrometry.

Results The most prominent gamma photon of iodine-123 has an energy of 0.159 MeV and is accompanied by the principal X-ray of 0.027 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

Results The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Alkalinity (*2.2.4*)

The solution is strongly alkaline.

RADIONUCLIDIC PURITY

Iodine-123

Minimum 99.7 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of iodine-123, iodine-125, tellurium-121 and other radionuclidic impurities present. For the detection of tellurium-121 and iodine-125, retain the solution to be examined for a sufficient time to allow iodine-123 to decay to a level which permits the detection of radionuclidic impurities. No radionuclides with a half-life longer than that of iodine-125 are detected.

The solution may be released for use before completion of the test.

RADIOCHEMICAL PURITY

$[^{123}I]$iodide

Liquid chromatography (*2.2.29*).

Test solution Dilute the solution to be examined with an equal volume of a solution containing 1 g/l of *potassium iodide R* , 2 g/l of *potassium iodate R* and 10 g/l of *sodium hydrogen carbonate R* and mix. If necessary, first dilute the solution to be examined with a 2 g/l solution of *sodium hydroxide R* to ensure that the final mixture has a radioactivity concentration suitable for the radioactivity detector.

Reference solution (a) Dissolve 10 mg of *potassium iodide R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b) Dissolve 20 mg of *potassium iodate R* in *water R* and dilute to 10 ml with the same solvent. Mix equal volumes of this solution and reference solution (a).

Column:

- *size: l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: constant, between 20 °C and 30 °C.

Use stainless steel tubing.

Mobile phase Dissolve 5.85 g of *sodium chloride R* in 1000 ml of *water R* , add 0.65 ml of *octylamine R* and adjust to pH 7.0 with *dilute phosphoric acid R* ; add 50 ml of *acetonitrile R* and mix.

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 220 nm and a radioactivity detector connected in series.

Injection 20 µl.

Run time 12 min.

Relative retention With reference to iodide (retention time = about 5 min): iodate = 0.2 to 0.3.

System suitability Reference solution (b):

— *resolution*: minimum 2 between the peaks due to iodide and iodate in the chromatogram recorded with the spectrophotometer.

Examine the chromatogram obtained with the test solution using the radioactivity detector and locate the peak due to iodide by comparison with the chromatogram obtained with reference solution (a) using the spectrophotometer.

Limit:
— *[^{123}I]iodide*: minimum 95 per cent of the total radioactivity.

RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

LABELLING

The label states:

— the vehicle and any substance added;

— that the solution is not for direct administration to humans.

IMPURITIES

A. iodine-125,

B. tellurium-121,

C. [^{123}I]iodate ion.

Ph Eur

Sodium Iodide [^{131} I] Capsules for Diagnostic Use

General Notices

(Ph Eur monograph 0938)

Ph Eur

DEFINITION

Capsules for diagnostic use containing iodine-131 in the form of sodium iodide on a solid support; they may contain sodium thiosulphate or some other suitable reducing agents and a suitable buffering substance. A package contains 1 or more capsules.

Content:

— iodine-131: maximum 37 MBq per capsule; the average radioactivity determined in the test for uniformity of content is 90 per cent to 110 per cent of the declared iodine-131 radioactivity at the date and hour stated on the label;

— iodide: maximum 20 µg per capsule.

PRODUCTION

Iodine-131 is obtained by neutron irradiation of tellurium or by extraction from uranium fission products. No carrier iodide is added.

CHARACTERS

Half-life and nature of radiation of iodine-131

See general chapter *5.7*. Table of physical characteristics of radionuclides.

IDENTIFICATION

A. Gamma-ray spectrometry.

Results The spectrum obtained with the preparation to be examined does not differ significantly from that of a standardised iodine-131 solution. The most prominent gamma photon has an energy of 0.365 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity.

Results The principal peak in the radiochromatogram obtained with test solution (b) is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Disintegration

The contents of the capsule dissolve completely within 15 min.

In a water-bath at 37 °C, warm in a small beaker about 20 ml of a 2.0 g/l solution of *potassium iodide R*. Add a capsule to be examined. Stir magnetically at 20 r/min.

Uniformity of content

Determine the radioactivity of each of not fewer than 10 capsules. Calculate the average radioactivity per capsule. The radioactivity of no capsule differs by more than 10 per cent from the average, the relative standard deviation is not greater than 3.5 per cent.

Iodide

Liquid chromatography (*2.2.29*).

Test solution (a) Dissolve a capsule to be examined in 10 ml of *water R*. Filter through a 0.2 µm filter.

Test solution (b) Dissolve a capsule to be examined in *water R*. Filter through a 0.2 µm filter and dilute the filtrate with a 2 g/l solution of *sodium hydroxide R* to a radioactive concentration suitable for the detector. Add an equal volume of a solution containing 1 g/l of *potassium iodide R*, 2 g/l of *potassium iodate R* and 10 g/l of *sodium hydrogen carbonate R* and mix.

Reference solution (a) Dilute 1 ml of a 26.2 mg/l solution of *potassium iodide R* to 10 ml with *water R.*

Reference solution (b) Dilute 1 ml of a 24.5 mg/l solution of *potassium iodate R* to 10 ml with *water R*. Mix equal volumes of this solution and reference solution (a).

Blank solution Prepare a solution containing 2 mg/ml of each constituent stated on the label, apart from iodide.

Column:
- *size:* *l* = 0.25 m, Ø = 4.0 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),
- *temperature*: constant between 20 °C and 30 °C.

Mobile phase Dissolve 5.85 g of *sodium chloride R* in 1000 ml of *water R*, add 0.65 ml of *octylamine R* and adjust to pH 7.0 with *dilute phosphoric acid R*; add 50 ml of *acetonitrile R* and mix.

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 220 nm and radioactivity detector connected in series.

Injection 20 µl of test solution (a), reference solutions (a) and (b) and the blank solution.

Run time 12 min.

Relative retention With reference to iodide (retention time = about 5 min): iodate = 0.2 to 0.3.

System suitability:

— in the chromatogram obtained with the blank solution, none of the peaks has a retention time similar to that of the peak due to iodide,

— *resolution*: minimum 2 between the peaks due to iodide and iodate in the chromatogram obtained with reference solution (b) recorded with the spectrophotometer.

Limit Examine the chromatograms obtained with the spectrophotometer:

— *iodide*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (20 µg/capsule).

RADIONUCLIDIC PURITY

Iodine-131

Minimum 99.9 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of iodine-131, iodine-133, iodine-135 and other radionuclidic impurities present.

RADIOCHEMICAL PURITY

[^{131}I]iodide

Liquid chromatography (*2.2.29*) as described in the test for iodide with the following modifications.

Injection 20 µl of test solution (b) and reference solution (a).

Limit Examine the chromatogram obtained with the test solution using the radioactivity detector and locate the peak due to iodide by comparison with the chromatogram obtained with reference solution (a) using the spectrophotometer:

— *[^{131}I]iodide*: minimum 95 per cent of the total radioactivity.

RADIOACTIVITY

Determine the radioactivity of the package using a calibrated instrument.

LABELLING

The label states any substance added and the number of capsules in the package.

IMPURITIES

A. [^{131}I]iodate ion.

Ph Eur

Sodium Iodide [^{131} I] Capsules for Therapeutic Use

General Notices

(Ph Eur monograph 2116)

Ph Eur

DEFINITION

Capsules for therapeutic use containing iodine-131 in the form of sodium iodide on a solid support; they contain sodium thiosulphate or some other suitable reducing agents and a suitable buffering substance.

Content:

— iodine-131: 90 per cent to 110 per cent of the declared radioactivity at the date and hour stated on the label,

— iodide: maximum 20 µg per capsule.

PRODUCTION

Iodine-131 is obtained by neutron irradiation of tellurium or by extraction from uranium fission products. No carrier iodide is added.

CHARACTERS

Half-life and nature of radiation of iodine-131

See general chapter *5.7. Table of physical characteristics of radionuclides.*

TESTS

Disintegration

The contents of the capsule dissolve completely within 15 min.

In a water-bath at 37 °C, warm in a small beaker about 20 ml of a 2.0 g/l solution of *potassium iodide R* . Add a capsule to be examined. Stir magnetically at a rotation rate of 20 r/min.

Iodide

Liquid chromatography (*2.2.29*).

Test solution (a) Dissolve a capsule to be examined in 10 ml of *water R* . Filter through a 0.2 µm filter.

Test solution (b) Dissolve a capsule to be examined in *water R* . Filter through a 0.2 µm filter and dilute the filtrate with an equal volume of a solution containing 1 g/l of *potassium iodide R* , 2 g/l of *potassium iodate R* and 10 g/l of *sodium hydrogen carbonate R.* If necessary, first dilute the filtrate with a 2 g/l solution of *sodium hydroxide R* to ensure that the final mixture has a radioactivity concentration suitable for the radioactivity detector.

Reference solution (a) Dilute 1.0 ml of a 26.2 mg/l solution of *potassium iodide R* to 10.0 ml with *water R* .

Reference solution (b) Dilute 1 ml of a 24.5 mg/l solution of *potassium iodate R* to 10 ml with *water R* . Mix equal volumes of this solution with reference solution (a).

Blank solution Prepare a solution containing 2 mg/ml of each added substance stated on the label, apart from iodide.

Column:

- *size:* *l* = 0.25 m, Ø = 4.0 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),
- *temperature*: constant, between 20 °C and 30 °C.

Use stainless steel tubing.

Mobile phase Dissolve 5.85 g of *sodium chloride R* in 1000 ml of *water R* , add 0.65 ml of *octylamine R* and adjust to pH 7.0 with *dilute phosphoric acid R* ; add 50 ml of *acetonitrile R* and mix.

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 220 nm and radioactivity detector connected in series.

Injection 20 µl of test solution (a), reference solutions (a) and (b) and the blank solution.

Run time 12 min.

Relative retention With reference to iodide (retention time = about 5 min): iodate = 0.2 to 0.3.

System suitability:

- in the chromatogram obtained with the blank solution, none of the peaks has a retention time similar to that of the peak due to iodide;
- *resolution*: minimum 2 between the peaks due to iodide and iodate in the chromatogram

obtained with reference solution (b) using the spectrophotometer.

Limits Examine the chromatograms obtained with the spectrophotometer; locate the peak due to iodide by comparison with the chromatogram obtained with reference solution (a):

— *iodide*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (20 µg/capsule).

RADIONUCLIDIC PURITY

Iodine-131

Minimum 99.9 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of iodine-130, iodine-131, iodine-133, iodine-135 and other radionuclidic impurities present.

RADIOCHEMICAL PURITY

[^{131}I]iodide

Liquid chromatography (*2.2.29*) as described in the test for iodide with the following modifications.

Injection 20 µl of test solution (b) and reference solution (a).

Limits Examine the chromatogram obtained with test solution (b) using the radioactivity detector and locate the peak due to iodide by comparison with the chromatogram obtained with reference solution (a) using the spectrophotometer:

— *[^{131}I]iodide*: minimum 95 per cent of the total radioactivity.

RADIOACTIVITY

Determine the radioactivity of each capsule using a calibrated instrument.

LABELLING

The label states any substance added.

IMPURITIES

A. [^{131}I]iodate ion,

Sodium Iodide [^{131} I] Solution For Radiolabelling

General Notices

(Ph Eur monograph 2121)

Ph Eur

DEFINITION

Strongly alkaline solution containing iodine-131 in the form of sodium iodide. It does not contain a reducing agent.

Content

90 per cent to 110 per cent of the declared iodine-131 radioactivity at the date and hour stated on the label.

PRODUCTION

Iodine-131 may be obtained by neutron irradiation of tellurium or by extraction from uranium fission products. No carrier iodide is added.

CHARACTERS

Appearance

Clear, colourless solution.

Half-life and nature of radiation of iodine-131

See *Table of physical characteristics of radionuclides (5.7)*.

IDENTIFICATION

A. Gamma-ray spectrometry.

Results The spectrum obtained with the preparation to be examined does not differ significantly from that of a standardised iodine-131 solution. The most prominent gamma photon of iodine-131 has an energy of 0.365 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

Results The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Alkalinity *(2.2.4)*

The preparation is strongly alkaline.

RADIONUCLIDIC PURITY

Iodine-131

Minimum 99.9 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of iodine-130, iodine-131, iodine-133, iodine-135 and other radionuclidic impurities present.

RADIOCHEMICAL PURITY

[^{131}I]iodide

Liquid chromatography *(2.2.29)* .

Test solution Dilute the preparation to be examined with an equal volume of a solution containing 1 g/l of *potassium iodide R*, 2 g/l of *potassium iodate R* and 10 g/l of *sodium hydrogen carbonate R* and mix. If necessary, first dilute the preparation to be examined with a 2 g/l solution of *sodium hydroxide R* to ensure that the final mixture has a radioactivity concentration suitable for the radioactivity detector.

Reference solution (a) Dissolve 10 mg of *potassium iodide R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b) Dissolve 20 mg of *potassium iodate R* in *water R* and dilute to 10 ml with the same solvent. Mix equal volumes of this solution and reference solution (a).

Column:
- *size*: *l* = 0.25 m, Ø = 4.0 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),
- *temperature*: constant, between 20 °C and 30 °C.

Use stainless steel tubing.

Mobile phase Dissolve 5.85 g of *sodium chloride R* in 1000 ml of *water R*, add 0.65 ml of *octylamine R* and adjust to pH 7.0 with *dilute phosphoric acid R*; add 50 ml of *acetonitrile R* and mix.

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 220 nm and a radioactivity detector connected in series.

Injection 20 µl.

Run time 12 min.

Relative retention with reference to iodide (retention time = about 5 min): iodate = 0.2 to 0.3.

System suitability Reference solution (b):

- *resolution*: minimum 2 between the peaks due to iodide and iodate in the chromatogram recorded with the spectrophotometer.

Limit Examine the chromatogram obtained with the radioactivity detector:

- *[^{131}I]iodide*: minimum 95 per cent of the total radioactivity.

RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

LABELLING

The label states:

- the method of production of iodine-131,
- the vehicle and any substance added,
- that the preparation is not for direct human use.

IMPURITIES

A. [^{131}I]iodate ion.

Ph Eur

Sodium Iodide [^{131} I] Solution

General Notices

(Ph Eur monograph 0281)

Ph Eur

DEFINITION

Solution containing iodine-131 in the form of sodium iodide and also sodium thiosulphate or some other suitable reducing agent. It may contain a suitable buffer.

Content:

— *iodine-131*: 90 per cent to 110 per cent of the declared radioactivity at the date and hour stated on the label,

— *iodide*: maximum 20 µg in the maximum recommended dose in millilitres.

PRODUCTION

Iodine-131 is a radioactive isotope of iodine and may be obtained by neutron irradiation of tellurium or by extraction from uranium fission products. No carrier iodide is added.

CHARACTERS

Appearance

Clear, colourless solution.

Half-life and nature of radiation of iodine-131

See general chapter *5.7. Table of physical characteristics of radionuclides.*

IDENTIFICATION

A. Gamma-ray spectrometry.

Results The spectrum obtained with the preparation to be examined does not differ significantly from that of a standardised iodine-131 solution. The most prominent gamma photon has an energy of 0.365 MeV.

B. Examine the chromatograms obtained in the test for iodide.

Results The principal peak in the radiochromatogram obtained with test solution (a) is similar in retention time to the principal peak in the chromatogram obtained with reference

solution (a).

TESTS

pH (*2.2.3*)

7.0 to 10.0.

Sterility

If intended for parenteral use, it complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The solution may be released for use before completion of the test.

Iodide

Liquid chromatography (*2.2.29*).

Test solution (a) The preparation to be examined.

Test solution (b) Dilute the preparation to be examined with *0.05 M sodium hydroxide* until the radioactivity is equivalent to about 74 MBq/ml. Add an equal volume of a solution containing 1 g/l of *potassium iodide R*, 2 g/l of *potassium iodate R* and 10 g/l of *sodium hydrogen carbonate R* and mix.

Reference solution (a) Dilute 1 ml of a 26.2 mg/l solution of *potassium iodide R* to *V* with *water R*, *V* being the maximum recommended dose in millilitres.

Reference solution (b) Dilute 1 ml of a 24.5 mg/l solution of *potassium iodate R* to *V* with *water R*, *V* being the maximum recommended dose in millilitres. Mix equal volumes of this solution and of reference solution (a).

Blank solution Prepare a solution containing 2 mg/ml of each of the components stated on the label, apart from iodide.

Column:

- *size:* *l* = 0.25 m, Ø = 4.0 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),
- *temperature*: maintain at a constant temperature between 20 °C and 30 °C.

Use stainless steel tubing.

Mobile phase Dissolve 5.844 g of *sodium chloride R* in 1000 ml of *water R*, add 650 µl of *octylamine R* and adjust to pH 7.0 with *phosphoric acid R*; add 50 ml of *acetonitrile R* and mix.

Flow rate 1.5 ml/min.

Detection Spectrophotometer at 220 nm and radioactivity detector connected in series.

Injection 25 µl; inject test solution (a), the blank solution and reference solutions (a) and (b).

Run time 12 min.

Relative retention With reference to iodide (retention time = about 5 min): iodate = 0.2 to 0.3.

System suitability:

- in the chromatogram obtained with the blank solution, none of the peaks shows a retention time similar to that of the peak due to iodide,
- *resolution*: minimum 2 between the peaks due to iodide and iodate in the chromatogram obtained with reference solution (b) recorded with the spectrophotometer.

Limit Examine the chromatogram obtained with the spectrophotometer; locate the peak due to iodide by comparison with the chromatogram obtained with reference solution (a):

- *iodide*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a).

RADIONUCLIDIC PURITY

Iodine-131

Minimum 99.9 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of iodine-131, iodine-133, iodine-135 and other radionuclidic impurities present.

RADIOCHEMICAL PURITY

[^{131}I]Iodide

Liquid chromatography (*2.2.29*) as described in the test for iodide with the following modification.

Injection Test solution (b).

Limit Examine the chromatogram obtained with the radioactivity detector:

- *[^{131}I]iodide*: minimum 95 per cent of the total radioactivity.

RADIOACTIVITY

Measure the radioactivity using suitable equipment by comparison with a standardised iodine-131 solution or by using a calibrated instrument.

LABELLING

The label states:

- any substance added,
- the maximum recommended dose, in millilitres,
- where applicable, that the preparation is suitable for use in the manufacture of parenteral dosage forms.

IMPURITIES

A. [131I]iodate ion.

Ph Eur

Sodium Iodohippurate [^{123} I] Injection

General Notices

(Ph Eur monograph 0564)

Ph Eur

DEFINITION

Sodium iodohippurate (^{123}I) injection is a sterile solution of sodium (2-[^{123}I]iodobenzamido) acetate. It may contain a suitable buffer and a suitable antimicrobial preservative such as benzyl alcohol. Iodine-123 is a radioactive isotope of iodine and may be obtained by proton irradiation of xenon enriched in xenon-124 (not less than 98 per cent) followed by the decay of caesium-123 formed via xenon-123. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared iodine-123 radioactivity at the date and hour stated on the label. Not less than 96 per cent of the radioactivity corresponds to iodine-123 in the form of sodium 2-iodohippurate. The specific radioactivity is 0.74 GBq to 10.0 GBq of iodine-123 per gram of sodium 2-iodohippurate. Not more than 0.35 per cent of the total radioactivity is due to radionuclides other than iodine-123.

CHARACTERS

A clear, colourless liquid.

Iodine-123 has a half-life of 13.2 h and emits gamma radiation and X-rays.

IDENTIFICATION

A. Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-123 solution apart from any differences attributable to the presence of iodine-125, tellurium-121 and other radionuclidic impurities. Standardised iodine-123, iodine-125 and tellurium-121 solutions are available from laboratories recognised by the national authorities. The most prominent gamma photon of iodine-123 has an energy of 0.159 MeV and is accompanied by an X-ray of 0.027 MeV. Iodine-125 has a half-life of 59.4 days and emits an X-ray of 0.027 MeV and a photon of 0.035 MeV. Tellurium-121 has a half-life of 19.2 days and the most prominent photons have energies of 0.507 MeV and 0.573 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity. The spot corresponding to the main peak of radioactivity in the chromatogram obtained with the test solution is similar in position to the spot corresponding to 2-iodohippuric acid in the chromatogram obtained with the reference solution.

TESTS

pH (*2.2.3*)

The pH of the solution is 3.5 to 8.5.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument. Determine the relative amounts of iodine-125, tellurium-121 and other radionuclidic impurities present. No radionuclides with longer half lives than iodine-125 are detected. For the determination of iodine-125, tellurium-121 and other radionuclidic impurities, retain the solution to be examined for a sufficient time to allow the radioactivity of iodine-123 to decrease to a level which permits the detection of radionuclidic impurities. Record the gamma-ray spectrum and X-ray spectrum of the decayed material using a suitable instrument. Not more than 0.35 per cent of the total radioactivity is due to radionuclides other than iodine-123. The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (*2.2.27*) using *silica gel GF* $_{254}$ *R* as the coating substance.

Test solution Dissolve 1 g of *potassium iodide R* in 10 ml of *water R*, add 1 volume of this solution to 10 volumes of the injection to be examined and use within 10 min of mixing. If necessary, dilute with the reference solution (carrier) to give a radioactive concentration sufficient for the detection method, for example 3.7 MBq per millilitre.

Reference solution (carrier) Dissolve 40 mg of *2-iodohippuric acid R* and 40 mg of *2-iodobenzoic acid R* in 4 ml of *0.1 M sodium hydroxide*, add 10 mg of *potassium iodide R* and dilute to 10 ml with *water R.*

Apply separately to the plate 10 µl of each solution. Develop over a path of 12 cm (about 75 min) using a mixture of 1 volume of *water R*, 4 volumes of *glacial acetic acid R*, 20 volumes of *butanol R* and 80 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatogram obtained with the reference solution shows a spot corresponding to 2-iodohippuric acid and nearer to the solvent front a spot corresponding to 2-iodobenzoic acid. Iodide ion remains near the starting-line. Determine the distribution of radioactivity using a suitable detector. In the chromatogram obtained with the test solution, not less than 96 per cent of the total radioactivity is found in the spot corresponding to 2-iodohippuric acid and not more than 2 per cent of the total radioactivity is found in either of the spots corresponding to 2-iodobenzoic acid and to iodide ion.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised iodine-123 solution or by measurement in an instrument calibrated with the aid of such a solution.

STORAGE

Store protected from light.

LABELLING

The label states whether or not the preparation is suitable for renal plasma-flow studies.

Ph Eur

Sodium Iodohippurate [^{131} I] Injection

General Notices

(Ph Eur monograph 0282)

Ph Eur

DEFINITION

Sodium iodohippurate (^{131}I) injection is a sterile solution of sodium 2-(2-[^{131}I]iodobenzamido) acetate. It may contain a suitable buffer and a suitable antimicrobial preservative such as benzyl alcohol. Iodine-131 is a radioactive isotope of iodine and may be obtained by neutron irradiation of tellurium or by extraction from uranium fission products. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared iodine-131 radioactivity at the date and hour stated on the label. Not less than 96 per cent of the iodine-131 is in the form of sodium 2-iodohippurate. The specific radioactivity is 0.74 GBq to 7.4 GBq of iodine-131 per gram of sodium 2-iodohippurate.

CHARACTERS

A clear, colourless liquid.

Iodine-131 has a half-life of 8.04 days and emits beta and gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-131 solution. Standardised iodine-131 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of iodine-131 has an energy of 0.365 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity. The main peak of radioactivity in the chromatogram obtained with the test solution is similar in position to the spot corresponding to 2-iodohippuric acid in the chromatogram obtained with the reference solution.

TESTS

pH (*2.2.3*)

The pH of the injection is 6.0 to 8.5.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)* . The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-131 solution. Determine the relative amounts of iodine-131, iodine-133, iodine-135 and other radionuclidic impurities present. Iodine-133 has a half-life of 20.8 h and its most prominent gamma photons have energies of 0.530 MeV and 0.875 MeV. Iodine-135 has a half-life of 6.55 h and its most prominent gamma photons have energies of 0.527 MeV, 1.132 MeV and 1.260 MeV. Not less than 99.9 per cent of the total radioactivity is due to iodine-131.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (*2.2.27*) using *silica gel GF$_{254}$ R* as the coating substance.

Test solution Dissolve 1 g of *potassium iodide R* in 10 ml of *water R*, add 1 volume of this solution to 10 volumes of the injection to be examined and use within 10 min of mixing. If necessary dilute with the reference solution (carrier) to give a radioactive concentration sufficient for the detection method, for example 3.7 MBq per millilitre.

Reference solution (carrier) Dissolve 40 mg of *2-iodohippuric acid R* and 40 mg of *2-iodobenzoic acid R* in 4 ml of *0.1 M sodium hydroxide*, add 10 mg of *potassium iodide R* and dilute to 10 ml with *water R.*

Apply separately to the plate 10 µl of each solution. Develop over a path of 12 cm (about 75 min) using a mixture of 1 volume of *water R,* 4 volumes of *glacial acetic acid R*, 20 volumes of *butanol R* and 80 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatogram obtained with the reference solution shows a spot corresponding to 2-iodohippuric acid and nearer to the solvent front a spot corresponding to 2-iodobenzoic acid. Iodide ion remains near the starting-line. Determine the distribution of radioactivity using a suitable detector. In the chromatogram obtained with the test solution, not less than 96 per cent of the total radioactivity is found in the spot corresponding to 2-iodohippuric acid and not more than 2 per cent of the total radioactivity is found in either of the spots corresponding to 2-iodobenzoic acid and to iodide ion.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised iodine-131 solution or by measurement in an instrument calibrated with the aid of such a solution.

STORAGE

Store protected from light.

LABELLING

The label states that the preparation is not necessarily suitable for renal plasma-flow studies.

Ph Eur

Sodium Molybdate [^{99} Mo] Solution (Fission)

General Notices

(Ph Eur monograph 1923)

Ph Eur

DEFINITION

Alkaline solution of sodium [^{99}Mo]molybdate obtained by extraction of fission products of uranium-235. It may contain stabilisers.

Content

90 per cent to 110 per cent of the declared molybdenum-99 radioactivity at the date and time stated on the label.

PRODUCTION

Molybdenum-99 is usually produced by fission of uranium enriched in uranium-235, which is caused by the absorption of a thermal neutron, resulting in high-specific-activity molybdenum-99. By the fission of uranium after neutron capture, more than 200 different radionuclides are produced. In approximately 6 per cent of the fissions, molybdenum-99 is formed after decay of a number of short-lived parent radionuclides. After dissolution of the target, the molybdenum-99 is separated from the mixture of nuclides and purified by using chromatographic processes in order to obtain molybdenum-99 with a high level of radionuclidic purity.

CHARACTERS

Appearance

Clear, colourless or almost colourless solution.

Half-life and nature of radiation of molybdenum-99

See general chapter *5.7. Table of physical characteristics of radionuclides.*

IDENTIFICATION

A. Gamma-ray spectrometry.

Results The most prominent gamma photon of molybdenum-99 has an energy of 0.740 MeV; a peak with an energy of 0.141 MeV, due to technetium-99-m is also visible.

B. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

Results The principal peak in the radiochromatogram obtained with the test solution has a similar retardation factor to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Solution S

Dilute the preparation to be examined to a radioactivity concentration of approximately 370 MBq/ml with a 2.42 g/l solution of *sodium molybdate R* .

Alkalinity

The preparation is alkaline (*2.2.4*).

RADIONUCLIDIC PURITY

Iodine-131, ruthenium-103 and tellurium-132:

— *iodine-131*: maximum 5×10^{-3} per cent of the total radioactivity;

— *ruthenium-103*: maximum 5×10^{-3} per cent of the total radioactivity;

— *tellurium-132*: maximum 5×10^{-3} per cent of the total radioactivity.

The following method has been found to be suitable; other validated methods, approved by the competent authority, may be used.

Gamma-ray spectrometry.

Condition a column with an internal volume of approximately 1.5 ml of *strongly basic anion exchange resin R* with a mixture of equal volumes of *glacial acetic acid R* and *water R* . All elutions of the column are made at a flow rate not exceeding 1 ml/min.

Test solution In a test-tube, successively add, with mixing, 1 ml of a 24.2 g/l solution of *sodium molybdate R* , 0.5 ml of *strong hydrogen peroxide solution R* , 2.5 ml of *glacial acetic acid R* , 1.0 ml of *iodine-123 and ruthenium-106 spiking solution R* and 1.0 ml of solution S. Allow to stand for 30 min at room temperature.

Reference solution Mix 1.0 ml of *iodine-123 and ruthenium-106 spiking solution R* and 4.0 ml of *water R.*

Apply the test solution to the column and elute. Just before the disappearance of the liquid from the top of the column, add 6 ml of a mixture of equal volumes of *glacial acetic acid R* and *water R* and elute. Transfer 5.0 ml of the combined eluates to a counting tube. Determine the radioactivity of iodine-123, iodine-131, ruthenium-103, ruthenium-106 and iodine-132 at the gamma-ray energies of 0.159 MeV for iodine-123, 0.365 MeV for iodine-131, 0.497 MeV for ruthenium-103, 0.512 MeV for ruthenium-106 and 0.668 MeV for iodine-132. Determine in the same way the radioactivity of iodine-123 and ruthenium-106 in the reference solution and calculate the recovery of iodine-123 and ruthenium-106 in the combined eluates.

Calculate the radioactivity of iodine-131, iodine-132 and ruthenium-103 in the combined eluates, taking into account the recovery, the fraction of eluate used, the counting efficiency and the radioactive decay. From the radioactivity of iodine-132 (daughter radionuclide of tellurium-132), calculate the radioactivity of tellurium-132, taking into account the time of the test and the time of separation of molybdenum-99.

Total radioactivity due to strontium-89 and strontium-90

Maximum 6 × 10^{-5} per cent of the total radioactivity.

The following method has been found to be suitable; other validated methods, approved by the competent authority, may be used.

Liquid scintillation spectrometry.

Connect 2 columns, each with an internal volume of approximately 1.5 ml of *strongly basic anion exchange resin R*, in series and condition the columns with 10 ml of a 4 g/l solution of *sodium hydroxide R*. All elutions of the columns are made at a flow rate not exceeding 1 ml/min.

Test solution In a test-tube, successively add, with mixing, 1.0 ml of solution S, 50 µl of *strontium-85 spiking solution R* and 0.05 ml of *strong sodium hypochlorite solution R*. Allow to stand for 10 min at room temperature.

Reference solution Mix 50 µl of *strontium-85 spiking solution R* with 5.0 ml of a 9.5 g/l solution of *nitric acid R* in a vial for liquid scintillation counting and add 10 ml of *liquid scintillation cocktail R*.

Apply the test solution to the upper of the 2 columns and elute. Just before the disappearance of the liquid from the top of the upper column, add 3 ml of a 4 g/l solution of *sodium hydroxide R* and elute until the columns are dry. Combine the eluates and add 4 ml of a 947 g/l solution of *nitric acid R* (molybdenum-poor eluate). Determine the radioactivity due to molybdenum-99 using gamma-ray spectrometry. If the radioactivity due to molybdenum-99 is higher than 6 × 10^{-7} per cent of the radioactivity due to molybdenum-99 in 1 ml of solution S, repeat the above procedure using 2 new columns.

Condition a column with an internal volume of approximately 2 ml of *strontium selective extraction resin R* with 5 ml of a 473 g/l solution of *nitric acid R* and dry the column. All elutions of the column are made at a flow rate not exceeding 1 ml/min. Apply to the column the molybdenum-poor eluate and elute. Just before the disappearance of the liquid from the top of the column, add 20 ml of a 473 g/l solution of *nitric acid R* and elute until the column is dry. Rinse the column with 2 ml of a 9.5 g/l solution of *nitric acid R*, dry the column and discard the eluate. Elute the column with 8.0 ml of a 9.5 g/l solution of *nitric acid R* until the column is dry. Transfer 5.0 ml of the eluate into a vial for liquid scintillation counting and add 10 ml of *liquid scintillation cocktail R*.

Determine the total radioactivity due to strontium-89 and strontium-90 in this solution by liquid scintillation spectrometry, and the radioactivity due to strontium-85 by gamma-ray spectrometry. Determine the radioactivity due to strontium-85 in the reference solution by gamma-ray spectrometry. Calculate the recovery of strontium-85 in the eluate. Calculate the measured total radioactivity of strontium-89 and strontium-90 in the eluate, taking into account the recovery of strontium and the fraction of eluate used.

Total radioactivity due to alpha-particle-emitting impurities

Maximum 1 × 10^{-7} per cent of the total radioactivity.

The following method has been found to be suitable; other validated methods, approved by the competent authority, may be used.

Alpha-ray spectrometry.

Test solution To 0.2 ml of the preparation to be examined add 1.0 ml of *plutonium-242 spiking solution R,* 1.0 ml of *americium-243 spiking solution R* and 9.0 ml of a 927 g/l solution of *hydrochloric acid R* . Evaporate the sample to dryness. Dissolve the residue in 2 ml of a 927 g/l solution of *hydrochloric acid R* . Evaporate again to dryness. Dissolve the residue in 2 ml of a 10.3 g/l solution of hydrochloric acid R.

Apply the test solution to a column containing 0.7 g of *anion exchange resin R1* . Collect the eluate and wash the column with 1 ml of a 10.3 g/l solution of *hydrochloric acid R* . Evaporate the combined eluates to dryness and dissolve the residue in 2 ml of a 10.3 g/l solution of *hydrochloric acid R* . Apply this solution to a 2nd column containing 0.7 g of *anion exchange resin R1* . Collect the eluate and wash the column with 1 ml of a 10.3 g/l solution of *hydrochloric acid R* . Evaporate the combined eluates to dryness and dissolve the residue in 1 ml of *nitric acid R.* Evaporate to dryness. Dissolve the residue again in 1 ml of *nitric acid R.*

Add 1 ml of a 42.6 g/l solution of *anhydrous sodium sulphate R* and evaporate to dryness. Add 0.3 ml of *sulphuric acid R* . Warm until the residue is dissolved. Add 4 ml of *distilled water R* and 0.01 ml of *thymol blue solution R* . Add *concentrated ammonia R* dropwise until the colour changes from red to yellow.

Prepare an electrodeposition cell as follows. An electropolished stainless steel planchet is fitted in the cap of a 20 ml polyethylene scintillation vial. The bottom of the vial has been cut off and a hole has been drilled through the centre of the cap for electrical connection to the planchet cathode. The planchet, 20 mm in diameter and 0.5 mm thick, is rinsed with *acetone R* and *water R* prior to use. The anode, a platinum spiral, is introduced through the bottom of the vial and fitted 5 mm from the cathode.

Pour the solution prepared as described above into the electrodeposition cell and rinse the container with a total of 5 ml of a 10 g/l solution of *sulphuric acid R* (the solution becomes slightly pink). Adjust to pH 2.1-2.4. with *concentrated ammonia R* or with a 200 g/l solution of *sulphuric acid R* . Electrolyse at 1.2 A for 75 min without stirring.

Add 1 ml of *concentrated ammonia R* about 1 min prior to switching off the current. Rinse the planchet with a 57 g/l solution of *ammonia R* . Rinse the planchet with *acetone R* and remove any residual solvent by patting the planchet with absorbent paper. Heat the planchet on a hot plate at 180 °C for 10 min.

Determine the radioactivity of alpha emitters by alpha-ray spectrometry, taking into account the recovery of the alpha-particle-emitting radionuclides (measured using the plutonium-242 and americium-243 spiking solutions).

Total of gamma-ray-emitting radionuclides other than molybdenum-99, technetium-99m, iodine-131, ruthenium-103 and tellurium-132

Maximum 1×10^{-2} per cent of the total radioactivity.

The following method has been found to be suitable; other validated methods, approved by the competent authority, may be used.

Gamma-ray spectrometry.

Allow the preparation to decay for 4-6 weeks. Examine the gamma-ray spectrum for the presence of other gamma-ray-emitting impurities. Identify and quantify other gamma-ray-emitting impurities. The preparation may be released for use before completion of the test.

RADIOCHEMICAL PURITY

[^{99}Mo]Molybdate

The following method has been found to be suitable; other validated methods, approved by the competent authority, may be used.

Thin-layer chromatography (*2.2.27*).

Test solution Dilute the preparation to be examined with a 4.0 g/l solution of *sodium hydroxide R* to a radioactivity concentration suitable for the detector.

Reference solution 50 g/l solution of *sodium molybdate R* in a 4.0 g/l solution of *sodium hydroxide R* .

Plate *TLC silica gel plate R.*

Mobile phase 10.6 g/l solution of *anhydrous sodium carbonate R* .

Application 5 µl of the test solution and 2 µl of the reference solution.

Development Over 2/3 of the plate.

Drying In a current of warm air.

Detection Determine the distribution of radioactivity using a suitable detector and spray with a 2 g/l solution of *phenylhydrazine R* in *glacial acetic acid R* ; heat at 100-105 °C for 5 min.

Retardation factor Molybdate and pertechnetate = about 0.9.

Limit:

— *sum of [^{99}Mo]molybdate and [^{99m}Tc]pertechnetate*: minimum 95 per cent of the total radioactivity.

RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

LABELLING

The label states that the preparation is only suitable for the preparation of technetium-99m generators.

IMPURITIES

A. iodine-131,

B. ruthenium-103,

C. tellurium-132,

D. strontium-89,

E. strontium-90.

Sodium Pertechnetate [^{99m} Tc] Injection (Fission)

General Notices

(Ph Eur monograph 0124)

Ph Eur

This monograph applies to sodium pertechnetate (^{99m} Tc) injection obtained from molybdenum-99 extracted from fission products of uranium. Sodium pertechnetate (^{99m} Tc) injection obtained from molybdenum-99 produced by the neutron irradiation of molybdenum is described in the monograph on Sodium pertechnetate (^{99m} Tc) injection (non-fission) (0283).

DEFINITION

Sodium pertechnetate (^{99m}Tc) injection (fission) is a sterile solution containing technetium-99m in the form of pertechnetate ion and made isotonic by the addition of sodium chloride. Technetium-99m is a radionuclide formed by the decay of molybdenum-99. Molybdenum-99 is a radioactive isotope of molybdenum extracted from uranium fission products. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 95 per cent of the radioactivity corresponds to technetium-99m in the form of pertechnetate ion.

The radioactivity due to radionuclides other than technetium-99m, apart from that due to technetium-99 resulting from the decay of technetium-99m, is not greater than that shown below, expressed as a percentage of the total radioactivity and calculated with reference to the date and hour of administration.

Molybdenum-99	0.1 per cent
Iodine-131	5×10^{-3} per cent
Ruthenium-103	5×10^{-3} per cent
Strontium-89	6×10^{-5} per cent
Strontium-90	6×10^{-6} per cent
Alpha-emitting impurities	1×10^{-7} per cent
Other gamma-emitting impurities	0.01 per cent

The injection may be prepared from a sterile preparation of molybdenum-99 under aseptic conditions.

CHARACTERS

A clear, colourless solution.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by measurement in an instrument calibrated with the aid of such a solution. Standardised technetium-99m, molybdenum-99, iodine-131, ruthenium-103, strontium-89 and strontium/yttrium-90 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.

TESTS

pH (*2.2.3*)

The pH of the injection is 4.0 to 8.0.

Aluminium

In a test tube about 12 mm in internal diameter, mix 1 ml of *acetate buffer solution pH 4.6 R* and 2 ml of a 1 in 2.5 dilution of the injection in *water R* . Add 0.05 ml of a 10 g/l solution of *chromazurol S R* . After 3 min, the colour of the solution is not more intense than that of a standard prepared at the same time and in the same manner using 2 ml of *aluminium standard solution (2 ppm Al) R* (5 ppm).

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Preliminary test To obtain an approximate estimate before use of the injection, take a volume equivalent to 37 MBq and determine the gamma-ray spectrum using a sodium iodide detector with a shield of lead, of thickness 6 mm, interposed between the sample and the detector. The response in the region corresponding to the 0.740 MeV photon of molybdenum-99 does not exceed that obtained using 37 kBq of a standardised molybdenum-99 solution measured under the same conditions, when all measurements are expressed with reference to the date and hour of administration.

Definitive test Retain a sample of the injection for a sufficient time to allow the technetium-99m radioactivity to decay to a sufficiently low level to permit the detection of radionuclidic impurities. All measurements of radioactivity are expressed with reference to the date and hour of administration.

— *Molybdenum-99*. Record the gamma-ray spectrum of the decayed material in a suitable instrument calibrated with the aid of a standardised molybdenum-99 solution. The most prominent photons have energies of 0.181 MeV, 0.740 MeV and 0.778 MeV. Molybdenum-99 has a half-life of 66.0 h. Not more than 0.1 per cent of the total radioactivity is due to molybdenum-99.

— *Iodine-131*. Record the gamma-ray spectrum of the decayed material in a suitable instrument calibrated with the aid of a standardised iodine-131 solution. The most prominent photon has an energy of 0.365 MeV. Iodine-131 has a half-life of 8.04 days. Not more than 5×10^{-3} per cent of the total radioactivity is due to iodine-131.

— *Ruthenium-103*. Record the gamma-ray spectrum of the decayed material in a suitable instrument calibrated using a standardised ruthenium-103 solution. The most prominent photon has an energy of 0.497 MeV. Ruthenium-103 has a half-life of 39.3 days. Not more than 5×10^{-3} per cent of the total radioactivity is due to ruthenium-103.

— *Strontium-89*. Determine the presence of strontium-89 in the decayed material with an instrument suitable for the detection of beta rays, by comparison with a standardised strontium-89 solution. It is usually necessary first to carry out chemical separation of the strontium so that the standard and the sample may be compared in the same physical and chemical form. Strontium-89 decays with a beta emission of 1.492 MeV maximum energy and has a half-life of 50.5 days. Not more than 6×10^{-5} per cent of the total radioactivity is due to strontium-89.

— *Strontium-90*. Determine the presence of strontium-90 in the decayed material with an instrument suitable for the detection of beta rays. To distinguish strontium-90 from strontium-89, compare the radioactivity of yttrium-90, the daughter nuclide of strontium-90, with an yttrium-90 standard after the chemical separation of the yttrium. If prior chemical separation of the strontium is necessary, the conditions of radioactive equilibrium must be ensured. The yttrium-90 standard and the sample must be compared in the same physical and chemical form. Strontium-90 and yttrium-90 decay with respective beta emissions of 0.546 MeV and 2.284 MeV maximum energy and half-lives of 29.1 years and 64.0 h. Not more than 6×10^{-6} per cent of the total radioactivity is due to strontium-90.

— *Other gamma-emitting impurities*. Examine the gamma-ray spectrum of the decayed material for the presence of other radionuclidic impurities, which should, where possible, be identified and quantified. The total gamma radioactivity due to these impurities does not exceed 0.01 per cent of the total radioactivity.

— *Alpha-emitting impurities*. Measure the alpha radioactivity of the decayed material to detect any alpha-emitting radionuclidic impurities, which should, where possible, be identified and quantified. The total alpha radioactivity due to these impurities does not exceed 1×10^{-7} per cent of the total radioactivity.

RADIOCHEMICAL PURITY

Examine by descending paper chromatography (*2.2.26*).

Test solution Dilute the preparation to be examined with *water R* to a suitable radioactive concentration.

Apply 5 µl of the test solution. Develop for 2 h using a mixture of 20 volumes of *water R* and 80 volumes of *methanol R*. Allow the paper to dry. Determine the distribution of radioactivity using a suitable detector. Not less than 95 per cent of the total radioactivity is in the spot corresponding to pertechnetate ion, which has an R_F value of about 0.6.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

Sodium Pertechnetate [^{99m} Tc] Injection (Non-fission)

General Notices

(Ph Eur monograph 0283)

Ph Eur

This monograph applies to sodium pertechnetate (^{99m} *Tc) injection obtained from molybdenum-99 produced by neutron irradiation of molybdenum. Sodium pertechnetate (* ^{99m} *Tc) injection obtained from molybdenum-99 extracted from fission products of uranium is described in the monograph on Sodium pertechnetate(* ^{99m} *Tc) injection (fission) (0124).*

DEFINITION

Sodium pertechnetate (^{99m}Tc) injection (non-fission) is a sterile solution containing technetium-99m in the form of pertechnetate ion and made isotonic by the addition of sodium chloride. Technetium-99m is a radionuclide formed by the decay of molybdenum-99. Molybdenum-99 is a radioactive isotope of molybdenum produced by neutron irradiation of molybdenum. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 95 per cent of the radioactivity corresponds to technetium-99m in the form of pertechnetate ion.

The radioactivity due to radionuclides other than technetium-99m, apart from that due to technetium-99 resulting from the decay of technetium-99m is not greater than that shown below, expressed as a percentage of the total radioactivity and calculated with reference to the date and hour of administration.

Molybdenum-99	0.1 per cent
Other radionuclidic impurities	0.01 per cent

The injection may be prepared from a sterile preparation of molybdenum-99 under aseptic conditions.

CHARACTERS

A clear, colourless solution.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.

B. Examine the chromatogram obtained in the test for radiochemical purity. The distribution of radioactivity contributes to the identification of the preparation.

TESTS

pH (*2.2.3*)

The pH of the injection is 4.0 to 8.0.

Aluminium

In a test tube about 12 mm in internal diameter, mix 1 ml of *acetate buffer solution pH 4.6 R* and 2 ml of a 1 in 2.5 dilution of the injection in *water R.* Add 0.05 ml of a 10 g/l solution of *chromazurol S R* . After 3 min, the colour of the solution is not more intense than that of a standard prepared at the same time in the same manner using 2 ml of *aluminium standard solution (2 ppm Al) R* (5 ppm).

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125) .* The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Preliminary test To obtain an approximate estimate before use of the injection, take a volume equivalent to 37 MBq and record the gamma-ray spectrum using a sodium iodide detector with a shield of lead, of thickness 6 mm, interposed between the sample and the detector. The response in the region corresponding to the 0.740 MeV photon of molybdenum-99 does not exceed that obtained using 37 kBq of a standardised solution of molybdenum-99 measured under the same conditions, when all measurements are expressed with reference to the date and hour of administration.

Definitive test Retain a sample of the injection for a sufficient time to allow the technetium-99m radioactivity to decay to a sufficiently low level to permit the detection of radionuclidic impurities. All measurements of radioactivity are expressed with reference to the date and hour of administration.

— *Molybdenum-99*. Record the gamma-ray spectrum of the decayed material in a suitable instrument calibrated using a standardised molybdenum-99 solution. The most prominent gamma photons have energies of 0.181 MeV, 0.740 MeV and 0.778 MeV. Molybdenum-99 has a half-life of 66.0 h. Not more than 0.1 per cent of the total radioactivity is due to molybdenum-99.

— *Other gamma-emitting impurities*. Examine the gamma-ray spectrum of the decayed material for the presence of other radionuclidic impurities, which should, where possible, be identified and quantified. The total radioactivity due to other radionuclidic impurities does not exceed 0.01 per cent of the total radioactivity.

RADIOCHEMICAL PURITY

Examine by descending paper chromatography (*2.2.26*).

Apply 5 µl of the test solution. Develop for 2 h using a mixture of 20 volumes of *water R* and 80 volumes of *methanol R*. Allow the paper to dry in air. Determine the distribution of radioactivity using a suitable detector. Not less than 95 per cent of the total radioactivity is found in the spot corresponding to pertechnetate ion, which has an R_F value of about 0.6.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

Sodium Phosphate [^{32} P] Injection

General Notices

(Ph Eur monograph 0284)

Ph Eur

DEFINITION

Sodium phosphate (^{32}P) injection is a sterile solution of disodium and monosodium (^{32}P) orthophosphates made isotonic by the addition of sodium chloride. Phosphorus-32 is a radioactive isotope of phosphorus and may be produced by neutron irradiation of sulphur. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared phosphorus-32 radioactivity at the date and hour stated on the label. Not less than 95 per cent of the radioactivity corresponds to phosphorus-32 in the form of orthophosphate ion. The specific radioactivity is not less than 11.1 MBq of phosphorus-32 per milligram of orthophosphate ion.

CHARACTERS

A clear, colourless solution.

Phosphorus-32 has a half-life of 14.3 days and emits beta radiation.

IDENTIFICATION

A. Record the beta-ray spectrum or the beta-ray absorption curve using a suitable method. The spectrum or curve does not differ significantly from that of a standardised phosphorus-32 solution obtained under the same conditions. Standardised phosphorus-32 solutions are available from laboratories recognised by the competent authority. The maximum energy of the beta radiation is 1.71 MeV.

B. Examine the chromatogram obtained in the test for radiochemical purity. The distribution of radioactivity contributes to the identification of the preparation.

TESTS

pH (*2.2.3*)

The pH of the injection is 6.0 to 8.0.

Phosphates

Dilute the injection with *water R* to give a radioactive concentration of 370 kBq of phosphorus-32 per millilitre. Mix in a volumetric flask, with shaking, 1.0 ml of the solution with a mixture of 0.5 ml of a 2.5 g/l solution of *ammonium vanadate R,* 0.5 ml of *ammonium* *molybdate solution R* and 1 ml of *perchloric acid R* and dilute to 5.0 ml with *water R*. After 30 min, the solution is not more intensely coloured than a standard prepared at the same time in the same manner using 1.0 ml of a solution containing 33 mg of orthophosphate ion per litre.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Record the beta-ray spectrum or the beta-ray absorption curve using a suitable method. The spectrum or curve does not differ significantly from that of a standardised phosphorus-32 solution obtained under the same conditions.

RADIOCHEMICAL PURITY

Examine by ascending paper chromatography (*2.2.26*).

Test solution Dilute the injection with *water R* until the radioactivity is equivalent to 10 000 to 20 000 counts per minute per 10 µl

Reference solution Prepare a solution of *phosphoric acid R* containing 2 mg of phosphorus per millilitre.

Using a strip of paper 25 mm wide and about 300 mm long, apply 10 µl of the reference solution. Apply to the same starting-point 10 µl of the test solution. Develop for 16 h using a mixture of 0.3 ml of *ammonia R*, 5 g of *trichloroacetic acid R*, 25 ml of *water R* and 75 ml of 2- *propanol R.* Allow the paper to dry in air. Determine the position of the inactive phosphoric acid by spraying with a 50 g/l solution of *perchloric acid R* and then with a 10 g/l solution of *ammonium molybdate R*. Expose the paper to *hydrogen sulphide R*. A blue colour develops. Determine the position of the radioactive spot by autoradiography or by measuring the radioactivity over the whole length of the chromatogram. Not less than 95 per cent of the total radioactivity of the chromatogram is found in the spot corresponding to phosphoric acid.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised phosphorus-32 solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

Strontium [^{89} Sr] Chloride Injection

General Notices

(Ph Eur monograph 1475)

Ph Eur

DEFINITION

Strontium (^{89}Sr) chloride injection is a sterile solution of [^{89}Sr]strontium chloride. Strontium-89 is a radioactive isotope of strontium and is produced by neutron irradiation of strontium enriched in strontium-88. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared strontium-89 radioactivity at the date stated on the label. Not more than 0.6 per cent of the total radioactivity is due to radionuclides other than strontium-89. The specific radioactivity is not less than 1.8 MBq of strontium-89 per milligram of strontium. The injection contains 6.0 mg/ml to 12.5 mg/ml of strontium.

CHARACTERS

A clear, colourless solution.

Strontium-89 has a half-life of 50.5 days and emits beta radiation with a maximum energy of 1.492 MeV.

IDENTIFICATION

A. Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised strontium-89 solution, when measured either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised strontium-89 solutions are available from laboratories recognised by the competent authority. The gamma photon detected has an energy of 0.909 MeV and is due to the short-lived daughter product, yttrium-89m (formed in 0.01 per cent of the disintegrations), in equilibrium with the strontium-89.

B. To 0.1 ml of the injection to be examined, add 1 ml of a freshly prepared 1 g/l solution of *sodium rhodizonate R* . Mix and allow to stand for 1 min. A reddish-brown precipitate is formed.

C. To 0.1 ml of *silver nitrate solution R2* add 50 µl of the injection to be examined. A white precipitate is formed.

TESTS

pH (*2.2.3*)

The pH of the solution is 4.0 to 7.5.

Note: the following tests for aluminium, iron and lead may be carried out simultaneously with the test for strontium. If this is not the case, the reference solutions are prepared such that they contain strontium at approximately the same concentration as in the test solution.

Aluminium

Not more than 2.0 µg/ml, determined by atomic emission spectrometry (plasma or arc method) (*2.2.22, Method I*).

Test solution Dilute 0.2 ml of the injection to be examined to a suitable volume with *dilute nitric acid R* .

Reference solutions Prepare the reference solutions using *aluminium standard solution (10 ppm Al) R* diluted as necessary with *dilute nitric acid R.*

Iron

Not more than 5.0 µg/ml, determined by atomic emission spectrometry (plasma or arc method) (*2.2.22, Method I*).

Test solution Dilute 0.2 ml of the injection to be examined to a suitable volume with *dilute nitric acid R.*

Reference solutions Prepare the reference solutions using *iron standard solution (20 ppm Fe) R* diluted as necessary with *dilute nitric acid R.*

Lead

Not more than 5.0 µg/ml, determined by atomic emission spectrometry (plasma or arc method) (*2.2.22, Method I*).

Test solution Dilute 0.2 ml of the injection to be examined to a suitable volume with *dilute nitric acid R.*

Reference solutions Prepare the reference solutions using *lead standard solution (10 ppm Pb) R* diluted as necessary with *dilute nitric acid R* .

Strontium

6.0 mg/ml to 12.5 mg/ml. Examine by atomic emission spectrometry (*2.2.22, Method I*).

Test solution Dilute 0.2 ml of the injection to be examined to a suitable volume with *dilute nitric acid R* .

Reference solutions Prepare the reference solutions using *strontium standard solution (1.0 per cent Sr) R* diluted as necessary with *dilute nitric acid R* .

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).*

RADIONUCLIDIC PURITY

Gamma emitters

Record the gamma-ray and X-ray spectrum of the injection to be examined using a suitable instrument. Not more than 0.4 per cent of the total radioactivity in the preparation to be examined is due to gamma emitting radionuclides other than yttrium-89m.

Beta emitters

Evaporate to dryness 100 µl of the injection to be examined under a radiant heat source. Dissolve the residue in 2 ml of *47 per cent hydrobromic acid R*, evaporate to dryness under the radiant heat source and dissolve the residue in 2 ml of *dilute hydrobromic acid R1.* Transfer the solution to the top of a column, 5 mm to 6 mm in diameter, packed with approximately 2 ml of *cationic exchange resin R1* (100 µm to 250 µm), previously conditioned with *dilute hydrobromic acid R1* and elute the column with the same solvent until 10 ml of eluate has been collected into a container containing 50 µl of a 15 g/l solution of *anhydrous sodium sulphate R* in *1 M hydrochloric acid*.

To a liquid scintillation vial add an appropriate volume of scintillation liquid followed by 1 ml of *water R*, 0.1 ml of a 15 g/l solution of *anhydrous sodium sulphate R* in *1 M hydrochloric acid* and 100 µl of eluate. Shake to obtain a clear solution. Using suitable counting equipment determine the radioactivity due to sulphur-35 and phosphorus-32 in the sample.

Taking into account the recovery efficiency of the separation, counting efficiency and radioactive decay, determine the radioactive concentration of sulphur-35 and phosphorus-32 in the sample and hence the percentage of total beta emitting impurities in the injection to be examined. Not more than 0.2 per cent of the total radioactivity in the injection to be examined is due to the sum of sulphur-35 and phosphorus-32 radioactivities.

RADIOACTIVITY

Measure the radioactivity using suitable equipment by comparison with a standardised strontium-89 solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

Table of Physical Characteristics of Radionuclides Mentioned in the European Pharmacopoeia

General Notices

The following table is given to complete the general monograph *Radiopharmaceutical preparations (0125)*.

The values are obtained from the database of the National Nuclear Data Center (NNDC) at Brookhaven National Laboratory, Upton. N.Y., USA, directly accessible via Internet at the address: 'http://www.nndc.bnl.gov/nndc/nudat/radform.html'.

In case another source of information is preferred (more recent values), this source is explicitly mentioned.

Other data sources:

* DAMRI (Département des Applications et de la Métrologie des Rayonnements Ionisants, CEA Gif-sur-Yvette, France),

** PTB (Physikalisch-Technische Bundesanstalt, Braunschweig, Germany),

*** NPL (National Physical Laboratory, Teddington, Middlesex, UK).

The uncertainty of the half-lives are given in parentheses. In principle the digits in parentheses are the standard uncertainty of the corresponding last digits of the indicated numerical value ('Guide to the Expression of Uncertainty in Measurement', International Organisation for Standardisation (ISO), 1993, ISBN 92-67-10188-9).

The following abbreviations are used:

e_A = Auger electrons,

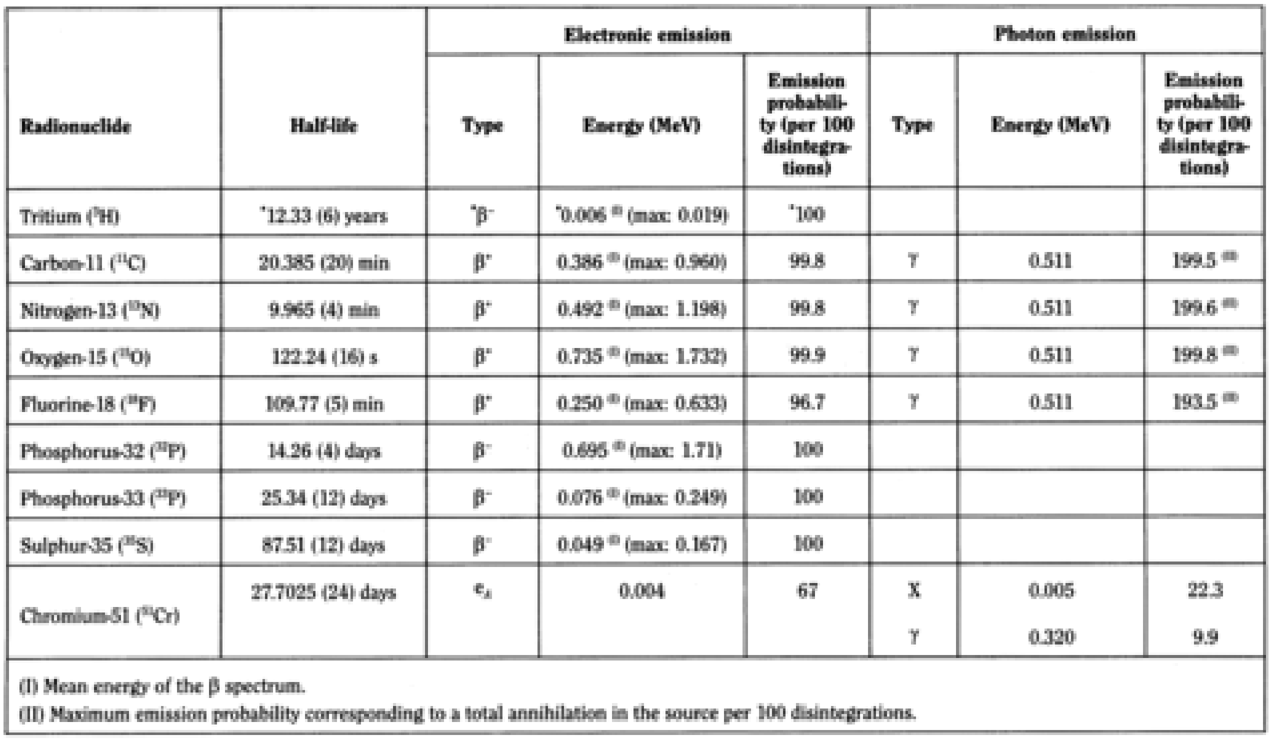
ce = conversion electrons,

β^- = electrons,

β^+ = positrons,

γ = gamma rays,

X = X-rays.



Radionuclide	Half-life	Electronic emission			Photon emission		
		Type	Energy (MeV)	Emission probability (per 100 disintegrations)	Type	Energy (MeV)	Emission probability (per 100 disintegrations)
Tritium (^{3}H)	*12.33 (6) years	*β^-	*0.006 $^{(I)}$ (max: 0.019)	*100			
Carbon-11 (^{11}C)	20.385 (20) min	β^+	0.386 $^{(I)}$ (max: 0.960)	99.8	γ	0.511	199.5 $^{(II)}$
Nitrogen-13 (^{13}N)	9.965 (4) min	β^+	0.492 $^{(I)}$ (max: 1.198)	99.8	γ	0.511	199.6 $^{(II)}$

Technetium [^{99m} Tc] Albumin Injection

General Notices

(Technetium (^{99m}Tc) Human Albumin Injection, Ph Eur monograph 0640)

Ph Eur

DEFINITION

Technetium (^{99m}Tc) human albumin injection is a sterile, apyrogenic solution of human albumin labelled with technetium-99m. It contains a reducing substance, such as a tin salt in an amount not exceeding 1 mg of Sn per millilitre; it may contain a suitable buffer and an antimicrobial preservative. Although, at present, no definite value for a maximum limit of tin can be fixed, available evidence tends to suggest the importance of keeping the ratio of tin to albumin as low as possible. The human albumin used complies with the requirements of the monograph on *Human albumin solution (0255).* The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the quantity of albumin stated on the label. Not less than 80 per cent of the radioactivity is associated with the albumin fractions II to V. Not more than 5.0 per cent of the radioactivity due to technetium-99m corresponds to free pertechnetate, as determined by the method described in the test for radiochemical purity.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile and apyrogenic ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A clear, colourless or pale-yellow solution.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.

B. Using a suitable range of species-specific antisera, carry out precipitation tests on the preparation to be examined. The test is to be carried out using antisera specific to the plasma proteins of each species of domestic animal currently used in the preparation of materials of biological origin in the country concerned. The injection is shown to contain proteins of human origin and gives negative results with antisera specific to plasma proteins of other species.

C. Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal human serum, compare normal human serum and the injection to be examined, both diluted if necessary. The main component of the injection to be examined corresponds to the main component of the normal human serum. The diluted solution may show the presence of small quantities of other plasma proteins.

TESTS

pH (*2.2.3*)

The pH of the injection is 2.0 to 6.5.

Albumin

Reference solution Dilute *human albumin solution R* with a 9 g/l solution of *sodium chloride R* to a concentration of 5 mg of albumin per millilitre.

To 1.0 ml of the injection to be examined and to 1.0 ml of the reference solution add 4.0 ml of *biuret reagent R* and mix. After exactly 30 min, measure the absorbance (*2.2.25*) of each solution at 540 nm, using as the compensation liquid a 9 g/l solution of *sodium chloride R* treated in the same manner. From the absorbances measured, calculate the content of albumin in the injection to be examined in milligrams per millilitre.

Tin

Test solution To 1.0 ml of the injection to be examined add 1.0 ml of *2 M hydrochloric acid R* . Heat in a water-bath at 100 °C for 30 min. Cool and centrifuge at 300 g for 10 min. Dilute 1.0 ml of the supernatant liquid to 10 ml with *1 M hydrochloric acid*.

Reference solution Dissolve 95 mg of *stannous chloride R* in *1 M hydrochloric acid* and dilute to 1000.0 ml with the same acid.

To 1.0 ml of each solution add 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R* , 0.05 ml of *thioglycollic acid R* , 0.1 ml of *dithiol reagent R* and 3.0 ml of *0.2 M hydrochloric acid* . Mix. Measure the absorbance (*2.2.25*) of each solution at 540 nm, using *0.2 M hydrochloric acid* as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution (1 mg of Sn per millilitre).

Physiological distribution

Inject a volume not greater than 0.5 ml and containing not more than 1.0 mg of albumin into a suitable vein such as a caudal vein or a saphenous vein of each of three male rats, each weighing 150 g to 250 g. Measure the radioactivity in the syringe before and after the injection. Euthanise the rats 30 min after the injection. Take one millilitre of blood by a suitable method and remove the liver and, if a caudal vein has been used for the injection, the tail. Using a suitable instrument determine the radioactivity in 1 ml of blood, in the liver and, if a caudal vein has been used for the injection, in the tail. Determine the percentage of radioactivity in the liver and in 1 ml of blood with respect to the total radioactivity calculated as the difference between the measurements made on the syringe minus the activity in the tail (if a caudal vein has been used for the injection). Correct the blood concentration by multiplying by a factor of *m*/200 where *m* is the body mass of the rat in grams. In not fewer than two of the three rats used, the radioactivity in the liver is not more than 15 per cent and that in blood, after correction, is not less than 3.5 per cent.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The injection may be released for use before completion of the test.

Bacterial endotoxins (*2.6.14*)

Less than 175/V IU/ml, V being the maximum recommended dose in millilitres.

RADIOCHEMICAL PURITY

A. Examine by thin-layer chromatography (*2.2.27*) using silica gel as the coating substance on a glass-fibre sheet. Heat the plate at 110 °C for 10 min. Use a plate such that during development the mobile phase migrates over a distance of 10 cm to 15 cm in about 10 min.

Apply to the plate 5 µl to 10 µl of the injection to be examined and allow to dry. Develop over a path of 10 cm to 15 cm using *methyl ethyl ketone R* . Allow the plate to dry. Determine the distribution of radioactivity using a suitable detector. The technetium-99m human albumin complex remains at the starting-point and pertechnetate ion migrates near to the solvent front. Not more than 5.0 per cent of the technetium-99m radioactivity corresponds to technetium in the form of pertechnetate ion.

B. Examine by size-exclusion chromatography (*2.2.30*).

Mobile phase (concentrated) Dissolve 1.124 g of *potassium dihydrogen phosphate R* , 4.210 g of *disodium hydrogen phosphate R* , 1.17 g of *sodium chloride R* and 0.10 g of *sodium azide R* in 100 ml of *water R.*

Test solution Mix 0.25 ml of the injection to be examined with 0.25 ml of the mobile phase (concentrated). Use immediately after dilution.

The chromatographic procedure may be carried out using:

— a stainless steel column 0.6 m long and 7.5 mm in internal diameter, packed with *silica gel for size-exclusion chromatography R,*

— as the mobile phase at a flow rate of 0.6 ml/min a mixture of equal volumes of mobile phase (concentrated) and *water R,*

— a radioactivity detector set for technetium-99m,

— a loop injector.

Inject 200 µl of the test solution. Continue the chromatography for at least 10 min after background level is reached.

Peaks are eluted with the following retention times:

I	High molecular mass compound	19-20 min
II	Poly III-albumin	23-24 min
III	Poly II-albumin	25-27 min

IV	Poly V I-albumin	28-29 min
V	Human serum albumin	32-33 min
VI	Tin colloid	40-47 min
VII	Pertechnetate	48 min

At least 80 per cent of the radioactivity applied to the column is associated with the albumin fractions II to V.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

LABELLING

The label states:

- — the amount of albumin,
- — the amount of tin, if any.

Ph Eur

DEFINITION

Sterile solution of a complex of technetium-99m with diethyl *N*,*N′*-ethylenedi-L-cysteinate. It may contain stabilisers and inert additives such as *Mannitol (0559)* and *Disodium edetate (0232).*

Content

90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label.

PRODUCTION

It is prepared from *N*,*N′*-(1,2-ethylenediyl)bis[(2*R*)-2-amino-3-sulphanylpropanoic acid] diethyl ester and *Sodium pertechnetate (* ^{99m} *Tc) injection (fission) (0124)* or *Sodium pertechnetate (* ^{99m} *Tc) injection (non-fission) (0283)* in the presence of reducing agents such as a stannous salt.

CHARACTERS

Appearance

Clear, colourless solution.

Half-life and nature of radiation of technetium-99m

See general chapter *5.7. Table of physical characteristics of radionuclides.*

IDENTIFICATION

A. Gamma-ray spectrometry.

Results The most prominent gamma photon of technetium-99m has an energy of 0.141 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

Results The principal peak in the chromatogram obtained with the test solution is similar in retardation factor to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

pH (*2.2.3*)

6.5 to 7.5.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)* . The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Impurities A, B, C, D, E, F

Thin-layer chromatography (*2.2.27*).

Test solution The preparation to be examined.

Reference solution (a) To vial B of *bicisate labelling kit CRS* in lead shielding add 2 ml of sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) containing 400-800 MBq. Dissolve the contents of vial A of *bicisate labelling kit CRS* in 3 ml of a 9 g/l solution of *sodium chloride R* . Immediately transfer 1.0 ml of the solution contained in vial A to vial B. Mix and allow to stand for 30 min at room temperature.

Reference solution (b) Sodium pertechnetate (^{99m}Tc) injection (fission or non fission).

Plate *TLC silica gel plate R.*

Mobile phase *ethyl acetate R.*

Application 5 µl, allow the spots to dry for 5-10 min.

Development Over 4/5 of the plate.

Drying In air.

Detection Determine the distribution of radioactivity using a suitable detector.

Retardation factors Technetium-99m bicisate = more than 0.4; impurities A, B, C, D, E and F = less than 0.2.

System suitability The retardation factor of the principal peak in the chromatogram obtained with reference solution (a) is clearly different from the retardation factor of the peak in the chromatogram obtained with reference solution (b).

Limit:

— *sum of impurities A, B, C, D, E and F*: not more than 6 per cent of the total radioactivity.

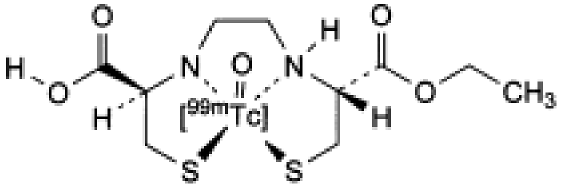
RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

IMPURITIES

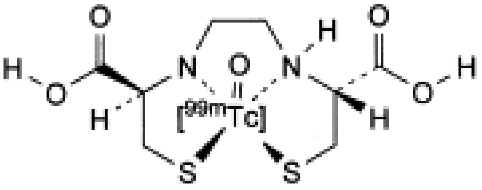
A. technetium-99m in colloidal form,

B. [^{99m}Tc]pertechnetate ion,



and isomers

C. complex of technetium-99m with ethyl hydrogen *N*,*N*′-ethylenedi-L-cysteinate,



D. complex of technetium-99m with *N*,*N*′-ethylenedi-L-cysteine,

E. complex of technetium-99m with mannitol,

F. complex of technetium-99m with disodium edetate.

Ph Eur

Technetium [^{99m} Tc] Colloidal Rhenium Sulphide Injection

General Notices

(Ph Eur monograph 0126)

Ph Eur

DEFINITION

Technetium (^{99m}Tc) colloidal rhenium sulphide injection is a sterile, apyrogenic colloidal dispersion of rhenium sulphide the micelles of which are labelled with technetium-99m. It is stabilised with gelatin. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 92 per cent of the radioactivity corresponds to technetium-99m in colloidal form. The pH of the injection may be adjusted by the addition of a suitable buffer such as a citrate buffer solution. The injection contains a variable amount of colloidal rhenium sulphide, not exceeding 0.22 mg of rhenium (Re) per millilitre, according to the method of preparation.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile, apyrogenic ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A light-brown liquid.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.

B. Examine the chromatogram obtained in the test for radiochemical purity. The distribution of radioactivity contributes to the identification of the injection.

C. To 1 ml add 5 ml of *hydrochloric acid R* , 5 ml of a 50 g/l solution of *thiourea R* and 1 ml of a 200 g/l solution of *stannous chloride R* in *hydrochloric acid R* . A yellow colour is produced.

TESTS

pH (*2.2.3*)

The pH of the injection is 4.0 to 7.0.

Rhenium

Test solution Use 1 ml of the injection to be examined.

Reference solutions Using a solution containing 100 µg of *potassium perrhenate R* (equivalent to 60 ppm of Re) and 240 µg of *sodium thiosulphate R* per millilitre, prepare a suitable range of solutions and dilute to the same final volume with *water R* .

To the test solution and to 1 ml of each of the reference solutions add 5 ml of *hydrochloric acid R* , 5 ml of a 50 g/l solution of *thiourea R* and 1 ml of a 200 g/l solution of *stannous chloride R* in *hydrochloric acid R* and dilute to 25.0 ml with *water R* . Allow to stand for 40 min and measure the absorbance (*2.2.25*) of each solution at 400 nm, using a reagent blank as the compensation liquid. Using the absorbances obtained with the reference solutions, draw a calibration curve and calculate the concentration of rhenium in the injection to be examined.

Physiological distribution

Inject a volume not greater than 0.2 ml into the caudal vein of each of three mice each weighing 20 g to 25 g. Euthanise the mice 20 min after the injection, remove the liver, spleen and lungs and measure the radioactivity in the organs using a suitable instrument. Measure the radioactivity in the rest of the body after having removed the tail. Determine the percentage of radioactivity in the liver, the spleen and the lungs from the expression:

$$\frac{A}{B} \times 100$$

A = radioactivity of the organ concerned,

B = total radioactivity in the liver, the spleen, the lungs and the rest of the body.

In each of the three mice at least 80 per cent of the radioactivity is found in the liver and spleen and not more than 5 per cent in the lungs. If the distribution of radioactivity in one of the three mice does not correspond to the prescribed proportions, repeat the test on a further three mice. The preparation complies with the test if the prescribed distribution of radioactivity is found in five of the six mice used. The injection may be released for use before completion of the test.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)* . The injection may be released for use before completion of the test.

Pyrogens

It complies with the test for pyrogens prescribed in the monograph on *Radiopharmaceutical preparations (0125)* . Inject not less than 0.1 ml per kilogram of the rabbit's mass. The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by ascending paper chromatography (*2.2.26*).

Apply to the paper 10 µl of the injection. Develop immediately over a path of 10 cm to 15 cm using a 9 g/l solution of *sodium chloride R* . Allow the paper to dry. Determine the distribution of radioactivity using a suitable detector. Technetium-99m in colloidal form remains at the starting-point and pertechnetate ion migrates with an R_F of about 0.6. There may be other impurities with an R_F of 0.8 to 0.9. The radioactivity corresponding to technetium-99m in colloidal form represents not less than 92 per cent of the total radioactivity of the chromatogram.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

LABELLING

The label states, in particular, the quantity of rhenium per millilitre.

Ph Eur

Technetium [^{99m} Tc] Colloidal Sulphur Injection

General Notices

(Ph Eur monograph 0131)

Ph Eur

DEFINITION

Technetium (^{99m}Tc) colloidal sulphur injection is a sterile, apyrogenic colloidal dispersion of sulphur, the micelles of which are labelled with technetium-99m. It may be stabilised with a colloid-protecting substance based on gelatin. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 92 per cent of the radioactivity corresponds to technetium-99m in colloidal form. The pH of the injection may be adjusted by the addition of a suitable buffer, such as an acetate, citrate or phosphate buffer solution. The injection contains a variable amount of colloidal sulphur, according to the method of preparation.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile, apyrogenic ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A clear to opalescent, colourless to yellowish liquid.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.

B. Examine the chromatogram obtained in the test for radiochemical purity. The distribution of radioactivity contributes to the identification of the injection.

C. In a test-tube 100 mm long and 16 mm in internal diameter, evaporate 0.2 ml of the injection to dryness. Dissolve the sulphur by shaking the residue with 0.2 ml of *pyridine R* and add about 20 mg of *benzoin R* . Cover the open end of the tube with a filter paper moistened with *lead acetate solution R* . Heat the test-tube in a bath containing glycerol at 150 °C. The paper slowly becomes brown.

TESTS

pH (*2.2.3*)

The pH of the injection is 4.0 to 7.0.

Physiological distribution

Inject a volume not greater than 0.2 ml into the caudal vein of each of 3 mice, each weighing 20 g to 25 g. Euthanise the mice 20 min after the injection, remove the liver, spleen and lungs and measure the radioactivity in the organs using a suitable instrument. Measure the radioactivity in the rest of the body after having removed the tail. Determine the percentage of radioactivity in the liver, the spleen and the lungs from the expression:

$$\frac{A}{B} \times 100$$

A = radioactivity of the organ concerned,

B = total radioactivity in the liver, the spleen, the lungs and the rest of the body.

In each of the 3 mice at least 80 per cent of the radioactivity is found in the liver and spleen and not more than 5 per cent in the lungs. If the distribution of radioactivity in 1 of the 3 mice does not correspond to the prescribed proportions, repeat the test on a further 3 mice. The preparation complies with the test if the prescribed distribution of radioactivity is found in 5 of the 6 mice used. The injection may be released for use before completion of the test.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)* . The injection may be released for use before completion of the test.

Pyrogens

It complies with the test for pyrogens prescribed in the monograph on *Radiopharmaceutical preparations (0125)* . Inject not less than 0.1 ml per kilogram of the rabbit's mass. The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by ascending paper chromatography (*2.2.26*).

Apply to the paper 10 µl of the injection. Develop immediately over a path of 10 cm to 15 cm with a 9 g/l solution of *sodium chloride R* . Allow the paper to dry. Determine the distribution of radioactivity using a suitable detector. Technetium-99m in colloidal form remains at the starting-point and pertechnetate ion migrates with an R_F of 0.6. There may be other impurities of R_F 0.8 to 0.9. The radioactivity corresponding to technetium-99m in colloidal form represents not less than 92 per cent of the total radioactivity of the chromatogram.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

Technetium [^{99m} Tc] Colloidal Tin Injection

General Notices

(Ph Eur monograph 0689)

Ph Eur

DEFINITION

Technetium (^{99m}Tc) colloidal tin injection is a sterile, colloidal dispersion of tin labelled with technetium-99m. The injection contains a variable quantity of tin not exceeding 1 mg of Sn per millilitre; it contains fluoride ions, it may be stabilised with a suitable, apyrogenic colloid-protecting substance and it may contain a suitable buffer. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 95 per cent of the radioactivity corresponds to technetium-99m in colloidal form.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration. Syringes for handling the eluate intended for labelling of the final product, or the final product, should not contain rubber parts.

CHARACTERS

A clear or opalescent, colourless liquid.

Technetium-99m has a half life of 6.02 h and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.

B. Mix 0.05 ml of *zirconyl nitrate solution R* with 0.05 ml of *alizarin S solution R.* Add 0.05 ml of the injection to be examined. A yellow colour is produced.

TESTS

pH (*2.2.3*)

The pH of the injection to be examined is 4.0 to 7.0.

Tin

Test solution Dilute 3.0 ml of the injection to be examined to 50.0 ml with *1 M hydrochloric acid*.

Reference solution Dissolve 0.115 g of *stannous chloride R* in *1 M hydrochloric acid* and dilute to 1000.0 ml with the same acid.

To 1.0 ml of each solution add 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R*, 0.05 ml of *thioglycollic acid R*, 0.1 ml of *dithiol reagent R* and 3.0 ml of *0.2 M hydrochloric acid*. Mix. Measure the absorbance (*2.2.25*) of each solution at 540 nm, using *0.2 M hydrochloric acid* as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution (1 mg of Sn per millilitre).

Physiological distribution

Inject not more than 0.2 ml into a caudal vein of each of three mice, each weighing 20 g to 25 g. Euthanise the mice 20 min after the injection and remove the liver, spleen and lungs. Measure the radioactivity in the organs using a suitable instrument. Measure the radioactivity in the rest of the body, after having removed the tail. Determine the percentage of radioactivity in the liver, the spleen and the lungs with respect to the total radioactivity of all organs and the rest of the body excluding the tail.

In each of the three mice at least 80 per cent of the radioactivity is found in the liver and spleen and not more than 5 per cent in the lungs. If the distribution of radioactivity in one of the three mice does not correspond to the prescribed proportions, repeat the test on a further three mice. The preparation complies with the test if the prescribed distribution of radioactivity is found in five of the six mice used.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (*2.2.27*) using silica gel as the coating substance on a glass-fibre sheet. Heat the plate at 110 °C for 10 min. Use a plate such that during development the mobile phase migrates over a distance of 10 cm to 15 cm in about 10 min.

Apply to the plate 5 µl to 10 µl of the injection to be examined. Develop immediately over a path of 10 cm to 15 cm using a 9 g/l solution of *sodium chloride R* purged with *nitrogen R*. Allow the plate to dry. Determine the distribution of radioactivity using a suitable detector. Technetium-99m in colloidal form remains at the starting point and pertechnetate ion migrates near to the solvent front. Not less than 95 per cent of the technetium-99m radioactivity corresponds to technetium in colloidal form.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

Technetium [^{99m} Tc] Etifenin Injection

General Notices

(Ph Eur monograph 0585)

Ph Eur

DEFINITION

Technetium (^{99m}Tc) etifenin injection is a sterile solution which may be prepared by mixing sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) with solutions of etifenin [[(2,6-diethylphenyl)carbamoylmethylimino]di-acetic acid; $C_{16}H_{22}N_2O_5$] and stannous chloride. The injection contains a variable quantity of tin (Sn) not exceeding 0.2 mg/ml. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 95.0 per cent of the radioactivity corresponds to technetium-99m complexed with etifenin.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable, sterile ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A clear, colourless solution.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.

B. Examine by liquid chromatography (*2.2.29*).

Test solution Dilute the injection to be examined with *methanol R* to obtain a solution containing about l mg of etifenin per millilitre.

Reference solution Dissolve 5.0 mg of *etifenin CRS* in *methanol R* and dilute to 5.0 ml with the same solvent.

The chromatographic procedure may be carried out using:

— a column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica* *gel for chromatography R* (5 µm to 10 µm),

— as mobile phase at a flow rate of 1 ml/min a mixture of 20 volumes of *methanol R* and 80 volumes of a 14 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 2.5 by the addition of *phosphoric acid R* ,

— a spectrophotometer set at 230 nm.

Inject 20 µl of each solution. The principal peak in the chromatogram obtained with the test solution has a similar retention time to the principal peak in the chromatogram obtained with the reference solution.

TESTS

pH (*2.2.3*)

The pH of the injection is 4.0 to 6.0.

Physiological distribution

Inject 0.1 ml (equivalent to about 3.7 MBq) into a caudal vein of each of three mice, each weighing 20 g to 25 g. Euthanise the mice I h after the injection. Remove the liver, gall-bladder, small intestine, large intestine and kidneys, collecting excreted urine. Measure the radioactivity in the organs using a suitable instrument. Measure the radioactivity of the rest of the body, after having removed the tail. Determine the percentage of radioactivity in each organ from the expression:

$$\frac{A}{B} \times 100$$

A = radioactivity of the organ concerned,

B = radioactivity of all organs and the rest of the body, excluding the tail.

In not fewer than two mice the sum of the percentages of radioactivity in the gall-bladder and small and large intestine is not less than 80 per cent. Not more than 3 per cent of the radioactivity is present in the liver, and not more than 2 per cent in the kidneys

Tin

Test solution Dilute 1.0 ml of the injection to be examined to 5.0 ml with *1 M hydrochloric acid* .

Reference solution Prepare a reference solution containing 0.075 mg of *stannous chloride R* per millilitre in *1 M hydrochloric acid* .

To 1.0 ml of each solution add 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R* , 0.05 ml of *thioglycollic acid R* , 0.I ml of *dithiol reagent R* and 3.0 ml of *0.2 M hydrochloric acid* . Mix. Measure the absorbance (*2.2.25*) of each solution at 540 nm, using *0.2 M hydrochloric acid* as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution (0.2 mg of Sn per millilitre).

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (*2.2.27*) using silicic acid as the coating substance on a glass-fibre sheet. Heat the plate at 110 °C for l0 min. The plate used should be such that during development the mobile phase moves over a distance of 10 cm to 15 cm in about 15 min.

Apply to the plate 5 µl to 10 µl of the injection to be examined. Develop immediately over a path of 10 cm to 15 cm using a 9 g/l solution of *sodium chloride R*. Allow the plate to dry. Determine the distribution of radioactivity using a suitable detector. Technetium-99m complexed with etifenin migrates almost to the middle of the chromatogram and pertechnetate ion migrates with the solvent front. Impurities in colloidal form remain at the starting point. The radioactivity corresponding to technetium-99m complexed with etifenin represents not less than 95.0 per cent of the total radioactivity of the chromatogram.

RADIOACTIVITY

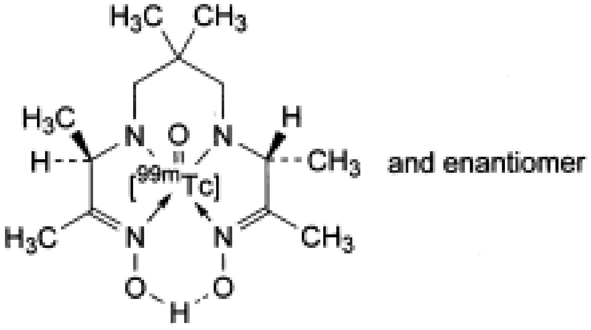
Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

Technetium [^{99m} Tc] Exametazime Injection

General Notices

(Ph Eur monograph 1925)



Ph Eur

DEFINITION

Sterile solution of lipophilic technetium-99m exametazime which may be prepared by dissolving a racemic mixture of (3*RS*,9*RS*)-4,8-diaza-3,6,6,9-tetramethylundecane-2,10-dione bisoxime in the presence of a stannous salt in *Sodium pertechnetate (^{99m} Tc) injection (fission) (0124)* or *Sodium pertechnetate (^{99m} Tc) injection (non-fission) (0283)*. It may contain stabilisers and inert additives.

Content

90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

Purity

Minimum of 80 per cent of the total radioactivity corresponds to lipophilic technetium-99m exametazime and its meso isomer.

CHARACTERS

Appearance

Clear solution.

Half-life and nature of radiation of technetium-99m

See general chapter *5.7. Table of physical characteristics of radionuclides.*

IDENTIFICATION

A. Gamma-ray spectrometry.

Comparison Standardised technetium-99m solution, or by using a calibrated instrument. Standardised technetium-99m solutions and/or standardisation services are available from the competent authority.

Results The spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised technetium-99m solution. The most prominent gamma photon has an energy of 0.141 MeV.

B. Examine the chromatograms obtained in the test Impurity A under Radiochemical purity.

Results The principal peak in the chromatogram obtained with the test solution is similar in retention time to the peak due to lipophilic technetium-99m exametazime in the chromatogram obtained with the reference solution.

TESTS

pH (*2.2.3*)

5.0 to 10.0.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)* . The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Impurity C

Thin-layer chromatography (*2.2.27*).

Test solution The preparation to be examined.

Plate *TLC silica gel plate R* ; use a glass-fibre plate.

Mobile phase 9 g/l solution of *sodium chloride R.*

Application About 5 µl.

Development Immediate, over 2/3 of the plate.

Drying In air.

Detection Determine the distribution of radioactivity using a suitable detector.

Retardation factors Impurity C = 0.8 to 1.0; lipophilic technetium-99m exametazime and impurities A, B, D and E do not migrate.

Limits:

— *impurity C*: maximum 10 per cent of the total radioactivity.

Total of lipophilic technetium-99m exametazime and impurity A

Thin-layer chromatography (*2.2.27*).

Test solution The preparation to be examined.

Plate *TLC silica gel plate R* ; use a glass-fibre plate.

Mobile phase *methyl ethyl ketone R* .

Application About 5 µl.

Development Immediate, over 2/3 of the plate.

Drying In air.

Detection Determine the distribution of radioactivity using a suitable detector.

Retardation factors Lipophilic technetium-99m exametazime = 0.8 to 1.0, impurity A = 0.8 to 1.0, impurity C = 0.8 to 1.0; impurities B, D and E do not migrate.

Limits Calculate the percentage of radioactivity due to impurities B, D and E from test B *(B)* and the percentage of the radioactivity due to impurity C from test A *(A)*. Calculate the total percentage of lipophilic technetium-99m exametazime and impurity A from the expression:

$$100 - A - B$$

— *total of lipophilic technetium-99m exametazime and impurity A*: minimum 80 per cent of the total radioactivity.

Impurity A

Liquid chromatography (*2.2.29*).

Test solution The preparation to be examined.

Reference solution Dissolve the contents of a vial of *meso-rich exametazime CRS* in 0.5 ml of a 9 g/l solution of *sodium chloride R* and transfer to a lead-shielded, nitrogen-filled vial. Add 6 µl of a freshly prepared 1 g/l solution of *stannous chloride R* in *0.05 M hydrochloric acid* and 2.5 ml of sodium pertechnetate (99mTc) injection (fission or non-fission) containing 370-740 MBq. Mix carefully and use within 30 min of preparation.

Column:

— *size:* l = 0.25 m, Ø = 4.6 mm,

— *stationary phase*: spherical *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 13 nm and a carbon loading of 11 per cent.

Mobile phase Mix 33 volumes of *acetonitrile R* and 67 volumes of *0.1 M phosphate buffer solution pH 3.0 R* .

Flow rate 1.5 ml/min.

Detection Radioactivity detector.

Injection Loop injector.

Run time 20 min.

Relative retention With reference to lipophilic technetium-99m exametazime: impurity A = about 1.2.

System suitability Reference solution:

— chromatogram similar to the chromatogram provided with *meso-rich exametazime CRS,*

— *resolution*: minimum of 2 between the peaks due to lipophilic technetium-99m exametazime and to impurity A.

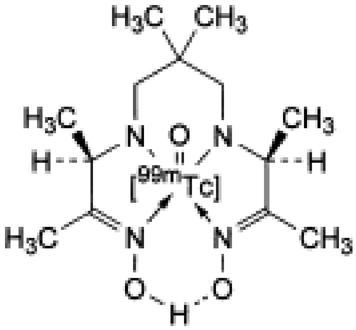
Limits:

— *impurity A*: maximum 5 per cent of the radioactivity due to lipophilic technetium-99m exametazime and impurity A.

RADIOACTIVITY

Measure the radioactivity using suitable equipment by comparison with a standardised technetium-99m solution or by using a calibrated instrument.

IMPURITIES



A. *meso* isomer of lipophilic technetium-99m exametazime,

B. technetium-99m in colloidal form,

C. [^{99m}Tc]pertechnetate ion,

D. non lipophilic technetium-99m exametazime complex,

E. *meso* isomer of non lipophilic technetium-99m exametazime complex.

Ph Eur

Technetium [^{99m} Tc] Gluconate Injection

General Notices

(Ph Eur monograph 1047)

Ph Eur

DEFINITION

Technetium (^{99m}Tc) gluconate injection is a sterile solution, which may be prepared by mixing solutions of calcium gluconate and a stannous salt or other suitable reducing agent with sodium pertechnetate (^{99m}Tc) injection (fission or non-fission). The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 90 per cent of the radioactivity corresponds to technetium-99m gluconate complex.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A slightly opalescent solution.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.

B. 5 µl of the solution complies with identification A prescribed in the monograph on *Calcium gluconate (0172).*

C. Examine the chromatograms obtained in the test for radiochemical purity. The distribution of the radioactivity contributes to the identification of the preparation.

TESTS

pH (*2.2.3*)

The pH of the solution is 6.0 to 8.5.

Physiological distribution

Inject a volume not greater than 0.2 ml into the caudal vein of each of three rats weighing 150 g to 250 g. Measure the radioactivity of the syringe before and after injection. Euthanise the rats 30 min after the injection. Remove at least 1 g of blood by a suitable method and remove the kidneys, the liver, the bladder plus voided urine and the tail. Weigh the sample of blood.

Determine the radioactivity in the organs, the blood sample and the tail using a suitable instrument. Calculate the percentage of radioactivity in each organ and in 1 g of blood with respect to the total radioactivity calculated as the difference between the two measurements made on the syringe minus the activity in the tail. Correct the blood concentration by multiplying by a factor of $m/200$ where m is the body mass of the rat in grams.

In not fewer than two of the three rats used, the radioactivity in the kidneys is not less than 15 per cent, that in the bladder plus voided urine is not less than 20 per cent and that in the liver is not more than 5 per cent. The radioactivity in the blood, after correction, is not more than 0.50 per cent.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)* . The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (*2.2.27*) using silica gel as the coating substance on a glass-fibre sheet. Heat the plate at 110 °C for 10 min. Use a plate such that during development the mobile phase migrates over a distance of 10 cm to 15 cm in about 10 min.

a) Apply to the plate 5 µl to 10 µl of the solution to be examined. Develop immediately over a path of 10 cm to 15 cm using a 9 g/l solution of *sodium chloride R* . Allow the plate to dry. Determine the distribution of radioactivity using a suitable detector. Impurities in colloidal form remain at the starting point. Technetium gluconate complex and pertechnetate ion migrate near to the solvent front.

b) Apply to the plate 5 µl to 10 µl of the solution to be examined and allow to dry. Develop over a path of 10 cm to 15 cm using *methyl ethyl ketone R* . Dry in a current of warm air. Determine the distribution of radioactivity using a suitable detector. Pertechnetate ion impurity migrates near to the solvent front. Technetium gluconate complex and technetium in colloidal form remain at the starting point.

The sum of the percentages of radioactivity corresponding to impurities in the chromatograms obtained in test (a) and (b) does not exceed 10 per cent.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

Technetium [^{99m} Tc] Macrosalb Injection

General Notices

(Ph Eur monograph 0296)

Ph Eur

DEFINITION

Technetium (^{99m}Tc) macrosalb injection is a sterile, apyrogenic suspension of human albumin in the form of irregular insoluble aggregates obtained by denaturing human albumin in aqueous solution; the particles are labelled with technetium-99m. The injection contains reducing substances, such as tin salts in an amount not exceeding 3 mg of Sn per millilitre; it may contain a suitable buffer such as acetate, citrate or phosphate buffer and also non-denatured human albumin and an antimicrobial preservative such as benzyl alcohol. The human albumin employed complies with the requirements prescribed in the monograph on *Human albumin solution (0255)*. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 90 per cent of the technetium-99m is bound to the particles of the suspension as determined by the test for non-filterable radioactivity. The particles have a typical diameter between 10 µm and 100 µm. The specific radioactivity is not less than 37 MBq of technetium-99m per milligram of aggregated albumin at the date and hour of administration.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile and apyrogenic ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A white or almost white suspension which may separate on standing.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.

B. The tests for non-filterable radioactivity and particle size contribute to the identification of the preparation.

C. Transfer 1 ml of the injection to a centrifuge tube and centrifuge at 2500 g for 5 min to 10 min. Decant the supernatant liquid. To the residue add 5 ml of *cupri-tartaric solution R2* , mix and allow to stand for 10 min. If necessary, heat to dissolve the particles and allow to cool. Add rapidly 0.5 ml of *dilute phosphomolybdotungstic reagent R* , mixing immediately. A blue colour develops.

TESTS

pH (*2.2.3*)

The pH of the injection is 3.8 to 7.5.

Non-filterable radioactivity

Use a polycarbonate membrane filter 13 mm to 25 mm in diameter, 10 µm thick and with circular pores 3 µm in diameter. Fit the membrane into a suitable holder. Place 0.2 ml of the injection on the membrane and filter, adding 20 ml of a 9 g/l solution of *sodium chloride R* during the filtration. The radioactivity remaining on the membrane represents not less than 90 per cent of the total radioactivity of the injection.

Particle size

Examine using a microscope. Dilute the injection if necessary so that the number of particles is just low enough for individual particles to be distinguished. Using a syringe fitted with a needle having a calibre not less than 0.35 mm, place a suitable volume in a suitable counting chamber such as a haemocytometer cell, taking care not to overfill the chamber. Allow the suspension to settle for 1 min and carefully add a cover slide without squeezing the sample. Scan an area corresponding to at least 5000 particles. Not more than 10 particles have a maximum dimension greater than 100 µm. No particle having a maximum dimension greater than 150 µm is present.

Aggregated albumin

Test solution Transfer a volume of the injection expected to contain about 1 mg of aggregated albumin to a centrifuge tube and centrifuge at about 2500 g for 5 min to 10 min. Decant the supernatant liquid. Resuspend the sediment in 2.0 ml of a 9 g/l solution of *sodium chloride R* . Centrifuge at 2500 g for 5 min to 10 min. Decant the supernatant liquid. Resuspend the sediment in 5.0 ml of *sodium carbonate solution R1* . Heat in a water-bath at 80 °C to 90 °C to dissolve the aggregated albumin. Allow to cool, transfer to a volumetric flask and dilute to 10.0 ml with *sodium carbonate solution R1.*

Reference solutions Prepare a range of reference solutions containing 0.05 mg to 0.2 mg of human albumin per millilitre in *sodium carbonate solution R1.*

Introduce 3.0 ml of each solution separately into 25 ml flasks. To each flask add 15.0 ml of *cupri-tartaric solution R2* , mix and allow to stand for 10 min. Add rapidly 1.5 ml of *dilute phosphomolybdotungstic reagent R* and mix immediately. Allow to stand for 30 min and measure the absorbance (*2.2.25*) at 750 nm using *sodium carbonate solution R1* as the compensation liquid. Using the absorbances obtained with the reference solutions, draw a calibration curve and calculate the content of aggregated albumin in the injection.

Tin

Test solution To 1.0 ml of the injection add 1.0 ml of *2 M hydrochloric acid R* . Heat in a water-bath for 30 min. Cool and centrifuge for 10 min at 300 g. Dilute 1.0 ml of the supernatant liquid to 25.0 ml with *1 M hydrochloric acid*.

Reference solution Dissolve 0.115 g of *stannous chloride R* in *1 M hydrochloric acid* and dilute to 1000.0 ml with the same acid.

To 1.0 ml of each solution add 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R*, 0.05 ml of *thioglycollic acid R*, 0.1 ml of *dithiol reagent R* and 3.0 ml of *0.2 M hydrochloric acid*. Mix. Measure the absorbance (*2.2.25*) of each solution at 540 nm, using *0.2 M hydrochloric acid* as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution (3 mg of Sn per millilitre).

Physiological distribution

Inject a volume not greater than 0.2 ml into the caudal vein of each of three rats weighing 150 g to 250 g. Euthanise the rats 15 min after the injection, remove the liver, the spleen and the lungs and measure the radioactivity in the organs using a suitable instrument. Measure the radioactivity in the rest of the body, including the blood, after having removed the tail. Determine the percentage of radioactivity in the lungs, the liver and the spleen from the expression:

$$\frac{A}{B} \times 100$$

A = radioactivity of the organ concerned,

B = total radioactivity in the liver, the spleen, the lungs and the rest of the body.

In not fewer than two of the three rats used, at least 80 per cent of the radioactivity is found in the lungs and not more than a total of 5 per cent in the liver and spleen. The injection may be released for use before completion of the test.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

Pyrogens

It complies with the test for pyrogens prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. Inject into the animals not less than 0.1 ml per kilogram of the rabbit's mass. The injection may be released for use before completion of the test.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

LABELLING

The label states:

- — that the preparation should be shaken before use,
- — the quantity of tin per millilitre, if any,
- — that the preparation is not to be used if after shaking, the suspension does not appear homogeneous.

Ph Eur

Technetium [^{99m} Tc] Medronate Injection

General Notices

(Ph Eur monograph 0641)

Ph Eur

DEFINITION

Technetium (^{99m}Tc) medronate injection is a sterile solution which may be prepared by mixing solutions of sodium methylenediphosphonate and a stannous salt with sodium pertechnetate (^{99m}Tc) injection (fission or non-fission). The injection contains a variable quantity of tin (Sn) not exceeding 3 mg/ml; it may contain antimicrobial preservatives, antioxidants, stabilisers and buffers. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Radioactivity present as chemical forms other than technetium-99m medronate complex is not greater than 5.0 per cent of the total radioactivity.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A clear, colourless solution.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity. The distribution of the radioactivity contributes to the identification of the preparation.

C. Examine by thin-layer chromatography (*2.2.27*) using cellulose as the coating substance.

Test solution Dilute the injection to be examined with water R to obtain a solution containing about 0.1 mg to 0.5 mg of sodium medronate per millilitre.

Reference solution Dissolve a suitable quantity (1 mg to 5 mg) of *medronic acid CRS* in a mixture of a 9.0 g/l solution of *sodium chloride R* and *water R* and dilute to 10 ml with the same solvent so as to obtain a solution similar to the test solution with regard to medronate and sodium chloride concentrations.

Apply separately to the plate 10 µl of each solution. Develop over a path of 12 cm to 14 cm (development time about 4 h) using a mixture of 20 volumes of *2-propanol R*, 30 volumes of *1 M hydrochloric acid* and 60 volumes of *methyl ethyl ketone R*. Allow the plate to dry in air and spray with *ammonium molybdate solution R4*. Expose the plate to ultraviolet light at 254 nm for about 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position and colour to the spot in the chromatogram obtained with the reference solution.

TESTS

pH (*2.2.3*)

The pH of the solution is 3.5 to 7.5.

Tin

Test solution Dilute 1.0 ml of the solution to 50.0 ml with *1 M hydrochloric acid*.

Reference solution Dissolve 0.115 g of *stannous chloride R* in *1 M hydrochloric acid* and dilute to 1000.0 ml with the same acid.

To 1.0 ml of each solution add 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R*, 0.05 ml of *thioglycollic acid R*, 0.1 ml of *dithiol reagent R* and 3.0 ml of *0.2 M hydrochloric acid*. Mix. Measure the absorbance (*2.2.25*) of each solution at 540 nm, using *0.2 M hydrochloric acid* as compensation liquid. The absorbance of the test solution is not greater than that of the reference solution (3 mg of Sn per millilitre).

Physiological distribution

Inject a volume not greater than 0.2 ml, equivalent to not more than 0.05 mg of sodium medronate into a suitable vein such as a caudal vein or the saphenous vein of each of three rats, each weighing 150 g to 250 g. Measure the radioactivity in the syringe before and after injection. Euthanise the rats 2 h after the injection. Remove one femur, the liver, and some blood. Weigh the blood. Remove the tail if a caudal vein has been used for the injection. Using a suitable instrument measure the radioactivity in the femur, liver, and blood, and in the tail if a caudal vein has been used for the injection. Determine the percentage of radioactivity in each sample from the expression:

$$\frac{A}{B} \times 100$$

A = radioactivity of the sample concerned,

B = total radioactivity, which is equal to the difference between the two measurements made on the syringe minus the radioactivity in the tail if a caudal vein has been used for the injection.

Calculate the radioactivity per unit mass in the blood. Correct the blood concentration by multiplying by a factor *m*/200 where *m* is the body mass of the rat in grams.

In not fewer than two of the three rats: not less than 1.5 per cent of the radioactivity is found in the femur; not more than 1.0 per cent is found in the liver and not more than 0.05 per cent per gram is found in the blood.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)* . The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (*2.2.27*) using silica gel as the coating substance on a glass-fibre sheet. Use plates such that during development, the mobile phase migrates 10 cm to 15 cm in about 10 min. Determine hydrolysed technetium and technetium in colloidal form by test (a) and pertechnetate ion by test (b).

(a) Apply to the plate 5 µl to 10 µl of the injection. Develop immediately over a path of 10 cm to 15 cm using a 136 g/l solution of *sodium acetate R* . Allow the plate to dry in air. Determine the distribution of radioactivity using a suitable detector. Hydrolysed technetium and technetium in colloidal form remain at the starting point. Technetium medronate complex and pertechnetate ion migrate near to the solvent front.

(b) Apply to the plate 5 µl to 10 µl of the injection and dry quickly. Develop over a path of 10 cm to 15 cm using *methyl ethyl ketone R* . Allow the plate to dry. Determine the distribution of radioactivity using a suitable detector. Pertechnetate ion migrates near to the solvent front. Technetium medronate complex and technetium in colloidal form remain at the starting-point.

The percentage of radioactivity corresponding to pertechnetate ion in the chromatogram obtained in test (b) is not greater than 2.0 per cent and the sum of the percentages of radioactivity corresponding to impurities in the chromatograms obtained in test (a) and test (b) (including pertechnetate ion) is not greater than 5.0 per cent.

RADIOACTIVITY

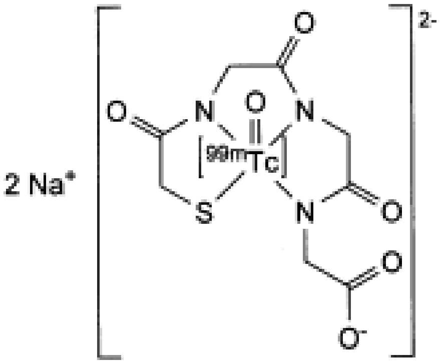
Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

Technetium [^{99m} Tc] Mertiatide Injection

General Notices

(Ph Eur monograph 1372)



Ph Eur

DEFINITION

Technetium (^{99m}Tc) mertiatide injection is a sterile solution which may be prepared by either heating a mixture containing S-benzoylmercaptoacetyltriglycine (betiatide), a weak chelating agent such as tartrate, a stannous salt and sodium pertechnetate (^{99m}Tc) injection (fission or non-fission), or by mixing solutions of mercaptoacetyltriglycine (mertiatide), a stannous salt and sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) at alkaline pH. It may contain stabilisers and a buffer. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and time stated on the label. Not less than 94 per cent of the radioactivity corresponds to technetium-99m in the form of [^{99m}Tc]technetium mertiatide.

CHARACTERS

A clear, colourless solution.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.

B. Examine the chromatogram obtained in test (b) for radiochemical purity. The principal peak in the chromatogram obtained with the test solution has approximately the same retention time as the principal peak in the chromatogram obtained with the reference solution.

TESTS

pH (*2.2.3*)

The pH of the injection is 5.0 to 7.5.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)* . The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

(a) Examine by ascending paper chromatography (*2.2.26*) using a suitable paper as the stationary phase.

Test solution The solution to be examined.

Apply 2 µl of the test solution to the paper. Develop over a path of 15 cm using a mixture of 40 volumes of *water R* and 60 volumes of *acetonitrile R* . Allow the paper to dry and determine the distribution of the radioactivity using a suitable detector. Not more than 2.0 per cent of the total radioactivity is retained at the origin (R_F value 0.0 to 0.1).

(b) Examine by liquid chromatography (*2.2.29*).

Test solution The solution to be examined.

Reference solution Dissolve with heating on a water-bath 5 mg of *S-benzylmercaptoacetyltriglycine CRS* in 5 ml of water R. To 1 ml of this solution in a closed vial filled with *nitrogen R* , add 0.5 ml of a 40 g/l solution of *sodium potassium tartrate R* , 25 µl of a 4 g/l solution of *stannous chloride R* in *0.05 M hydrochloric acid R* and 370 MBq to 740 MBq of sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) in a volume not exceeding 3 ml. Heat the mixture on a water-bath for 10 min and allow to cool to room temperature.

The chromatographic procedure may be carried out using:

— a stainless steel column 0.25 m long and 4.0 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R (5 µm),*

— as mobile phase at a flow rate of 1.0 ml/min:

Mobile phase A A mixture of 7 volumes of *ethanol R* with 93 volumes of a solution of a 1.36 g/l solution of *potassium dihydrogen phosphate R* , adjusted to pH 6.0 with *0.1 M sodium hydroxide* ,

Mobile phase B A mixture of 10 volumes of *water R* with 90 volumes of *methanol R* ,

— a suitable radioactivity detector,

— a 20 µl loop injector.

Equilibrate the column with mobile phase A for 20 min. Inject the test solution and the reference solution. Switch 10 min after each injection to mobile phase B and continue the chromatographic procedure for 15 min.

The test is not valid unless in the chromatogram obtained with the test solution the principal peak has approximately the same retention time as the principal peak in the chromatogram obtained with the reference solution. In the chromatogram obtained with the test solution the sum of the areas preceding the principal peak (corresponding to hydrophilic impurities, including [^{99m}Tc]pertechnetate) is not greater than 3.0 per cent of the sum of the areas of all peaks. The sum of the peaks following the principal peak (corresponding to lipophilic impurities) is not greater than 4.0 percent of the sum of the area of all peaks.

Not less than 94 per cent of the radioactivity corresponds to [^{99m}Tc]technetium mertiatide.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

Technetium [^{99m} Tc] Microspheres Injection

General Notices

(Ph Eur monograph 0570)

Ph Eur

DEFINITION

Technetium (^{99m}Tc) microspheres injection is a sterile, apyrogenic suspension of human albumin which has been denatured to form spherical insoluble particles; the particles are labelled with technetium-99m. The injection contains reducing substances, such as tin salts in an amount not exceeding 3 mg of Sn per millilitre; it may contain a suitable buffer such as acetate, citrate or phosphate and additives such as wetting agents. The human albumin used complies with the requirements of the monograph on *Human albumin solution (0255).* The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 95 per cent of the technetium-99m is bound to the particles of the suspension as determined by the test for non-filterable radioactivity. The particles have a typical diameter between 10 µm and 50 µm. The radioactivity is not less than 185 MBq of technetium-99m per million particles at the date and hour of administration.

Technetium (^{99m}Tc) microspheres injection is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile and apyrogenic ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A suspension of white, yellow or artificially coloured particles which may separate on standing.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.

B. The tests for non-filterable radioactivity and particle size contribute to the identification of the preparation.

C. Transfer 1 ml of the injection to a centrifuge tube and centrifuge at 2500 g for 5 min to 10 min. Decant the supernatant liquid. To the residue add 5 ml of *cupri-tartaric solution R2*, mix and allow to stand for 10 min. If necessary, heat to dissolve the particles and allow to cool. Add rapidly 0.5 ml of *dilute phosphomolybdotungstic reagent R*, mix immediately and allow to stand. A blue colour develops.

TESTS

pH (*2.2.3*)

The pH of the injection is 4.0 to 9.0.

Non-filterable radioactivity

Use a polycarbonate membrane filter 13 mm to 25 mm in diameter, 10 µm thick and with circular pores 3 µm in diameter. Fit the membrane into a suitable holder. Place 0.2 ml of the injection on the membrane and filter, adding 20 ml of a 9 g/l solution of *sodium chloride R* during the filtration. The radioactivity remaining on the membrane represents not less than 95 per cent of the total radioactivity of the injection.

Particle size

Examine using a microscope. Dilute the injection if necessary so that the number of particles is just low enough for individual particles to be distinguished. Using a syringe fitted with a needle having a calibre not less than 0.35 mm, place a suitable volume in a suitable counting chamber such as a haemocytometer cell, taking care not to overfill the chamber. Allow the suspension to settle for 1 min and carefully add a cover slide without squeezing the sample. Scan an area corresponding to at least 5000 particles. The particles have a uniform spherical appearance. Not more than 10 particles have a maximum dimension greater than 75 µm. No particle having a maximum dimension greater than 100 µm is present.

Number of particles

Examine using a microscope. Fill a suitable counting chamber such as a haemocytometer cell with a suitable dilution of the injection taking care that particles do not separate during the transfer. Count the number of particles in the chamber. Repeat this procedure twice and calculate the number of particles per millilitre of the injection.

Tin

Test solution To 1.0 ml of the injection add 0.5 ml of *sulphuric acid R* and 1.5 ml of *nitric acid R*. Heat and evaporate to approximately 1 ml. Add 2 ml of *water R* and evaporate again to approximately 1 ml. Repeat this procedure twice, cool and dilute to 25.0 ml with *1 M hydrochloric acid*.

Reference solution Dissolve 0.115 g of *stannous chloride R* in *1 M hydrochloric acid* and dilute to 1000.0 ml with the same acid.

To 1.0 ml of each solution add 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R*, 0.05 ml of *thioglycollic acid R*, 0.1 ml of *dithiol reagent R* and 3.0 ml of *0.2 M hydrochloric acid*. Mix. Measure the absorbance (*2.2.25*) of each solution at 540 nm, using *0.2 M hydrochloric acid* as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution (3 mg of Sn per millilitre).

Physiological distribution

Inject a volume not greater than 0.2 ml into a caudal vein of each of three rats weighing 150 g to 250 g. Euthanise the rats 15 min after the injection, remove the liver, the spleen and the lungs and measure the radioactivity in the organs using a suitable instrument. Measure the radioactivity in the rest of the body, including the blood and voided urine, after having discarded the tail. Determine the percentage of radioactivity in the liver, the spleen and the lungs from the expression:

$$\frac{A}{B} \times 100$$

A = radioactivity of the organ concerned,

B = total radioactivity in the liver, the spleen, the lungs and the rest of the body, including voided urine.

In not fewer than two of the three rats used, not less than 80 per cent of the radioactivity is found in the lungs and not more than a total of 5 per cent in the liver and spleen. The injection may be released for use before completion of the test.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The injection may be released for use before completion of the test.

Pyrogens

It complies with the test for pyrogens prescribed in the monograph on *Radiopharmaceutical preparations (0125)* . Inject not less than 0.1 ml per kilogram of the rabbit's mass. The injection may be released for use before completion of the test.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

LABELLING

The label states:

— the quantity of tin per millilitre, if any,

— that the preparation should be shaken before use.

(Ph Eur monograph 0642)

Ph Eur

DEFINITION

Technetium (^{99m}Tc) pentetate injection is a sterile solution which may be prepared by mixing solutions of sodium diethylenetriaminepenta-acetate or calcium trisodium diethylenetriaminepenta-acetate and a stannous salt with a solution of sodium pertechnetate (^{99m}Tc). It contains a variable quantity of tin (Sn) not exceeding 1 mg/ml; it may contain suitable antimicrobial preservatives, antioxidants, stabilisers and buffers. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 95.0 per cent of the radioactivity corresponds to technetium-99m complexed with sodium pentetate or calcium trisodium pentetate.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable, sterile ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A clear, colourless or slightly yellow solution.

Technetium-99m has a half life of 6.02 h and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity. The distribution of radioactivity contributes to the identification of the preparation.

C. Place in a clean, dry 10 ml glass tube a volume of the injection to be examined containing 2 mg of pentetate. Dilute, if necessary, to 1 ml with *water R*. Place in a second tube 1 ml of *water R* (blank). To each tube add 0.1 ml of a 1 g/l solution of *nickel sulphate R*, 0.5 ml of a 50 per cent *V/V* solution of *glacial acetic acid R* and 0.75 ml of a 50 g/l solution of *sodium hydroxide R*. Mix and verify that the pH is not above 5. To each tube add 0.1 ml of a 10 g/l solution of *dimethylglyoxime R* in *alcohol R*. Mix and allow to stand for 2 min. Adjust the pH in each tube to not less than 12 by adding a 100 g/l solution of *sodium hydroxide R*. Mix and check that the pH is not below 12. Allow to stand for 2 min. Heat the tubes gently on a water-bath for 2 min. The solution in the tube containing the injection to be examined remains clear and colourless throughout. The solution in the blank tube becomes red on addition of dimethylglyoxime solution and a red precipitate is formed when the tube is heated on a water-bath.

TESTS

pH (*2.2.3*)

The pH of the injection is 4.0 to 7.5.

Tin

Test solution Dilute 1.5 ml of the injection to 25.0 ml with *1 M hydrochloric acid*.

Reference solution Dissolve 0.115 g of *stannous chloride R* in *1 M hydrochloric acid* and dilute to 1000.0 ml with the same acid.

To 1.0 ml of each solution add 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R*, 0.05 ml of *thioglycollic acid R*, 0.1 ml of *dithiol reagent R* and 3.0 ml of *0.2 M hydrochloric acid*. Mix. Measure the absorbance (*2.2.25*) of each solution at 540 nm, using *0.2 M hydrochloric acid* as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution (1 mg of Sn per millilitre).

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (*2.2.27*) using silica gel as the coating substance on a glass-fibre sheet. Heat the plate at 110 °C for 10 min. Use a plate such that during development the mobile phase migrates over a distance of 10 cm to 15 cm in about 10 min.

(a) Apply to the plate 5 µl to 10 µl of the injection to be examined. Develop immediately over a path of 10 cm to 15 cm using a 9 g/l solution of *sodium chloride R*. Allow the plate to dry in air. Determine the distribution of radioactivity using a suitable detector. Impurities in colloidal form remain at the starting point. Technetium pentetate complex and pertechnetate ion migrate near to the solvent front.

(b) Apply to the plate 5 µl to 10 µl of the injection to be examined and allow to dry. Develop over a path of 10 cm to 15 cm using *methyl ethyl ketone R*. Allow the plate to dry. Determine the distribution of radioactivity using a suitable detector. Pertechnetate ion migrates near to the solvent front. Technetium pentetate complex and impurities in colloidal form remain at the starting point.

The sum of the percentages of radioactivity corresponding to impurities in the chromatograms obtained in test (a) and (b) does not exceed 5.0 per cent.

RADIOACTIVITY

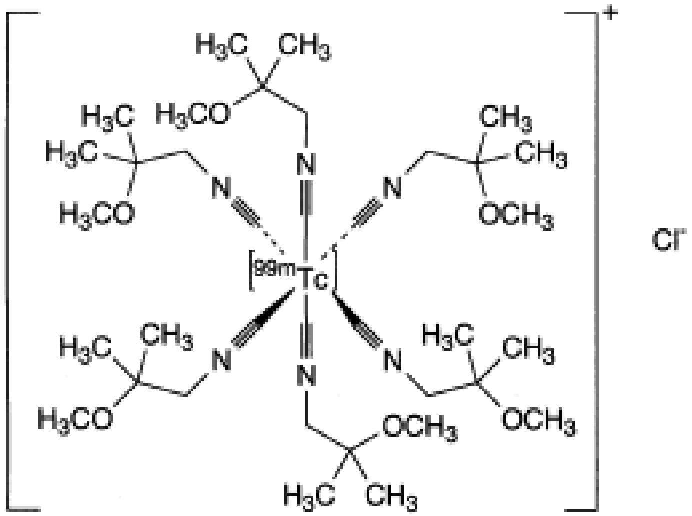
Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

Technetium [^{99m} Tc] Sestamibi Injection

General Notices

(Ph Eur monograph 1926)



Ph Eur

DEFINITION

Sterile solution of (*OC*-6-11)-hexakis[1-(isocyano-κ*C*)-2-methoxy-2-methylpropane][^{99m}Tc] technetium(I) chloride, which may be prepared by heating a mixture containing [tetrakis(2-methoxy-2-methylpropyl-1-isocyanide)copper (1+)] tetrafluoroborate, a weak chelating agent, a stannous salt and *Sodium pertechnetate (^{99m} Tc) injection (fission) (0124)* or *Sodium pertechnetate (^{99m} Tc) injection (non-fission) (0283).*

Content

90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label.

CHARACTERS

Appearance

Clear, colourless solution.

Half-life and nature of radiation of technetium-99m

See general chapter *5.7. Table of physical characteristics of radionuclides.*

IDENTIFICATION

A. Gamma-ray spectrometry.

Results The spectrum obtained with the solution to be examined does not differ significantly from that of a standardised technetium-99m solution. The most prominent gamma photon has an energy of 0.141 MeV.

B. Examine the chromatograms obtained in the test for impurity C under Radiochemical purity.

Results The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the radiochromatogram obtained with the reference solution.

TESTS

pH (*2.2.3*)

5.0 to 6.0.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Impurity A and other polar impurities

Thin-layer chromatography (*2.2.27*).

Test solution The preparation to be examined.

Plate *TLC octadecylsilyl silica gel plate R.*

Mobile phase Mix 10 volumes of *tetrahydrofuran R* , 20 volumes of a 38.5 g/l solution of *ammonium acetate R* , 30 volumes of *methanol R* and 40 volumes of *acetonitrile R* .

Application About 5 µl.

Development Immediately over a path of 6 cm.

Drying In air.

Detection Determine the distribution of radioactivity using a radioactivity detector.

Retardation factors Impurity B and apolar impurities = 0 to 0.1; impurity C and technetium-99m sestamibi = 0.3 to 0.6; impurity A and other polar impurities = 0.9 to 1.0.

Limit See test for impurity B.

Impurity B

Paper chromatography *(2.2.26) . If no activity is found at retardation factor 0 to 0.1 in the test for impurity A and other polar impurities, impurity B is absent and the test for impurity B may be omitted.*

Test solution The preparation to be examined.

Paper *paper for chromatography R.*

Mobile phase Mix equal volumes of *acetonitrile R* , *0.5 M acetic acid* and a 20 g/l solution of *sodium chloride R .*

Application About 5 µl.

Development Over a path of 10 cm.

Drying In air.

Detection Determine the distribution of radioactivity using a radioactivity detector.

Retardation factors Impurity B = 0 to 0.1; impurity A, impurity C and technetium-99m sestamibi = 0.8 to 1.0.

Limit:

— *sum of impurity A and other polar impurities, and impurity B*: maximum 5 per cent of the total radioactivity.

Impurity C

Liquid chromatography (*2.2.29*).

Test solution The preparation to be examined.

Reference solution To a vial of *sestamibi labelling kit CRS* add 3 ml of a 9 g/l solution of *sodium chloride R* containing 700 MBq to 900 MBq of sodium pertechnetate (^{99m}Tc) injection (fission or non-fission). Heat the mixture in a water-bath for 10 min and allow to cool to room temperature.

Column:

— *size:* *l* = 0.25 m, Ø = 4.6 mm,

— *stationary phase*: spherical *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase Mix 20 volumes of *acetonitrile R,* 35 volumes of a 6.6 g/l solution of *ammonium sulphate R* and 45 volumes of *methanol R* .

Flow rate 1.5 ml/min.

Detection Radioactivity detector.

Injection 25 µl.

Run time 25 min.

Relative retention

With reference to technetium-99m sestamibi: impurity C = about 1.3.

System suitability Reference solution:

— the chromatogram is similar to the chromatogram provided with *sestamibi labelling kit*

CRS,

— *relative retention* with reference to technetium-99m sestamibi: impurity C = minimum 1.2.

Limits:

— *impurity C*: not more than 3 per cent of the total radioactivity,

— *technetium-99m sestamibi*: minimum 94 per cent of the total radioactivity.

Calculate the percentage of radioactivity due to technetium-99m sestamibi from the expression:

$$\frac{(100 - B) \times T}{100}$$

B = percentage of radioactivity due to impurity B determined in the test for impurity B under Radiochemical purity,

T = area of the peak due to technetium-99m sestamibi in the chromatogram obtained with the test solution.

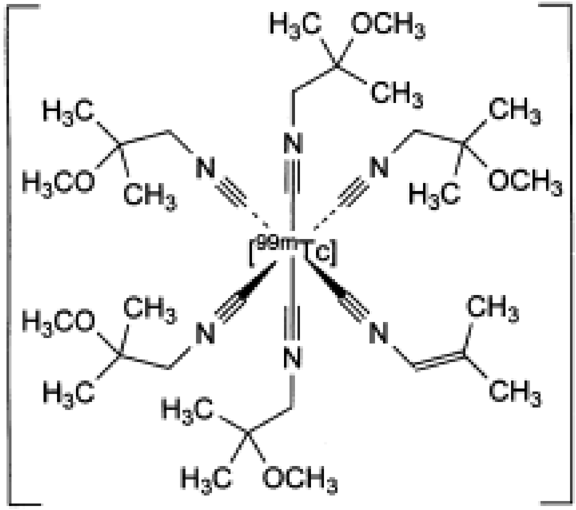
RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

IMPURITIES

A. $[^{99m}Tc]O_4^-$: (^{99m}Tc)pertechnetate ion,

B. technetium-99m in colloidal form,



C. (*OC*-6-22)-pentakis[1-(isocyano-κ*C*)-2-methoxy-2-methylpropane][1-(isocyano-κ*C*)-2-methylprop-1-ene][^{99m}Tc]technetium (1+).

Technetium [^{99m} Tc] Succimer Injection

General Notices

(Ph Eur monograph 0643)

Ph Eur

DEFINITION

Technetium (^{99m}Tc) succimer injection is a sterile solution of *meso*-2,3-dimercaptosuccinic acid labelled with technetium-99m. It contains a reducing substance, such as a tin salt in an amount not exceeding 1 mg of Sn per millilitre, and may contain stabilisers, antioxidants such as ascorbic acid, and inert additives. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 95.0 per cent of the radioactivity corresponds to technetium-99m succimer complex.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration. Syringes for handling the eluate intended for labelling of the final product, or for handling the final product should not contain rubber parts.

CHARACTERS

A clear, colourless solution.

Technetium-99m has a half life of 6.02 h and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.

B. Examine the chromatogram obtained in the test for radiochemical purity. The distribution of the radioactivity contributes to the identification of the preparation.

C. Place 1 ml of the injection to be examined in a test-tube and add 1 ml of a 20 g/l solution of *sodium nitroprusside R* and 0.1 ml of *glacial acetic acid R* . Mix. Place carefully at the top of the solution a layer of *concentrated ammonia R* . A violet ring develops between the layers.

TESTS

pH (*2.2.3*)

The pH of the injection is 2.3 to 3.5.

Tin

Test solution Dilute 1.5 ml of the injection to be examined to 25.0 ml with *1 M hydrochloric acid* .

Reference solution Dissolve 0.115 g of *stannous chloride R* in *1 M hydrochloric acid* and dilute to 1000.0 ml with the same acid.

To 1.0 ml of each solution add 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R* , 0.05 ml of *thioglycollic acid R* , 0.1 ml of *dithiol reagent R* and 3.0 ml of *0.2 M hydrochloric acid* . Mix. Allow to stand for 60 min. Measure the absorbance (*2.2.25*) of each solution at 540 nm, using *0.2 M hydrochloric acid* as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution (1 mg of Sn per millilitre).

Physiological distribution

Inject a volume not greater than 0.2 ml and containing not more than 0.1 mg of dimercaptosuccinic acid into a suitable vein, such as a caudal vein or a saphenous vein, of each of three rats each weighing 150 g to 250 g. Measure the radioactivity in the syringe before and after the injection. Euthanise the rats 1 h after the injection. Remove the kidneys, the liver, the stomach, the lungs and, if a caudal vein has been used for the injection, the tail. Using a suitable instrument determine the radioactivity in the organs and, if a caudal vein has been used for injection, in the tail. Determine the percentage of radioactivity in each organ with respect to the total radioactivity calculated as the difference between the two measurements made on the syringe minus the activity in the tail (if a caudal vein has been used for the injection).

In not fewer than two of the three rats used, the radioactivity in the kidneys is not less than 40 per cent, that in the liver is not more than 10.0 per cent, that in the stomach is not more than 2.0 per cent and that in the lungs is not more than 5.0 per cent.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (*2.2.27*) using silica gel as the coating substance on a glass-fibre sheet. Heat the plate at 110 °C for 10 min. Use a plate such that during development the mobile phase migrates over a distance of 10 cm to 15 cm in about 10 min.

Apply to the plate 5 µl to 10 µl of the injection to be examined. Develop immediately over a path of 10 cm to 15 cm using *methyl ethyl ketone R* . Allow the plate to dry. Determine the distribution of radioactivity using a suitable detector. Technetium succimer complex remains at the starting point. Pertechnetate ion migrates near to the solvent front. Not less than 95.0 per cent of the total radioactivity is found in the spot corresponding to technetium succimer complex. The radioactivity corresponding to pertechnetate ion represents not more than 2.0 per cent of the total radioactivity.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

STORAGE

Store protected from light.

Ph Eur

Technetium [^{99m} Tc] Tin Pyrophosphate Injection

General Notices

(Ph Eur monograph 0129)

Ph Eur

DEFINITION

Technetium (^{99m}Tc) tin pyrophosphate injection is a sterile, apyrogenic solution which may be prepared by mixing solutions of sodium pyrophosphate and stannous chloride with sodium pertechnetate (^{99m}Tc) injection (fission or non-fission). The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 90 per cent of the radioactivity corresponds to technetium-99m complexed with tin pyrophosphate. The injection contains a quantity of sodium pyrophosphate ($Na_4P_2O_7,10H_2O$) that may vary from 1 mg to 50 mg per millilitre and a variable quantity of tin (Sn) not exceeding 3.0 mg per millilitre.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile, apyrogenic ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A clear, colourless solution.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity. The distribution of radioactivity contributes to the identification of the injection.

C. To 1 ml add 1 ml of *acetic acid R*. Heat on a water-bath for 1 h. After cooling, add 10 ml of *nitro-vanadomolybdic reagent R* and allow to stand for 30 min. A yellow colour develops.

D. To 1 ml add 2 ml of a 30 per cent *V/V* solution of *sulphuric acid R*, 1 ml of *hydrochloric acid R*, 0.05 ml of *thioglycollic acid R*, 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R* and 0.1 ml of *dithiol reagent R* and allow to stand for 30 min. A pink colour develops.

TESTS

pH (*2.2.3*)

The pH of the injection is 6.0 to 7.0.

Sodium pyrophosphate

Test solution Use 1 ml of the injection to be examined or a suitable dilution of it.

Reference solutions Using a solution containing *sodium pyrophosphate R* and *stannous chloride R* in the same proportions as in the injection to be examined, prepare a range of solutions and dilute to the same final volume with *water R* .

To the test solution and to 1 ml of each of the reference solutions add successively 10 ml of a 1 g/l solution of *disodium hydrogen phosphate R* , 10 ml of *iron standard solution (8 ppm Fe) R* , 5 ml of *glacial acetic acid R* and 5 ml of a 1 g/l solution of *hydroxylamine hydrochloride R.* Dilute each solution to 40 ml with *water R* and heat in a water-bath at 40 °C for 1 h. To each solution add 4 ml of a 1 g/l solution of *phenanthroline hydrochloride R* and dilute to 50.0 ml with *water R* . Measure the absorbance (*2.2.25*) of each solution at 515 nm using as the compensation liquid a reagent blank containing hydrochloric acid (1.1 g/l HCl) instead of the *iron standard solution (8 ppm Fe) R* . Using the absorbances obtained with the reference solutions, draw a calibration curve and calculate the concentration of sodium pyrophosphate in the injection to be examined.

Tin

Test solution Use 1 ml of the injection to be examined or a suitable dilution of it.

Reference solutions Using a solution in hydrochloric acid (6.2 g/l HCl) containing *sodium pyrophosphate R* and *stannous chloride R* in the same proportions as in the injection to be examined, prepare a range of solutions and dilute to the same volume with hydrochloric acid (6.2 g/l HCl).

To the test solution and to 1 ml of each of the reference solutions add 2 ml of a 300 g/l solution of *sulphuric acid R* , 1 ml of *hydrochloric acid R* , 0.05 ml of *thioglycollic acid R* , 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R* and 0.1 ml of *dithiol reagent R* and dilute to 15 ml with hydrochloric acid (6.2 g/l HCl). Allow the solutions to stand for 30 min and measure the absorbance (*2.2.25*) of each solution at 530 nm, using as the compensation liquid a reagent blank containing the same quantity of *sodium pyrophosphate R* as the injection to be examined. Using the absorbances obtained with the reference solutions, draw a calibration curve and calculate the concentration of tin in the injection to be examined.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The injection may be released for use before completion of the test.

Pyrogens

It complies with the test for pyrogens prescribed in the monograph on *Radiopharmaceutical preparations (0125).* Inject not less than 0.1 ml per kilogram of the rabbit's mass. The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

(a) Examine by thin-layer chromatography (*2.2.27*) using silica gel as the coating substance on a glass-fibre sheet. Heat the plate at 110 °C for 10 min. The plate used should be such that during development the mobile phase migrates over a distance of 10 cm to 15 cm in about 10 min.

Apply to the plate 5 µl to 10 µl of the injection and dry in a stream of nitrogen. Develop over a path of 10 cm to 15 cm using *methyl ethyl ketone R* through which nitrogen has been bubbled in the chromatography tank for 10 min immediately before the chromatography. Allow the plate to dry. Determine the distribution of radioactivity using a suitable detector. The technetium-99m tin pyrophosphate complex remains at the starting-point and pertechnetate ion migrates with an R_F of 0.95 to 1.0.

(b) Examine by thin-layer chromatography (*2.2.27*) using silica gel as the coating substance on a glass-fibre sheet. Heat the plate at 110 °C for 10 min. The plate used should be such that during development the mobile phase migrates over a distance of 10 cm to 15 cm in about 10 min.

Apply to the plate 5 µl to 10 µl of the injection. Develop immediately over a path of 10 cm to 15 cm using a 136 g/l solution of *sodium acetate R*. Allow the plate to dry and measure the distribution of radioactivity using a suitable detector. Impurities in colloidal form remain at the starting-point and technetium-99m tin pyrophosphate complex and pertechnetate ion migrate with an R_F of 0.9 to 1.0.

Add together the percentages of radioactivity corresponding to impurities in the chromatograms obtained in test (a) and test (b). The sum does not exceed 10 per cent.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

LABELLING

The label states, in particular, the quantity of sodium pyrophosphate per millilitre and the quantity of tin per millilitre.

Ph Eur

Thallous [^{201} Tl] Chloride Injection

General Notices

(Ph Eur monograph 0571)

Ph Eur

DEFINITION

Thallous (^{201}Tl) chloride injection is a sterile solution of thallium-201 in the form of thallous chloride. It may be made isotonic by the addition of *Sodium chloride (0193)* and may contain a suitable antimicrobial preservative such as *Benzyl alcohol (0256).* Thallium-201 is a radioactive isotope of thallium formed by the decay of lead-201. Lead-201 is a radioactive isotope of lead and may be obtained by irradiation, with protons of suitable energy, of thallium which may be enriched in thallium-203. Thallium-201 may be separated from lead-201 by passing through a column of an ion-exchange resin. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared thallium-201 radioactivity at the date and hour stated on the label. Not more than 2.0 per cent of the total radioactivity is due to thallium-202 and not less than 97.0 per cent is due to thallium-201. Not less than 95.0 per cent of the radioactivity is due to thallium in the form of thallous ions. The specific radioactivity is not less than 3.7 GBq per milligram of thallium.

CHARACTERS

A clear, colourless solution.

Thallium-201 has a half-life of 3.05 days and emits gamma radiation and X-rays.

IDENTIFICATION

A. Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised thallium-201 solution when measured either by direct comparison or by use of an instrument calibrated with the aid of such a solution. Standardised thallium-201 and thallium-202 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photons have energies of 0.135 MeV, 0.166 MeV and 0.167 MeV. The X-rays have energies of 0.069 MeV to 0.083 MeV.

B. Examine the electropherogram obtained in the test for radiochemical purity. The distribution of radioactivity contributes to the identification of the preparation.

TESTS

pH (*2.2.3*)

The pH of the injection is 4.0 to 7.0.

Thallium

To 0.5 ml of the injection add 0.5 ml of hydrochloric acid (220 g/l HCl) and 0.05 ml of *bromine water R* and mix. Add 0.1 ml of a 30 g/l solution of *sulphosalicylic acid R*. After decolorisation add 1.0 ml of a 1 g/l solution of *rhodamine B R*. Add 4 ml of *toluene R* and shake for 60 s. Separate the toluene layer. The toluene layer is not more intensely coloured than the toluene layer of a standard prepared at the same time in the same manner using 0.5 ml of *thallium standard solution (10 ppm Tl) R*.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).* The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Record the gamma-ray and X-ray spectrum using a suitable instrument calibrated with the aid of standardised thallium-201 and thallium-202 solutions. The spectrum does not differ significantly from that of the standardised thallium-201 solution. Determine the relative amounts of thallium-201 and thallium-202 and other radionuclidic impurities present. Thallium-202 has a half-life of 12.2 days and its most prominent gamma photon has an energy of 0.440 MeV. Thallium-200 has a half-life of 1.09 days and its most prominent gamma photons have energies of 0.368 MeV, 0.579 MeV, 0.828 MeV and 1.206 MeV. Lead-201 has a half-life of 9.4 h and its most prominent gamma photon has an energy of 0.331 MeV. Lead-203 has a half-life of 2.17 days and its most prominent gamma photon has an energy of 0.279 MeV. Not more than 2.0 per cent of the total radioactivity is due to thallium-202 and not less than 97.0 per cent is due to thallium-201.

RADIOCHEMICAL PURITY

Examine by zone electrophoresis (*2.2.31*), using a suitable strip of cellulose acetate, as the support and a 18.6 g/l solution of *sodium edetate R* as the electrolyte solution. Soak the strip in the electrolyte solution for 45-60 min. Remove the strip with forceps taking care to handle the outer edges only. Place the strip between 2 absorbent pads and blot to remove excess solution.

Test solution Mix equal volumes of the injection to be examined and the electrolyte solution.

Apply not less than 5 µl of the test solution to the centre of the strip and mark the point of application. Apply an electric field of 17 V/cm for at least 10 min. Allow the strip to dry in air. Determine the distribution of radioactivity using suitable equipment. Not less than 95.0 per cent of the radioactivity migrates towards the cathode.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised thallium-201 solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

Tritiated [^{3} H] Water Injection

General Notices

(Ph Eur monograph 0112)

Ph Eur

DEFINITION

Tritiated (^{3}H) water injection is water for injections in which some of the water molecules contain tritium atoms in place of protium atoms. It may be made isotonic by the addition of sodium chloride. Tritium (^{3}H) may be obtained by the neutron irradiation of lithium. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared tritium activity at the date stated on the label.

CHARACTERS

A clear, colourless liquid.

Tritium has a half-life of 12.3 years and emits beta radiation.

IDENTIFICATION

Record the beta-ray spectrum by the method prescribed in the test for radionuclidic purity. The spectrum does not differ significantly from that of a standardised tritiated (^{3}H) water. Standardised tritiated (^{3}H) water is available from laboratories recognised by the competent authority. The maximum energy of the beta radiation is 0.019 MeV.

TESTS

pH (*2.2.3*)

The pH of the injection is 4.5 to 7.0.

Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125).*

RADIONUCLIDIC PURITY

(a) Mix 100 µl of a suitable dilution of the injection with 10 ml of a scintillation liquid consisting of 1000 ml of *dioxan R* , 100 g of *naphthalene R* , 7 g of *diphenyloxazole R* and 0.3 g of *methylphenyloxazolylbenzene R* , the reagents being of an analytical grade suitable for liquid scintillation. Measure the radioactivity of the mixture in a liquid scintillation counter fitted with a discriminator. The count should be about 5000 impulses per second at the lowest setting of the discriminator. Record the count at different discriminator settings. For each measurement count at least 10 000 impulses over a period of at least 1 min. Immediately determine in the same conditions the count for a standardised tritiated (^{3}H) water having approximately the same activity.

Plot the counts at each discriminator setting, correcting for background activity, on semi-logarithmic paper, the discriminator settings being in arbitrary units as the abscissae.The vertical distance between the two curves obtained is constant. They obey the mathematical relationship:

$$\frac{\frac{A_1}{B_1} - \frac{A_2}{B_2}}{\frac{A_1}{B_1}} \times 100 < 20$$

A_1 = radioactivity recorded for the standardised preparation at the lowest discriminator setting,

B_1 = radioactivity recorded for the preparation to be examined at the lowest discriminator setting,

A_2 = radioactivity recorded for the standard at the discriminator setting such that,

$$A_2 \approx A_1 \times 10^{-3}$$

B_2 = radioactivity recorded for the preparation to be examined at the latter discriminator setting.

(b) Record the gamma-ray spectrum. The instrument registers only background activity.

RADIOCHEMICAL PURITY

Place a quantity of the injection equivalent to about 2 µCi (74 kBq), diluted to 50 ml with *water R* , in an all-glass distillation apparatus of the type used for the determination of distillation range (*2.2.11*). Determine the radioactive concentration. Distil until about 25 ml of distillate has been collected. Precautions must be taken to avoid contamination of the air. If the test is carried out in a fume cupboard, the equipment must be protected from draughts. Determine the radioactive concentration of the distillate and of the liquid remaining in the distillation flask. Neither of the radioactive concentrations determined after distillation differs by more than 5 per cent from the value determined before distillation.

RADIOACTIVITY

Determine the radioactivity using a liquid scintillation counter.

DEFINITION

Water (^{15}O) injection is a sterile solution of [^{15}O]water for diagnostic use. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared oxygen-15 radioactivity at the date and time stated on the label. Not less than 99 per cent of the total radioactivity corresponds to oxygen-15 in the form of water.

PRODUCTION

RADIONUCLIDE PRODUCTION

Oxygen-15 is a radioactive isotope of oxygen which may be produced by various nuclear reactions such as proton irradiation of nitrogen-15 or deuteron irradiation of nitrogen-14.

RADIOCHEMICAL SYNTHESIS

In order to recover oxygen-15 as molecular oxygen from the nitrogen target gas, carrier oxygen is added at concentrations generally ranging from 0.2 per cent *V/V* to 1.0 per cent *V/V*. [^{15}O]Water can be prepared from [^{15}O]oxygen by reaction with hydrogen using a suitable catalyst.

An alternative method is to produce [^{15}O]water "in-target" by adding hydrogen to the irradiated target gas at a concentration generally ranging from 2 per cent *V/V* to 5 per cent *V/*V.

The [^{15}O]water vapour contained in the gas-stream is either bubbled through a reservoir of a sterile 9 g/l solution of sodium chloride, or is exchanged by diffusion into such a solution through a membrane filter for dialysis.
